TO THE

KING.

SIR,

THE ARTS and SCIENCES humbly crave audience of Your Majeſty. The near connexion they have with the happineſs of a people, promiſes them a favourable reception from a Prince who makes his people's happineſs the baſis of his own. 'Tis by them the parſimony of nature is ſupplied, and life rendered eaſy and agreeable under its numerous infirmities. By them the mind is reclaimed from its native wildneſs, and enriched with ſentiments which lead to virtue and glory. 'Tis they, in fine, that make the difference between Your Majeſty's Subjects, and the ſavages of Canada, or the Cape of Good Hope.

THE protection of ARTS has been ever eſteemed the proper province of the Great. 'Tis a branch of the regal office, which a prince, equal to the whole charge of a Crown, will not ſuffer to be alienated into other hands. From this, do the firſt and moſt diſtinguiſhed names in hiſtory derive a large ſhare of their glory: and if there be any age or nation conſpicuous above the reſt, and which is looked on with envy by our own, it is that wherein the Sovereigns have ſignalized themſelves moſt in this quality.—But, the time is now at hand, when we are no longer to envy Rome her AUGUSTUS and AUGUSTAN AGE; but Rome, in her turn, ſhall envy ours.

SOMETHING extraordinary ſeems intended by Providence, in placing ſuch a Prince at the head of ſuch a people; a Prince inſpired with a generous paſſion, to devote his cares to the welfare of mankind; and a people conſpiring with unexampled ardor and unanimity to all his glorious views. Some of our beſt Princes have had their hands tied down; checked by reluctant factions, which oppoſed every nobler deſign: Your Majeſty has found the happy ſecret to make even contention do You homage; and turn oppoſition itſelf into approbation and applauſe.

THERE is a time reſerved in fate for every nation to arrive at its height; and the uppermoſt place on the terreſtrial ball is held ſucceſſively by ſeveral ſtates. May not the numerous preſages, which uſher in Your Majeſty's reign, give us room to

expect that our turn is next; and that what Greece was under ALEXANDER, and Rome under AUGUSTUS CÆSAR, Britain ſhall be under Your Majeſty's government and protection.

BUT even this were to under-rate our hopes, which are raiſed by your Majeſty to ſomething ſtill more truly glorious. Greatneſs, ſo fondly coveted, has already coſt the world very dear; and though ſtill purſued by unthinking Men under almoſt every ſhape, is only deſirable in a few. Of itſelf it is rather an object of terror and alarm, than delight; and at beſt only pleaſes, when joined with ſomething naturally amiable. From the practice of Your Majeſty, men may correct their ſentiments, and learn, that greatneſs has no charm, except when founded in goodneſs. To be Great and a King, is but a ſmall matter with Your Majeſty; it is a quality many others enjoy in common with You, and to which ſome have even been doomed to their infamy: it is what Herod was; and what Nebuchadnezzar was; and what Nero, and Domitian, were. But, while ſome Princes chuſe to be great in what is deſtructive, and others in things wholly indifferent; it is Your Majeſty's praiſe to be great in what is the perfection of our nature, and that whereby we approach neareſt the Deity. Happy choice! to uſe power only as the means of rendering your beneficence more diffuſive; and thus to make Royalty miniſter to the happineſs of mankind, which it has been uſed to invade.

YOUR Majeſty commands a people capable of every thing. Not more fitted to ſhine in arms, or maintain an extended commerce; than to ſucceed in the ſtiller purſuits of philoſophy, and literature. And it will be Your Majeſty's glory, not to let any of their talents lie unemployed. If Your Majeſty gives the word, while ſome of them are buſied in avenging Your cauſe, by humbling ſome turbulent monarch; ſome in extending Your dominions by new ſettlements, and ſome in increaſing Your people's wealth, by new trades: others will be employed in enlarging our knowledge by new diſcoveries in nature, or new contrivances in art; others in refining our language; others in improving our morals; and others in recording the glories of Your reign in immortal ſong.

THE Work I here preſume to lay at Your Majeſty's feet, is an attempt towards a ſurvey of the republic of learning, as it ſtands in Your Majeſty's moſt auſpicious reign. We have here ſomewhat of the boundary that circumſcribes our preſent proſpect; and ſeparates the known, from the unknown parts of the intelligible world. Under Your Majeſty's princely influence and encouragement, we promiſe ourſelves this boundary will be removed, and the proſpect extended far into the other hemiſphere.—Methinks I ſee trophies erecting to Your Majeſty in the yet undiſcovered regions of Science; and Your Majeſty's Name inſcribed to inventions at preſent held impoſſible.

I am, with all ſincerity and devotion,

May it pleaſe Your MAJESTY,

Your Majeſty's moſt dutiful,

and obedient Subject,

and Servant,

GRAY'S-INN,
October 15th,
1727.

EPHRAIM CHAMBERS.

TO THE

KING.

SIR,

THE patronage of works of Univerſal Science is one of the prerogatives which pertain to Your MAJESTY's high ſtation. The nature of this work, therefore, prompted the Editor to requeſt the honour of Your MAJESTY's protection, and his views could conſiſtently be directed to no other Patron.

AS the ſovereign of a country, in which every kind of Science is induſtriouſly purſued and ſo liberally encouraged, they who labour in promoting it, even in the humbler occupation of collecting and recording the diſcoveries of others, may hope to obtain the favour of Your Royal countenance.

THE original compiler of this Dictionary introduced it to the public notice under the ſanction of Your Royal Grandfather. The Editor of it, in its preſent enlarged ſtate, feels a like ambition: and whilſt he gratefully acknowledges Your MAJESTY's condeſcenſion in permitting him to preſent it to the public under Your Royal Patronage, he is doubly anxious, that the work itſelf, in the execution of it, may appear worthy of Your MAJESTY's approbation.

YOUR MAJESTY's known judgment in many of the ſubjects, which the Dictionary comprehends, might juſtly alarm his diffidence. He is encouraged, however, by the reflection, that he has recorded diſcoveries and improvements, many of which were unknown and unthought of at the time of Your MAJESTY's happy acceſſion: diſcoveries and improvements, which, by extending the boundaries of Science and enlarging the empire of the human mind, diffuſe a glory over this country, unattainable by conqueſt or dominion.

IN the progreſs of this work, the Editor has impartially ſought out and recorded every kind of information, which may do juſtice to the merit of thoſe, of *every country*, who have diſtinguiſhed themſelves in the cauſe of Science: but he has been more particularly

larly ſolicitous to pay a due reſpect to the genius of Britain; and he has felt a peculiar pride, as well as pleaſure, in recording thoſe inventions and improvements, which do honour to *his own country*, and to the diſtinguiſhed munificence of his Sovereign.

THE ſcene, which the Editor's predeceſſor in this literary labour contemplated only in imagination, has been realized under the auſpices of Your MAJESTY. Whilſt ſome have ſucceſſively traverſed the globe, and "erected trophies" to Your MAJESTY in the various departments of Geography, Navigation, and Natural Hiſtory; others, with a ſkill and aſſiduity which have been honoured with Your MAJESTY's peculiar patronage, have explored the heavens, aſcertained with an accuracy unknown before, and extended, far beyond their imagined limits, the dimenſions of the ſolar ſyſtem, and furniſhed the Aſtronomer with new views and ideas of the material univerſe.

SUCH, Sir, are the numerous and important diſcoveries, which have been already made, and which we have yet reaſon to hope for, under Your Royal ſanction and encouragement, as muſt ſecure to Your MAJESTY a tribute of grateful recollection from the learned of the preſent age, and, in the future hiſtory of Science, ſtamp a luſtre on the æra of Your MAJESTY's reign to the lateſt generations.

THAT Your MAJESTY's government, for the farther encouragement of every uſeful art, and for the univerſal benefit of Your ſubjects, may be long and happy: that You may uninterruptedly enjoy every perſonal and domeſtic bleſſing: that You may tranſmit to ſucceeding Princes of Your illuſtrious Family the affectionate attachment of a free and grateful people: and that, after having been long continued in the faithful diſcharge of the duties of Your earthly crown, You may finally receive the reward of a heavenly one, are the fervent prayers of the Editor, who is happy in every occaſion of expreſſing his own attachment to Your Perſon and Family, and who with the profoundeſt reſpect ſubſcribes himſelf,

Your MAJESTY's moſt faithful,
Moſt obedient and moſt devoted
Subject and Servant,

ABRAHAM REES.

Old Jewry,
January 24th 1786.

PREFACE

TO THE

NEW EDITION.

THERE are few works in the Engliſh language which have been more generally and more deſervedly eſteemed than the CYCLOPÆDIA of Mr. CHAMBERS. As a DICTIONARY of univerſal literature and ſcience, comprehending a variety of ſubjects in a ſmall compaſs, and in alphabetical order, it is adapted to a very numerous claſs of readers. We need not fear incurring the charge of exaggerated praiſe, when we aſſert, that it has contributed more to the diffuſion of knowledge than any other publication in our language. In its extent and arrangement, it is ſuited to the occaſions and to the convenience of many perſons, who have neither leiſure nor opportunity to recur to thoſe different ſources of information, whence the materials of which it is compiled are collected. The ſpirit of inquiry that prevails among ſuch perſons merits attention and encouragement. To them a work of this kind, that facilitates their acquiſition of knowledge, cannot fail of being peculiarly acceptable; and from them the compiler of a DICTIONARY, humble and ſubordinate in the ſcale of literary labourers as ſome may think his occupation, will receive a tribute of reſpect and praiſe.

TO others, whoſe acquaintance with particular branches of ſcience precludes the neceſſity of their application to ſuch a work, it will communicate general information concerning ſubjects, to which their attention has not been ſo immediately directed; and thus afford them leiſure for gratifying their taſte or inclination in reſearches, which they may deem more important or more pleaſing, and in which they may be more ambitious of excelling.

THE inquiſitive and ſtudious, whatever be the peculiar object of their inveſtigation, will think it no inconſiderable advantage to be directed by references, ſubjoined to a variety of articles, where they may proſecute their inquiries with ſatisfaction: whilſt thoſe, who are proficients in ſcience, will find it uſeful, on many occaſions, to conſult a DICTIONARY, as they would refer to a common-place book, in order to aſſiſt their memories, without the labour and the loſs of time, which it would require to recur to a great number of diſtinct treatiſes, whence their knowledge was originally derived. Although a profeſſed mathematician would not ſtudy mathematics, nor a philoſopher philoſophy, nor a divine theology, nor any profeſſional man the ſubjects that form the baſis of his profeſſion, in a DICTIONARY; yet all perſons may receive benefit from it, even in the line of their profeſſion or favourite purſuit; and much more in diſquiſitions and inquiries, remote from the courſe of ſtudies, to which their ſituation or inclination leads them. The knowledge with regard to many ſubjects, which a DICTIONARY ſupplies, will bound their views, and anſwer all their purpoſes.

IT is, likewiſe, a conſideration of no ſmall moment, in eſtimating the importance and utility of a SCIENTIFIC DICTIONARY, that it ſupplies in ſome degree the want of a large library; by furniſhing the inquiſitive and curious with hints and abſtracts of ſcience, that are diſperſed in many volumes, which cannot be procured without difficulty, and without conſiderable expence.

IN enumerating the advantages recommending this work, we muſt not forget to mention, that it records and tranſmits to future ages many inventions and improvements, which might otherwiſe ſink into oblivion; that it forms a compendious hiſtory of ſcience; that it furniſhes the outlines of its gradual progreſs and advancement; and that, by preſerving a ſummary of what has been already done and diſcovered, it lays a foundation for farther diſcoveries and improvements. In this latter view of its importance and uſe, it may not be improperly compared to a map of ſcience, in which the line that terminates the *terra cognita* is diſtinctly marked out for the direction of thoſe, whoſe ingenuity and induſtry are employed in extending the boundaries of knowledge, and in exploring thoſe regions that are ſtill unknown.

A DICTIONARY of SCIENCE muſt appear, from this brief account of its deſign and uſe, to be a work of great importance; and its importance, in every country, will be eſtimated by the degree in which knowledge is purſued and promoted. The firſt work of this kind, formed on a ſcale ſufficiently extenſive to anſwer moſt of the purpoſes that have been now recited, which any country can boaſt, was the CYCLOPÆDIA of Mr. CHAMBERS: a work, not only excellent in its general plan and deſign, but executed in a manner that has preſerved its reputation for more than half a century.

AS to the plan, it was admirably adapted to the nature and neceſſary limits of a popular work; deſigned not merely for public libraries and for the uſe of thoſe who ſpare no expence in obtaining the beſt means of information, but for diſſeminating literature and ſcience through the ſubordinate claſſes of mankind. With this view Mr. CHAMBERS ſeems to have adopted the happy medium between a work conſiſting merely of definitions, etymologies, and references, and a voluminous collection of diffuſe and elaborate treatiſes on various ſubjects, the price of which muſt reſtrict it to few purchaſers, and the peruſal of which would be thought tedious by many, who had occaſion for conſulting it.

IN judging of the execution of the CYCLOPÆDIA, there are many circumſtances which ought to be conſidered, before we ſhall be able to form a candid or even a juſt opinion. The limits of two volumes in folio, to which the author, probably doubtful of the ſucceſs of his undertaking, thought proper to confine himſelf, would prevent his admitting, or allow only his curſorily mentioning, many articles, which he might think of inferior importance, or the omiſſion of which, at the time of the firſt publication of the Dictionary, the purchaſers would not much regret. This ſeems to be one reaſon why Natural Hiſtory makes ſo inconſiderable a part of this work, in its original ſtate. The ſucceſs of the firſt edition, which appeared in 1728, enlarged the views of the author; and previouſly to the publication of the ſecond edition in 1738, he had formed a deſign of publiſhing a new work on a more extenſive ſcale, and had actually prepared a conſiderable part of the copy with this view. This deſign, however, was fruſtrated by a bill agitated in parliament (which, indeed, paſſed the houſe of commons, but was rejected in the houſe of lords), containing a clauſe, that obliged the publiſhers of all improved editions of books to print the improvements ſeparately. Accordingly the ſecond edition was publiſhed with corrections and additions, and with an apology to the public for diſappointing their expectations of a larger work. Mr. CHAMBERS was, therefore, far from imagining, that two volumes would allow ſufficient ſcope for the execution of the comprehenſive plan which he had formed for a Dictionary of univerſal literature and ſcience; and he was prevented, merely by collateral circumſtances, from purſuing his own ideas of its perfection to their utmoſt extent.

IT deſerves alſo to be conſidered, that, in a work of ſuch variety and magnitude, adapted to readers of every deſcription, the ſame articles will be thought needleſsly diffuſe or conciſe, according to the particular views and taſte of the reader; and the only juſt ſtandard is that of their real importance, of which, perhaps, the author himſelf is not, in all caſes, a proper judge. Beſides, ſubjects that engage the public attention at the time when a work of this kind is compiled, will naturally be extended beyond the limits, which thoſe who do not conſider the circumſtances that might firſt attend them, may be diſpoſed to allow; and a writer, who ſtudies to gratify the curioſity of his contemporaries, as well as that of poſterity, will be in danger of erring on the ſide of exceſs. This obſervation will probably furniſh an apology for ſome prolonged articles that occur in the original CYCLOPÆDIA.

AFTER all, when we conſider that this was the work of a ſingle perſon, who had the labour of collecting, as well as of arranging its principal materials, it will be thought the moſt wonderful production both of judgment and application, which this or any other country can boaſt. And, therefore, inſtead of complaining of the defects and imperfections to which it is unavoidably ſubject, the judicious and candid will make every reaſonable allowance for the numberleſs difficulties attending its execution.

SUCH, indeed, has been the opinion of the public, with regard to the merit of the CYCLOPÆDIA, that the ſale of it has exceeded that of any other publication of equal price. The ſecond edition in 1738 was ſo favourably received, as to require the publication of a third in 1739, of a fourth in 1741, and of a fifth in 1746. Theſe repeated teſtimonies of the public approbation amply juſtify the character given of it by one, who well knew its value, and who calls it "the pride of booksellers, and the honour of the "Engliſh nation." The proprietors, therefore, were induced, by motives of reſpect and gratitude to the public, as well as by their own intereſt in ſo valuable a work, to correct the errors, and to ſupply the defects of the original Dictionary; errors and defects which time had diſcovered, and which ſubſequent inveſtigations and improvements had occaſioned. Accordingly, in the proſpect of a demand for the ſixth edition, they engaged the late George Lewis Scott, eſq. to prepare a SUPPLEMENT in two additional folio volumes. This gentleman had not proceeded far in the execution of this deſign, when he was diverted from it by other avocations; ſo that the completion of the buſineſs was entruſted with Dr. Hill, whoſe voluminous publications in natural hiſtory are well known. The SUPPLEMENT undoubtedly contained many important and valuable articles, relating to ſubjects that had been either wholly omitted or ſlightly mentioned by Mr. CHAMBERS. But the rapidity with which Dr. Hill executed the province aſſigned him, and the freedom with which he tranſcribed from his own writings and thoſe of others, were not favourable either to the reputation of the work, or to the intereſt of the proprietors.

THE ORIGINAL WORK and the SUPPLEMENT remained in this ſeparate ſtate for many years. However, the inconvenience of a double alphabet continued to be the ſubject of renewed complaints; and it was thought that the SUPPLEMENT, when properly abridged and corrected, might be incorporated, to the ſatisfaction of the public, with the ORIGINAL WORK.

But

But the views of the proprietors extended much farther than to this ſingle object. They were not unapprized of the rapid progreſs of ſcience; and they wiſhed that a work, in the reputation and ſucceſs of which they were ſo much intereſted, might be a comprehenſive and complete regiſter of modern diſcoveries and improvements.

AFTER ſome unſucceſsful attempts to execute this laudable deſign, the work was entruſted to the care of the preſent Editor. The courſe of his ſtudies and official engagements had led him into a general acquaintance with the contents of the CYCLOPÆDIA: and having had frequent occaſions for conſulting it, he was not altogether ignorant either of its excellencies or defects. Having been accuſtomed to ſcientific reſearches, he was not unacquainted with the ſources of information, to which he muſt recur in the progreſs of the work: he had alſo acceſs to ſome valuable libraries, that would furniſh him with books, both ancient and modern, to which he might have occaſion often to refer: he was happy in an intimate acquaintance with ſeveral learned friends, by whoſe advice he might profit, and of whoſe aſſiſtance he could avail himſelf on many occaſions: and the habits of his life were ſuch as would diſpoſe him to ſubmit to the application and labour, which the execution of ſuch a work muſt unavoidably require.

NOTWITHSTANDING theſe advantages, the recital of which ſeems to be neceſſary in order to vindicate him from the charge of preſumption in this undertaking, he engaged in it with great diffidence and anxiety; fearful leſt he ſhould diſappoint the views of the Proprietors and the juſt expectations of the Public. Having embarked, however, he determined to perſevere; and to make every effort, of which he was capable, for improving the work and for ſecuring the approbation of the judicious and candid. With an induſtry and ardour, which the hope of giving ſatisfaction to the public animated, and which the extent and importance of the undertaking both deſerved and required, he devoted to the accompliſhment of it all that time and attention, in the courſe of many years, which his other engagements would allow: and he thinks himſelf happy, that no accident has prevented the uninterrupted progreſs of a publication, to the completion, as well as the reputation and ſucceſs of which his wiſhes and labours have been uniformly directed.

IT was the Editor's intention to recite, at the cloſe of the work, the principal Amendments which the CYCLOPÆDIA has received, and the Additions which it has been thought neceſſary to introduce into this new edition. But they have been ſo numerous, that the recital, however it might redound to the credit of his induſtry, would be tedious and unintereſting to the reader. Thoſe, who have either inclination or leiſure to compare the CYCLOPÆDIA in its preſent ſtate with the ORIGINAL WORK and SUPPLEMENT, will find, that many of the original articles in both have been either abridged or enlarged, as their reſpective nature and importance required; and that many new articles have been inſerted in their alphabetical order; ſo that it would not be eaſy, if it were thought neceſſary or uſeful, to recount the alterations which the former have undergone, and the additions of which the latter conſiſt.

IT will be ſufficient to obſerve, in general, from a regular account which the Editor has preſerved, that the number of NEW ARTICLES amounts to more than FOUR THOUSAND FOUR HUNDRED; ſeveral of which do not occur in any DICTIONARY of SCIENCE, which he has had an opportunity of conſulting: ſome of them are of conſiderable length; many comprehend ſubjects of moment; and the leaſt important were thought too intereſting to be omitted. The ORIGINAL ARTICLES, which ſeemed to require correction, abridgment, or addition, many of which have been very much altered or enlarged, are more numerous than thoſe that are altogether new.

FROM this brief detail it will not be thought ſurpriſing, that, whilſt the number of volumes remains the ſame, agreeably to the propoſals of the Proprietors, the ſize of each volume ſhould be much increaſed. Beſides, by the union of the two alphabets, the combination of articles under the ſame title, the abridgment of thoſe that were needleſly diffuſe, an alteration in the references by cancelling ſome that were of no importance, and printing the ſubject of reference in a different character in the body of the article itſelf, and by a minute attention to many other circumſtances, the Editor has made room for introducing a variety of new matter within the ſame compaſs.

THE Editor reflects with pleaſure, and with grateful reſpect to the numerous purchaſers of this new edition of the CYCLOPÆDIA, that his labours in the cauſe of ſcience have been ſo favourably received. He truſts, that he may be allowed to interpret the extenſive ſale with which it has been honoured, as a teſtimony of the approbation, as it is a full proof of the candour of the public. Acknowledging that candour and confiding in it, it is needleſs to urge thoſe apologies which are furniſhed by the magnitude of this publication, and the variety of ſubjects it comprehends: but he would be unworthy of the indulgence he has experienced, and to which he farther appeals, if he had not conſidered it as an encouragement to unremitting application.

HOPING that the errors and defects, which have eſcaped the moſt diligent attention, will not be thought very conſiderable, either in their number or in their nature, by thoſe who are diſpoſed to judge of the execution of this work by the unavoidable difficulties attending it; and that the numerous corrections and additions, in the various departments of ſcience, which this enlarged

larged edition of the CYCLOPÆDIA contains, will be regarded as important and valuable improvements: the Editor ſubmits it, entire, to the candid judgment of the Public. Their approbation will be eſteemed as the greateſt recompence which he can receive: and the conſciouſneſs of having contributed, in any degree, to the ſpreading of uſeful knowledge, will afford him peculiar ſatisfaction.

THE Editor gratefully acknowledges the hints and communications which he has received, both in converſation and writing, for the improvement of this work. It will appear, by the articles to which they refer, and by the ſubjoined liſt of CORRIGENDA & ADDENDA, that they have not been diſregarded. But he is under peculiar obligations to the friendſhip of the Rev. Dr. Price, to whom the public are indebted for ſeveral articles, that will be thought to enrich this edition, on the ſubjects of ANNUITIES, ASSURANCE, FUNDS, LIFE-*Annuities*, *Bills of* MORTALITY, and SURVIVORSHIP.

SEVERAL flattering teſtimonies of approbation from unknown Correſpondents demand alſo the reſpectful acknowledgments of the Editor: as they have ſerved to animate his aſſiduity and perſeverance in the proſecution of an undertaking, which required reſolution and patience; and in which he muſt have been ſingularly fortunate, if he had eſcaped every kind of reflection.

THE Proprietors think themſelves happy, that the extenſive ſale of this edition has enabled them to cancel moſt of the old Plates, and to be at the expence of new engravings; and to increaſe the number of new plates, far beyond their original deſign. The ingenious artiſt, who had the conduct of this buſineſs, has executed it with an attention and accuracy which, it is hoped, will give ſatisfaction to the Public.

THE ſcheme of annexing an INDEX to this edition was previouſly ſuggeſted to ſeveral judicious friends and approved by them: and experience will evince its utility. The labour of compiling it was undertaken, independently of any regard to the intereſt of the Proprietors, with the ſole view of improving the work, and from a full conviction that it would ſerve as a directory in the uſe of it; and anſwer the purpoſe of informing the reader, where any particular kind of knowledge, which his occaſions or curioſity might diſpoſe him to ſeek, was to be found, and of conducting him from one ſubject to another, much better than any number of references incorporated in the work itſelf. Beſides, it contains an analyſis of ſeveral articles; ſo that by merely running the eye over each column, the reader will readily diſcover, where he may meet with miſcellaneous information on a variety of ſubjects, which the general titles of ſuch articles could not have ſuggeſted to him. To readers, therefore, who conſult the DICTIONARY in order to obtain a general acquaintance with any ſcience or ſubject, and who are not converſant with the terms that occur in it, the INDEX cannot fail of being uſeful: and to others, to whom the terms of any ſcience are more familiar, it will be of ſervice in directing them to a variety of obſervations and facts, which are interſperſed through the ſeveral volumes of the DICTIONARY, and to which no term, however appoſite or comprehenſive in itſelf, or readily occurring to their recollection, could immediately lead them. If we may be allowed to compare the DICTIONARY to a library, conſiſting of a number of books on various ſubjects, the INDEX, which comprehends an alphabetical arrangement of the ſeveral terms contained in it, referred to thoſe heads of ſcience to which they belong, is ſimilar, in its uſe, to that of an Alphabetical and Scientific Catalogue, containing not only an arrangement of the books, under their proper titles, in the order of the alphabet, but an analyſis of their contents, diſtributed in the ſame order, under the diſtinct ſcience or ſubject to which they relate.

THOUGH the Editor was ſatisfied of the importance and uſe of ſuch an INDEX, he was fearful of treſpaſſing on the patience of the public, who, as well as himſelf, could not but wiſh to ſee a ſpeedy termination of this work: he is happy, however, that it is compriſed in ſeven numbers; and hopes the purchaſers will be of opinion, that the DICTIONARY derives a value from it much more than adequate to the additional expence with which it is attended.

PREFACE.

IT is not without ſome concern that I put this work in the reader's hands; a work ſo ſeemingly diſproportionate to any ſingle perſon's experience, and which might have employed an academy. What adds to my apprehenſions, is the ſcanty meaſure of time that could be employed in a performance, which a man's whole life ſcarce appears equal to. The Vocabulary of the academy *della Cruſca* was above forty years in compiling, and the Dictionary of the French Academy much longer; and yet the preſent work will be found more extenſive than either of them in its ſubject and deſign, as much as it falls ſhort of them in reſpect of years, or of hands employed in it.

HERE, the reader might be led to ſuſpect ſomething of diſingenuity; and think I firſt offer him a book, and then give him reaſons why I ſhould not have done it. But his ſuſpicions will abate, when he is appriſed of ſome advantages under which I engaged; which are ſuperior to what had been known in any former work of the kind: ſince all that had been done in them accrued, of courſe, to the benefit of this. I come, like an heir, to a large patrimony, gradually raiſed by the induſtry and endeavours of a long race of anceſtors. What the French and Italian academiſts, the abbé Furetiere, the editors of Trevoux, Savary, Chauvin, Harris, Wolfius, Daviler, and others have done, has been ſubſervient to my purpoſe. To ſay nothing of an inferior claſs of books of this kind, which contributed their ſhare; dictionaries on almoſt every ſubject, from medicine and law, down to heraldry and the manege.

YET this is but a part: I am far from having contented myſelf to take what was ready collected; but have augmented it with a large acceſſion from other quarters. Few parts of the commonwealth of learning, but have been trafficked to on this occaſion. Recourſe has been frequently had to the originals themſelves on the ſeveral arts; and, not to mention what ſmall matters could be furniſhed from my own ſtock, the reader will here have extracts and accounts from a great number of books of all kinds, either overlooked by former lexicographers, or not then extant; and a multitude of improvements in the ſeveral parts, eſpecially of natural knowledge, made in theſe laſt years. If inſtances hereof were required, I hope there are few pages which will not afford ſeveral.

SUCH are the ſources from whence the materials of the preſent work were derived; which, it muſt be allowed, were more than ſufficiently ample: ſo that the difficulty lay in the form and œconomy of it; ſo to diſpoſe ſuch a multitude of materials, as not to make a confuſed heap of incoherent parts, but one conſiſtent whole. And here it muſt be confeſſed there was little aſſiſtance to be had. Former lexicographers have ſcarce attempted any thing like ſtructure in their works; nor ſeem to have been aware, that a dictionary was, in ſome meaſure, capable of the advantages of a continued diſcourſe. Hence it is that we ſee nothing like a whole in what they have done; and, for this reaſon, ſuch materials as they did afford for the preſent work, generally needed farther preparation, ere they became fit for our purpoſe; which was as different from moſt of theirs, as a ſyſtem from a cento.

OUR view was, to conſider the ſeveral matters, not only in themſelves, but relatively, or as they reſpect each other: both to treat them as ſo many wholes, and as ſo many parts of ſome greater whole; their connexion with which to be pointed out by a reference. So that by a courſe of references, from generals to particulars; from premiſes to concluſions; from cauſe to effect, and vice verſa, i. e. from more to leſs complex; and from leſs to more; a communication might be opened between the ſeveral parts of the work; and the ſeveral articles be, in ſome meaſure, replaced in their natural order of ſcience, out of which the alphabetical order had removed them.

FOR an inſtance.—The article ANATOMY, is not only to be conſidered as a whole, i. e. as a particular ſyſtem, or branch of knowledge; and accordingly divided into its parts, *human*, and *comparative*; and human, again, ſubdivided into the *anatomy of ſolids*, and *fluids* (to be referred to in their ſeveral places in the book, where they themſelves being treated of, refer to others ſtill lower, and ſo on); but alſo as a part of MEDICINE; which, accordingly, it refers to; and which, itſelf, refers to another higher, &c. By ſuch means, a chain may be carried on from one end of an art to the other, i. e. from the firſt or ſimpleſt complication of ideas, appropriated to the art, which we call the *elements*, or principles thereof, to the moſt complex, or general one, the name or term that repreſents the whole.

NOR is the purſuit to be dropped here: but as the elements or data, in one art, are ordinarily quæſita in ſome other ſubordinate one, and are furniſhed thereby (as here, for inſtance, the elements of anatomy are furniſhed by *natural hiſtory*, *phyſics*, and *mechanics*; and anatomy itſelf may be conſidered as a datum furniſhed to *medicine*); we may carry on the view farther, and refer out of one art or province into the adjoining ones; and thus lay, as it were, the whole land of knowledge open. It may appear, indeed, with the face of a wilderneſs: but it ſhould be a wilderneſs through which a reader might find his way as ſecurely, though not ſo expeditiouſly and eaſily, as through a regular parterre.

IT may be even ſaid, that if the Syſtem be an improvement upon the Dictionary, the Dictionary is ſome advantage to the Syſtem; and that this is, perhaps, the only way wherein the whole circle, or body of knowledge, with all its parts and dependencies, can well be delivered. In any other form, many thouſand leſſer things muſt needs be concealed: all the pins, the joints, the binding of the fabric, muſt be inviſible of courſe; all the leſſer parts, one might ſay, all the parts whatſoever, muſt be, in ſome

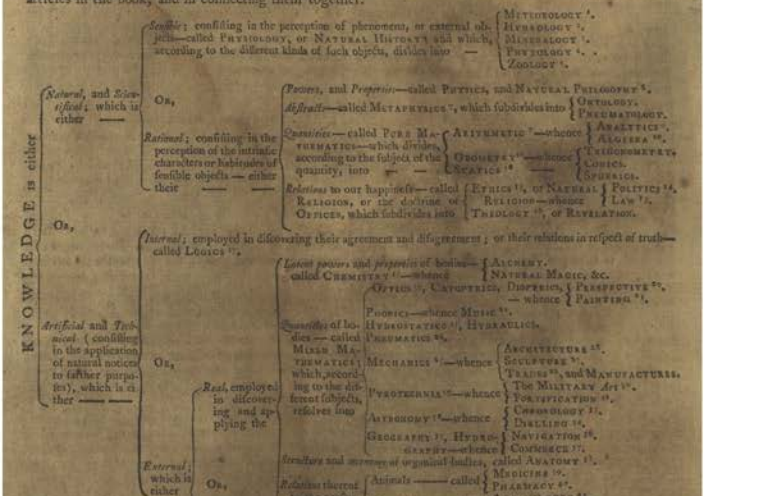
measure, swallowed up in the whole. The imagination, stretched and amplified to take in so large a structure, can have but a very general, undistinguishing perception of any of the component parts. Whereas the parts are not less matter of knowledge when taken separately, than when put together. Nay, and as our ideas are all individuals; and as every thing that exists is one; it may seem more natural to consider knowledge in its parts, i. e. as divided into separate articles, denoted by so many different terms, than to consider the whole assemblage in its utmost composition; which is a thing merely artificial, and the work of imagination.

AND yet the latter way must be allowed to have many and real advantages over the former; which, in truth, is only of use and significance, as it partakes of it. Whence it should follow, that the most advantageous way is, to make use of both: to consider every point, both as a part, to help the imagination to the whole; and as a whole, to help the understanding to each part.—Which is the view in the present work.—So far, we mean, as the many and great difficulties we had to labour under would allow us to pursue it.

IN this view we have endeavoured to give the substance of what has been hitherto discovered in the several branches of knowledge, both natural and artificial: that is, in the knowledge of *nature*, first, as she appears to our senses, either spontaneously, as in *natural history*; or with the assistance of art, as in *anatomy*, *chemistry*, *medicine*, *agriculture*, &c. Secondly, to our imagination, as in *grammar*, *rhetoric*, *poetry*, &c. Thirdly, to our reason; as in *physics*, *metaphysics*, *logics*, and *mathematics*: with the several subordinate arts arising from each; as *agriculture*, *painting*, *sculpture*, *trade*, *manufactures*, *policy*, *law*, &c. and numerous remote particulars, not immediately reducible to any of these heads; as *heraldry*, *philology*, *antiquities*, *customs*, &c.

THE plan of the work, then, I hope, may be allowed to be good, whatever exceptions be taken to the execution of it. It would look extravagant to say, that half the men of letters of an age might be employed in it to advantage; and yet it will appear, that a work accomplished as it ought to be, on the footing of this, would answer most of the purposes of a library, except parade; and contribute more to the propagating of useful knowledge through the body of a people, than half the books extant. After this, let the reader judge how far I may deserve censure for engaging in it, even under some disadvantages; and whether to have failed in such a design may not be some degree of praise.

BUT it will be here necessary to carry on the division of knowledge, just laid down, a little farther; and make a more precise partition of the body thereof, in the formal way of an analysis: the rather, as an analysis, by shewing the origin and derivation of the several parts, and the relation in which they stand to their common stock, and to each other, will assist, both in reinstating the scattered articles in the book, and in connecting them together.



KNOWLEDGE is either
Natural, and Scientifical; which is either
Or,
Sensible; consisting in the perception of phenomena, or external objects—called PHYSIOLOGY, or NATURAL HISTORY: and which, according to the different kinds of such objects, divides into
METEOROLOGY [a].
HYDROLOGY [b].
MINERALOGY [c].
PHYTOLOGY [d].
ZOOLOGY [e].
Rational; consisting in the perception of the intrinsic characters or habitudes of sensible objects — either their
Powers, and Properties—called PHYSICS, and NATURAL PHILOSOPHY [f].
Affects—called METAPHYSICS [g], which subdivides into
ONTOLOGY.
PNEUMATOLOGY.
Quantities—called PURE MATHEMATICS—which divides, according to the subject of the quantity, into
ARITHMETIC [h]—whence ANALYTICS [i], ALGEBRA [k].
GEOMETRY [l]—whence TRIGONOMETRY, CONICS, SPHERICS.
Relations to our happiness—called ETHICS [m], or NATURAL RELIGION—whence POLITICS [n], LAW [o].
RELIGION, or the doctrine of OFFICES, which subdivides into
THEOLOGY [p], or REVELATION.
Or,
Artificial and Technical (consisting in the application of natural notices to farther purposes), which is either
Or,
Internal; employed in discovering their agreement and disagreement; or their relations in respect of truth—called LOGICS [q].
External; which is either
Or,
Real, employed in discovering and applying the
Latent powers and properties of bodies—called CHEMISTRY [r]—whence ALCHEMY. NATURAL MAGIC, &c.
OPTICS [s], CATOPTRICS, DIOPTRICS, — whence PERSPECTIVE [t], PAINTING [u].
PHONICS—whence MUSIC [w].
Quantities of bodies—called MIXED MATHEMATICS; which, according to the different subjects, resolves into
HYDROSTATICS [x], HYDRAULICS.
PNEUMATICS [y].
MECHANICS [z]—whence ARCHITECTURE [A]. SCULPTURE [B]. TRADES [C], and MANUFACTURES.
PYROTECHNIA [D]—whence The MILITARY ART [E]. FORTIFICATION [F].
ASTRONOMY [G]—whence CHRONOLOGY [H]. DIALLING [I].
GEOGRAPHY [K], HYDROGRAPHY—whence NAVIGATION [L]. COMMERCE [M].
Structure and economy of organized bodies, called ANATOMY [N].
Relations thereof to the preservation and improvement — either of
Animals — called MEDICINE [O]. HUSBANDRY [P].
Vegetables — called AGRICULTURE [Q]. GARDENING [R].
Beasts — called FARRIERY [S]. MANAGE—whence HUNTING. FALCONRY. FISHING, &c.
Symbolical, employed in framing and applying
Words, or articulate signs of ideas—called GRAMMAR [T].
Numbers—called HERALDRY [V].
Tropes and Figures—called RHETORIC [X].
Fables—called POETRY [Y].

THIS is a view of knowledge, as it were *in stamine*; exhibiting only the grand constituent parts thereof: it would be needless to pursue it into all its members and ramifications; which is the proper business

[a] METEOROLOGY, or the history of *AIR*, and the *ATMOSPHERE*: including, 1. That of its contents, Æther, Fire, Vapour, Exhalation, &c. 2. Meteors formed therein; as CLOUD, RAIN, SNOW, DEW, DROP, SNOW, HAIL, DEW, DAMP, &c. RAINBOW, PARHELION, HALO, THUNDER, WATER-SPOUT, &c. WINDS, MONSOON, HURRICANE, and the like.

[b] HYDRO-

buſineſs of the book itſelf. It might here, therefore, ſeem ſufficient to refer, from the ſeveral branches thus deduced, to the ſame in the courſe of the work; where their diviſion is carried on. And yet this would

[8] HYDROLOGY, or the hiſtory of *WATER*; including that of SPRINGS, RIVERS, ACIDULÆ, BATHS, &c. of LAKES, SEA, OCEAN, &c. of TIDES, DELUGE, and the like.

[9] MINERALOGY, or the hiſtory of *EARTH*; 1. Its parts; as MOUNTAIN, MINE, MOSS, BOG, GROTTO; and their phenomena, as EARTHQUAKE, VOLCANO, CONFLAGRATION, &c. Its STRATA, as CLAY, BOLE, SAND, &c. 2. FOSSILS or MINERALS, as METALS, GOLD, SILVER, MERCURY, &c. with operations relating to them; as FUSION, REFINING, PURIFYING, PARTING, ESSAYING, &c. LITHARGE, LAVATORY, &c. SALTS, as NITRE, NATRON, GEMMA, ALUM, ARMONIAC, BORAX, &c. SULPHURS, as ARSENIC, AMETZ, AMBERGRISE, COAL, BITUMEN, NAPHTHA, PETROL, &c. SEMI-METALS, as ANTIMONY, CINNABAR, MARCASITE, MAGNET, BISMUTH, CALAMINE, COBALT, &c. STONES, as MARBLE, PORPHYRY, SLATE, ASBESTOS, &c. GEMS, as DIAMOND, RUBY, EMERALD, OPAL, TURCOISE, &c. EMERY, LAPIS LAZULI, whence ULTRAMARINE, AZURE, &c. PETRIFACTIONS, as CRYSTAL, SPAR, STALACTITES, TROCHITES, CORNU AMMONIS, and the like.

[10] PHYTOLOGY, or the hiſtory of *PLANTS*; their origin in the SEED, FRUIT, &c. Their kinds; as TREE, HERB, &c. Extraordinary ſpecies; as TEA, COFFEE, PARAGUAY, VINE, GINSENG, COTTON, TOBACCO, &c. CORAL, MUSHROOM, TRUFFLE, PARASITES, MISTLETO, MOSS, &c. Parts; as ROOT, STONE, FLOWER, WOOD; as GUAIACUM, SASSAFRAS, EBONY, ALOES, &c. LEAVES, FOLIATION, ROLL, &c. BARK; as QUINQUINA, &c. alſo PISTIL, FARINA, STAMINA, &c. Operations thereof; as VEGETATION, GERMINATION, CIRCULATION, &c. Circumſtances; as PERPENDICULARITY, PARALLELISM, FECUNDITY, &c. Productions; as HONEY, WAX, BALSAM, SUGAR, MANNA, &c. GUM, RESIN, CAMPHOR, &c. INDIGO, OPIUM, GALLS, and the like.

[11] ZOOLOGY, or the hiſtory of *ANIMALS*; their origin in EGG, EMBRYO, FŒTUS, GENERATION, CONCEPTION, GESTATION, HATCHING, MIGRATION, &c. Their kinds; as QUADRUPED, BIRD, FISH, INSECT, REPTILE, RUMINANT, CARNIVOROUS, &c. EFFIGIDIARY ſpecies; as UNICORN, TORPEDO, TARANTULA, TORTOISE, CAMELION, SALAMANDER, BARNACLES, ANCHOVY, DEATH-WATCH, &c. MONSTERS; as DOUBLE ANIMALS, HERMAPHRODITES, MULE, PYGMY, GIANT, &c. Metamorphoſes; as AURELIA, METEMPSYCHOSIS, &c. Parts; as HEAD, HAND, FOOT, FINGER, TAIL, FIN, WING, GILLS, &c. Covering; as HAIR, WOOL, SILK, FEATHERS, &c. Armature; as NAIL, STING, HORN, TOOTH, SHELL, PRODUCTS, WEB, &c. Productions; as PEARL, BEZOARD, CASTOREUM, CIVET, MUMMY, UANEA, KERMES, COCHINEAL, &c. Motion; as FLYING, SWIMMING, and the like.

[12] PHYSICS, or the doctrine of *CAUSES*; as NATURE, LAW, &c. Occaſions or means; as PRINCIPLE, MATTER, FORM, &c. Their compoſition, or conſtitution, in ELEMENT, ATOM, PARTICLE, BODY, CHAOS, WORLD, UNIVERSE, SPACE, VACUUM, &c. Properties of body; as EXTENSION, SOLIDITY, FIGURE, DIVISIBILITY, &c. Powers thereof; as ATTRACTION, COHESION, GRAVITATION, REPULSION, ELASTICITY, ELECTRICITY, MAGNETISM, &c. QUALITIES; as FLUIDITY, FIRMNESS, DUCTILITY, HARDNESS, VOLATILITY, DENSITY, POLARITY, LIGHT, HEAT, COLD, &c. Operations or effects thereof; as MOTION, RAREFACTION, DILATATION, CONDENSATION, DISSOLUTION, EBULLITION, FREEZING, EVAPORATION, FERMENTATION, DIGESTION, EFFERVESCENCE, &c. VISION, SEEING, HEARING, FEELING, SMELLING, &c. Modifications or changes; as ALTERATION, CORRUPTION, PUTREFACTION, GENERATION, DEGENERATION, TRANSMUTATION, &c. Syſtems or hypotheſes thereof; CORPUSCULAR, EPICUREAN, ARISTOTELIAN, PERIPATETIC, CARTESIAN, NEWTONIAN, &c. Occult and factitious qualities, powers, and operations; ANTIPERISTASIS, SYMPATHY, ANTIPATHY, ARCHEUS, &c. MAGIC, WITCHCRAFT, FASCINATION, VINCULA DIVINA, LIGATURE, TALISMAN, CABBALA, &c. DRUID, BARD, BRACHMAN, GYMNOSOPHIST, MAGI, ROSICRUCIAN, and the like.

[13] METAPHYSICS, or the doctrine of *ENS*; Eſſence, Exiſtence, Power, Act, *UNDERSTANDING*, &c. (the *MIND*) its Faculties; APPREHENSION, JUDGMENT, IMAGINATION, REASON, WIT, &c. Its Operations; RETENTION, REFLECTION, ASSOCIATION, ABSTRACTION, &c. Its PERCEPTIONS; as SUBSTANCE, ACCIDENT, MODE, &c. RELATIONS; as UNITY, MULTITUDE, INFINITY, UNIVERSAL, &c. QUANTITY, QUALITY, WHOLE, PART, &c. GENUS, SPECIES, DIFFERENCE, &c. PROPER, OPPOSITE, CIRCUMSTANCE, EXTERNAL, &c. Effects hereof; KNOWLEDGE, SCIENCE, ART, EXPERIENCE, &c. Conditions; PROBABILITY, CERTAINTY, FALLACY, &c. Syſtems hereof; NOMINALS, SCOTISTS, &c.

[14] ARITHMETIC, including the doctrine of *DISCRETE* or DISCONTINUOUS *QUANTITY*; viz. NUMBER, RATIO, PROPORTION, &c. Kinds; as INTEGER, FRACTION, DECIMAL, SURD, &c. Relations; as ROOT, POWER, SQUARE, CUBE, &c. RULES or operations thereof; as NOTATION, NUMERATION, ADDITION, SUBTRACTION, &c. REDUCTION, PRACTICE, POSITION, &c. EXTRACTION, APPROXIMATION, &c. Inſtruments ſubſervient thereto; as LOGARITHMS, NEPER'S BONES, &c.

[15] ANALYTICS, or the reſolution of *PROBLEMS* by SPECIES, or ſymbolical expreſſions: RULES or operations hereof; as ADDITION, SUBTRACTION, MULTIPLICATION, &c. Application thereof, in COMBINATION, PERMUTATIONS, MAGIC, SQUARES, CHANCES, GAMING, &c. SERIES, PROGRESSIONS, &c. METHODUS DE MAXIMIS, FLUXIONS, EXPONENTIALS, TANGENTS, &c.

[16] ALGEBRA, or the doctrine of *EQUATIONS*; SIMPLE, QUADRATIC, CUBIC, &c. Operations thereof; as REDUCTION, CONSTRUCTION. Objects thereof; PROBLEMS, RESOLUTION, &c.

[17] GEOMETRY, or the doctrine of *EXTENDED* or CONTINUOUS *QUANTITY*; viz. 1. LINES; RIGHT, PERPENDICULAR, PARALLEL, OBLIQUE, &c. ANGLES; ACUTE, SCALENOUS, VERTICAL, OPPOSITE, &c. 2. FIGURES or SURFACES; TRIANGLE, SQUARE, PARALLELOGRAM, POLYGON, &c. Circumſtances hereof; as PERIMETER, AREA, &c. Operations relating hereto; as BISECTING, DIVIDING, MULTIPLYING, MEASURING, &c. Inſtruments uſed therein; as COMPASSES, RULER, SQUARE, PARALLELISM, SCALE, &c. CURVES; as CIRCLE, CYCLOID, CISSOID, CATENARIA, CAUSTIC, EVOLUTE, QUADRATRIX, &c. Circumſtances thereof; as AXIS, DIAMETER, RADIUS, CENTER, CIRCUMFERENCE, ASIDES, ORDINATE, &c. ARCH, CHORD, SINE, TANGENT, SECANT, &c. Inſtruments uſed herein; as artificial LINES, CANONS, &c. Operations ariſing herefrom; as SURVEYING, taking ANGLES or BEARINGS, &c. with QUADRANT, PLAINTABLE, SEMICIRCLE, CIRCUMFERENTOR, &c. taking DISTANCES, with CHAIN, PERAMBULATOR, &c. PLOTTING into DRAUGHT, MAP, &c. with PROTRACTOR, &c. 3. SOLIDS, or bodies; as CUBE, PARALLELEPIPED, PRISM, PYRAMID, CYLINDER, POLYHEDRON, &c. Their SUPERFICIES, SOLIDITY, &c. Operations relating hereto; as CUBATURE, meaſuring of TIMBER, GAUGING, &c. Inſtruments uſed herein; as CARPENTER'S RULE, SECTOR, SLIDING RULE, GAUGING ROD, &c. The SPHERE; its doctrine, PROJECTION, &c. Application thereof; in PLANISPHERE, ANALEMMA, &c. The CONE; its SECTIONS, ELLIPSIS, PARABOLA, HYPERBOLA, &c. with its ASYMPTOTES, FOCI, &c. Their CONSTRUCTION; QUADRATURES, RECTIFICATION, &c.

[18] STATICS, or the doctrine of *MOTION*: its laws; VELOCITY, MOMENTUM, &c. Cauſes; as GRAVITY, PERCUSSION, COMMUNICATION, &c. Modifications; as COMPOSITION, ACCELERATION, RETARDATION, REFLECTION, REFRACTION, &c. Kinds; as ASCENT, DESCENT, CENTRAL, CENTRIPETAL, &c. OSCILLATION, UNDULATION, PROJECTION, &c. POWERS, or applications thereof; in LEVER, SCREW, &c. PENDULUM, PROJECTILE, &c. Operations directed hereby; as GUNNERY, the MECHANICAL ARTS, &c. enumerated hereafter.

[19] ETHICS, or the conſideration of NATURAL INCLINATIONS,

would sometimes prove inconvenient for the reader; who, to find some particular matter, would go a long circuit, and be referred backwards and forwards, from one end of the book to another: to say nothing

NATIONS, PASSIONS, TASTES, &c. Objects thereof; as GOOD, EVIL, VIRTUE, VICE, BEAUTY, DEFORMITY, &c. PLEASURE, PAIN, &c. RECTITUDE, EQUITY, CONSCIENCE, &c. LAW, OBLIGATION, &c. WILL, LIBERTY, ACTION, ASSENT, &c. NECESSITY, PREMOTION, PROVIDENCE, &c. Systems hereof; STOICS, PLATONISM, ACADEMY, CYNIC, and the like.

" POLICY, or the consideration of *SOCIETY* and *GOVERNMENT*: its origin; in CONTRACT, &c. Constitutions and forms thereof; as, 1. MONARCHY, DESPOTISM, &c. Powers thereof: KING, QUEEN, PRINCE, DUKE, EMPEROR, SULTAN, SOPHY, CALIPH, CÆSAR, CZAR, INCA, ETHNARCH, TETRARCH, DESPOT, and the like. Their TITLES and QUALITIES; MAJESTY, HIGHNESS, GRACE, EXCELLENCE, and the like. Their REGALIA; CROWN, SCEPTRE, TIARA, FASCES, &c. 2. ARISTOCRACY, its powers; as ARCHON, DICTATOR, DOGE, SENATE, COUNCIL, &c. 3. DEMOCRACY, STATES-GENERAL, STADTHOLDER, PROTECTOR, &c. Their SUCCESSION, ELECTIVE, HEREDITARY, by PRIMOGENITURE, &c. Their transactions; as PEACE, WAR, TREATY, UNION, CRUSADE, &c. By ARMIES, FLEETS, EMBASSIES, SECRETARY, PLENIPOTENTIARY, ENVOY, LEGATE, NUNCIO, &c. Their TERRITORIES, EMPIRE, SIGNORY, &c. Their ESTATES, NOBLES, COMMONS, CLERGY, CENSUS, ENUMERATION, TRIBE, QUARTER, &c. PROVINCE, CIRCLE, COUNTY, CITY, TOWN, &c. Magistrature, CHANCELLOR, JUDGE, SHERIFF, JUSTICE, MAYOR, ALDERMAN, BAILIFF, CONSTABLE, INTERREX, CONSUL, PRETOR, CENSOR, VISIER, TRIBUNE, TRIUMVIR, PROVOST, EPHORI, ÆDILE, PREFECT, QUÆSTOR, PROCONSUL, VICEROY, LIEUTENANT, STEWARD, WARDEN, KEEPER, JURISCONSULTUS, PROCURATOR, ADVOCATE, BARRISTER, PROTHONOTARY, CUSTOS, PHILAZER, CHIROGRAPHER, USHER, CLERK, &c. Their jurisdiction; COURTS; as AREOPAGUS, COMITIA, &c. PARLIAMENT, DIET, DIVAN, CHAMBER, ASSIZE, PRIVY-COUNCIL, &c. CHANCERY, KING's-BENCH, EXCHEQUER, ADMIRALTY, VERGE, SESSIONS, TURN, COURTY COURT, LEET, EYRE, &c. TERMS, CIRCUITS, COMMISSIONS, OYER, CONVOCATION, ARCHES, PREROGATIVE, FACULTIES, DELEGATES, ROTA, INQUISITION, &c. Their REVENUES, TREASURY, FISC, EXCHEQUER, TALLY, POLITICAL ARITHMETIC, DUTIES, CUSTOMS, TARIFF, EXCISE, &c. COINAGE, MONEY, INTEREST, USURY, &c. Their HOUSHOLD, CHAMBER, GREEN-CLOTH, WARDROBE, &c. Under STEWARD, CHAMBERLAIN, COMPTROLLER, COFFERER, ACA, ODA, &c. GUARDS, ORDNANCE, &c. directed by CAPTAIN, MASTER, EQUERRY, &c. MILITIA, NAVY, POST, TIMARIOT, ARTIZAN BAND, &c. DIGNITIES; DAUPHIN, ELECTOR, PALATINE, GRAVE, PALSGRAVE, THANE, EARL, COUNT, KNIGHT, GARTER, BARONET, BATH, TEUTONIC, MALTA, ELEPHANT, &c. GENTLEMAN, YEOMAN, &c. Their NAMES, SURNAMES, TITLES, PRECEDENCE, &c. FACTIONS, PATRICIAN, GUELPH, TORY, &c. CORPORATIONS, or lesser COMMUNITIES, UNIVERSITY, ACADEMY, COLLEGE, SOCIETY, CHANTER, SCHOOL, HOSPITAL, INN, Public BUILDINGS; HALL, BASILICA, GUILDHALL, PRISON, TOWER, ARSENAL, LIBRARY, MUSEUM, CIRCUS, &c. Solemn CEREMONIES; as TRIUMPH, TOURNAMENT, CARROUSAL, QUADRIL, DONATIVE, MEDAL, TROPHY, MONUMENT, FUNERAL, TOMB, CATACOMB, &c.

" LAW, or the rules and measures of *SOCIETY*; published in ACT, STATUTE, CHARTER, RESCRIPT, CONSTITUTION, DECRETAL, SENATUS-CONSULTUM, PRAGMATIC SANCTION, &c. Recorded in INSTITUTES, CODE, NOVEL, REGISTER, PANDECT, CENSUS, DOMESDAY, &c. Kinds; CIVIL, CANON, STATUTARY, respecting, 1. Persons; as the KING; his PREROGATIVE, ROYALTIES, &c. viz. Granting DISPENSATION, PARDON, COMMENDAM, EXEMPTION, DIGNITIES, FRANCHISES, FOREST, PARK, PURLIEU, VERT, CHASE, IMPOST, SUBSIDY, TOLL, TAX, AID, HOMAGE, SCUTAGE, PRISAGE, WAIF, ESTRAY, ESCHEAT, TREASURE TROVE, &c. OFFICERS and Magistrates; created by WRIT, WARRANT, COMMISSION, &c. Their OATH, TEST, DECLARATION, VISITATION, PROCURATION, &c. CORPORATIONS; REGULAR, SECULAR, &c. made by CHARTER, PATENT, &c. dissolved by QUO WARRANTO, MANDAMUS, &c. SUBJECTS; as DENIZEN, ALIEN, NATURALIZATION, HUSBAND, WIFE, MARRIAGE, CONCUBINE, SEPARATION, ALIMONY, DOWER, AFFINITY, BASTARD, ADOPTION, EMANCIPATION, LORD, TENANT, VILLAIN, VASSAL, CLIENT, PATRON, SERVANT, SLAVE, RETAINER, MANUMISSION, ENFRANCHISING, &c. TENURE, SERVICE, HOMAGE, FEALTY, SERJEANTY, ESCUAGE, RELIEF, GUARDIAN, WARDSHIP, SOCAGE, HEIR, INTESTATE, ANCESTOR, &c. 2. ESTATES, or things; either real, as TENEMENTS, HEREDITAMENTS, FREEHOLD, FEE, CUSTOMARY, TAIL, GAVELKIND, COURTESY, &c. In REVERSION, MORTGAGE, HYPOTHECA, &c. MANOR, DEMESNE, HONOURS, COMMON, GLEBE, ADVOWSON, &c. Acquired by OCCUPANCY, PRESCRIPTION, DESCENT, CONVEYANCE, FEOFFMENT, FINE, RECOVERY, DEFEIZANCE, LEASE, DEVISE, ATTORNMENT, INVESTITURE, LIVERY, &c. Lost by ALIENATION, MORTMAIN, DISSEISIN, ABATEMENT, SURRENDER, DISCONTINUANCE, DISCLAIMER, FORFEITURE, RESIGNATION, DEPRIVATION, LAPSE, &c. Or personal; as GOODS, CHATTELS, EMBLEMENTS, ANNUITY, DEBTS, SPECIALTY, RECOGNIZANCE, &c. Acquired by SUCCESSION, HERIOT, MORTUARY, HEIRLOOM, TESTAMENT, EXECUTOR, ADMINISTRATOR, ORDINARY, JUDGMENT, FIERI FACIAS, &c. 3. WRONGS or INJURIES; either to person; as CRIMES, TREASON, PARRICIDE, MURDER, FELONY, ASSAULT, RAPE, ASSASSIN, ADULTERY, FORNICATION, DEFLORATION, POLYGAMY, HERESY, &c. Prosecuted by INDICTMENT, ACCUSATION, ACTIONS of CONSPIRACY, and upon the CASE, HABEAS CORPUS, &c. Punished with HANGING, CRUCIFIXION, WHEEL, FURCA, SCALA, PILLORY, TRANSPORTATION, DIVORCE, SCARPISM, &c. Or CIVIL, and to things; as TRESPASS, NUISANCE, DISTURBANCE, &c. Remedied by WRITS of QUARE IMPEDIT, DARREIN PRESENTMENT, APPEAL, ATTAINT, ERROR, RIGHT, DISCENT, SUPERSEDEAS, ACTITA QUERELA, &c. SUIT, or COURSE of proceedings, whereby redress is procured; including, 1. PROCESS; either by BILL, SUMMONS, SUBPŒNA, ATTACHMENT, CAPIAS, EXIGENT, &c. to which belong APPEARANCE, ATTORNEY, BAIL, ESSOIN, DEFAULT, NONSUIT, ARRAIGNMENT, &c. 2. PLEADING; whence COUNT, DECLARATION, AID PRIER, VOUCHER, AGE PRIER, BAR, ABATE, RELEASE, REPLICATION, OUTLAWRY, SEQUESTRATION, &c. 3. ISSUE; whence DEMURRER, 4. TRIAL; whence PROOF, EVIDENCE, PRESUMPTION, OATH, AFFIDAVIT, AFFIRMATION, JURY, CHALLENGE, ARRAY, VERDICT, BATTEL, DUEL, CHAMPION, PURGATION, ORDEAL, &c. FAINE FORT ET DURE, RACK, TORTURE, &c. 5. JUDGMENT; whence ARREST, &c. 6 EXECUTION; whence SCIRE FACIAS, REPLEVIN, &c.

" THEOLOGY, or the consideration of *GOD*: his nature and ATTRIBUTES; as ETERNITY, UBIQUITY, &c. His UNITY, TRINITY, &c. PERSONS, HYPOSTASIS, &c. Our duty to him, discovered by INSPIRATION, REVELATION, PROPHECY, &c. by the MESSIAH, EVANGELISTS, APOSTLES, &c. In the BIBLE, PENTATEUCH, HAGIOGRAPHA, PSALTER, GOSPEL, APOCALYPSE, &c. CANON, DEUTEROCANONICAL, APOCRYPHA, &c. Circumstances thereof; STYLE, ALLEGORY, TYPE, PARABLE, MYSTICAL, &c. TEXT, VERSION, SEPTUAGINT, VULGATE, &c. PARAPHRASE, TARGUM, &c. POINTS, QUOTATIONS, &c. Matter thereof; Declarations, of INCARNATION, PASSION, CRUCIFIXION, MIRACLES, &c. Injunctions; as WORSHIP, PRAYER, SACRIFICE, &c. SACRAMENTS; as EUCHARIST, BAPTISM, &c. PROMISES; as GRACE, JUSTIFICATION, &c. DECREES; as PREDESTINATION, ELECTION, REPROBATION, &c. Breaches on our part, SIN, FALL, IMPUTATION, &c. Remedies thereof; by PENITENCE, CONFESSION, &c. Rewards and punishments allotted thereto; HEAVEN, HELL, RESURRECTION, IMMORTALITY, &c. His MINISTERS; ANGELS, DEVILS, &c. His CHURCH; either TRIUMPHANT; as SAINTS, MARTYRS, CONFESSORS, FATHERS, DOCTORS, &c. or MILITANT, &c. In OFFICES, CREEDS, LITURGY, DECALOGUE, DOXOLOGY, TRISAGION, &c. Discipline and rites; as ABSOLUTION, ANATHEMA, EXCOMMUNICATION, &c. CATECHISM, CONFIRMATION, CONFESSION, &c. Its HIERARCHY; as BISHOP, PRIEST, DEACON, &c. PATRIARCH, ARCHBISHOP, PRIMATE, DEAN, CANON, PREBEND, ARCHDEACON, CHANTER, &c. Their cuftoms; MITRE, CROZIER, PALLIUM, &c. Their ORDINATION,

nothing of the interruptions which may frequently happen in the series of references. To obviate this, we have taken a middle course, and carried on the distribution farther, in the way of notes at the bottom

tion, Consecration, Collation, Imposition, &c. Benefices, Revenues, Tithes, &c. Places set apart; as Church, Chapel, Oratory, &c. Cathedral, Parochial, Cardinal, &c. Choir, Nave, Altar, Font, &c. Diocese, Province, &c. Assemblies; as Synod, Council, Convocation, Consistory, Chapter, Presbytery, &c. Feasts, Fasts, Lent, Vigils, &c. Easter, Epiphany, Pentecost, Annunciation, Purification, Presentation, &c. Particular Systems, or professions thereof, viz. Reformed, or Protestant; as the Church of England, Lutheranism, Calvinism, &c. Romish, or Latin; its Mass, Breviary, Legend, &c. Transubstantiation, Extreme Unction, Supererogation, Penance, &c. Hierarchy; Pope, Cardinal, &c. Secular, Regular, Monk, Religious, Abbot, Prior, &c. Order, Congregation, Monastery, General, &c. Jesuit, Carthusian, Carmelite, Augustine, Dominican, &c. Third order; Coenobite, Anachoret, Hermit, Recluse, Monastery, Cell, Rule, Vow, Reform, Noviciate, &c. Image, Relics, Saint, Virgin, Rosary, &c. Canonization, Beatification, &c. Indulgence, Jubilee, Exorcism, &c. Greek; its Anthologion, Prothesis, Particles, &c. Maronite, Jacobite, Thomaan, &c. Armenian, Cophti, Solitary, &c. Sects, and Heresies; as Manichees, Gnostics, Arians, &c. Esonites, Nestorians, Millennaries, Quartodecimans, &c. Montanists, Socinians, Arminians, &c. Presbyterians, Anabaptists, Independents, Quakers, &c. Quietists, Servetists, Pre-Adamites, &c. Deist, Atheist, Spinosism, &c. Jewish; its Talmud, Tradition, &c. Temple, Tabernacle, Sanctuary, Ark, &c. Pontiff, Levite, Tribe, &c. Ephod, Urim and Thummim, Circumcision, Sabbath, Sanhedrim, &c. Rabbi, Doctor, Cabbala, Massora, &c. Pharisee, Sadducee, Essean, Caraite, &c. Nazarite, Therapeutæ, &c. Samaritan, Dositheans, Hellenist, &c. Passover, Scenopegia, Genesima, &c. Mahometan; their Alcoran, Mosti, Dervis, Morabet, Muselman, &c. Heathen; their Idolatry, Theogony, &c. Their Gods; Penates, Lares, Lemures, &c. Satyrs, Sylvans, Nymphs, Tritons, &c. Demi-God, Hero, Fortune, Destiny, Demon, Genius, &c. Apotheosis, Sacrifice, &c. Feast, Lustration, &c. as Eleusinia, Saturnalia, Cerealia, &c. Ministers thereof; Rex, Pontifex, Flamen, Vestal, Cortezans, &c. Games; Olympic, Isthmia, &c. Divination, Oracle, Pythian, Sibyl, &c. Augur, Auspex, &c. Trifle, Fane, Pagod, &c. Sects; as Bramans, Brachmans, Sabæans, &c.

" LOGICS, or the consideration of *IDEAS* or *NOTIONS* their kinds; Simple, Complex, Adequate, &c. Disposition into classes or Categories, Predicaments, Predicates, &c. Their composition, or adhesion into Axioms, Propositions, Problems, Theorems, Tropes, Hypotheses, Arguments, as Syllogism, Enthymeme, Sorites, Sophism, Dilemma, Crocodile, &c. Their Resolution; Definition, Division, &c. into Premises, Consequences, Terms, &c. Their Truth, Falsehood, Evidence, Demonstration, &c. Operations therewith; as Argumentation, Induction, Discoursing, Philosophizing, &c. Distinction, Distinction, Contradiction, Reductio ad Absurdum, &c.

" CHEMISTRY, including the use of *FIRE*, Water, Dutch, Fern-Pots, Athanors, Furnaces, Retorts, and other instruments to change Minerals, Vegetables, and Fossils bodies, by inducing Fusion, Putrefaction, Fermentation, Distillation, Exhalation, &c. and thereby procuring Spirits, Salts, Oils, Acids, Alcalies, Aromatic Tinctures, Wines, Vinegars, Flowers, Calces, Crystals, Soaps, Tartars, Regulus, Magistery, Extracts, Elixirs, Cerusse, Menstruum, Limbarde, Quintessence, Philosophic Alcahest, Philosopher's Stone, and the like; by the operations of Distillation, Exhalation, Coloration, Sublimation, Rectification, Crystallization, Calcination, Amalgamation, Digestion, Precipitation, Vitrification, Fixation, Transmutation, and the like. Arbor Dianæ, Aurum Fulminans, artificial Earthquake, Magic, Divination, &c.

" OPTICS, including the laws and consideration of *VISION*, and Visible Objects; effected by means of Light; its Rays; their Refrangibility, Reflexibility, &c. Focus, Transparency, Opacity, Shadow, &c. Reflection thereof, in Mirror, Looking-Glass, Catoptric, Cistula, &c. Refraction, in Lens, Prism, Glass, &c. Application, in Telescope, Microscope, Magic Lantern, &c. Spectacle, Polemoscope, Polyhedron, Camera Obscura, &c.

" PERSPECTIVE, or the projection of Points, Lines, Planes, &c. in Scenography, Orthography, Iconography, Anamorphosis, &c.

" PAINTING, or the *DESIGNING* of objects in Clair-obscure, Proportion, &c. with Ordonnance, Expression, &c. Circumstances hereof; Attitude, Contrast, Group, &c. Kinds; Limning, Miniature, Camieux, Fresco, &c. Enamelling, Mosaic, &c.

" PHONICS, or the doctrine of *SOUNDS*, Voice, &c. Their Modifications, in Echo, Resonance, Whispering Place, Speaking Trumpet, &c. Their Tune, Gravity, Interval, &c. Time, Triple, &c. expressed by Note, Chord, &c. Comparisons thereof; Concord, as Union, Octave, Third, Fourth, Diapason, &c. Compositions; as Melody, Harmony, Counterpoint, Symphony, Sylvodia, Chime, Song, Rhythmus, &c. Kinds; Genius, Mode, &c. Circumstances; Key, Cleff, Signature, Transposition, &c. Staff, Scale, Gammut, Solfaing, Modulation, &c. Instruments; Organ, Bell, Trumpet, Lyra, Cymbal, Violin, Harpsichord, &c.

" HYDROSTATICS, or the consideration of *FLUIDS*; their Specific Gravity, Density, Equilibrium, &c. Instruments to measure the same; as Areometer, Hydrostatical Balance, &c. Siphon, Torricellian, &c. Motion thereof, in Pump, Fountain, Spiral Screw, Hydrocaristerium, Hydromantic, &c.

" PNEUMATICS, or the consideration of the *AIR*; its Weight, Density, Pressure, Elasticity, &c. Condensation, Rarefaction, Motion, Wind, &c. in Air-Pump, Suction, Vacuum, &c. Measured by Barometer, Thermometer, Hygrometer, Manometer, &c. Anemometer, Windmill, &c.

" MECHANICS, including the structure and contrivance of *MACHINES*; as Balance, Steelyard, Pulley, Polypast, &c. Wheel, Clock, Watch, Pendulum, Spring, Fusee, &c. Clepsydra, Coach, Rota Aristotelica, Perpetual Motion, &c. Mill, Press, Vice, Lathe, Loom, Windlass, &c. Operations of Swimming, Diving, Flying, &c.

" ARCHITECTURE, including the consideration of *BUILDINGS*; as House, Temple, Church, Hall, Palace, Theatre, &c. Ship, Galley, Galleon, Ark, Boat, Raft, &c. Pyramid, Mausoleum, Pantheon, &c. Capitol, Seraglio, Lucullus, &c. Arch, Vault, Bridge, Monument, Tomb, &c. Forms thereof; Rotundo, Playform, Pinnacle, &c. Terms, Design, Iconography, Profile, &c. Parts; as Foundation, Wall, Roof, &c. Door, Window, Stairs, Chimney, &c. Orders; as Tuscan, Doric, Corinthian, &c. Caryatides, Attic, Gothic, Rose Chrome; Pilasters, Astile, &c. Parts thereof; Entablature, Capital, Portal, &c. Cornice, Frieze, Base, &c. Modern Refinement, Modillion, Console, &c. Modillion; Ogee, Tore, Astragal, Scotia, Scotia, Cymol, &c. Materials; as Brick, Stone, Tile, Slate, Shingle, &c. Timber, Wainscot, Glass, Lead, Plaister, &c. Beam, Rafter, Mortar, Nail, Hinge, Key, Lock, &c. Quarry, Masonry, &c.

" SCULPTURE, or the framing of Statue, Figure, Ornament, &c. in Relievo, Creux, &c. as Carving,

tom of the pages; but this is in a looser manner, to prevent the embarrafs of a ſtrict analyſis, ſo complex and diffuſive as this muſt otherwiſe prove. Some of the principal articles, in every branch of ſcience

CARVING, POTTERY, PORCELAIN, &c. ENGRAVING; SEAL, DYE, &c. ETCHING, CUTTING, MEZZOTINTO, &c. FOUNDERY: of BELL, LETTER, ORDNANCE, &c. COINING; MONEY, MEDAL, MEDALLION, &c. PILE, LEGEND, &c. LAPIDARY, TURNING, INLAYING, VARNEERING, DAMASQUEENING, ENCHASING, &c.

" TRADES and MANUFACTURES; as PRINTING, PAPER-MAKING, BOOK-BINDING, &c. GILDING, JAPANNING, GLASS-MAKING, GRINDING, &c. PLUMBERY, FORGING, HAMMERING, &c. WEAVING, BLEACHING, WHITENING, &c. FULLING, DYING, PRESSING, SHEERING, CALENDRING, TARRYING, FRIEZING, &c. WOOLLEN, SILK, LINEN INCOMBUSTIBLE, &c. CLOTH, SERGE, TAFFETY, STOCKING, &c. VELVET, TAPESTRY, HAT, &c. TANNING, CURRYING, TAWING, &c. SHAMOISING, SHAGREEN, MOROCCO, &c. Making PARCHMENT, GLUE, GUNPOWDER, SMALT, SOAP, STARCH, &c. CANDLE, TAPER, TORCH, &c. STEEL, BUTTON, PIN, NEEDLE, PIPE, FAN, PERUKE, &c.

" PYROTECHNY, or Artificial *FIRE-WORKS*: including the conſideration and uſe of GUNPOWDER, MATCH, FUSIL, &c. Of ORDNANCE, CANNON, GUN, MORTAR, &c. CARRIAGE, CHARGE, PROJECTION, RANGE, POINT-BLANK, RECOIL, &c. PETARD, CARCASS, SHOT, BOMB, GRANADO, &c. ROCKET, STAR, &c.

" MILITARY ARTS, including the conſideration of *ARMIES*, FLEETS, CAVALRY, INFANTRY, &c. conſiſting of REGIMENTS, TROOPS, COMPANIES, PHALANX, LEGION, &c. SOLDIERS; DRAGOON, GRENADIER, PIONEER, CUIRASSIER, ARCHER, JANISSARY, SPAHI, VELITES, ARQUEBUSIDES, GENS'ARMERY, &c. Divided into SQUADRON, BATTALION, BRIGADE, &c. commanded by GENERAL, MARSHALL, BASHAW, ADMIRAL, &c. LIEUTENANT, BRIGADIER, COLONEL, CAPTAIN, SERJEANT, MAJOR, ADJUTANT, ENSIGN, QUARTER-MASTER, TRIBUNE, CENTURION, PRIMIPILUS, &c. In BATTLE, SIEGE, MARCH, CAMP, &c. Ranged in LINE, COLUMN, &c. Motions; ATTACK, RETREAT, HALT, &c. EVOLUTION; WHEELING, COUNTER-WHEELING, &c. SIGNALS; WORD, DRUM, CHAMADE, &c. GUARDS; GARRISON, PIQUET, PATROL, ROUND, QUARTER, PLACE of ARMS, &c. STANDARD, BANNER, EAGLE, LABARUM, &c. Their ARMS; ARTILLERY, CARABINE, MUSQUET, &c. HELMET, BUCKLER, PELTA, CUIRASS, &c. AXES, BALISTA, CATAPULTA, SLING, &c.

" FORTIFICATION, or the conſtruction of *FORTRESSES*; as CITADEL, CASTLE, TOWER, &c. FORT, STAR, REDOUBT, &c. WORKS, or parts thereof; RAMPART, BASTION, DITCH, COUNTERSCARP, CURTIN, &c. RAVELINE, HORN WORK, CROWNWORK, &c. APPROACHES; TRENCH, SAP, MINE, &c. LINE, PARALLEL, CIRCUMVALLATION, &c. BATTERY, ATTACK, &c.

" ASTRONOMY, or the doctrine of the *HEAVENS*; their CIRCLES, ECLIPTIC, ZODIAC, MERIDIAN, EQUATOR, VERTICAL, AZIMUTH, GALACTIC, POINTS; as POLE, ZENITH, NADIR, &c. Celeſtial bodies, viz. STARS, SUNS, &c. Aſſemblage thereof; into SIGN, CONSTELLATION, &c. Their DESCRIPTION, CULMINATION, REFRACTION, DECLINATION, ASCENSION, LONGITUDE, LATITUDE, ALTITUDE, AMPLITUDE, AZIMUTH; PLANETS; as SATURN, VENUS, EARTH, MOON, SATELLITE, COMET, &c. Their PLACES, ASPECTS, SYZIGY, CONJUNCTION, QUADRATURE, DIAMETER, DISTANCE, PERIOD, REVOLUTION, ORBIT, NODE, &c. Their STATION, RETROGRADATION, ELONGATION, &c. Their PHASES, ECLIPSE, PENUMBRA, OCCULTATION, PARALLAX, CREPUSCULE, MACHINE, &c. Obſervations thereof; taken with the QUADRANT, CANNON, MICROMETER, RETICULA, &c. Collected in CATALOGUE, TABLES, &c. HYPOTHESES, or SYSTEMS thereof; COPERNICAN, TYCHONIC, PTOLEMAIC, &c. Exhibited in SPHERE, GLOBE, &c.

" CHRONOLOGY, or the doctrine of *TIME*; meaſured by YEAR, MONTH, WEEK, DAY, HOUR, AGE, PERIOD, CYCLE, &c. Commencing from EPOCHA, INCARNATION, HEGIRA, &c. Laid down in FASTI, ALMANACK, CALENDAR, JULIAN, GREGORIAN, &c. Accommodated to FEASTS, FERIÆ, EASTER, &c. by means of EPACT, GOLDEN NUMBER, DOMINICAL, &c.

" DIALLING, including the FURNITURE, and projection of *DIALS*; HORIZONTAL, DECLINING, RECLINING, DITROCHINING, &c. MOON-DIAL, RINGDIAL, HORODICTICAL, &c. Inſtruments; as DECLINATOR, ANALEMMA, SCALE, &c.

" GEOGRAPHY, including the doctrine of the *EARTH*, or *GLOBE* in CIRCLES, PARALLEL, TROPIC, HORIZON, AXIS, POLE, &c. In ZONES, CLIMATES, &c. Its PLACES; their LONGITUDE, LATITUDE, DISTANCE, ELEVATION, &c. Inhabitants; ANTIPODES, ABORIGINES, HETEROSCIANS, AMPHISCII, PERIŒCI, &c. Inſtruments relating thereto; GLOBE, MAP, &c.

" NAVIGATION, or the conſideration of *SAILING*; in SHIP, FRIGATE, BARK, &c. Parts thereof; MAST, ANCHOR, SAILS, YARDS, CORDAGE, CAPSTAN, RUDDER, DECK, &c. Their COURSE, ROUTE, &c. ſhewn by COMPASS, NEEDLE, VARIATION, &c. Directed by STEERING, CURRENT, &c. Diſtance, or RECKONING, by LOG, OBSERVATION, LONGITUDE, LATITUDE, &c. Taken by FORESTAFF, BACKSTAFF, ASTROLABE, NOCTURNAL, NAVICAL QUADRANT, &c. Wrought by GUNTER, CHART, MERCATOR, TRAVERSE, &c. The operations of SOUNDING, WEIGHING, CAREENING, SIGNALS, BUOY, &c.

" COMMERCE, or the affairs of *MERCHANDIZE*; including MONEY, COIN, SPECIES, &c. as POUND, CROWN, SHILLING, PENNY, STERLING, DUCAT, DOLLAR, PIECE of EIGHT, TALBOT, SESTERCE, SHEKEL, and the like. WEIGHTS; LIBRA, OUNCE, &c. MEASURES; FOOT, YARD, STANDARD, &c. Given in EXCHANGE, TRUCK, PERMUTATION, COMMUTATION, &c. for MANUFACTURE, SPICE, DRUG, WOOLLEN, SLAVE, NEGRO, &c. IMPORTED, EXPORTED, TRANSPORTED, CONVOY, FLEET, &c. Conditions thereof; TARIFF, CONTRABAND, CHARTER-PARTY, FREIGHT, AVERAGE, &c. CUSTOMS, DUTY, DRAWBACK, POUNDAGE, &c. BOTTOMRY, FIRE, &c. Tranſacted by COMPANY; as HANSE, STEELYARD, EAST INDIA, TURKEY, HAMBURGH, MISSISIPPI, SOUTH SEA, ASSIENTO, REGISTER, COLONY, FISHERY, FACTORY, &c. At STAPLE, FAIR, MARKET, BANK, EXCHANGE, &c. By COMMISSION, FACTOR, BROKER, &c. WEIGHING, paying by BILLS of USANCE, ACCEPTANCE, PAR, PROTEST, DISCOUNT, RECHANGE, &c. ACTION, SUBSCRIPTION, BOOK-KEEPING, &c.

" ANATOMY, or the ANALYSIS of *ANIMAL BODIES*, and their PARTS, viz. BONES; as CRANIUM, RIB, VERTEBRA, RADIUS, FEMUR, TIBIA, SACRUM, PUBIS, PATELLA, &c. Their ARTICULATION, APOPHYSES, &c. MUSCLES; ADDUCTION, ABDUCTION, ERECTOR, DEPRESSOR, DELTOIDES, SARTORIUS, CUCULLARIS, ORBICULARIS, SPHINCTER, &c. Their TENDONS, FIBRES, &c. VESSELS; as ARTERY, AORTA, ASPERA, TRACHEA, PULMONARY, &c. VEINS; as CAVA, PORTA, JUGULAR, CARDIAC, &c. GLANDS; as PANCREAS, PAROTIDES, TESTICLES, &c. NERVES; OPTIC, OLFACTORY, AUDITORY, &c. LYMPHATIC, LACTEAL, MESENTERIC, MUSCULOUS, &c. Their VALVES, TUNICS, ANASTOMOSES, &c. Their HUMOURS; as CHYLE, BLOOD, SPIRIT, SERUM, GALL, URINE, MILK, SWEAT, MARROW, &c. MEMBRANE; PANNICLE, CUTIS, CUTICULA, PAPILLA, &c. VENTRICLES, MEDIASTINUM, BRAIN, &c. EYE, EAR, PUPIL, TYMPANUM, TONGUE, TOOTH, PALATE, LARYNX, GLOTTIS, OESOPHAGUS, &c. VISCERA, STOMACH, LUNGS, HEART, &c. LIVER, SPLEEN, KIDNEY, INTESTINES, BLADDER, &c. FUNCTIONS of operations hereof; RESPIRATION, DEGLUTITION, DIGESTION, CHYLIFICATION, SANGUIFICATION, CIRCULATION, SYSTOLE, NUTRITION, SECRETION, EXCRETION, PERSPIRATION, VOMITING, &c. GENERATION, PENIS, TESTICLES, CLITORIS, MATRIX, NYMPHÆ, HYMEN, EMBRYO, ZOOPHYTE, MOLE, &c. EJECTION, GENERATION, CONCEPTION, GESTATION, DELIVERY, LOCHIA, MEMBRI, &c.

" MEDICINE, including the conſideration of *LIFE* and *HEALTH*: conditions thereof; LONGEVITY, STRENGTH,

ence, are hereby brought to light, and such as will naturally suggest, and lead to the rest; so that this may afford the reader a sort of *summary* of the whole; and, at the same time, dispense a kind of auxiliary, or succedaneous order throughout the whole; the articles omitted all naturally enough ranging themselves in their proper places among these. A detail of this kind is of the more consequence, as it may not only supply the office of a *table of contents*, by presenting the dispersed materials of the book in one view; but also that of a rubric, or directory, by indicating the order they are most advantageously read in. Note, then, that the initial words of the *notes* correspond to the final ones of the *analysis*; and that their several members, or items of both, make so many heads or articles in the book.

I might here have ended my preface; and perhaps the reader would be willing enough to be thus dismissed. But something has been already started, which will require farther disquisition. The distribution we have made of knowledge is founded on this; that the several branches thereof commence either Art or Science, according to the agency or non-agency of the human mind, in respect thereof. It remains to take the matter up a little higher, and explain the reason and manner of this operation: to consider knowledge in its principles, antecedent to such intervention of ours; and even pursue it up to its cause, and shew how it exists there: and trace the progress of the mind through the whole, and the order of the modifications induced by it. This is a desideratum which we could not here decline entering upon, on account of its immediate relation to the present design. It is the basis of all learning in general; the great, but obscure hinge, on which the whole Encyclopædia turns.

TO be more explicit:—Words are the immediate matter of knowledge; I mean of knowledge considered as communicable, or capable of being transmitted from one to another. We should have known many things without language; but it would only have been such as we had seen or perceived ourselves. The observations of others could no way have been added to our own; but every individual must have

STRENGTH, TEMPERAMENT, &c. Means; as FOOD, DRINK, EXERCISE, &c. Opposites; as DEATH, DISEASE, &c. Kinds hereof; CHRONIC, EPIDEMIC, CONTAGIOUS, &c. as PLAGUE, FEVER, GOUT, APOPLEXY, EPILEPSY, PALSY, POX, POLYPUS, PALPITATION, MANIA, HYDROPHOBIA, SPASM, HYPOCHONDRIAC, PHTHISIS, SCORBUTUS, DROPSY, TYMPANITES, LEPRA, ITCH, PLICA, OPHTHALMIA, GUTTA CATARACT, and the like. WOUND, ULCER, CANCER, FRACTURE, FISSURE, CARIES, and the like. SYMPTOMS: SIGN, DIAGNOSTIC, PULSE, URINE, &c. PRESCRIPTION, CRISIS, CURE, &c. REGIMEN, DIET, MEDICINE, &c. Kinds hereof; SPECIFIC, PURGATIVE, EMETIC, DIAPHORETIC, DIURETIC, ALTERATIVE, STYPTIC, ASTRINGENT, EMOLLIENT, ODIATE, ABSORBENT, CAUSTIC, ANODYNE, SYMPATHETIC, CARDIAC, CEPHALIC, FEBRIFUGE, ANTIMONIAL, CHALYBEAT, MERCURIAL, and the like. OPERATIONS; as EVACUATION, PHLEBOTOMY, SUTURE, LITHOTOMY, AMPUTATION, INOCULATION, SALIVATION, COUCHING, CUPPING, TREPANNING, TOUCHING, PARACENTESIS, STROAKING, TRANSFUSION, CASTRATION, CIRCUMCISION, and the like.

" PHARMACY, or the PREPARATION and COMPOSITION of *REMEDIES*; as MITHRIDATE, TREACLE, HIERA PICRA, LAUDANUM, DIALEMA, TINCTURE, CALOMEL, &c. in the form of ELECTUARY, CONFECTION, EXTRACT, TINCTURE, SYRUP, TROCHE, PILL, POWDER, LOHOC, POTION, APOZEM, DROPS, medicated ALES, WINES, WATERS, UNGUENT, EMPLASTER, PURGE, CLYSTER, SUPPOSITORY, PESSARY, COLLYRIUM, &c. From DRUGS, or SIMPLES; as GUAIACUM, SASSAFRAS, COLOCYNTHIS, CROCUS, RHUBARB, CASSIA, SENNA, CORTEX, STYRAX, JALAP, SCAMMONY, OPIUM, &c. FATS, CLAWS, HORNS, &c. of VIPER, CRAB, ELK, &c. CANTHARIDES, MILLEPEDES, MUMMY, USNEA, ICHTHYOCOLLA, &c. ANTIMONY, ORPIMENT, ASPHALTUS, BISMUTH, MARCASITE, BOLE, CINNABAR, MARS, VENUS, &c.

" AGRICULTURE, or the TILLAGE and improvement of *SOILS*, CLAY, SAND, EARTH, &c. by the operations of PLOWING, FALLOWING, BURNING, SEMBRADURE, SEMINATION, MANURING, &c. To produce CORN, HEMP, FLAX, LIQUORICE, SAFFRON, &c. For MALT, FARINA, &c. GRANARY, THRESHING, &c. The culture of TREES, TIMBER, &c. by PLANTING, SHROWDING, BARKING, &c. For COPPICE, PARK, PADDOCK, HEDGE, PASTURE, &c.

" GARDENING, including the culture of *HERBS*, FLOWERS, FRUITS, &c. as DWARF, STANDARD, WALL, ESPALIER, SALLET, &c. The operations of PLANTING, TRANSPLANTING, REPLANTING, WATERING, ENGRAFTING, INOCULATING, PRUNING, PINCHING, VARIEGATING, &c. Preventing DISEASES, BLIGHTS, GUM, &c. The USE and ordering of a HOT-BED, GREEN-HOUSE, NURSERY, GARDEN, VINEYARD, &c. Their EXPOSURE, WALLS, HORIZONTAL SHELTER, &c. WALKS, GRASS-PLOT, TERRACE, QUINCUNX, PARTERRE, &c.

" MANEGE, including the consideration of *HORSES*, their AGE, COLOUR, TOOTH, HOOF, STAR, &c. PACES; as AMBLE, GALLOP, &c. AIRS; as VOLTE, DEMIVOLTE, CURVET, CAPRIOLE, &c. AID, CORRECTION, HAND, BIT, &c. SADDLE, SHOE, BRIDLE, &c. DISEASES; as HALTING, FARCY, STAGGERS, SCRATCHES, YELLOWS, &c. Operations; as ROWELLING, CURTAILING, GELDING, &c. HAWK, HAWKING, HOOD, &c. RECLAIMING, CASTING, &c. PIP, FILANDERS, &c. HOUND, HUNTING, &c. RUT, STALKING, BIRDLIME, TRAMMEL-NET, BAT-FOWLING, &c. FISH, FISHING, FISHERY, &c. ANGLING, HOOK, ROD, FLOAT, &c. BAIT, FLYING, HUXING, &c.

" GRAMMAR, or the consideration of *LANGUAGE*: as ENGLISH, LATIN, GREEK, HEBREW, FRENCH, &c. Their DIALECT, IDIOM, PATAVINITY, &c. Matter thereof; LETTER, VOWEL, CONSONANT, DIPHTHONG, ASPIRATE, CHARACTER, SYMBOL, HIEROGLYPHIC, &c. SYLLABLE, PARTICLE, &c. WORDS; kinds thereof; NOUN, PRONOUN, VERB, &c. SUBSTANTIVE, ADJECTIVE, &c. Their CONSTRUCTION, CONCORD, REGIMEN, &c. In CASE, NOMINATIVE, GENITIVE, &c. GENDER, MASCULINE, &c. NUMBER, PERSON, MOOD, TENSE, &c. INFINITENESS, PHRASE, PERIOD, &c. Distinguished by POINT, ACCENT, COMMA, &c. Delivered by PRONUNCIATION, WRITING, ORTHOGRAPHY, &c.

" HERALDRY, or the consideration of *COATS*; consisting of FIELD, CHARGE, FIGURE, &c. as CROSS, CHEVRON, BEND, PALE, &c. with ABATEMENT, DIFFERENCE, QUARTERING, &c. Composed of COLOUR, METAL, POINTS, &c. Born on ESCUTCHEON, SHIELD, &c. Accompanied with SUPPORTERS, HELMET, CREST, MANTLING, MOTTO, &c. DEVICE, EMBLEM, REBUS, ÆNIGMA, &c. And described by BLAZON.

" RHETORIC, or the means of *PERSUASION*; as INVENTION, AMPLIFICATION, TOPIC; PLACE, ARGUMENT, PASSIONS, MANNERS, &c. DISPOSITION, EXORDIUM, NARRATION, CONFIRMATION, PERORATION, &c. ELOCUTION, SUBLIME, STYLE, NUMBERS, &c. FIGURES; as EXCLAMATION, PLEONASM, EPIZEUXIS, APOSTROPHE, PROSOPOPŒIA, ANTITHESIS, &c. TROPES; as METAPHOR, ALLEGORY, SYNECDOCHE, SARCASM, HYPERBOLE, CATACHRESIS, &c. ACTION, CRISPEX, MONSTONIA, &c. COMPOSITIONS; as ORATION, DECLAMATION, PANEGYRIC, &c. PARABLE, ESSAY, DIALOGUE, HISTORY, &c.

" POETRY; including the consideration of *VERSE*; as METRE, FEET, QUANTITY, &c. as HEXAMETER, ALEXANDRINE, SPONDEE, IAMBIC, &c. RHYME, STANZA, &c. COMPOSITIONS; as EPIGRAM, ELEGY, SONG, MADRIGAL, HYMN, ODE, PINDARIC, &c. ECLOGUE, IDYLLIUM, GEORGIC, &c. ANAGRAM, ACROSTIC, BURLESQUE, MACARONIC, LEONINE, TROUBADOUR, &c. DRAMATIC; as TRAGEDY, COMEDY, HISTORY-TRAGEDIES, FARCE, &c. Parts thereof; ACT, SCENE, PROTASIS, EPITASIS, CATASTROPHE, &c. Circumstances; PROLOGUE, EPILOGUE, SOLILOQUY, CHORUS, &c. Laws; UNITY, ACTION, &c. EPIC; its FABLE, HERO, MACHINES, &c. CHARACTERS, MANNERS, SENTIMENTS, &c. PROSOPOPŒIA, PROPOSITION, INVOCATION, EPISODE, &c. ILIAD, ODYSSEY, RHAPSODY, &c.

gone

gone through a courſe for himſelf, without any aſſiſtance either from predeceſſors, or contemporaries. It is evident, that, in this caſe, nothing like an art or ſcience could ever have ariſen: the little ſyſtem of things, which come immediately in one man's way, would but have afforded a ſlender ſtock of knowledge; eſpecially to a being whoſe views were all to terminate in himſelf. Add, that as the chief occaſions of his obſervation would have been of the ſame kind with thoſe of other animals; it is probable his knowledge would not have been very different, whether we conſider its quantity or quality. It is confeſſed, that all our knowledge, in its origin, is no other than ſenſe; whence it ſhould follow, that one being has no natural advantage over another, in its diſpoſitions for knowledge, other than what it has in the ſuperior number, extent, or acuteneſs, of its ſenſes.

IT is, then, to language that we are chiefly indebted for what we call *ſcience*. By means of language our ideas and notices, though things in their own nature merely perſonal, and adapted only to private uſe, are extended to others, to improve their ſtock. And thus, by a kind of ſecond ſenſe, a man gets perceptions of the objects that are perceived by all mankind; and is preſent, as it were by proxy, to things at all diſtances from him: we hear ſounds made a thouſand years ago; and ſee things that paſs a thouſand miles off. If the eagle really ſees, the raven ſmells, and the hare hears, farther and better than man; their ſenſe, at beſt, is but narrow, in compariſon of ours, which is extended, by the artifice of language, over the whole globe. They ſee with their own eyes only; we with thoſe of a whole ſpecies. In effect, by language, we are upon much the ſame footing, in reſpect of knowledge, as if each individual had the natural ſenſe of a thouſand: an acceſſion, which, alone, muſt have ſet us far above any other animals. But, at the ſame time, this very acceſſion of a multitude of ideas, more than naturally belonged to us, muſt have been in a great meaſure uſeleſs, without certain other faculties of ordering and arranging them; of abſtracting, or making one a repreſentative of many; of comparing them together, in order to learn their relations; and of combining them, &c. The effect thereof is what we call *diſcovering* and *philoſophizing*; whence ariſe *doctrines*, *theories*, &c.

EVERY word is ſuppoſed to ſtand for ſome point, article, or relation of knowledge. From which it follows, that the vocabulary of any language is repreſentative of the ſeveral notices of the people among whom it obtains: I mean of the primary, or abſolute notices; for, by the conſtruction of theſe words with one another, a new ſet of ſecondary or relative notices are expreſſed. To enter better into this, it may be obſerved, that the ſeveral objects of our ſenſes, with that other ſet of things analogous hereto, the proper objects of the imagination, are repreſented by fixed names *; denoting ſome of them, individuals †; others, kinds §, &c. Now theſe, which make the firſt or fundamental part of a language, it is obvious, are no other than a repreſentation of the works of nature and art, as they exiſt in a kind of ſtill life, or in a ſtate of inaction, and independency one upon another. But, in regard we do not find the creation thus quieſcent, but obſerve a great number of mutations ariſe in the things we are converſant among; we are hence put under a neceſſity of framing another ſet of words, to expreſs theſe variations, and the actions to which they are owing, with the ſeveral circumſtances and modifications thereof ‖. By this means, nature is removed, as it were, out of her dormant conſtitution, and ſhewn in action; and thus may occaſional deſcriptions be framed, accommodate to the preſent ſtate of things.

HENCE ariſe two kinds of knowledge; the one abſolute, including the ſtanding phænomena; the other relative, or occaſional, including what is done, or paſſes, with regard to them. The former is, in ſome ſenſe, permanent; the latter is merely tranſient, or hiſtorical. The firſt is held forth, as already obſerved, in the vocabulary: the ſecond is vague, and uncircumſcribed by any bounds; being what fills all the other books. In effect, this laſt, being in ſome meaſure caſual, may be ſaid to be infinite: becauſe every new caſe, i. e. every new application and combination of the former, furniſhes ſomething new.

IN the wide field of intelligibles appear ſome parts which have been more cultivated than the reſt; chiefly on account of the richneſs of the ſoil, and its eaſy tillage; but partly too by reaſon of the ſkilful and induſtrious hands under which it has fallen. Theſe ſpots, regularly laid out, and conveniently circumſcribed, and fenced round, make what we call the *Arts and Sciences*: and to theſe have the labours and endeavours of the men of curioſity and learning, in all ages, been chiefly confined. Their bounds have been enlarged from time to time, and new acquiſitions made from the adjoining waſte; but ſtill the ſpace of ground they poſſeſs is but narrow; and there is room either to extend them vaſtly, or to lay out new ones.

THEY were divided, by their firſt diſcoverers, into a number of ſubordinate provinces, under diſtinct names; and have thus remained for time immemorial, with little alteration. And yet this diſtribution of the land of ſciences, like that of the face of the earth and heavens, is wholly arbitrary; and might be altered, perhaps not without advantage. Had not Alexander, Cæſar, and Genghis Khan, lived, the diviſion of the terraqueous globe had, doubtleſs, been very different from what we now find it: and the caſe would have been the ſame with the world of learning, had no ſuch perſon been born as Ariſtotle. The firſt diviſions of knowledge were as ſcanty and ill converted as thoſe of the firſt geographers; and for the like reaſon: and though future Bacons, Cartes's, and Newtons, by opening new tracks, have carried our knowledge a great way farther; yet the regard we bear to the ancient adventurers, and the eſtabliſhed diviſions, have made us take up with it, under all its inconveniences, and ſtrain and ſtretch things, to make our later diſcoveries quadrate thereto. I do not know whether it might not be more for the general intereſt of learning, to have the partitions thrown down, and the whole laid in common again, under new diſtinguiſhed names. Our inquirers, in ſuch caſe, would not be confined to ſo narrow bounds; but we ſhould be led to explore many a rich track, now doomed to lie neglected, becauſe it is without the pale.

ART, and SCIENCE, are, indeed, words of familiar uſe, and great ſignificance: but, I doubt, little underſtood: philoſophers have long laboured to explain and aſcertain their notion and difference; but all their explanation amounts to little more than the ſubſtituting of one obſcure notion for another. Their attempts have uſually terminated in ſome abſtracted definition, which rather caſts obſcurity than light on the ſubject: and ſuppoſes very little of the eſſence, and obvious phenomena thereof. To come at which, we muſt look at the ſame of a new inveſtigation.

TO SCIENCE, then, ſeem to belong ſuch things as men may diſcover by the uſe of ſenſe and reaſoning; whatever the mind objects in virtue of that faculty whereby we perceive things, and their rela-

* *Nouns.* † *Proper Names.* § *Appellatives.* ‖ *Verbs, Particles, Adverbs, &c.*

tions,

tions, is matter of science: such are the laws of nature, the affections of bodies, the rules and criterions of right and wrong, truth and error, the properties of lines and numbers, &c. Science, in effect, is the result of reason and sense, in their general or natural state, as imparted to all men, and not modified, or circumstantiated, by any thing peculiar in the make of a man's mind, the objects he has been conversant among, or the ideas he has present to him. In fine, science is no other than a series of deductions, or conclusions, which every person, endued with those faculties, may, with a proper degree of attention, see, and draw: and a science, i. e. a formed science, is no more than a system of such conclusions, relating to some one subject, orderly and artfully laid down in words. Thus a person who has all the ideas expressed in Euclid's *Definitions*, and sees the immediate connexion of those in his *Axioms*; which no man, acquainted with his language, can be supposed without; may be said to have it in his power, with attention and industry, to form all the theorems and problems that follow: he has nothing to do but to range those ideas orderly in his mind, compare them together, one by one, in all their changes, and put down the immediate relations observed in the comparison, i. e. their parity, imparity, &c. And after the relations of each to each are thus got, which make a kind of primary propositions; to proceed to combine them, and take down the relation resulting from a comparison of the several combinations. By such means, without any other helps than penetration and perseverance, might he make out an infinite number of propositions; possibly more than Euclid has done: there being a new relation, i. e. a new proposition, resulting from every new combination.

TO ART, on the other hand, belong such things as mere reason would not have attained to; things which lie out of the direct path of deduction, and which require a peculiar cast, or turn of mind, to see, or arrive at. A man might call these the results of particular or personal reason, in opposition to the former; but that such a denomination would be thought unphilosophical. It may, perhaps, be more just to consider reason, here, as modified or tinctured with something in the complexion, humour, or manner of thinking, of the person; or as restrained and diverted out of its proper course, by some views or notices peculiar to him. The difference between the two may be illustrated by that between wit and humour: the former whereof is a general faculty of exciting agreeable and surprising pictures in the imagination; and the latter a particular one: the former is pure and absolute in its kind: the latter tinged with something foreign and complexional.

AN *art* and a *science*, therefore, only seem to differ as less and more pure: a science is a system of deductions made by reason alone, undetermined by any thing foreign, or extrinsic to itself: an art, on the contrary, requires a number of data, and postulata, to be furnished from without; and never goes any length, without, at every turn, needing new ones. It is, in one sense, the knowledge and perception of these data that constitutes the art: the rest, that is, the doctrinal part, is of the nature of science; which attentive reason alone will descry.

AN art, in this light, appears to be a portion of science, or general knowledge, considered, not in itself, as science, but with relation to its circumstances, or appendages. In a science, the mind looks directly backwards and forwards to the premises and conclusions: in an art we also look laterally to the concomitant circumstances. A science, in effect, is that to an art, which a stream running in a direct channel, with regard to any thing but its own progress, is to the same stream turned out of its proper course, and disposed into cascades, jets, cisterns, ponds, &c. In which case the progress of the stream is not considered with regard to itself, but only as it concerns the works; every one of which modifies the course of the stream, and leads it out of its way. It is easy to trace the progress of the former, from its rise to its issue; in regard it flows consequentially: but a man ever so well acquainted with this, will not be able to discover that of the latter, in regard it depends on the genius, humour, and caprice, of the engineer who laid the design.

THESE are some of the different characters, or conditions, of *art* and *science*; but there is a difference between them prior to any of these, and of which these are only consequences. The origin of them all lies higher, in the principle of action, or operation, above specified; namely, as the mind is either active or passive, in respect of them. With regard to this, those things may be said to belong to science, which we only see, or perceive; which flow from the nature and constitution of things, by the sole agency of the author thereof; subservient only to his general purposes; exclusive of any immediate agency, or intervention of ours. And, on the contrary, those things belong to art, wherein such science or perception is further modified, and applied, by us, to particular purposes and occasions of our own. From hence arise the several differences above mentioned: for the matters of art are only personal, as they are according to the measure of the artist's natural faculties, in respect of quantity and degree; and to the complexion and cast of his moral faculties, in respect of their quality. The perception, even of matters of art, is of the nature of science: to that thus far the two agree: and their differences only commence from the superinducing of a farther modification in the matter of such perception; and the giving it a new direction to some particular end. By means hereof, it becomes invested with a new set of conditions, and circumstances wholly personal; as being all framed and adapted to the particular view and aim of the artist, and conducted according to his particular degree of knowledge and abilities; which is the effect of a particular set of objects, and a particular organism of body. In a word, in art there is a moral view or motive, superadded to the natural science, or perception; which motive is the proper principle, or primum mobile, of art; perception is its matter; and some member of the body its organ, or instrument. And from such new principle, &c. arise a new set of secondary perceptions analogous to the natural and primary ones. The whole, therefore, ends in this; that science arises from a natural principle, art from a moral one; or even, as moral matters are also, in one sense, natural, science may be said to be of divine original, art of human*.

HAVING

* THIS doctrine may seem to overturn the Aristotelian definition of art; *Art is nature worse with reason effected*; a definition, which, at first sight, appears to be taken from a partial consideration of the subject. It is to be the single character or condition of art, to proceed according to right reason; the more and purer this reason, the more perfect the art. But, in some of the arts, reason appears to have little to do; and the less, as those arts are in greater purity and perfection. Thus it is in poetry; a man that would undertake an ode, or an epic poem, on the strength of his reason, would be miserably mistaken: all his efforts would not carry him above the humble sphere of versification, where he must be confined as much as an impotent, another kind. So far is reason from being the sole, or chief, or even a considerable, ingredient in poetry, that it can scarce follow at a distance, or even at all. The principle of motion is evidently something other than reason; or how was the greatest philosophers would be the best poets, and vice versa. On the contrary, most of us have known people very much in the natural science, or perception; kind of madness. Poetry is an appendage of one a symptom thereof. Longinus accordingly puts among phenomena, for the poets: a spice of the same thing, and no more, is to be thought any reflection upon a man, seated on that throne, fine, flourish to very good compass: some of the greatest philosophers, prophets, legislator,

HAVING discussed the nature and characters of *art* and *science*, it remains to settle the notion of a TERM *of art*; an expression as little understood as any thing in language. Art and science, we have observed

doctors, fathers, and saints, of all ages, being confessedly his admirers. It is remarkable with what respect and awe the ancients treated people suspected to be touched: the very names they called them by inspire a high veneration, and place them, as it were, at the threshold of Jupiter's. One of their most common appellations, *numine afflati*, is, at the same time, the most just and philosophical that can be thought of. In effect, a share of fury and enthusiasm is held, by them, a condition absolutely necessary, in order to rise above the crowd. We may add, that the poets themselves have a hundred times expressly attributed all their greatest and happiest thoughts to enthusiasm, ecstasy, and fury; and they do it implicitly, almost in every piece they write; it being their standing practice to take a formal leave of common sense at first setting out, and call a Muse for their future guide; which, to talk out of the poetical style, is as much as to say, they resign themselves over to the conduct of genius and imagination, which they now find strong and prevalent in them: thus inspired, a new scene of objects arises; calles on calles; and they see things invisible to other eyes. From such prevalency of imagination arises what we call POWER, which is common to all men, in a greater or less degree; philosophers have a little of it, poets a great deal, and lunatics scarce any thing else.

IT may seem strange to say, that the principle is precisely of the same kind in things all. We are wont to consider it, in the two first, as constituting, in the latter, as diffusive in the former, it is only accidental to the latter, perpetual in the one, it is voluntary, and incontrollable in the other, limited, and restrained. The lunatic, in the one case, driven of necessity, as reasoning exists and anchor to hold by; and, in the other, falls out of concert as finding the wind favourable, and the voyage desirable. But let us not count to much upon this difference in degree, between the talents of the poet, and those of the lunatic: the moving principle is the same in both, though its effects be various. If the proper balance and adjustment between the powers of reason and imagination be wanting, yet they still retain their nature; as far as mad is the same, whether the pilot directs the helm or not.

THIS doctrine is plainly countenanced by the ancients; who, in some respects, seem to have had clearer and juster notions than the moderns: if being not embarrassed with the jargon and refinements of the scholastic learning. Philosophy, which shews us one degree more simple and obvious than nature, nature itself not yet covered and concealed under so much elucidation, but affected more frequent, and more clear of herself. Accordingly, the divine Plato in his *Phædrus*, affirms, "that rushing "mania and madness all one and the same thing;" and has a long and cogent discourse to prove, that it must be so: and among the several species of enthusiastic, he expressly ranks poetry. In effect, the motions and passions make use of the principal branches in the division of madness, or inspiration. Aristotle, indeed, though he divide enthusiasm somewhat differently from Plato; yet agrees with him in making poetry a species of it. Nay, the most reserved of all the ancient critics, Longinus, declares, "that the poet is possessed with a kind of enthusiasm; that he "believes he really sees what he speaks; and represents it thus "to others, that they catch the enthusiasm, and be likewise." Add, that, speaking of the sublime, he does not scruple to use *divine inspiration* as synonymous with *genius*.

THE principle, then, of the art of poetry, is something other than reason; and I know of no appellation more proper for the nature and effects of it, than poetry: nothing that can follow, build, and produce things to fine, and so full of genius, architecture, agriculture, &c. are arts, but in an inferior degree. And yet, turning another side of things towards, poetry will hence appear to have any thing of an art in it, but rather to be all the work of nature, wherein human thought and study have the least hand. It is produced by a principle superior to that of reason, i. e. a more immediate gift of God: and the poet, in the same manner as the philosophers and artists, is what he is, not that he can be told of most of them, or even what they are, but precisely what, and when we say, that are produced itself, we mean nothing more than the poet's imagination may be considered as a field, wherein the authors of nature produces a set of objects, which existed not before: new images arise here, like new plants, according to the settled laws of the Creator; so fruitful is the womb of nature! New worlds, innumerable, arise out of every particle of an old one.

THE *subject* area, or fame love in call things, i. e. such from which proceed all the rest, may be divided into the primary or secondary or derivative nature, added by amplifications from the old stock; and producing out of something true things that just the like. Here, at first sight, some persons seem to be quality of creation; the poetry's power over the truth has been made a shadow or the limits of that of the Deity over his works: and yet the parties, as both imply nothing in accordance to his own productions. Where, that is, the power or principle of action and motion, to which we owe the visible frame, and all the appearances and alternations of nature; or that power, which perfectly produces different effects, according to the different circumstances of things: runs a great globe, being perfectly terrified about its axis, and so hard applied to its surface, grows warm, emits light, attracts bodies, &c. [illegible] homogeneous, electrical body, though before, in the same of their properties. So compounded, a mass of stone, iron, [illegible] matters, being only touched with a [illegible] hand, instantly leaves off, and

smoke, with noise; perhaps bursts a rock, or drives a ball to a parabolic direction, and bowls a tower, or other work. Now nothing arises here, but in consequence of pre-established laws which impose, that the globe and the powder, whenever matter they come under such circumstances, shall exhibit such appearances. There are no two bodies in nature more different from each other, than the same is from itself, under the different circumstances of contiguity or non-contiguity with some other body, e. gr. with a spark of fire. But both states are equally natural; and there must be a law of nature to produce the appearances of one state, as well as of the other. Now the necessity of man amounts to this, that he has it in his power to put bodies in such circumstances, as are necessary to make this or that respective law take hold of them. And this we call *art*; and by this means we can produce a number of things, or bring them into all, which otherwise would have remained in eternal non-entity. Men may be said to create them, but no otherwise than the apothecary creates the lilliber, or the gardener the apple; i. e. those effects would necessarily have arisen, upon the same position of the circumstances and the cause, and the scion and stock, if there never had been apothecary or gardener in the world.

WE may define the works or productions of art, therefore, to be all those phænomena, or effects, which would not have arisen without the agency, or intervention of man. But man can only be said to act, or intervene, so far, as what he does is his own principle, without being moved or directed by any external power; i. e. so far as he is exempted from the influence of any necessary laws of nature, concerning, however remotely, to such effect. So that if, as those philosophers have maintained, man were not really and truly a free agent, there would be no such thing as art, in the sense here affixed to that word: and we have a name given to that system or laws of effects, to which man is made by nature, and in her hands, subservient; and might, with equal reason, be attributed to such effects as any other natural production is subservient to.

WE see, then, how far man is concerned in the productions of art. Our endeavours are restricted, by nature, to be means necessary to the laws taking place, from whence the effects are to arise. We are part of the chain, whereby the effect is connected to the cause. The circumstances are in our power, on which such and such laws depend; and these we may be said to be active, in the sole of art: supposing that there is nothing higher, or further; and that the effect rests with *us*: in a word, that our agency is not subordinate, but collateral, to that of the Almighty. But if there be other superior laws which inspect those same circumstances, and which are such in our power; i. e. if the circumstances necessary to the former laws be, themselves, suggested the effects of necessary laws, and the immediate work of nature; our agency will absolute into nothing. The utmost that can be said of us in such case is, that we are the instrument of the one, and passive in respect of the other; which, in most people, may appear a kind of contradiction. The thing cannot be formed, unless our inclination concur thereto; so far its existence depends on art: but are our inclinations, with respect thereto, of our own growth; or do they rise naturally, in consequence of an apprehension of good and disadvantage in the subject? That is, does any thing appear good and advantageous to us, absolutely, and of itself? or only what the Creator represents to us as such? And do we desire and pursue such forming good, from any principles and tendency that is in us, other than what are owing to his laws? The difficulty seems to amount to this; whether between our faculties of apprehending, or willing, and their respective objects, there be any relation which he did not create? If any allege, that in such relation consistences the faculty; and therefore, that the question ends in this, whether our faculties are from God, or ourselves; i. e. whether they be the causes of themselves? I should suspect some sophism in the case, which, at present, I have not penetration enough to detect.

BUT having traced the agency of man thus far, we must here divide; and, from the consideration of the effects ours; i. e. no such part from what art does out of us, to what it does in us: or rather, from the arts whose fruits is supposed in ourselves, and which proceed outwards; to those whose fruits comes without us, and act inwards; that is, from those which arise from our observation and reason, directing us how to manage occasions to the laws which obtain in the external world; to those which flow from our imagination, and fecundity excellent of the laws which obtain in the internal world. And the query which may, perhaps, carry us where the reader little imagines; but which will afford an ample discussion of the principle above established; and a further insight into the origin and course of science and art, and the nature and province of our agency, and powers, therein.

WE have already said something concerning poetry; one for its own sake, but as a proper introduction to the matter in view. It remains the lowest article in our progress, and may be considered as the toil in the book of arts; there being a sort of precedence from the beginning of the subject to the end. It begins with the first matter of knowledge, the common objects of our senses; and proceeds through the various modifications they undergo by the other faculties of imagination and reason, till it ends in the most sublime speculations of which our nature is capable. All these parts are connected in us, and, as it were, interwoven, that they are part of one

Chancellor, Librarian, Orderly, Tutor, Kalyan, Editorial, Pharmacist, Psychiatrist, &c.

observed, are denominations of knowledge, under this or that habitude; and words are representatives of the several parts thereof. The whole compass of words, in all their cases, is supposed equivalent to the

selves, and obey and take directions from our will, and minister to all our wiles and purposes: of which, this of producing images, and making fables, is in one sense, the most conspicuous; insomuch as the greatest effects here arise from the slenderest means and endeavours. The poet flies but little in the matter; but nature cooperates so strongly with him, that this little suffices, even to make new worlds. In effect, the poet feems, as it were, to sit nearer the spring of action than other men; and to have only to do with the general and higher principles thereof, which command and direct a number of other subordinate ones, that he himself is not ordinarily aware of. What we shall say of poetry, therefore, will hold proportionably of all the other arts; and we have only here to note, by the bye, the influence of inspiration is here the most apparent and palpable. The principle or spirit of poetry may be said to be that of art in general; and hence many authors do not scruple to make all arts the invention of poets; thus Je is that Homer is often complimented with being the father of all arts.

THE mind is allowed to be paffive, in refpect of the matter of the art of poetry. We need no quote the fects to prove it: no true poet ever queftioned his inspiration: every body knows, that their whole fyftem is built on the fuppofition. And hence the ftories of *Apollo* and the *Muſes*, of *Helicon* and *Parnaſſus*; the dreams of *Pindus*, and the *Aonian* maids; but the philofophers and critics alfo give them their fuffrages, and affert their inspiration, in the ftrongeft terms. Plato contends at large, that all poetry is "by immediate divine inſpiration, in the proper and "literal fenfe of the word." Ariſtotle confirms it; φασι γαρ, poetry comes by divine inſpiration. And Plutarch fays as much of all the branches of enthuſiaſm, poetical, divinatory, bacchical or conviviall, martial or erotic: to all which, he obferves, the appellation θειασμος was made ufe of, equally agreed. And not only fo, but they hold the enthuſiaſm communicable from one to another. It arifes from the poet, as its centre, and is diffufed in orbem; in a lefs degree of intenſeneſs, the farther it recedes from him. Plato affirms, that the audience, or thofe who ſung and rehearſed the poets words on the public theatres, nay, and the ſpectators themſelves, were all divinely inſpired, in fome degree; which is illuſtrated in the caſe of a needle touched by a magnet, which communicates the attractive property to another needle; that, to a third; and ſo on, but with a continual diminution. Nor does the effeft end here; but the profeſſors of other arts, as ſculpture, criticiſm, and even philoſophy itſelf, borrow their flame and inſpiration from this fire. Thus Phidias declared he was inſpired to make that wonderful ſtatue of Jupiter Olympius, by the reading of Homer: and thus Ariſtotle may be ſaid to have been inſpired by the ſame poet, to compoſe his ſyſtematical *Poetics*, the like, one of our own poets ſays of Longinus, that he was inſpired by the Muſes, or with the fire of a poet.

BUT, after poetry, rhetoric comes neareſt, and ſhares moſt of the ſpirit thereof: accordingly Plato, in his dialogue intitled *Ion*, allows, that "as we ſay pythians, prophets, and "poets, are div nely agitated; ſo we do of orators." Elſewhere he adds, "that they are certainly inſpired of God, and plainly "poſſeſſed." So *Iſocrates* himſelf tells us, that "Demoſthenes's fpeech plainly ſhewed the deity favoured him with a ſhare "in among the muſeleers, that "they were poſſeſſed as ſecond "hand, and brought to do many things againſt their own reaſon "and judgment." And Æſchines, his profeſſed enemy and antagoniſt, allows as much. I need not ſay, that Plutarch relates the life of Cicero, in the inſtance of his oration to Cæſar for Ligarius.

SOMETHING like this has been obſerved, even in the caſe of prayer to God: ſeveral heroes are on record for poſſeſſing their hearers that way. Hacket, conſured for blaſphemy under queen Elizabeth, is ſaid, by the biſhop, "to have ra- "viſhed all that heard him at his devotions, and converted many "in ſpite of their teeth." and Surravius relates, the people were poſſeſſed, that "God directed his tongue." S. Baſil even affirms, "that our prayers are never right or acceptable, till the "fervour thereof carry us out of ourſelves, ſo that God poſ- "ſeſſes us in ſome extraordinary manner." And hence the learned and pious Cudworth thinkſ there a new kind of enthuſiaſm, which he calls "a poſſeſſion by God, without any inſpiration." The author laſt mentioned makes no ſcruple to rank even "the omi- "nary delights and benefits men receive from the harangues of "orators, ſophiſts, preachers, &c. among the effects of enthu- "ſiaſm and inſpiration; as being what could never have ariſen "from mere common reaſon." And Plutarch, and others, make that ardour which the ſoldier feels in battle, of the ſame kind with that which inſpired the prophet, orator, and poet.

WE have here laid no leſs than a ſyſtem, ſufficient to account for moſt of the phænomena in the moral world, on principles of enthuſiaſm: and yet there are only a few, out of infinite inſtances, of the immediate agency and inſpiration of the Deity. We find the ſame principle in every art, every invention, every diſcovery; where no natural and neceſſary connexion is perceived between the diſcovery, and ſomething known before. What has no immediate dependence, either on what we perceive by ſenſation, or reflection, comes by the ſchools of inſpiration, i. e. of imagination; for theſe are ſynon. The imagination may be called the inſtrumental art, as ſenſe is of ſcience. The faculty of reaſon can make no great diſcoveries; it can only advance from one ſtep to another, which muſt be ready laid to its hand; and if there be any where interrupted or diſcontinued, there it is at a ſtand. It is, in fine, a limited principle, ſubject to very narrow bounds; whereas the imagination ſeems to be indefinite, and diſtinguiſh'd from the Creator's hand, to be occaſionally made uſe of for the conduct of mankind.

THE truth is, when we ſay, ſuch a thing is the effect of enthuſiaſm, or inſpiration (ſpeaking, I mean, of profane matters; the inſpiration, by influence, of Scripture, being matter of a very different conſideration, and quite beſide our preſent purpoſe); this does not remove it out of the ordinary courſe of things: it does not put it on any principle different from that whereby cauſes and effects ſucceed each other in the phyſical world. We can account for the phænomena of the imagination, as well as thoſe of ſenſation. They have their reſpective laws, like other things, which they are ſubject to; and to which we have ſeen, and profeſs appropriated. In effect, all the inſpiration here ſpoken of may be produced without any great conjectures. If the reader will but take advice at this novel philoſophize, he may be convinced of it. And, 1. In the inſtance of the poetical kind.

THE inſpiration of poetry is of a full and pure kind; and needs little artifice and apparatus to produce it in an imagination naturally diſpoſed for it. The attentive conſideration of ſome intereſting object uſually ſuffices to ſet it a-working. And the gentleneſs of that faculty have all nature to chooſe out of: the moſt ſublime, the moſt agreeable ſcenes, and the moſt moving objects. Hence it is, that they are continually harping on "groves and "ſhades, and gods and nymphs, and ſtars and flowers." How do they riot in "meadows, rivulets, and purling brooks, "and rivers wide: towers and battlements they ſee, boſom'd "high in tufted trees!" Sometimes they ſing of "knights and "squires, and maids forlorn." Then, "of rills and tournaments, "and feats of arms: pomp, and feaſt, and revelry, with courtly "and antique pageantry: ſtories of Thebes and of Troy; or "the tale of Troy divine: of Arthur and Conſtantine bold: of "Cambal and of Algariffe, and who took Canace to wife." If there fail, they have all that is gloomy, and ſolemn, and terrible, in nature, at their beck: we may now expect to ſee "the "red bolt, or forked lightning glanc!" Earthquakes and tempeſts ſhaken roar in vain: if by chance they do, the "ill-boding "raven's croak" is ready at hand; or elſe "the fat-off curfew "ſounds o'er ſome wide watered ſhore, ſwinging ſlow with ſullenn "roar." And now for "ſolemn obſcure ſhades, and ragged hor- "rid rocks:" next enter "hoary hoaſts and ſhriefs, and "fights unholy: Gorgons, and Hydras, and Chimæras dire." Images of things moſt moving to ſenſe readily alarm, and raiſe a commotion in the imagination. And the new ideas thus procured, coming to be mixed and combined, in the imagination, with others there before, new effects ariſe from them, in conſequence of the laws of the ſenſitive: much as inſenſibly as fire and water, meeting, produce a new ſpirit of nitre, and oil of vitriol.

SCALIGER diſtinguiſhes two kinds of *Enthuſiaſts*, or poets diſtinctly inſpired: the firſt, thoſe on whom the inſpiration falls, as it were, from heaven; without any thought or ſeeking; or, at leaſt, by means of prayer and invocation. The ſecond, thoſe to whom it is procured by the fumes of wine. All required to the firſt, is a delicate, pregnant imagination; ſuſceptible of any ſudden impreſſions that may happen to be made in the courſe of the animal ſpirits. Thoſe ſpirits, like the ſubtile and active parts of the finer fluids, we find, are kept in continual motion, by the bare tremor of the atmoſphere, though to us inſenſible: and thus the air is never ſo ſtill, but that the aſpen leaf feels its impulſe, and bends and trembles to it; when others require a ruder guſt to move them: yet theſe, too, give way in a general ſtorm; while ſtones, from utter inſenſibility accordingly, we read in ancient hiſtory, of whole nations being ſtruck into fenſe with the poetical fury; few of the cities of Greece, not even Athens itſelf with all its philoſophy, but has, one time or other, laboured under theſe ſyſtematical enthuſiaſms.

WE have already obſerved, that invention is the principle or ſource of poetry: an excellent poet, of our own age and ſide, is to this effect, furniſhes an art with all its materials; and that, without it, judgment itſelf can, at beſt, but fit it wiſely. Now this faculty of imagination itſelf is uſually, no other than a delicacy, or readineſs of taking hints; but more or ſeldom, when we are led to cauſes, relating to, or the contemplation of, the paſſions. Invention, conſiſts in the ſudden ſimple ideas: thoſe can only come by the way of ſenſe and obſervation; all that paſſes in the other caſe, is, then from the harmony of certain things, i. e. the comprehenſive ſyſtem, or general ſcheme, certain new images or pictures ariſe, according to the order of things. The ſprightly imagination is led, on various occaſions, to compound new ideas: and many of them ſo oddly and luckily, that we take its proceedings for new things; and think poets are never known, becauſe they did not before exiſt. But, in ſtrictneſs, there is no more real invention in the poet, than in the ingenuity or mobile worker, who mingles and combines the various coloured materials furniſhed to his hand, ſo as to make an advantage or picture, which before had no exiſtence.

THE reader who has any doubts about this, need only take the firſt piece of poetry that comes in his way to be convinced that all that is new, and ſurprizing in it, is no other than new compoſition, and combination of former ideas. In the *Iliad* or *Odyſſey*, *Paradiſe Loſt*, and the moſt poetical pieces in our, or perhaps in any language; how eaſy is it to reſolve all that is to be great and ravishing, to the new, unuſual, and frequently wild and romantic aſſemblages of imagination? Who can contain himſelf at—? Sport which wrinkled care derides, and laughter holding

the whole system of possible science, though it is only a small part thereof that is actual, i. e. only a few of the possible combinations are, or ever will be, made.

THE

" hock his sides.—Cynthia peeping through a cloud, while rock-" ing winds are piping loud.—To hear the lark begin her flight, " and singing startle the dull night; or early cock with lively " din, scatter the rear of darkness thin: or, listen how the " hounds and horn, loudly rouse the slumbering morn.—Or few " glowing embers, through the room, teach light to counterfeit " a gloom.—Or, flaried windows richly dight, calling a dim re-" ligious light.—Or hear Orpheus sing such notes, as warbled to " the string, drew iron tears down Pluto's cheek."

PERSONIFICATION, which is of that extent and importance, that it is usually held the life and essence of poetry, is a vast source of new imagery. By this, not only different objects, but different systems and worlds, are combined and blended together; and what belongs to one kind of being, man, is attributed to every other; each object, either of sense or imagination, being occasionally invested with all the characters and properties belonging to the human kind. Thus an arrow grows impatient, and thirsts to drink the blood of a foe; or hunters and dogs half-way, hasten to carry death, &c. So an action of the body, laughter, is represented, by Milton, as lifeful Morning, ready to build its sides. One of the planets, the moon, is represented as tricked up, and frounced; and again as ker chiefed, and in a decent undress, and thus going a hunting. To tell us that a fine spring morning, attended with a gentle gale of wind, is very pleasant; poetically—" Zephyr with Aurora playing, as " he met her once a maying, on a bed of violets blue, and " fresh-blown roses dight in dew, filled her with a daughter fair, " yclept sweet Hesperidusa, and Mirth an eirl." How confident with the nature of things, is the breath of air found lay on early hour of the day down; and that, from a green gown thus borne, a portion of the mind should in time be brought forth! In effect, the inspiration of the poet frequently amounts to little more, than relating things that are naturally incongruous. He does not invent, he only manipulates; nor has he the least power to move, other than what he derives from the novelty and strangeness of his combinations; to which nothing exists in the ordinary system, but one way constantly. If by means, it any such, you furnish an unnatural novelty against the invention; and sensation the memory, where all knowledge originally commences. And the whole process is nothing but the action or operation of the Deity, in a course of laws.

AS to the second kind of poets, in whom the inspiration is excited by means of wine, Cataubon is perfectly inclined at it; judging it the highest strain of forgery, to suppose a man may be divinely inspired by the fumes of liquor. And yet I do not know whether his right be not founded on a misapprehension. If Scaliger allege, that the juice of the grape may be a means or condition necessary to make the laws that produce to invention take place; I do not see what religion here to be hurt, more than in any other enthusiasm. The use of such means is no way derogatory to the power or goodness of God, who still remains the author of this, as of any other inspiration; whether he be by vision, by voices, dreams, or the like. What matters it, whether the sound of a speech, or the sight of a book, or the refreshment of a liquor, be the occasion? And of all the blessings this juice is made the instrument of to us; why should it be precluded from that, which even the vilest of God's creatures occasionally minister?

THE inspiration of orators, bears a near relation to that of the poets; though, being somewhat grosser, it demands more industry and art. Quintilian tells us how a orator is to get inspired: " not by fustian hyperbolics, and gaping at the stars more-" over, and carefully avoiding things worn in the mind; but by mix-" ging the judge and the audience perfons, and lroughly re-" presenting to himself the fact, the occasion," &c. He adds, that nobody ought to pretend to be an orator, unless he have this art of inspiration at command; for that he can raise it at pleasure.

WHAT has been said above, explains some of the general principles of this art, and their connexion with other physical effects: and it would be easy to trace and purfue the same, where they appear in other cases, and with other circumstances. Thus the inspiration exerted by the orator in his audience, is resolved, by Cataubon, into the music of the speaker, i. e. the tone and cadence of his voice; and the ordering, or order and placing of his words: in which last, how simple and trivial soever it may seem, all the great masters on the subject allow something mysterious, and unaccountably forcible: and accordingly make it the principal part of rhetoric. And yet there is nothing in the whole, but what refolves from the powers, properties, &c. of the several letters, combined as to many sounds, artfully combined. In effect, there is found figure, or numbers, and some degree, or dimension, in all diction; much more in that of oratory: and music itself has no charms in it, but what it derives from thofe very sources.

NOR need it be noticed, that the use of metaphors contributes in fhare to the effect: the secret wonder conlists in this, that they are, as it were, accommodated to the senses; and present such images to the imagination, as move as much, when perceived in the way of sensation.

AS to that enthusiasm felt in prayer, we cause is not far to seek. The powers of rhetoric and music, and a peculiar fervour of imagination, called by an apprehension of the presence of God, &c. will go a great way. We may add, that the ancient heathens made use of dithyrambics in all their most solemn prayers; which, Proclus observes, are peculiarly fit to stir up enthusiastical dispositions. A man that rides Pindar's horse cannot well fail of going at a great rate.

BUT the most extraordinary and unaccountable kind of inspiration is still left behind; viz. that of prophecy, divination, discovering cures by dreams, &c. which yet may all be produced by art: and accordingly, they have all been taught and studied like other arts: not to fay, alfo, profited like trades for a livelihood. Schools and colleges of prophets, diviners, augurs, &c. were numerous, both among Jews and Gentiles; and there was little in their discipline, but what may be resolved into what has been already laid. Hence all the means above mentioned, all the springs of enthusiasm, were used; and frequently all combined together, to make the more compound and extraordinary effect. The light of rainbjects, as rocks and mountains, wild prospects, solitary places, gloomy cares, furious rivers, seas, &c. which we find so work so strongly on the mind, were indulged; and frequent changes, and sudden transitions, were made from one to another. Such unusual objects necessarily suggested unusual ideas; which were heightened by proper applications to all the other faculties. And when the person was at length got out of the ordinary forms of thinking, what he uttered was judged oracular. And among a large mass of objects, which presented themselves to him, some could not want an analogy to things that were ready to happen; at leaft in the opinion of a person already poflefled with the notion thereof. It may be added, that the prophecies themselves had their share in producing identity; the events whereof partook of the predictions some more, others less, according to the degree of poflible, of the parties concerned in them. In effect, the respective skill retained immediately of the means made use of to raise it. And hence a revelation was artificially productive of the completion required; which was the very aim of the art. So that the distinction, when most perfect, really supposed a natural knowledge of the thing demanded and was built on it.

AS to dreams, &c. there was a foundation for them; the circumstances whereof might be appropriated to raise in the imagination, and the idea of the thing requested. And in the celebration of ceremonies, the party was to fast, to lie in the temple; and the priests had not only the pleasing of his body, and the strewing of his bed, but also the management of omens, sounds, &c. in the night-time. So that if many natural means were known for the cure, here was room enough to fuggeft it to the patient's imagination, which was made accessible to them; and, as it were, put into their hands. But if no adequate remedy were known; as, it is probable, they chiefly entered to far into the part; yet, what was the harm, if the means fuggested, perhaps at random, to some operation, when enforced by the opinion of its coming by miracle and inspiration? We see what the bare posfuence and assurance of a physician will frequently do; even cure disorders for above the reach of his skill: and what an improvement would it not be to the faculty, to have the further assistance of a little flaw of religion and ceremony?

I AM afraid I may seem to have been too long about from my subject; but I think it worth doing in my eye, as little as capitulation will convince the reader, that we have no wandered far out of the way. We have shewn whence all our knowledge originally rifes; that fantasm is its only source; that what comes this way, comes by the agency of the Divine Being; that it is further modified by the memory or imagination, where new assemblages are frequently made, which is called invention; that it is continually altering, by the addition of new ideas from without; but ftill retains fubject to the laws impofed by the Creator; so that nothing happens thereon, but as conformable of fuch laws. Thus has the mind appears merely paflive; and thus it ftands with respect to the matter of all knowledge and art. It remains, now, to conlider its form, or that whereby such knowledge becomes art, i. e. becomes fubservient to human purposes, and under the direction of human reason.

HERE, therefore, a new ftate of the mind, agency, and a new faculty observed, whereby it operates on the fantasm and effects the end. We will be best ascertained, by inquiring what we find in the arts, e. g. Homer's mind, that concurred with his inspiration or invention, to the production of his poem? This will be found to resolve into, firft, an inclination to produce fome piece, in the way of fable, that ftall strongly represent the misfchiefs of discord among confederates; and, fecondly, a knowledge of certain means necessary to that end, or an acquaintance with certain rules and maxims which tend to produce such an effect.

THE firft is a moral virtue, or motive, which has already been laid down as the fpring, or principle, of all human action, and which is founded on the appointment of good, or utterance, to arife from fuch a power. The fecond, viz. the knowledge of the means, ftands on the common footing of the knowledge hitherto difcovered of.

THE means and inventions of an art make a kind of preliminary doctrine, secretary or instructive element, called *the theory of the art*; which alfo, in our fenfe, may be conlidered as another art, diftinct from the former; as itself, in time at it, is the business of another art. For inftance, a certain pofition, or fet of motions of the body, is conditional, by nature, the occasion of a poetic inflammation; and fuch and fuch images and ideas, arifing therefrom, be conlidered the occasions of fuch paflions in the mind of a reader, and fuch views consequent thereon; viz. an averfion to enmity and contention; to form an art productive of these effects, we muft firft observe the like effects to arife from

THE business of knowledge, then, is cantoned out among the body of words: but they do not bear equal shares thereof. Being creatures of our own, we have dealt with them accordingly; and made some the like causes; and infer, that it is probable these motions, or those images, are the occasions thereof: and consider their order, manner, and circumstance, so form the art, or method. So that we have here, as before, 1. Matter, or phenomena, furnished by sensation, and preserved in the memory. 2. Form, arising from the moral view, which led us to frame an art; and, in order thereto, to consider and dwell on the phenomena, compare their together, and infer something from them.

IT appears, therefore, that we have two sorts of poetry, very different from each other, arising from different souls, tending to different ends, and rarely found, in any great degree, in the same person. The first art Homer perfected in perfection; the second, Aristotle.

BUT, for all their difference, the two will be found of the same general nature and kind; and only to differ in point of degree, and subordination: as they are to the, or further from, the principles of all knowledge and art; judgment. Homer, we have shewn, was inspired: he derived his art only from nature, acting on him in the ordinary course of things, and first presenting objects to his senses, then to his imagination; and others as inspired from him, i. e. from whom the inspiration from nature, through his means, among them as Aristotle. Nature, as he appears to the senses, is Homer's object; as he frames herself in Homer, he is Aristotle's: by which time the inspiration is grown a degree cooler, and the terrible: and the mind, thus excited or second-hand, moving the mind-knife, it can spread more readily to them, and perceive their relations better. To the first it fails like lightning immediately from heaven; the second may be compared to the reflexion of the same lightning in a mirror. The reading of Homer, i. e. the exciting and calling up his ideas, and images, is more severe, impregnate Aristotle's imagination, and manifest the poet's whole face: turn the philosopher's widow, to be farther subtituted. Accordingly, Aristotle, applying his reason to them, and examining them closely on all sides, perceived divers relations and analogies between them, which Homer was not aware of: and which the warmth of his imagination, and the quick succession of new ideas, would not give him room to attend to. These analogies he calls rules, or forms; the collection of them advanced make what we call Aristotle's Art of Poetry.

THE like process might be observed in the several other arts. Those we have hitherto chiefly kept to, have been of the symbolical kind: we shall here give an instance in what we call the real kind, viz. architecture. An Athenian sculptor, then, observing an acanthus drooping up under a bellarc, is pleased with the figure it presents; and, taking the hint, frames the capital of a column on the same: and, by a number of like helps, an entire order gradually arose; and, in time, a whole art. Things then advanced, and another person finding a building framed after such manner, he attentively examines the several members, their forms, proportions, &c. and puts them down in writing: and thus does another perform set after set. And between the two there will remain the information already observed between the master and occasions of producing them: and the rules thus formed, being couched in words, supply the office of the external objects they were originally derived from, and prove occasions of taking hints, or imagery, in the imaginations of future artists, to be imitated in the proper manner.

THE arts, then, of poetry and architecture, even first in at Homer's and Callimachus's time, in the simple quality of natural objects; which, meeting with other ideas in the memory, or imagination, and coming to be compared and combined together with, by the agency of the moral view or principle which suggested the making of a poem, &c. to advantageous and definable, new productions arise, e. g. a poem or a building; which coming, at length, under the cognizance and consideration of reason, certain relations or analogies are discovered therein, which tend to propagate and produce the like at any time. Reason turns rules in matter; which rules prove like the philosophers stone, which tends to change whatever it is applied to into its nature, and the materials thus transmuted, like the pretended multiplied conversations of the same thing, from every thing they are applied to, produce rules again. And thus are we arrived at the reason of the artificial definition of art above mentioned, which we see has pretty deep, and cost some pains to come at; as the many other doctrines of the philosophers, which the precociousness of moderns has scoffed at falls, only because they would not be at the pains to follow their track.

REASON, in short, which is the full faculty the matter of art arrives at, is the full time which the form or rules thereof, which are to propagate it, arise. In which view, reason may be laid down as the principle of this secondary art, or theory: as imagination is of the primary one. We fall for the effect of the first here, even in the latter art; external objects strike the senses and imagination so strongly, that they recede to reason; which, like an infallible middle substance, reflects them back again; and thus they again grow into objects of sense, and so on in a circle.

THIS seems to make the two arts differ very widely: and as reason appears our highest faculty, (inasmuch as it is this alone that tends to produce and multiply, and accordingly all our knowledge appears proportionably higher and purer, as reason is more concerned therein), the rules or theory of an art appears of infinitely greater consequence than the matter thereof. Reason is, in some sense, active and, like the Almighty mind, tends to produce new things, new systems, without end: the latter is more passive, and ends in mere human perception.

YET Aristotle's rules, it must be observed, do not tend to produce poetry: I mean not the matter of poetry, but only the form; Aristotle's art is not the art of poetry, in that sense, as the rules do not tend to produce enthusiasm. They only give the human parts, and points when reason observes in the productions of the imagination, i. e. what there is in them, that is a proper object to this full faculty, and enters under its notice. In short, poetry is only subject to Aristotle's rules, as there is reason, not as there is imagination or invention, in it.

THE theory of poetry, we have observed, is now of poetry, in a higher ground; and to turn the lemon upon us, is the bulkiest of this other art or inspiration. The immediate inspiration is not to immediate as we may imagine: it is not the absolute principle of art; but with itself subordinate to another farther or higher art; for that we must not only have art, and rules to produce poetry, but also to produce the principle thereof, inspiration, or invention. And the same will hold of the rules of this last art, themselves, which will require others: and so on in succession: at least, the series will be infinite, if we only take outwards, and not one step, into the centre.

TO clear up this, it may be observed, that the art, e. g. of poetry, is not only subordinate to another higher art, as above laid down, but that its matter and form to each of them the subject of a particular art, and each of them requires another higher art to produce them. The theory for instance, necessary for inspiration, or the invention of things, make one arts and those for their application to the perfect purpose, another; to shut the art of poetry resolves itself into two subordinate ones; the first of which may be called the art of invention, the other the art of judgment, or disposition; each of which has all the characters of the general art, and is to be treated in the same abstracted manner, like its, and resolves into principles of its own kind with it. Nor does the view end here: for to each of these subordinate arts may be conceived as consisting of matter and form, each of them resolves itself into two other arts; and the first may be said of each of these; and so on. So that there is really an infinite series of arts, previous to one another, and mutually subordinate; different from each other, though all of the same general nature, and only differing in points of order, or subordinacy. They are subordinately from the same cause, and tend subordinately to the same end; which difference or subordination, as already noted, arises only from their greater or less distance from the principle of all knowledge, sensation.

UPON the whole; sensible nature furnishes the matter of them all, by means of the imagination; and moral nature the form, by means of the light of reason. The former proposition has been sufficiently insisted on already; it remains to explain a little further into the latter, viz. *that reason furnishes the means*, &c. must be further explained, ere it be received. Our reason, it is to be observed, does not perceive any necessary and immediate connexion between the means and the effect; but there really is none; contingently, reason cannot be the author of them: in regard, the medium is nothing, whereby alone, it could possibly attain the end. Reason, therefore, is determined by some other cause, which will, at length, be found to end in instinct, or fate, which we are know, that fixed causes produce to such end, we must still have observed, or found it so by experience. Our memory suggests to us, that such or the like causes have been followed by such or the like effects; which is the only foundation we have to expect any thing from them on the present occasion. Thus, if Homer's reason directs him to retire into a place free of noise and disturbance, that he may meditate his poem; and to dine temper, and there to apply himself with attention and application to what he has formed; to contemplate of which manner, new ideas and images present themselves, some more immediately relative to the present purpose, others less: whence comes all this, but that Homer remembers such or the like ideas were now wanted, to have arisen upon the use of such or the like means? And if, among the crowd of images, he chooses only such as are most proper and pertinent to his purpose, it is because he finds, upon reflection, that the rest will not do. This is all that he remembers fairly, or becomes conscious of, to have contributed more fully to ends the last mind. But how others? So that the whole process appears to be little other than instinct, which, we know, resolves into fate.

BUT accuracy, it is here to be noted, deals only in positive things in nature: that no fact can be, or exist, but under some determinate circumstances; that effects of fact be matters are merely variations of circumstance, and relate only to those circumstances, circumstances, &c. which can never happen again. So that memory speaks nothing to the purpose, but only of the circumstances how the particular purpose, one in view, is to be obtained: its language is only this: "So such means and such circumstances, such effects." To make the application of past things to present, is the office of reason; which comes in to the assistance of memory, and tells us that, "since these things have been so formerly, and nothing else, they will now be so too." And, consequently, it is reason that, in brief, presides over the present matters.

OUR insight into things ranges in two lines; and it is only reason in that, in some manner or other to the end, i. e. what further or higher ends there are, to enable it to furnish materials for the present purpose; from the circumstances of past cases? This is the business of memory, properly so called: and of discrimination, good and bad judgment, and invention, &c. By virtue of these, the mind sees, that such or such means were

some more, others less significant, at pleasure; some stand for large provinces, others for petty districts thereof. In effect, the order wherein we attain our knowledge, has occasioned us to make a kind of sort-ment in the matter thereof. Though the mind only sees and perceives individuals, which alone are the proper objects thereof; yet it has a power of combining and complicating these together, for its own convenience: and hence its progress from particulars to generals, from simple to complex. Hence we come to have words of all orders and degrees; from the simplicity of an atom, to the com-plexness of the universe. It is pleasant to trace the mind, bundling up its ideas, and giving names to the several parcels; to observe, for instance, how it proceeds from the simple idea, *thinking*, to the more comprehensive one, *knowledge*, thence to a *science*, thence forward to *scientifical*, &c.

INDEED there are very few of our words that express single or simple ideas. The reason is, that, observing certain relations to obtain between the several ideas; as of cause and effect, subject and attri-bute, &c. we do not so much consider them absolutely, and independently, as under such circumstances and relations to each other. The great readiness or propensity of the mind to combine its ideas, and thus pay or receive them in parcels, has left us very few simple ones; I mean, very few names which denote only one idea. The words *atom*, or *mathematical point*, usually imply several ideas; in regard we are led to take the attributes and relations into the consideration of the subject: thus we consider the *atom*, as hard, heavy, and indivisible; as the principle of physical magnitude; as contributing to the constitution of bodies, &c. And even the primary qualities themselves, as hardness, heaviness, and the like, simple as they are in their own nature, are so far combined with particular circumstances, e. gr. their cause, &c. that their names become none of the least complex.

NOW what we call a *term*, is no other than "a word which denotes an assemblage, or system of "ideas, relating to some one point, which the mind has artfully complicated, or associated together, "for the convenience of its own operations." Or, it is "a word which comprehends several ideas "under a certain relation to each other, whereby they represent some complex piece of knowledge to "the mind, for the convenience, &c." Or, "it is a word, which holds several different ideas com-"bined together in a relation, such as they appeared under when the mind first considered them as a "flanding phenomenon, and took measures to have them fixed or retained in that quality."

THE effect of *term* is, that by virtue thereof, we are enabled to receive or communicate knowledge with more ease and dispatch; forasmuch as, having proper combinations thereof always ready made, we are saved the necessity of beginning *de novo*, and detailing it in individuals: much as in arithmetic, to avoid the embarrass of a large number of units, we tell by tens, or sixties, or hundreds: with the like view, on some occasions, we make up certain sums of money in rouleaux, or in purses; and thus pay and receive them, without the trouble of telling or enumerating the contents.

IN this sense of a *term*, we shall find little else in language. Among nouns all are such, except pro-per names, which, indeed, are out of the ordinary case of language; yet even these sometimes become terms: as when any particular ideas become constantly attached to them, e. gr. in *Maecenas*, *Machiavel*, *Augustus*, *Atlas*, *Thersites*, *Argus*, &c. And, among verbs, very few but are terms, except the general ones, *to be*, *to do*, and *to suffer*. As all the others suppose these, and modify, or superadd some farther cir-cumstances thereto; they commence terms of course: such, for instance, is the word *to moisten*; which, as it carries a farther meaning than the bare act of applying a fluid to a dry body; and denotes, e. gr. the modus of action, and the alteration superinduced by it, viz. the softening, lubricating, &c. is a thorough term. So, *to strike*, as it not only implies a certain motion of the arm, but this motion ef-fected by the successive contraction and dilatation of certain muscles, &c. has every thing that is essen-tial to a term. In the same sense, a *staff* is a term, as much as a *lever*; and a *pin*, as an *axis in peri-trochio*.

THIS may look like stretching a point, especially to those who are wed to consider *terms*, as things, I know not how, quaint and mysterious; and make a *term* and a hard word the same thing. But there is no remedy: complexness is the only characteristic, that will be found to hold good, of them all; and if there be any other more specific, and distinguishing properties in most of them, as we shall have occasion, hereafter, to shew there are; yet these, not being universal, cannot be made the foundation of a just philosophical definition. They may, perhaps, be introduced, to good purpose, into a popu-lar one; as they afford a more useful and adequate knowledge of the subject, so far as they do obtain.

THUS much relates to what we may call *terms of knowledge*, which are one degree more simple than the terms of an art or science: and were, for that reason, pitched upon to exhibit the common nature and origin of both. These latter arise out of the former, by the superaddition of some new character, or condition. They were before members of the commonwealth of knowledge: but they are now in-

"followed by such effects; such others, by parity of reason, will "be followed by such others." And that, "as there are such "and such differences between former and present occasions, and "circumstances; there must be such and such other correspond-"ent variations in the present motions, to keep up the vicis-"situde." All which relates to what the comprehension of *analogy* is. Thus it is found, that every reason, every step of an art, includes what has been already shewn of the whole art; and consists of *matter*, furnished by memory, from former and ob-servation; and *form*, furnished by reason, from comparison and analogy.

AND thus it is evident that makes all our historical knowledge of any significancy to us. It is thus that natural events are follow-ed to the perfect conclusion. We may look upon them as the bestowment or faculty of transferring; whereby the effects of be-ner times and places are brought over to the present ones. With-out this, facts would lie in their sites and numbers, with all its copia, would be no other than artificial lumber. It is this fa-culty alone, that arranges and bundles them into any thing of subordinacy. Memory only performs them as they first ap-peared; without direct act, and independency of each other, be-ing connected by nothing but their contemporaneity, or co-existence, in point of time and place. The establishment of all other rela-tions is the work of reason; which, from these low faculties re-lations, infers numerous recovery; e. gr. from the coexistence of two things in respect of time, place, &c. it concludes they have new appearances, perceived by the very act coexistent by the other; and, moreover, that there was some power in the latter, by which this was effected, &c. And thus it is we come at the relations of perception of cause, effect, action, passion, pro-perty, quality, &c. So that to this faculty of reason we owe the whole science of physics; which is no other than the doctrine of causes: at least the form thereof. The matter, i. e. the facts, come furnished in, being furnished by *senses*, constitute *natural his-tory*, the basis of all knowledge whatever.

WE are now got to the top of all our natural faculties, *reason*; and the most refined of all our common, vulgar. It re-mains to observe, that with this natural reason is connected *mo-ral perception*. In the case, the influence, of good; to the voice of reason representing a thing as such, is connected a desire or inclination towards the same; which is the great principle of hu-man action, or operation, and ministers a number of subordi-nate ones; the application of all which constitutes what we call the *power* of finding good.

AND thus we are got to the bottom of all our moral faculties, *affections* or *inclinations*. Hence, as reason is the end of pur-pose, or perception; inclination is the beginning of action; the one terminating in the apprehension of good, where the other commences. And again, as the perception of reason is the ul-timate effect of science; the inclination, arising by means here-of, is the beginning of art: the two being joined, and, as it were, incorporated, in some middle point. And thus external or physical things come to influence or produce internal or moral nature. And thus do physics take hold of ethics, God of man.

corporated into some certain province, or city thereof; where they become of farther significance and conſideration than before: that is, ſome new ideas and circumſtances are now taken into the combination, which before did not belong to it. A term of art, then, "is a word that has a meaning beyond its general or ſcientifical one, and this meaning reſtrained to ſome one art." Or, "it is a word uſed "to denote a certain combination of ideas, under ſome peculiar relation, retained arbitrarily in ſome "art, and either not uſed in any other art, or for a different combination, or with other relations and "circumſtances."

TO make the way a little clearer to the philoſophy of a term of art, it is to be obſerved, that from the primary, or literal ſenſe of words, we frequently, by abſtraction, form a ſecondary, general, or philoſophical one, expreſſing only the quality moſt predominant in the former, excluſive of the particular circumſtances of the concrete. Thus, the word *ſpirit* literally and primarily ſignifying *breath*, we thence frame a more ſimple general meaning, and uſe the word for any thin, ſubtile matter whatſoever. Now, terms of art are not immediately formed from the literal or grammatical, but from the general or philoſophical acceptation of words; which is their proper baſis, or the ground-work they are erected on. The general or abſtract ſenſe of ſome word already eſtabliſhed, being found to agree to ſomething which we have occaſion to give a name to; we take the word in that ſenſe, and ſuperadd the other incidents and circumſtances, which the preſent occaſions furniſh, thereto; which, being different, according to the different matter and ſubject of the art, ſpecify the meaning of the term in this or that art. So that the word which, to raiſe it to a philoſophical or ſcientifical ſenſe, was generalized, to form a technical one, is again particularized, or appropriated, and inveſted with new accidents.

THUS, the ſame word *ſpirit*, which literally ſignifies breath, and philoſophically any ſubtile ſubſtance, is technically brought to denote divers other things; as, in anatomy, a thin, animal juice ſecreted in the brain, and deriached thence through the nerves, for the uſes of ſenſation, and muſcular motion; in chemiſtry, the exhalations of bodies expoſed to the fire: in theology, the third perſon of the Trinity: in metaphyſics, any incorporeal agent, or intelligence, &c. In all which, we ſee the ſame ſubſtratum, viz. a fine ſubtile ſubſtance; but this modified a great diverſity of ways; each of which is ſuſceptible, by farther ſuper-additions, of infinite more. And hence we have legions of ſorts of ſpirits, both in the human body, the chemiſts laboratories, the hierarchy, &c.

THE notion of a term will receive ſome farther light from that of a DEFINITION; which is, as it were, the analyſis thereof. By *definition* we undo what was done in forming the term; that is, we reſolve the complex ideas into ſimple ones, or reſtore the ideas from their new and artificial ſtate, to their primitive and vague one. A *definition*, then, may be defined, "An enumeration of the ſeveral ſimple "ideas couched under any terms, in the relation wherein they ſtand to one another." We have already ſhewn, that terms are words which have peculiar and determinate meanings, reſulting from a certain combination of ideas; in which view, a term may be ſaid to be "a word that is capable of definition;" i. e. of having its ſenſe explained and aſcertained, by an enumeration of its properties and relations; by which it is diſtinguiſhed from words merely grammatical, whoſe meanings are general and indeterminate, and may be uſed with equal propriety in a thouſand caſes. We can explain a term; a word is inexplicable: all we can do towards this, amounts not to definition, but only to ſubſtitution, or the giving a ſynonymon.

THUS the idea attached to the word *force*, is abſolutely incommunicable by means of any language: we can only try whether the party have it not already, under another name; to which end, we may tell him it is *power*, or *energy*, or *vigour*; if he have ideas for any of theſe, he will take in that of force, by its relation thereto; if he have not, we muſt proceed to try him with more, and tell him it is *force*, or *vis*, or *efficacia*, or *potentia*, &c. or it is *ſua*, or *ωϛη*, or *δυναμις*, &c. If none of theſe will do, it remains to try, whether he may not have it without any name to it; and ſay, it is "that whereby one thing, "coming in contact with another, moves, or ſhakes, or breaks it," &c. If, by any of theſe means, he learns what force is, he does not form any new idea; he only learns a new name; and finds, that what he had known by one name, others call by another; or that what he had never taken the pains to diſtinguiſh by any name, ſome others have. To get the idea, he muſt have recourſe to ſenſation, not to language; it being a phyſical *cur*, and only to be attained that way.

BUT the ſimple idea, called *force*, being given; and coming to be afterwards modified, or circumſtantiated by new accidents added thereto, and thus formed into terms, in this or that art; it is here in the power of language alone to excite them, by reſolving ſuch compound idea into its ingredient ones; which, being re-compounded, or put together again, in the manner aſſigned by the definition, give the full adequate import thereof. Thus the idea of *force* being variouſly modified, and combined with other ideas of *centre*, *attraction*, *repulſion*, *mill*, *machine*, &c. in the words *central force*, *centripetal force*, *centrifugal force*, *neceſſity* or *moral force*, *mechanic force*, &c. we can, by definition, arrive at the meaning thereof; by having thoſe circumſtances ſpecified, or ſuperadded to the idea of force. In this caſe, there is no coming at the idea by ſenſation, in regard it is a creature of our own, and does not exiſt any where without us, to make an object of ſenſe.

HENCE appear all the diverſity of definitions; technical ones, compoſing only to terms, as to *central force*; ſcientifical, or philoſophical, to qualities, as *heaviness*; and nominal, or ſucceedaneous, belonging to ſimple ideas, as *power*, or *energy*.

IT is the various aſſemblage of ſimple ideas, denoted by common words, that makes all the variety of terms; as it is of ſimples in an apothecary's ſhop, that makes the variety of his medicines. The analogy goes farther; and it may be ſaid, terms, like medicines, only differ from each other as their ingredient ideas, and the relations thereof differ. If theſe be not all rehearſed in the definition, the term or medicine is not ſpecified, or diſtinguiſhed from ſome other, which may have all, except that one or two omitted. Conſequently, ſuch one or two are the characteriſtics of that term; which may be explained, in ſome ſort, by only enumerating thoſe characteriſtics, and couching the reſt under the name of that other term. This amounts to little more than the ſubſtitution above mentioned; and yet to this is reducible all that the ſchoolmen teach of *genus*, *ſpecies*, and *differences*.

BESIDES ſimple words, which we have obſerved are, in their own nature, inexplicable; there are divers others that become accidentally ſo; and ſuch are all the duties or preliminary principles of any art, with reſpect to thoſe who confine themſelves to the bounds of that art. Thus, if it be demanded of an apothecary to define one of his ſimples, e. gr. mercury; he muſt needs be at a ſtand, unleſs he be likewiſe verſed in mineralogy; by reaſon it is putting him to explain a principle, which his art does not explain, but aſſume; the explication thereof lying in another province. But aſk him to de-

fine calomel, and he is prepared for you: and will readily enumerate the several ingredients, and the manner of preparing it, which is the proper pharmaceutical definition of calomel.

HERE it may be observed, that the words used in the definition of a term do many of them represent complex ideas; and, consequently, ought themselves to be first defined, if we would have the definition complete. The term has usually divers subaltern ones; all which are resolvable into it, and make part and parcel of the knowledge held forth by it. Thus, if mercurius precipitatus albus be defined, "A white medicinal powder, precipitated from a solution of crude mercury in aqua fortis by adding thereto a lixivium of sea-salt:" and then purified by repeated solutions in a filter," &c. &c. the ideas, *powder, precipitated, solution, mercury, aqua fortis, solution, filter*, &c. remain to be explained, or turnish the complete notion of white precipitate. But as this would be endless, and would defeat the intention of a definition, the practice obtains, to suppose all other terms known, except that particular one under definition. By this means we avoid the embarrass of bringing down every word to its principles, or simple ideas, and confine ourselves by bringing it to the next complex ones: since the bringing an unknown term to several known ones, is a kind of indirect definition.

SUCH is the nature of a technical definition, which holds good or valid for those of that art, or craft, who are to be supposed furnished with the necessary data, or preliminary notices. But to make a scientifical definition, we must go a little lower; and bring down the words, if not to their simple ideas, yet to general or common ones. For it is to be observed, there are great numbers of complex ideas current among most common people, which therefore may be considered as data, and used as simple ones, for more convenience sake. All technical apparatus, then, is to be here thrown by; and instead of giving five or six hard words for one, the general effect and meanings thereof are to be made use of. Thus, the precipitate above mentioned may be defined, "a white powder, which falls down "from quicksilver dissolved in spirit of saltpetre, upon adding salt there in; and afterwards washed, again "and again, by passing fair water through it," &c. where, though several of the words be complex; yet most people, in the ordinary course of life, have framed the complex ideas belonging to them; so that they may be considered as simple ones. Yet the definition can scarce be said to be complete, even here: the general, or philosophical sense of words, we have observed, is formed from the grammatical one; and, consequently, the definition ought, in strictness, to extend thither: the solution, to be adequate, should go as far as the knot; the analysis, as the synthesis.

THE reader already begins to feel this Preface grow tiresome; and yet several things are still behind. Where so large a work was to follow, he perhaps imagines he should have been excused from a long introduction: and the like, probably, may the author say; who, after so tedious a work, could not be over-fond of any additional fatigue. But, the expediency of the case, which swayed and determined the one, may, we hope, induce to satisfy the other. Several matters were purposely waved in the course of the BOOK, to be treated of in the PREFACE: which appeared the most proper place for such things as bore a regard to the whole work. What has been hitherto omitted on, as well as what remains, immediately attacks every article in the book; and tends, withal, to let a little needful light into certain points, hitherto involved in great obscurity. A *preface* may be considered as a vehicle wherein fit to convey the reader, commodiously, from the title-page into the book. The preface is a kind of comment upon the title; the book a paraphrase on it: or, if you had rather, the book is the title extended, the preface the title explained.

HAVING, therefore, dilucidated some of the leading words of our title, ART, SCIENCE, TERMS, and DEFINITION; we proceed to consider the nature of a DICTIONARY. It were to be wished, that the many adventurers in print, who publish their thoughts under this or that form and denomination, would frame to themselves some precise notion of the character and laws thereof. There is something arbitrary and artificial in all writings: they are a kind of draughts, or pictures, where the aspect, attitude, and light, which the objects are taken in, though merely arbitrary, yet ever must direct the whole representation. Books are, as it were, plans or prospects of ideas artfully arranged and exhibited, not to the eye, but to the imagination; and there is a kind of analogous perspective, which obtains in them, wherein we have forced, or not much unlike points of sight, and of distance. An author, in effect, has some particular view or design in drawing out his ideas; either scientific, to represent something, or to distort and ridicule it, or to amplify and exremate, or discover, or teach, or prove, &c. whence arise divers kinds or compositions, under the names of *systems, treatises, theories, essays, inquiries, examinations, complexions, comments, memoirs, lectures*, &c. in all which, though the matter or subject may be the same, the conduct or artificial part is very different: as much as a full-life room a history, or a grotesque, or a nudity, or a caricature, or a frame-work, or a miniature, or a profile, &c. each of these methods of composition has its particular characters, and laws: and, to form a judgment of the things represented, from the pictures made of them, it is necessary we be able to unravel or undo what is artificial in them, reduce them into their former state, and extricate what has been added to them in the representation: that is, we should know the manner thereof; whether, as they be mere nature, shewn through this or that medium, in a true, or fun-view, whether in or without, to be viewed from above, or below; or nature raised and improved, or altered for the better, or the worse. The case amounts to the same as the viewing of objects in a mirror; where, unless the form of the mirror be known, viz. whether to be plain, concave, convex, cylindric, or conic, &c. we can make no judgment of the magnitude, figure, &c. of the objects.

IT is beyond our purpose to enter into the nature of the several methods of composition above mentioned; I shall only note, by the way, that the first writers in each worked and chalked out the measures of all that came after them. The several manners of composing amount to so many arts; which, we have already seen, are things, in great measure, personal, and depend on the genius or humour of the inventor.

WERE we to inquire who first led up the way of Dictionaries, of first to which frequented, some little grammarian would, probably, be found at the head thereof; and from his particular views, designs, &c. if known, one might probably deduce not only the general sense but even the particular circumstances of the motive, or collection under that name. The solution, however, extends both ways; and if we cannot deduce the nature of a Dictionary from the condition of the author, we may the condition of the author from the nature of the Dictionary. Thus much at least, we may conclude, that he was an *artist*: that his view was not to improve or advance knowledge, but to teach to convey it; and that he was hence led to untie the complexions, or bundles of ideas his predecessors had made, and to reduce them to their natural simplicity; which is all that is essential to a lexicographer. Probably this was

was in the early days of the Egyptian sages, when words were more complex and obscure than now, and mystic symbols and hieroglyphics obtained; so that an explication of their marks or grammarian, we must put, perhaps, a priest or mystagogue at the head of Dictionaries. Indeed, this seems the more probable, because a grammatical Dictionary could only have place where a language was already become very copious, and many synonymous got into it; or where the people of one language were desirous to learn that of another; which we have no reason to think could be very early, or till much commerce and communication had made it necessary.

WHEN a path is once made, men are naturally disposed to follow it, even though it be not the most convenient: numbers will enlarge and widen, or even make it straighter and easier; but it is odds they do not alter its course. To deviate from it, is chiefly for the ignorant, or the irregular; persons who do not well know it, or are too licentious to keep it. And hence the alterations and improvements made in the several arts, are chiefly owing to people of those characters. There is scarce a more powerful principle in nature than that of imitation, which not only leads us to do what we see others do, but *as* they do it. It is true, there are exceptions from every rule: there are persons in good measure exempted from the influence of this principle; and it is happy there are; witness our Pericclides, Hobbeses, Leibnitzes, &c. In effect, if an art were first launched by a happy genius, it is afterwards cultivated, on his principles, to advantage; otherwise not: and it may wait long for the anomalous hand of some reformer, to let it to rights. Some of our arts have met with such hands, others still want them.

WERE we to give an absolute and consistent definition of a Dictionary; we should say, "It is a "collection of definitions of the words of a language." Whence, according to the different kinds of words, and definitions above laid down, i. e. according to the different matter, and the different view wherein such matter is considered, will arise different sorts of Dictionaries: *grammatical*, as the common Dictionaries of languages; which, for one word, substitute another of equal import, but more obvious sense: *philosophical*, which give the general force or effect of words, or what is common to them in all the occasions where they occur: and *technical*, which give the particular sense attached to them in some one or more arts.

BUT, in truth, this is a little chimerical: though we have Dictionaries under all these titles, it would, perhaps, be hard to find any conformable to this partition; which is not so much taken from what really is, as what might, or should be. Dictionary-writers are far from confidering their subject so closely, or confining themselves to so narrow, though direct a channel: they must have more room; and think themselves privileged by the general quality of lexicographers, to use all kinds of definitions promiscuously. It is no wonder they should not keep to views which they had not, and which could only arise from researches they never made. While the notions of *term* and *art* remained yet in the rubbish wherein they were left by the schoolmen, those of *definition*, and *Dictionary*, must needs be vague, and arbitrary enough; and the Dictionarists and Expositors profited by an embarrass which it was their business to have removed. They have not only built on it, but improved it, by a continual varying and confounding of views, imperfect enumerations, &c.

IT is not to be imagined, what mischiefs and inconveniences have arisen from this single head; what great uncertainty it has introduced into language; and what an obstacle it has been to the improvement thereof. It is certain it has, in great measure, defeated the intention of speech; and turned knowledge, which that was to be the medium of, into jargon and controversy. All the confusion of Babel is brought upon us hereby; and people of the same country, nay the same profession, no longer understand one another. The effect is, that our knowledge is grown into little other than that of peoples misunderstandings or misapprehensions of one another; which is the only kind of knowledge that grows; and which will for ever grow; there being the seeds already laid of such disputes, as, according to the ordinary spreading of such things, must overshadow and starve every thing else. If all men meant precisely the same thing by the same name, there would be no room for their differing upon any point, either in philosophy, or any thing else: there is no more possibility of seeing the relations of things to each other differently, than of altering their nature, and overturning the system. Relations of ideas are as immutable as the Creator's will. Error, in effect, is no natural production: nor is there any direct way of coming at it: we must go about for it; and find some law of nature, to put it in our power. So that error is, in one sense, truth, ere it take place; only it is not the truth it is taken for.

THERE are two manners of writing: in the one, which we may call *scientifical*, we proceed from ideas, and things, to words; that is, we first lay down the thing, then the name it is called by. This is the way of discovery, or invention; because the thing ought to be first found, before it is named. In this way, we come from knowledge to ignorance; from simple and common ideas, to complex ones.

THE other is *didactic*, just the reverse of the former: in which we go from words and sounds, to ideas and things; that is, begin with the term, and end with the explanation. This is the historical way, or the way of teaching and narration; of resolving the extraordinary knowledge of one person into the ordinary of another; of distributing artificial complications into their simple ideas; and thus raising, and levelling again, what art had erected.

THE Dictionary comes under the latter kind. It supposes the advances and discoveries made, and proceeds to explain or relate them. The Lexicographer, like an historian, comes after the affair; and gives a description of what passed. The several terms are so many subjects, supposed to be known to him; and which he imparts to others, by a detail of the particulars thereof. Indeed, the analogy between a *Dictionary* and a *history*, is closer than people at first sight may imagine: the Dictionary relates what has passed, with regard to each of our ideas, in the coalitions or combinations that have been made thereof: its business is, to deliver the progresses made in the several parts of knowledge under consideration, by an orderly retrospect, and deduction of the terms, from their present complex, to their original simple state. The dictionary of an art, is the proper history of such art; the Dictionary of a language, the history of that language. The one relates that such an art, or such and such parts thereof, stand so and so; are managed so and so; and the result: so and so: the other, that such and such a word is used as synonymous to such and such others. The Dictionary-writer is not supposed to have any hand in the thing he relates; he is no more concerned to make the improvements, or establish the significations, than the historian to atchieve the transaction he relates.

THE difference between what we commonly call the *history of an art*, and a *Dictionary* thereof, is only circumstantial; arising from the different views of the two sorts of authors; the one chiefly re-

gards the time and order, when each ſtep, each advance was firſt made; i. e. how it ſtood with reſpect to ſuch and ſuch æras, or periods of time; and might more properly be called the *chronology of the art*: the other, regarding chiefly the object or intention of the art, relates its preſent conſtitution, and how it proceeds to attain the end propoſed. You may add, that the former primarily conſiders what is paſt, or already advanced; the other, alſo what is preſent, or remains to be done: the one tells, e. gr. how Mercury, finding a dead tortoiſe on the ſhore, took its ſhell, added ſtrings to it, and made it into a lyre: the other, how a lyre is, or may be, made. And if you will likewiſe add this, that the hiſtory intermixes divers foreign and accidental circumſtances with the diſcovery, which the Dictionary abſtracts, and ſets aſide, and ſo reduces it nearer to ſcience; you will have the full and adequate difference between them. Thus the making of the firſt lyre is related with ſome circumſtances, which have no place in the proper ſtructure of the inſtrument, and are therefore to be omitted in the Dictionary; which only takes in what belongs to the art, or artiſts in general; not what belongs to ſome one of them.

THE whole, in effect, amounts to this, that the firſt time of doing a thing is related by the hiſtorian with the ſeveral particulars which in any-wiſe, though occaſionally only, and remotely, affected it: whereas the lexicographer, coming afterwards, keeps more cloſely and ſecretly to the point, and

more than authentic inſtruments, declarations, &c. in a hiſtory. To demonſtrate the ſeveral properties and relations, e. gr. of *lines*, *angles*, *numbers*, &c. in a Dictionary, were an indiſcretion as great, as for an hiſtorian to produce certificates and copies of pariſh-regiſters, of the births, burials, marriages, &c. of the ſeveral perſons whoſe actions he relates. And yet, on ſome extraordinary occaſions, we have not omitted to give demonſtrations; where, for inſtance, there was any thing very intereſting, or important in them: a practice like which hiſtorians themſelves frequently give into; though it be a confeſſed irregularity; as it breaks in upon the unity of the narration.

BUT we are far from the views of certain Dictionary-writers, who ſeem to think it incumbent on them to demonſtrate every thing that is capable thereof. This is directly to forget the nature of their work; and to diſpenſe with the rules, both to their own and reader's coſt. How dear, e. gr. muſt a competent demonſtration of moſt of Euclid's propoſitions be here purchaſed! Either the reader muſt be at the pains of picking it piece-meal out of twenty ſeveral parts of the book, where the alphabet has happened to caſt it; or the author muſt relinquiſh the Dictionary-method, and deliver things together, that properly belong to ſo many ſeveral places: or elſe there muſt be a repetition of the ſame thing a dozen times over? And for what? Why, to make the Dictionary do the buſineſs of an Euclid's Elements: which it is the unfitteſt in the world for. You might, with equal propriety, make an oziers-baſket ſupply the office of a pleaſure-boat; or a ſword-pummel that of a portmanteau, as Parſeeſius is ſaid to have done.

WHEN a thing has been once regularly demonſtrated, it may be aſſumed, or taken for granted: every body, perhaps, may be concerned in the truth of it, but not to ſee the truth of it. To make it a principle to take nothing on truſt, would be as troubleſome in the ſciences, as in life; and would render us, for ever, both wretched and ignorant. Not only ſuppoſitions, but even errors, frequently lead us to knowledge otherwiſe inacceſſible. Mathematicians themſelves, who, of all others, keep moſt to demonſtration, yet find themſelves under a frequent neceſſity of admitting and making uſe of things as true, which they do not then ſee to be ſo; and thus are ſwayed, like other people, by authority. A perſon who makes uſe of the equality of the ſquare of the hypothenuſe, to the ſquares of the two ſides, upon the credit of Pythagoras or Euclid's having demonſtrated it, does little more than what they themſelves do on many occaſions, who aſſume and make uſe of propoſitions they have no other evidence of, but the knowledge and remembrance of their having been demonſtrated.

THE caſe is much the ſame with *experiments*, which ſtands on the like footing as demonſtrating. They are both neceſſary in their kind; the former, as it leads on our knowledge, the latter as it follows and ſecures the rear: but their uſe is to be reſtrained to theſe purpoſes; and may be diſpenſed withal, in caſes where neither of theſe are concerned. A perſon who would diſcover any point in phyſics, or broach and eſtabliſh any point in mathematics, muſt uſe them: but the occaſion is, in great meaſure, private and perſonal; and does not extend to the public in the ſame degree as the knowledge of the doctrines themſelves. That is, the particular means by which a thing was firſt come at, or is ſhewn to be true, do not intereſt us ſo immediately as the knowledge of the thing itſelf, which might have ariſen from various other means, and in other manners: a man may know a thing in the way of *preſumption*, of *opinion*, of *surmiſe*, of *authority*, and forty other ways; which, though all much inferior, and leſs excellent than the way of *demonſtration* and *certainty*; yet we are glad of them on many occaſions, and uſe them to good purpoſe. Every degree of knowledge is valuable. It would be an unreaſonable, as well as incommodious fulleneſs in us, to refuſe all light, except that of noon-day. We find our eaſe and happineſs frequently depend on the doing of things by twilight, or even moon-light, or the ſtill more dubious light of a ruſh, or glow-worm.

PYTHAGORAS, in all probability, was not ignorant of the equality of the ſquare of the hypothenuſe, &c. before he demonſtrated it; elſe, what ſhould have led him to look for the demonſtration? And the like may be ſaid of many of Mr. Boyle's experiments. Plato even obſerves, that "the "very putting a queſtion, implies ſome knowledge of the thing demanded; ſince, without this, we "ſhould not know what what is returned is an anſwer."

LESS might have ſufficed to ſhew why, in the courſe of this work, we have uſually omitted the apparatus of demonſtrations and experiments; and given the doctrines pure, and unincumbered by any thing not eſſential to them. The experiments, for inſtance, which led to the theory of light and colours, what would they be, but like the ſcaffolding before a fine building, which break and interrupt the ſight, and hide moſt of the beauties of the work? Such ſcaffolding, it is true, would be of uſe to the connoiſſeurs; who might have a mind to examine the work, to meaſure the proportions of the ſeveral parts, and inquire whether every ſtone were juſtly laid. But, to the generality, it would rather be an incumbrance, much to the diſadvantage of the edifice. Yet, in the caſe of experiments, as of demonſtrations, we have receded a little from ſtrict method, in favour of ſuch as have any thing very remarkable or beautiful in them. For the reſt, the reader, if his curioſity ſerve him, is told where to have them at firſt-hand.

IN the caſe of definitions, too, we do not keep inviolably to what has been above laid down, but reſerve to ourſelves the diſcretionary right claimed by our predeceſſors. We make uſe, occaſionally, of all ſorts of definitions, as they beſt ſuit our deſign, the conveying of knowledge. In effect, we have uſually a regard to the degree of notoriety, importance, &c. of the term, though a point arbitrary and indeterminate enough; and endeavour to accommodate the explication thereto. The rule ſhould be, to ſay, *Communia propriis, propria communibus*; to expreſs common things ſo, as that even the learned may be the better for them; and the more abſtract and difficult ſo, as that even the ignorant may enter into them. Accordingly, in popular terms, we endeavour to give a *cyclopical* definition; i. e. to wave the general and obvious meaning, which is ſuppoſed to be known, and enter farther into the nature of the thing, not known. But, in the more remote terms, the *genuine* and *nominal* definition is alſo given, as being ſuppoſed there to be wanted.

THE literal and technical definitions of a term are lame and imperfect without each other; the firſt gives its uſe and effect, as part of general or abſtracted ſcience; the ſecond, as applied to ſome particular ſubject. The literal notion, e. gr. of *relation*, is that of "conformity, dependence, or com- "parition of one thing to another;" than which nothing is common to relation, both in grammar, logic, geometry, &c. i. e. it expreſſes this, both when applied to words, to propoſitions, to quantities, &c. The technical notion of relation, in grammar, is "the dependence of words in conſtruction:" this makes the grammatical notion of relation, i. e. it limits, or ties down, the general abſtract idea of relation, to the particular ſubject of grammar, words. So, the technical notion of relation with regard to

arithmetic, geometry, &c. is "the conformity or dependence between two or more lines or "numbers."

FROM the whole, it follows, that the two kinds of definitions differ as an art and a science, as general and particular reason. And hence, from the several technical or particular meanings, one might run back to the general, or literal meaning, by abstracting, but not contrariwise, from the general or abstract, to the particular ones; in regard those other are arbitrary, and depend on the good pleasure of the artist, who first introduced them.

IN strictness, every term should be first given in its literal or grammatical meaning; especially if it be a term in several arts: as this helps to shew the orderly derivation of the word, from the simple or general idea that gave rise to it, to its last, and most complex one. Yet we have not always kept to this method. In some words, there is much of the literal import of the word preserved in the term, or the technical one; as in the word *free*, or *freedom*: a man who has a notion of *freedom*, in its common or literal sense, will easily pass on to all the particular ones, as *free city*, *free port*, *freedom of speech*, *of behaviour*, &c. to that, in this case, a literal definition might almost alone suffice; the meaning of the word having suffered little alteration at the hands of artists. In other words, the literal or primary import of the word is almost lost in the term: for instance, in the word *power*, in arithmetic; which will scarce bear any tolerable definition at all. Literally, the word implies a relation of superiority, or influence over something, which, in respect hereof, is conceived as weak, &c. According to the analogy of language, therefore, the arithmetical power should have somewhat of this relation of superiority over the root: but the root itself is also a power; so that the definition of power must take in two opposite relations, viz. both power and subjection.

PERHAPS, to go on in the most regular manner, and take up things at their source, we should begin with settling the etymologies of words: but the great alteration many words have undergone, and the great length they have been carried from their original meanings, in being borrowed from one language or age to another, would frequently make this not only a tedious, but an useless labour: so that here, too, we have used a discretionary power, and only meddled with etymologies, where they appeared of some significance.

TO explain a term, as a term, we usually express the circumstances wherewith it is attended, in the art to which it belongs, in their technical names. This is agreeable to the manner of artists, who, writing of their respective arts, use terms as common words, and suppose them to be known; and it is this that constitutes a technical explanation; not the giving the general effect or force, in such words as may equally agree to all other arts. And yet, in some cases, we recede from this rule, particularly in divers of the lower trades or manual arts, and the structure of some machines: thus, e. gr. in turnery, we make no difficulty, instead of *chord*, to say a round piece of wood, &c. The reason is, that where the several subordinate terms of a definition are themselves explained in their places, we may suppose them understood: but where the term defined is itself so low, that we do not go lower to define the parts couched under it; there we choose, as more intelligible, to substitute some more obvious name, or the general meaning of the word, for the term itself; and thus prefer the general or popular, to the technical definition.

FOR it is to be observed, that the Dictionary has its limits; it only carries matters to a certain pitch of simplicity, where we suppose people may take them up, and carry them farther as they please. We bring them into their sphere, and so leave them. So much knowledge, i. e. such a number of complex ideas, as we may presume people usually to have got in the common occurrences of life, we are willing to suppose, as a footing: where these end, our work is to begin, which is to take in the rest.

IF, at any time we explain a complex idea, which it may be supposed most people have formed; it is because we think they do not take in all the simple ideas that go to constitute it: as in the case of *milk*, *blood*, or the like, where people are contented with two or three of the more obvious properties and phenomena, and slur over the rest. Thus, in milk, *whiteness* and *fluidity* are almost alone considered; and these, in the common opinion, constitute *milk*; so that whatever has these two attributes, comes in for the denomination *milky*. The texture and component parts of this milk, the manner of that fluid's being secreted, collected, &c. with the peculiar properties and virtues resulting from all these, are left behind. So in *blood*, it is enough it be a reddish, pretty compact, animal juice; when warm, fluid and homogeneous, &c. This is going a great way, and even Dictionaries seldom go farther: but, for the component parts, the *crass* and *serum*; with the component principles of these, viz. the *oil*, *phlegm*, &c. their forms, properties, &c. whence arise the crasis, colour, heat, specific gravity, &c. of blood, Dictionary-writers do not ordinarily trouble themselves.

IF, by the artifice above mentioned, we get free of a vast load of plebeian words, which must have greatly incumbered us; the grammar and analogy of language disengage us from a still greater number of all kinds. The various states of the same word, considered as it comes under different parts of speech, and accordingly assumes different terminations, increases the list of terms immensely: as in *dark*, *darkness*, *darkening*; *prodigal*, *prodigious*, *prodigiously*, *prodigiousness*, &c. which may either be considered as one and the same word, under different habitudes; in regard there is a common basis of them all: or, as so many different terms, in regard every one takes in something not contained in the other. This latitude we make use of occasionally; and either consider the words this way or that, as seems most advantageous to our purpose. In some cases, where the alteration is merely grammatical, we content ourselves to explain them in one state, e. gr. *precipice*; and suppose the reader able, by grammar, to form the rest, as *precipitous*, &c. In others, where several particular ideas are arbitrarily superadded to the word in one part of speech which do not belong to it in another, we there explain it in all: as, *precipitate*, *precipitant*, *precipitation*, &c.

THIS gives an occasion to mention a strange kind of licence, frequently practised in our language. Though there be ordinarily a great deal of difference between the several states or modifications of the same word, e. gr. *reading*, *reputing*, *reasoning*, &c. the same as between the action and quality, the power and the exercise of it in this or that case, the cause and the effect; yet authors make no difficulty of using them promiscuously; which would make downright nonsense, were the readers to keep to the strict import of the word. But the truth is, they are not so critical about the matter: if the meaning come within their reach, they jump at it, and are glad to take it; without waiting to see whether it would reach them in its proper direction, or whether it might not rather fall short, or fly by them. What confusion should we make, even in our best and clearest writers, were we to resolve not to understand

ſtand them but according to the ſtrict rules of grammar, and not indulge them the liberty of uſing one word for another? In a thouſand caſes, the ſame idea is denoted by oppoſite terms: thus, we ſay, ſuch a medicine is good *for*, or *againſt*, the worms, plague, &c.

IT may be urged, that as cuſtom has authorized this latitudinarian practice, it is become of grammatical authority; and that as the licence is known, it cannot deceive us; ſince the readers are led, on ſuch occaſions, to relax the bonds of grammar, and annul the difference between words, in order to admit one a ſubſtitute for another. But I am afraid this expedient ſcarce indemnifies us from the abuſe. Beſides the extraordinary embarraſs of reading what is thus promiſcuouſly written; it is not always we know when and how to ſuperſede the ſtrict import of an author's words, and make him ſpeak ſenſe in his own deſpite. This I take to be none of the leaſt occaſions of controverſy and diſpute owing to language, and which we may almoſt deſpair of ſeeing rectified, unleſs in a new one.

I SHALL not here enter upon the merits and defects of the Engliſh tongue, conſidered as a language: a great deal has been ſaid on that head by others, for which the reader may turn to the proper article in the Dictionary itſelf. What we have to add, will be chiefly as it ſtands with regard to the arts, and more particularly, to a Dictionary of arts.

I BELIEVE none will queſtion but we have met with difficulties enough in the courſe of this work. The very bulk and dimenſions of it confeſs as much, and the variety of its matter ſtill more. But theſe were natural difficulties, appendant to the very deſign; and therefore did not affect us ſo much as ſome others, which aroſe from it at ſecond-hand, or were ſuperadded to it, as it were, by accidents. And ſuch was the preſent ſtate of our language, which alone were ſufficient to have baffled the beſt ſcheme, and broken through the beſt meaſures, that could be formed.

WE have already repreſented language as ſomething very important: and as having a near and neceſſary intereſt in knowledge. *Words* are ſolemn things, as they are repreſentatives of ideas themſelves, and uſed on moſt occaſions in their ſtead: and *terms*, or combinations of ideas, are ſtill more ſo; as much as complex engines are of farther and nicer conſideration than the ſimple mechanic powers. But who would imagine this, to conſider the wanton uſe we make of them; and with how little fear or diſcretion words are treated among us? Every body thinks himſelf privileged to alter, or let alone, the old, and introduce new ones at pleaſure. England is open to all nations; and our traders in the commodity import their wares from every country, in all ſecurity. The humour of importing ſeems to have poſſeſſed every part of us: we are not only unwilling to be without the natural produces, the faſhions, and the follies, of our neighbour countries; but we even envy them their ſounds and phraſes. The effect is, that our language continues in a perpetual flux; and no body maſter of it for two days together.

A MAN never knows when he is at the end of the terms, e. g. in architecture. When he has got two or three names for ſome one member, and thinks himſelf over-ſtocked, it is odds he has not half. It is not enough he knows what the thing is named in Engliſh; but he muſt likewiſe learn what the French, Italians, Latins, and Greeks, likewiſe call it, or frequently find himſelf at a ſtand. Thus it is in the caſe of *filets, liſts, liſtels, regulæ, platbands, bandlets, taeniæ*, and *bayettes*: of *cornices, ogivals, baſcons*, and *tores*: of *gules, guttæ, modions, cymas, cymatiums, ogees*, and *talons*: *mutules, modules, echinuſes, quarter-rounds, boultins*, &c. between which, there are no known, allowed differences: but they are either uſed indiſcriminately, or diſtinguiſhed arbitrarily; one perſon making this diſtinction, and the next another, or perhaps none at all. So that if we come ſtrictly to Dictionaries, we ſhould have a different one for every author.

BUT the miſchief does not end here: for as the ancient arts are, in many reſpects, different from the moderns; the uſe of their terms neceſſarily involves us in a new confuſion, and makes the ſame word ſtand in an ancient author for one thing, and in a modern for another. Thus it is in *parabata, veſtibula, aula*, &c. In effect, there is that alteration continually making in the language of architecture, that there ought to be a different Dictionary of it for every different age.

THE truth is, a fourth part of the words, in ſome of our popular Dictionaries, ſtand on no better authority than the ſingle practice of ſome one fanciful author, who has met with Dictionary-writers fond enough to take his trippery off his hands, and expoſe them to the public for legitimate goods. By ſuch means theſe exotics have obtained a kind of currency: ſo that a Dictionary would be thought defective without them. To omit even our fopperies, would be thought a fault; and might even be eſteemed, by ſome, as the moſt unpardonable of all. On theſe accounts we have been obliged to tranſporize a little, how much ſoever againſt the grain; and thus, perhaps, have contributed to the ſtill farther eſtabliſhment of a number of words, which we had much rather have proſcribed.

UPON the whole, nothing could be more deſireable than an *actus reformatorius*, to clear the language of ſuperfluous words and ſynonymes; to expunge the modern French and Italian terms in the ſeveral arts, where we have Latin and Greek ones; and even the Latin and Greek ones, where we have Engliſh or Saxon ones, equal in ſound and ſignificancy. I think the learned languages ought to have the preference to the moderns, becauſe every perſon may be ſuppoſed to have read, but not to have travelled; and our country words I would prefer to any others, becauſe there is the moſt analogy between them, and they uſually retain more of the origin and etymology than thoſe tranſplanted from other languages. Such a reform would reduce our dictionaries to more reaſonable dimenſions; and diſencumber the arts of half the difficulty now to be ſurmounted in attaining them.

BUT there is another ſpring of words no leſs prolific than that hitherto ſpoken of, and which has produced a ſwarm of ſpurious, miſhapen words, which no nation but our own would have owned: I mean the itch of coining, or making, Engliſh words, by a fact of analogy, from the Latin and Greek ones. This fault the tribe of lexicographers have carried to a deteſtable exceſs. How muſt a man ſtare, to ſee what deteſtable ſtuff ſome late writers of that claſs have furniſhed us with; words of their own manufacture, ſcarce fit to do any thing with, except ruin paper! Witneſs *ſcepticiſm, ſtoicism, pantheiſm, ſcribe, pragmatic, ſagacity, ſophiſtry, modernity, exigent, ſophiſtic*, and many thouſand more, at the reader's ſervice, to be met with all in a Dictionary which few people are without. We are already overrun with this writer's ſcarecrows: what ſhall we do, when, having thus anglicized all the Greek and Latin words, he proceeds to do the ſame with the Dutch, Iriſh, and Welſh? Indeed I am the leſs angry with him, for that he has carried the abuſe ſo far, as muſt not only ſave people from being ſeduced, but bring the practice into contempt: ſuch monſters cannot poſſibly live long; if they have eſcaped the miſchief, who ought to have ſtrangled them ere they came to light, yet, if ever they ſtir abroad, they muſt infallibly be knocked o'the head.

HOW oddly will our practice in this reſpect look, when confronted with that of our neighbours? One of the moſt learned men, and beſt critics, of the laſt age, M. Menage, incurred infinite cenſure, for only endeavouring to introduce the ſingle word *proſateur*, and could not ſucceed in it; notwithſtanding that a word of that import was confeſſedly wanting in the French, and both the ſound and analogy of the new word were unexceptionable.

TO return.—The different ſtates of different arts are remarkable: ſome of them have been refined to a degree of ſubtilty that has ruined them; as metaphyſics, and logics: others have ſcarce had any culture, but lie waſte and over-run for want of it: as agriculture, &c. The groſſneſs of ſome is their fault; it being ſuch as diſguſts and forbids a delicate mind from purſuing them: in others, their ſubtilty and nicety is their bane, as leaving nothing for the mind to feed on. What meagre fare, for inſtance, are the ſchool rules, and doctrines of *mediums*, and *extremes*? &c. They furniſh us, indeed, with relations, and true relations too: but theſe ſo remote from all purpoſes of life, that they are in great meaſure inſignificant.

IT is certain, all our knowledge and arts ultimately refer to the great end of preſervation. The faculties of the mind, like thoſe of the body, were not given us for the mere exerciſe, or gratification, of them, but in ſubſerviency to farther purpoſes. Our knowledge is all originally a ſort of revelation; and the Divine Being reveals nothing to us for the mere vague ſake of our knowing it, but that it may miniſter to his ends, the being and well-being of his creatures. Our perceptions and notices are ſecond cauſes, or at leaſt occaſions, of what we do; and, no doubt, are under the direction of him for whom we do, whoſe glory is ſerved thereby. In reality, they all centre and terminate, at laſt, in our preſervation; and, according as they are farther from, or nearer to, this point, they are found fainter or ſtronger; very near, they are palpable and cogent; as they recede, they contiually abate of their clearneſs and evidence; and when arrived at a certain diſtance, they dwindle to nothing, and are loſt. At a great height from this centre, the nexus, or chain, whereby things are held together, and in virtue whereof we conclude from things known, to things unknown, becomes inſenſible; ſo that we loſe our hold, and wander on we know not where. Our faculties here falter; the objects they meet with are inadequate to them; the air grows too thin for reſpiration. But where we leave off, there, poſſibly, ſome ſuperior order of beings may take it up.

IN effect, the ſeveral arts have been cultivated to more or leſs purpoſe, as our preſervation is more or leſs immediately intereſted in them; and by this key one might almoſt venture to judge which arts are capable of being carried ſtill farther, and which not. Our knowledge of *very great*, and of *very little* things, is very imperfect, e. gr. of very great and little *objects*, *diſtances*, *ſounds*, &c. And the reaſon, no doubt, is, that there is but little relation between us and them; ſo that we are but little intereſted in the knowledge of them. Thoſe things we have neceſſarily and immediately to do withal, are made to our reach: for the reſt, it is no great matter what they are.

AND yet our curioſity has found means of making even theſe more cognizable than otherwiſe they are: we can, in ſome meaſure, alter the eſtabliſhed relation between our faculties and their objects, and make uſe of one law of nature to undo, or ſuperſede, another. Thus we can magnify a little ſound, or little body, or a little diſtance, &c. or we can diminiſh large ones; and thus make things, in ſome meaſure, adequate objects, that naturally are not ſo.

BUT there is no great advantage in this: we only, by theſe means, come at a better apprehenſion of things which nature ſeemed to put out of our way, for no other reaſon but becauſe they did not concern us, leſt we ſhould be engaged to miſtake, and run after things we had no buſineſs with, to the neglect of thoſe with which we have. Thus anatomy is found of leſs uſe in phyſic than at firſt ſight one would imagine; as being employed in taking things aſunder, and conſidering them in parts, which nature intended to act in conjunction. There is I know not what ſecret law, whereby the effect of a thing is, as it were, annexed to its integral ſtate; ſo that in proportion as you either diminiſh it, or enlarge it, its effect is altered, in a manner beyond what we can well account for, from the bare conſideration of magnitude.

ABUNDANCE of the leſs uſeful notices we find were kept back, and left to be accidentally turned up in courſe of time: ſuch as the knowledge of optic glaſſes, and their effects. This affords an illuſtration of the goodneſs of nature, in contriving, that things moſt uſeful and neceſſary ſhould be moſt obvious, ſo as to be almoſt diſcoverable by a ſort of inſtinct; and the other leſs immediately uſeful ones leſt to be accidentally turned up in the courſe of experiment and diſquiſition. We may admire her wiſdom ſtill farther in this, that ſhe ſhould, as it were, go out of her way, and annex a ſort of pleaſure beyond her main purpoſe, to the knowledge even of things not immediately uſeful, in order to engage us to induſtry and activity. This ſhews that ſhe has ends to ſerve by that very activity; and, perhaps, is the beſt demonſtration in the world of the neceſſity we are under to purſue knowledge: and may raiſe a ſuſpicion, that this very purſuit may poſſibly contribute to our preſervation, in ſome farther manner not yet attended to.

IT is no wonder the ſchool-philoſophy ſhould be carried to ſuch a length, conſidering the narrowneſs of its object, and the great number of hands to cultivate it, for ſo long a time. Its chief employment is in aſſigning and enumerating the characters and differences of our perceptions, taken as they are excited in us in the natural courſe of things; by which it is diſtinguiſhed from the modern philoſophy, which is chiefly employed in means to vary and modify theſe perceptions; and thus find out farther relations and differences than would otherwiſe have appeared. The philoſophers of the former kind are contented to take nature as ſhe comes home to them, and apply their reaſonings thereto without more ado: thoſe of the latter go out in queſt of her, to have more matter to reaſon upon. The former are more contemplative, the latter more active; the former, in fine, reaſon, abſtract, and diſcourſe, more; the latter, obſerve, try, and deſcribe, more.

HENCE we diſcover why the old is much more perfect in its kind than the new. The former has little to do but compare, order, methodize, &c. what is ready at hand; the latter has likewiſe to *find*. After which, all the labour of the other ſtill remains. The former takes nature in all her ſimplicity; the latter adds art to her; and thus brings nature into conſideration in all her diverſity: the former chiefly conſiders natural bodies in their integral ſtate; the latter divides and analyſes them: ſo that the former finds moſt of the principal relations; the latter many more curious and amuſing ones. Hence the former haſted to its perfection, and could not long hold out, for that its matter was limited: the latter can ſcarce arrive at perfection, ſince experiments are endleſs. To ſay no more, to have philoſophy complete, we ſhould have the order, preciſion, and diſtinctneſs, of the old; and the matter, the copia, of the new.

THE modern is yet wild, and unascertained: it is not arrived at the maturity of method; the mine is but just opened, and the adventurers are chiefly solicitous about the matter, to see what it affords; it will be long ere it arrive at a just extent, to give room and leisure for reducing it to regularity: not but the rules and methods of the ancients are, in some measure, applicable to the new, and will go a good way towards the arranging of it; but the present philosophers seem too warm and sanguine for such a business; and the farther they go on to dig materials, still the more difficult will the ranging of them be. This a man may be positive of, he never will see half the experiments and observations already made, employed in a system of physics.

BUT when that is done, much will still remain ere we have the chief uses of it. For physical knowledge, strictly considered, is only a means of arriving at a higher and farther kind. Histories, observations, and experiments of the kinds, order, strata, &c. for instance, of fossils, are useful things, as they tend to lay in a stock of sensible phenomena for the mind to work upon, digest, and draw new notices from, for the improvement of our own faculties, and the better conduct of life: but it is short-sightedness to forget this farther view, and look only to the things themselves. The bare acquisition of new ideas is no real advantage, unless they be such as are adapted to the circumstances of our wants and occasions, or capable of being made so. Knowledge, in its first state, is like food in the stomach, which may please and satisfy us, but is of no use to the body till farther prepared: it must be carried farther, and assimilated, ere it feed us. The modern philosophy is not so properly a philosophy, as the adv. or opening, of one: its matter has yet only undergone the first concoction: we are yet chiefly conversant about new physical relations, learned by sensation; whereas, to bring it to the perfection required, it must have undergone the farther operations of imagination and reason. Mere physics, as such, do not make a philosophy; those physics must first be carried up to metaphysics, and ethics, ere we can justly stop.

SENSIBLE phenomena, we have already shewn, are the foundation of philosophy; but the edifice will neither make any figure, nor afford much convenience, till it be carried one or two stories higher; it is but, as it were, the cellaring, or ground-work; which one would think were no very commodious place to live and spend one's time in: it is one extreme to take our lodging, as some virtuosos are contented to do, under-ground; and another, to reside altogether in the garrets, as the schoolmen may be said to have done.

THE school-philosophy, however, is of some farther use, as matter of history: we learn by it how people have thought, what views have obtained, and in what various manners the same thing has been conceived; which, though it be knowledge, as it were, once removed, yet is not entirely useless. The history of human thoughts is, no doubt, the most valuable of all others; it being this alone that can make the basis of a just logic: as physiology, of just physics. We must know wherein people have failed, or fallen short, or been deceived, to learn the reasons thereof, or be able to form rules for avoiding the like. The several opinions that have obtained, may be considered as so many phenomena of the human mind, which must be considered, and enquired into, to find its nature. This alone were enough to have engaged us not to omit that part of learning in the present work: though there were not wanting other circumstantial reasons, which had also their share; as the necessity hereof to the understanding, not only of the ancient writers, but even of the modern ones, who frequently combat, remark, &c. upon the ancient notions. To which it may be added, that abundance of our terms and phrases are derived from them, and therefore could not be so completely understood without them.

THE language of the ancient and modern philosophy is not very different: the chief diversity is in the different ideas affixed to the same words, and the different applications of them. And happy had it been for the moderns, had they formed a new set of terms, adapted to their new notions! By adopting the old ones, they have not only introduced much ambiguity and confusion, but have even lost the credit of many of their own discoveries, which now lie blended and buried among those of the ancients. One is at a loss to think what could induce the great philosopher of our age to retain the word *attraction* in the sense he has done. The stamp and impression it had already taken from the ancients, made it less fit to receive a new one; it could, at best, but take it imperfectly, and the result was, a promiscuous image, wherein we neither see the old nor the new distinctly. It is difficult for the imagination totally to divest a sound of its received meaning, and consider it as indifferent to all things, as much as it is to annihilate the characters on a piece of paper, and consider it as a mere blank. Accordingly, though the great author above mentioned explained over and over, in the clearest terms, the sense he affixed to his *attraction*, yet experience verifies how much he was overseen; the chief objections against his whole system having been drawn from misapprehensions of this very word, which keep half the philosophers in Europe still at a distance, afraid to admit a most excellent doctrine, merely out of distrust of the vehicle by which it is conveyed. But this by the way. The reader who desires to see farther, may turn to the articles ATTRACTION, NEWTONIAN PHILOSOPHY, GRAVITATION, &c.

WHAT has been spoken of the school-philosophy reminds us of *astrology*, the terms whereof are not omitted in this work. Were it only that it once obtained, is still extant in books, and has given occasion to abundance of terms and phrases adopted into other arts, it would have a title to be remembered. "The history of men's follies, says the inimitable Fontenelle, makes no small part of "learning; and, unhappily for us, much of our knowledge terminates there." But this is not all; and they who absolutely reject all astrology as frivolous, do not know it. Every art and science has its vanities and foibles, even philosophy, mathematics, and theology; and every one its good sense, even astrology. The heavenly bodies have their influences: the foundation, therefore, of astrology is good; but those influences are not directed by the rules commonly laid down, nor do they produce the effects usually attributed to them; so that the superstructure is false. Astrology, therefore, ought not to be exploded, but reformed. Indeed a reformation would reduce it into a little compass; but this little is too much to be lost, as it now is, among the heap of trumpery mixed with it. We have even been careful to preserve what is just and rational in the doctrines of *physiognomy*, *witchcraft*, and many other fanciful arts. The time was, when physics was not much more worthy the study of a man of sense than astrology now is; so that one might propose an *introductio ad famam astrologiam*, as a desideratum.

OUR Preface seems now grown into a Dissertation in good earnest: enough has been discoursed of the general nature and subject of the work; allow me now to descend a little more to particular and personal matters, and thus end my Preface, where I need not have wanted precedents for beginning it.

WHAT

WHAT has been said hitherto, has been on the advantageous side of my work: to acquit myself to the reader, it will be necessary I turn the medal, and represent some things which appear on the contrary side. The book, in reality, is not without considerable failings, of more kinds than one. The curious reader must expect he will here meet with omissions, and there with redundancies: here the method and œconomy are not kept to; there an article is imperfectly treated: here, a passage from some other language is not sufficiently naturalized; there, a sentiment of some other author is not sufficiently digested: here, in fine, the author was overseen; and there the printer.

ONE might palliate these objections, by alleging, that "they are things not peculiar to this "work, but extend to all the kind; that most of them arise, of necessity, from the very nature "and form of a Dictionary; and that many of them are not peculiar even to a Dictionary, but "are found in all extensive undertakings, and are appendant to the very best part of its design, "its universality." But, instead of extenuating, I had rather be taxed with inflaming and aggravating.

FOR *errors*, they cannot be very few, considering the hands through which most parts of our knowledge have passed, and from whom we are obliged to take many of our accounts! What one author, upon the shortest subject, can be produced, that has not his share of them? And what Argus could possibly see and correct the overlights in all the authors he had to do with? Scaliger, in his exercitations against Cardan, has shewn some twenty thousand in one small work; and no one imagines he has picked it perfectly clean. Yet Cardan was no ill author. Bayle's chief design in composing his Dictionary, was to detect the errors in Moreri; which he succeeded in so well, that his book has been called the *errata of Moreri*. Yet is not Bayle himself without his errors: a late writer has discovered some twenty-five in a single article of not quite so many lines. F. Hardouin, in the preface to his Nummi Antiqui Populorum & Urbium, says, it may be called *Errata Antiquariorum*; and yet M. Vaillant spied not less than three hundred errors at the first reading it over. So easy a matter is it to discover faults in others, and so difficult to prevent them in ourselves! The most learned Dr. ***** who offered to point out five thousand faults in the Lexicon of Hesychius, has been charged with committing forty-six in his emendations of the first book of Horace's Odes, besides many in the notes.

NOTHING of this kind can appear surprising, when we consider on what a multitude of sides a man is accessible to error! An author we trust to, deceives us—our own judgment betrays us—our attention leaves us for a moment—our very eyes and hands play us false—or, suppose we escape all these snares, an amanuensis shall bring us into the scrape; or, if we get clear here too, we are in imminent danger of miscarrying in the printer's hands.

IN a work of any considerable extent, and variety of matters, it seems impossible not to err. All the qualifications requisite for a faultless writer, scarce ever concurred in a more signal manner than they did in *Jos.* Scaliger, whose book De Emendatione Temporum is one of the chief performances in the whole compass of literature. Yet has F. Petau discovered, at least, a thousand slips in it!—Who then can be safe? He only who writes nothing, or next to nothing. If a Baronius will compile Annals; Du Pin, a Bibliotheque; or Baillet, Jugemens des Sçavans; what triumphs do they prepare for future Pagis, Simons, and Menages?

THE most we can say, is, that we hope there will be few errors found in the present work, in comparison with others of the like kind: many thousands we have corrected, both in the Dictionaries and other writings we have collected from, by means of the light which other parts of knowledge afforded; but after so large a harvest, no doubt, there remains a sufficient gleaning. We flatter ourselves, however, that what we have overlooked, the reader will frequently be enabled to correct, by the means here afforded; and that there will not be many errors found in the book, which the book itself will not help to rectify.

AS to *omissions*, there is scarce any avoiding them; and the more intelligent the reader is, the more of this kind he will necessarily discover. Indeed, I must own myself greatly a debtor on this score; and though at present insolvent, yet if the reader will give me credit, it shall be my endeavour to see all I owe discharged: if not in a lump, yet by a course of payments.

FOR *redundancies*, people will hardly be agreed about them. After one man has picked what he thinks fit of this kind, and laid it by, it is odds but a second taxes his temerity, and want of taste, and reflettes half of them to their places; and a third will, perhaps, be tempted to replace the remainder.

AS to *irregularities*, and breaches of method, I will not claim impunity on the score of being the first that has attempted to introduce any certain rules or method into this way of writing; but there will be, at least, this peculiarity attending my case, that I cannot easily be indicted for the breach of any laws but my own. I am liable, however, there is no point I have been more delinquent in, than this of method; and that the references, and necessary connexions between the parts, which *should shew their* relation, and help to put them together, are but too frequently either drops, by which the reader is left without his clue; or misplaced, by which he is put on a wrong quest.

THE *references*, it may be necessary to observe, are of two kinds; the one *real*, which direct to some other article, wherein the matter in hand is farther explained; the other *grammatical*, or *verbal*, serving to indicate some particularity relating to the name; e. gr. some synonym, paronym, opposite, etymon, or the like. The use of the former is palpable, as they are convenient about the relation of *things*; that of the latter is more obscure, as dealing only in the relations of *words*: yet are these as essential to the work, considered as a Dictionary, as the others are to it, considered as a body, or system.

AS to *falsehood*, and crudity, no doubt, there must be much of that kind, considering the short time to great a load of fruit had to hang and ripen. Much of it was gathered ere it could possibly be matured; so that it is no wonder it now-and-then tastes of the wood. But setting aside this; if a man may not be allowed to lay a good number of but indifferent things in the compass of five hundred sheets, I know not who would be an author.

LASTLY, as to there being little *new*, and of my own growth, I must here change my style; and, from confession, turn to vindication. The work is, what it ought to be, a *collection*; not the produce of one man's wit, for that would go but a little way; but of a whole commonwealth. If any person will undertake to write a Dictionary, even of some one particular art, from his own fund alone, a man may safely venture to foretel, that it will not be good for much. I do not pretend to

entertain

entertain my guests at this rate, with just what my own scanty granaries afford: the whole country is ransacked to make them the fuller banquet. Nobody that fell in my way has been spared, ancient nor modern, foreign nor domestic, Christian, nor Jew, nor Heathen: philosophers, divines, mathematicians, critics, casuists, grammarians, physicians, antiquaries, mechanics, have been all brought under contribution.

NONE of my predecessors can blame me for the use I have made of them; since it is their own avowed practice. It is a kind of privilege attached to the office of lexicographer; if not by any formal grant, yet by connivance, at least. I have already assumed the *bee* for my device; and who ever brought an action of trover or trespass against that avowed free-booter?

IT is vain to pretend any thing of property in things of this nature. To offer our thoughts to the public, and yet pretend a right reserved therein to one's self, if it be not absurd, yet it is sordid. The words we speak, nay, the breath we emit, is not more vague and common than our thoughts, when divulged in print. You may as well prohibit people to use the light that shines in their eyes, because it comes from your candle: even clap it in a dark lantern, and let us not be amused and dazzled by it: if we may not be the better for the good things, let us not be the worse for the ill and indifferent ones mixed with them.

WE see the same thought, which was first started in one author under a world of crudity, borrowed by another, become farther improved and ripened; and at length, being transmitted to a third, yield fruit in abundance. All plants will not thrive in all soils that will produce them; some languish in their mother beds: whence the gardener is under a frequent necessity of replanting, &c.

SOME persons, I know, condemn all use of Dictionaries, abridgments, and compilations whatever. The Scaligers, Salmasiuses, Huets, and other critics, protest against every thing that may tend to facilitate and shorten the course of study, as it tends, at the same time, to lessen diligence and application, to exempt men from the necessity of going to the fountain-heads, and thus renders them superficial. What we attain easily, say they, is lost again as easily: one of the chief fruits of study is, to cause men to labour and attention: what room is left for the judgment to act, where every thing is methodized, and laid in order? What occasion for the memory, where a man can immediately have recourse to every thing he wants? And who would burden his head with a stock of knowledge, which he can always keep by him on much easier terms? It is added, that the exact and profound learning of the ancient writers was chiefly owing to this, that they had no such helps; which obliged them to go painfully to the sources, and study their authors at first hand.

THIS is the common style of men of the first-rate erudition; and were it only directed to those who aspire to the same rank with themselves, it would undoubtedly be excellent. He who pretends to have a seat on that bench, must go to work the severe way: he must not study, e. gr. *antiquity*, in Dictionaries, or even in modern Systems, but in the ancient writers themselves; the *Jewish* antiquities, for instance, in the books of the Old Testament, Philo, Josephus, the Talmud, Maimonides, and the Rabbins: the *Grecian*, in Homer, the ancient tragedians, Aristophanes's comedies, Diodorus Siculus, Pausanias, Athenæus, and others: the *Roman*, in Livy, Dionysius Halicarnassus, and other ancients in both languages; the *Christian* in the Acts of the apostles, and the Greek and Latin fathers. These he is to be reading night and day, in order to arrive at the right understanding of them, meditating, and making frequent reflections on them, striving to penetrate into all their views; maturely weighing all the circumstances in them; and, lastly, comparing all with the hints, remarks, and improvements, suggested in the writings and comments of the more learned among the moderns.

ALL this, no doubt, is excellent. But there are not many subjects or branches of science that a man can thus go through! And the greater part of mankind consists of such as are not enough interested in any one, to be solicitous about so thorough and profound a knowledge of it. Add, that those who do, are forced, on many occasions, to make use of Dictionaries, and other helps; and that those who speak most contemptuously of them do the same, oftener than they care to own it.

IN reality, a reduction of the vast bulk of universal knowledge into a lesser compass (as I have elsewhere had occasion to observe) is of no small advantage to all those concerned in the acquisition of learning, that is, of all persons in general: for I know of no rank, condition, or even sex, that is dispensed from the necessity of cultivating and improving their own minds. By means hereof a stock of knowledge becomes attainable on easy terms, sufficient for the purposes of most persons, except those who make learning their more immediate profession; and for those too in most parts of science, except that which makes their immediate province. Such a design may perhaps seem most adapted to the uses of men of business, who cannot spend a deal of time; or of men of pleasure, who do not care to be at such pains in the pursuit of knowledge: but it would be no less advantageous to men of letters and study, whatever faculty or branch of science they devote themselves to; since Polymathy, or a general acquaintance with all the rest, is indispensably requisite to arrive at an excellency in any one, by reason of that near connexion which is between the several sciences, and the mutual lights they afford each other. And what a vast career does this open? what a multitude of books and subjects will they have to make their way through; and what helps are not requisite to facilitate to laborious a course? Without these, either a man's whole life will be in danger to be spent in preliminaries, and preparing himself for his province, or he must resolve to set out with less ceremony, exclude the numerous kindred sciences out of his scheme, and retrench himself within the narrow limits of a single one. This, it must be owned, is but too often done, to the no small dishonour both of learning itself, and of those who cultivate it. By this means the sciences become cantoned out into so many separate districts, and the due communication between them is cut off, by which each is defrauded of the improvements which might be derived to it from the rest. Hence, in great measure, the inferiority of the modern authors to the ancient. A narrow compass of knowledge, it is certain, will not enable a man to write with that dignity and masterhood, which is found in most of the ancient writers; who, besides the particular science they wrote on, were conversant in all the rest. Those who have the least acquaintance with the ancient method of study, know how severe they were on this head: a man was not allowed to be an orator, historian, poet, grammarian, or even architect, or musician, much less a philosopher, without the whole circle of sciences. The same we still find insisted on as necessary by later writers, though the difficulty of arriving at it is so much increased, and the modern *Cyclopædia* become so vastly more extensive, as well as intricate, than the ancient. How many new arts and sciences, and new appendages

pendages of old ones, come under consideration among us, that the ancients overlooked? How many languages, living and dead, is a modern obliged to learn, when a Roman or Athenian was thought sufficiently furnished with one, or two? And how many difficulties have we to struggle with, in the acquisition of their sciences; the ancient chronology, for instance, geography, or the like; from which they were free? We charge ourselves with the knowledge of their affairs, as well as our own; study minutely not only their sciences, but their most indifferent actions and customs, and their very words and phrases, which with us make spacious fields of learning, under the denomination of *antiquity* and *philology*. The dilemma then is apparent; either our talents and application must be greater, or our lives must be longer than those of the ancients; or else our proficiency must be less in proportion, unless some means be had recourse to, to expedite the same.

IN effect, a reduction of the body of learning is growing every day more and more necessary; as the objects of our knowledge are increasing, books becoming more numerous, and new points of dispute and inquiry turning up. For want of this, the sciences remain in great measure at a stand, or can advance only imperceptibly; since the whole life of those who should make discoveries, is spent in learning what is already found out. Hence, such improvements as are occasionally made, rarely arrive at any maturity, but terminate in hints, and imperfect openings, or in queries and proposals for farther inquiry. Most of the late discoveries in the sciences remain thus crude and imperfect; the whole vast systems of microscopical plants and animals, and telescopic worlds, of attraction, magnetism, electricity, and the like, remain as it were, in embryo. How many curious observations, and anomalous cases, are scattered in the writings of modern philosophers, which want to be reduced to systems? And what numerous lights are held forth in the writings of modern virtuosos, for supplying divers desiderata in the sciences, to no other purpose? How many operations are there, both of nature and art, of which we have imperfect notices, which want to be compared, and traced more minutely? Transmutations, petrifactions, reproductions of organical parts, recompositions of bodies from their principles, rectifications, meliorations, accelerations of growth, multiplications of species; to say nothing of transfusions, inoculations, injections, and the like; which are like to perish, as multitudes have done before them, for want of time to pursue them.

TO do justice to a *collection*, I mean a general and promiscuous one, it has its advantages. Where numbers of things are thrown precariously together, we sometimes discover relations among them, which we should never have thought of looking for; as the painter's and sculptor's fancy is frequently led on to the boldest and most masterly designs, by something they spy in the fortuitous sketches of chance or nature; insomuch that a celebrated Italian makes no scruple to lay this down as the first origin and occasion of all these arts. It is certain most of our knowledge is empirical, the result of accident, occasion, and casual experiment; it is but very little we owe to dogmatizing and method; which, as already observed, are posterior things, and only come in play after the game is started. It was, in all probability, the hand of chance, that first threw sulphur, charcoal, and saltpetre, together; and little did he, who thus produced gunpowder, imagine he was inventing a new art of making war.

IT is, indeed, surprising, to consider what slender experiments and observations many of the capital doctrines have arisen from: the blows of a smith's hammer on an anvil are said to have given rise to the musical notes; which Guido, a poor friar, perfected by what he observed in conning over his beads. The inventions of printing, of glass, of dying, of the dipping-needle, of phosphorus, of telescopes, of taffety, of antimony, &c. are supposed to have arisen in the like manner; as the reader may find under their proper articles; and how many more we know not, by reason the great obscurity of their first rise, ere they attained a degree of usefulness and perfection fit to be taken notice of, has buried the particular circumstances thereof. If we will hear the ancient Phœnicians and Egyptians, among whom most of the arts are supposed to have arisen, they all came from casual observations; geometry from the inundations of the Nile; the flight of the crane gave occasion to the invention of the rudder; the ibis taught to administer a clyster; the swallow to build; and the spider to weave, &c. In effect, a new observation, in some people's minds, prepared for it, is like a spark in an heap of gunpowder, which may blow a whole mine.

WHAT advantages may not philosophy be expected to derive from such a collection, or farrago, of arts, when it is considered, that every circumstance, every article of an art, is to be looked upon as a datum, a phenomenon, or experiment in philosophy? and that the least of them may possibly be the foundation of a new system?—To consider only the dying of cloth; or tanning, or currying, of leather; what is the whole process, but a series of physical effects, arising from new applications of body to body? And how many lectures will the philosopher have, from painting, gardening, agriculture, &c. touching planting, ingrafting, pruning, exposure, expression, walls, &c. which might never have come in his way but by such a chance? When a thing is once started, it may be applied infinite ways, and nobody knows where it will stop.

THROUGHOUT the whole of this work a particular regard has been had, both in the choice of the several heads, and in amplifying on them, to the extending of our views, and opening new tracks, new scenes, new vistas. We have endeavoured not only to furnish the mind, but to enlarge it, by placing it in a great variety of situations, and presenting to it the sentiments, notions, manners, customs, &c. of most ages, people, sects, &c. that have any thing new, unusual, or original, in them.

SUCH a variety of views, and manners of thinking, is a sure remedy against being too violently attached to any one; and is the best way of preventing the making of pedants, bigots, &c. of any kind. It may be said, that every art, every system, tends to give the mind a particular turn; and that the only way of maintaining it in its natural rectitude, is by calling in other opposite ones, by way of counter-balance. Thus what is unsufferable in the mere mathematician, critic, grammarian, chemist, poet, or herald, is qualified, and rendered amiable, by a due admixture of the rest.

THIS, indeed, is not the way to make a very great progress in any art; but at the same time it is the only way to hinder our being spoiled by any. Though this is only to be understood with regard to personal benefit; for no doubt the public is more benefited by the mere pursuers of particular arts, than by the general appliers to all; since, by the former, each is brought to greater perfection, and the mixture and temperament wanting in the individuals is found in the whole.

TO conclude: the ultimate view of a work of this kind should be, the forming of a sound mind, i. e. acquiring a system of perceptions and notions agreeing to the system of things, or in the relations

thereto intended by its author. The end of learning and ſtudy, is not the filling of our heads with other men's ideas; that is an enrichment which may prove for the worſe: richneſs is only a matter of ſecondary conſideration; ſoundneſs is the firſt. There are many manures which the huſbandman dare not uſe, by reaſon they would corrupt the land, at the ſame time they enriched it, and lay the foundation of a diſeaſe, which would in the end impoveriſh, and make it ſpend itſelf in unprofitable weeds. But it muſt be owned, men's heads are not ſo eaſily filled; the memory is not ſo tenacious as we may imagine; ideas are tranſient things, and ſeldom ſtay long enough with us to do either much good, or harm: ten to one but what we read to-day, is moſt of it forgot again to-morrow. And what chiefly makes new ideas of any ſignificancy, is their extending and enlarging the mind, and making it more capacious, and ſuſceptible. But neither is this enlargement the laſt aim; but is chiefly of uſe, as it contributes to the increaſing our ſenſibility, to the making our faculties more ſubtile and adequate, and giving us a more exquiſite perception of things that occur; and thus enabling us to judge clearly, pronounce boldly, conclude readily, diſtinguiſh accurately, and to apprehend the manner and reaſons of our deciſions. To which end ſeveral things may conduce, that are not ſo much direct matters of knowledge, as collateral to it; for inſtance, much of the ſchool-philoſophy, which, by exerciſing and exciting the mind, has a kind of inſtrumental tendency to ſharpen its faculties, and needs only be read, not retained, to produce its effect. But even this does not amount to the full and adequate end of knowledge: this is only improving the organ; and there muſt be ſome farther end in ſuch improvement. No man ſharpens his weapon on the ſole conſideration of having it ſharp, but to be the fitter for uſe. Briefly then, our faculties being only ſo many inlets whereby, and according to the meaſure whereof, we receive intimations of the Creator's will, and the effects of his power and action; all the improvements made in them, have a tendency to ſubject us more entirely to his influence and direction; and thus make us conſpire, and move more in concert with the reſt of his works, to accompliſh the great end of all things; in which our happineſs and perfection conſiſt; the perfection of a ſingle nature ariſing in proportion as it contributes to that of the univerſe.

CYCLOPÆDIA:

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES.

A.

A May be considered, I. As a LETTER; II. As a WORD; and III. As an ABBREVIATION.

I. A, as a LETTER, or the mark of a vocal sound, is the most simple, and that which the mouth and throat will easily suffer to utter.

To pronounce it clearly, we need only open the mouth wider than for any other sound, and then emit the air from our lungs. It is the first letter of the alphabet in all the known languages of the world, except in that of the Sclavonians; to which, according to Ludolfus, it is the thirteenth.

We must seek the origin of this, and the rest of our letters, in the Oriental languages. See ALPHABET and LETTER.

In the English language, the character A is the mark of three different sounds, which are termed by our grammarians, the broad A, the open A, and the close A.

1. Our broad A resembles the sound marked by the German A, and is found in many of our monosyllables, as *all*, *wall*, *call*, *talk*, where it is pronounced as in *ewig*, and *law*, as in *laus*.

It is probable that this sound was that which the Saxons sometimes expressed by the character A, as it is still, almost universally, retained in the rustic pronunciation and northern dialects of our language; as *mare* for *mill*, *more* for *mun*, *hawk* for *hank*, &c.

2. The open A of the English, is not unlike the A of the Italian, and is the sound marked by this letter in *father*, *rather*, &c.

3. The close sound marked by the character A, is peculiar to the English language, and resembles the sound of the French *e masculine*, or of that diphthong in *ai*, *au*, perhaps it is a middle sound between these, or between the *a* and *e*. Such we have in the words *place*, *face*, *wake*, and in all those that terminate in *ation*, as *salvation*, *profanation*, &c.

The sound of which A is the character in our language, is sometimes short; as in the words *can*, *man*, *hand*, &c. at other times long; as in *cane*, *mane*, &c. Their length is commonly denoted by an *Italian* letter placed to the *a*; as in *plate*, *cane*, &c. or by an *e* added at the end of a word; as in *plane*, *crane*, &c.

Some contend that there are four, others, that there are five distinct sounds, denoted by the character A in the English language. There are, perhaps, little variations and distinctions in the sounds marked by the character A, as well as by the other vowel letters in our alphabet; but they are so local or arbitrary, or, else all, so nice and subtile, that they entirely escape the notice of foreigners, and are barely distinguishable by the natives. Those who desire to enter more deeply into the first formation of sounds, and to see the elementary principles of speech treated with philosophical accuracy will find satisfaction in the ingenious treatises of Wallis and Holder.

In harmonic poetry, the letter A is sometimes added after words, to lengthen them a syllable, without altering their sense; as *home*, for *hame*, in Dryden, &c. It is sometimes redundant, when prefixed to words, as *wife*, *awake*; the same with *with*, *awhile*, &c.

In our calendar, A is the first of the *dominical* letters, which were introduced in imitation of the eight *nundinal* letters of the Romans, of which their A was one.

II. A is a WORD. This first simple sound is used in our language to express most of the different emotions of the soul. We naturally utter it on all sudden occasions of admiration, joy, anguish, apprehension of danger, &c. and where the emotion is very great, viz. A is enforced by adding an *h* to it, *ah!*

It is sometimes a noun, for we say, great A and little a; but it is most commonly a definite.

A, is also a pronoun, and denotes the number one; as man is among the *a*, as were one man. It is also used as an indefinite article; for we say, a man may conclude what he pleases, any man.

A, used as an article, has no plural signification; before a word beginning with a vowel, *y* and *h* excepted, and before silent *h* preceding a vowel, it is written *an*, which also is the contraction of *one*; as an harbour, an ox, an hour, &c. A seems to be a true and genuine preposition, in the three following cases. 1. When it is put before a participle or participial noun, denoting some action not yet accomplished; as I am *a* writing. 2. When it is placed before local surnames; as Thomas *a* Becket. 3. When it is used in computations; e. g. about, *about*, &c. Dr. Wallis supposes it to be a contraction of *at*; but Dr. Lowth thinks that *a* is the preposition *on*, and sometimes *of*. *At*, he says, has relation chiefly to *place*; *on* has a more general relation, and may be applied to *action*, and many other things, as well as *place*.

In some instances, A has a peculiar signification, denoting the proportion of one thing to another; as such income a year; so many hours a day; so much a man, &c.

III. A is also an ABBREVIATION. A put to bills of exchange, is in England an abbreviation for *accepted*, and in France for the word *avisé*. It is likewise often among merchants to mark their sets of books with the letters A, B, C, &c. instead of the numbers, 1, 2, 3, &c.

In the Roman inscriptions, the sense of the A is to be collected chiefly from the connection of the words, and the scope of the inscription. A finely stands for *ædilis*, *Augustus*, *agere*, *aiunt*, *ante*, *ab*, *ad*, *aio*, *annus*, *ars*, *aurum*, *aqua*, *aurum*, *amicus*, *ager*, *aut*, *aula*, *aulus*, &c. and by a more modern abbreviation for *annus*. Thus A. M. stands for *ab urbe Anno*, *Master of Arts*, and A. D. for *Anno Domini*, *Doctor of Arts*. A A. signifies *Annis*, and A A A. stands for *auro, argento, ære*. All stands for *ante hanc*, and A U for *ab urbe condita*, &c. On Greek and Roman medals, A denotes commonly the name of the place where they were struck; as Athens, Argos, Antioch, Apollonia. On French coins A is the mark of the mint of Paris, and AA signifies their coinage at Metz.

The Romans in their wills used their A to denote distribution; wherce Cicero calls it *littera fatidica & fatalis*.

Laws. Their manner was this: Three ballots were given to each judge, marked one with A for *absolvo*, *I absolve*; a second with C for *condemno*, *I condemn*; and the third with NL for *non liquet*, *it is not clear*. One or other of these, each judge according to his judgment, put into an urn; and the greater sequence or combination of letters, or the other in the order of their being drawn out, was the most common; if the numbers of the two first were equal, the accused was acquitted.

The Romans also made use of the letter A, in recording their suffrages in favour of any person. When a cause was propounded to the people, and all were come to agreement, each voter had two tablets put into his hand, the one marked A, signifying *absolvo*, I absolve; the other C, *condemno*, I condemn. *I absolve* and *I condemn* were also marked by the letters U. R. for *uti rogas*, as you ask; and by turning the *apex*, by putting the one, or the other, into the form A, in the days of Severus and Antoninus, all the criminal causes, and appeals for liberty, were written with a dash over it, thus A, signifying the timeform. The letter A was also used by chronologers and historians as an abbreviation for *ante*; as they put A. M. for *ante meridiem*, A. D. for *anno Domini*, &c.

The Romans dated from the building of Rome; and in their writings A. U. C. stands for *anno urbis conditæ*. The C. or the anno, As prefixed, to a word, is a genitive case particle. So Livy says it was done *anno* urbis conditæ *centesimo quinquagesimo*. Well, there it was also a numeral letter for a hundred.

Among logicians, A denotes an universal affirmative proposition.

In Algebra, A or a, and the first letters of the alphabet, represent known quantities, and the last letters represent unknown: thus $ax^2 + bx = c$.

In the *prolegomena* of physicians, A, or a, or an, denotes some part of the ingredients which are to a composition of the preparation and which is taken in the same quantity as another in the Greek receipt.

Among chemists, AAA signifies an AMALGAM, or the operation of amalgamating.

AABAM. Some of the Jewish rabbi's have also this word for the flood.

AAM, or CAAM, is a liquid measure generally used by the Dutch; it contains 128 *mingles*, each single mingle about 38 ounces avoirdupois; and consequently the *aam* is equal to 140 pints of Paris, or 120 pints of English wine measure. The *aam* just weighing 252 pounds, and that of England 256 pounds.

AARONICAL, in Sacred History, the lot of a Levite appointed to the Priest's office, and in Hebrew, שרת, of the tribe of Aaron's race, as distinguished from Levites, who were not of the race of Aaron's sons, which constituted the first and principal order of priesthood.

AB, in the Hebrew chronology, the eleventh month of the civil year, and the fifth of the ecclesiastical year, which begins with *Nisan*. The month is subject to the moon of *Tabi*, and consists of 30 days.

The ninth day of this month is observed as a fast by the Jews, in commemoration of the destruction of the temple by Nebuchadnezzar, in the year before Christ 588. Josephus observes, that the burning of the temple by Nebuchadnezzar happened on the fortieth day of the year on which it was afterwards burned by Titus.

ABACISTS, in the Greek Assembly, is the name of the 318 fathers of the council of Nice.

ABACUS, in Architecture, the uppermost member of the capital of a column, serving as a crowning to the whole. It is a kind of square table, supporting the architrave. Some of the Moderns call it *Tailloir*, or *Tailloir*, from its use in cutting meat. It is also called the *Plinth*, and sometimes the *Cymatium*. It is usually made square, and is always so in the Tuscan and Doric orders; but in the Ionic and Corinthian it is sometimes circular, and sometimes square with the sides bent in circularly. The height of the abacus is usually one-seventh part of the diameter of the column; but in the Tuscan order it is one-sixth, and in the Ionic and Corinthian one-eighth. The breadth of the abacus is usually equal to the height of the column, but in the Tuscan order it is one-seventh more than the height.

ABACUS, in Perspective, a plane parallel to the geometrical plane, on which the figure is supposed to be drawn.

ABACUS, among the Romans, was a sort of cupboard, or buffet, for plate.

The word is derived from the Greek ἄβαξ, which among that people, signified the same thing.

ABACUS, among the Mathematicians, was a little table covered over with dust, on which they drew their schemes and figures.

In the East, the word seems formed from the Phœnician עבק, *abak*, *dust*.

ABACUS *Pythagoricus*, a table of numbers, contrived for the ready learning of the principles of arithmetic; so denominated from his inventor, Pythagoras.

He has, from an agreement in point of use, the names *Abacus* and *Mensa* are used, among Latin and Italian writers, for arithmetic, or ABC, &c.

The *Abacus Pythagoricus* was, in all probability, no other than what we call a multiplication table.

Lindenius and Wedelius give us methods of performing the operation with the help of the *Abacus*; but they are too operose to commend them for practice. See MULTIPLICATION.

The *Abacus* for facilitating the operations of arithmetic is an instrument adapted to universal use in the art of arithmetic; whether it is to have reference to the method of computing by the fingers, counting agreed on, or figures (which is the most common way), or to the Indian method of performing by means of counters, or figures, wrought with the pen.

Hence the *Abacus* is distinguished into various kinds, according to the various sorts of nations, among the Greeks, Romans, Chinese, Georgians, French, &c. It consists, in point of facility, and circumstance of operation, in a table, cabinet, or frame of wood, or other of the same, or with a piece of linen, adapted to the performance in point of acquisition.

The *Abacus* is variously contrived; that chiefly used in European accounting, consists by drawing any number of parallel lines, at pleasure, at a distance from each other, equal to half the diameter of a counter, or counter-like. Here a counter placed on the first or lowermost line signifies 1; on the second, 2; on the third, 3; and so on the fourth, 4; on the fifth, 5; and so on. In the spaces between the lines, the same numbers signify half as much as in the lines; thus, a counter placed in the first space signifies 10, in the second 20, in the third 30, &c. By this contrivance the first line signifies 1, 10, 100, 1000, &c. the second 2, 20, 200, 2000, &c. the third 5, 50, 500, 5000, &c. the fourth 10, 100, 1000, 10000, &c. the fifth 20, 200, 2000, 20000, &c. and the sixth 50, 500, 5000, 50000, &c. By which means any sum, by placing of counters, is made. Wolf. Lex. Math.

The Gothic Abacus, &c. is a curious book, cut in oblong forms, invented by Gerard Langraave, described parallel to one another, and numbered with an equal number of little lines half, like the heads of a necklace. By this arrangement of the lines, differentiating the numbers into different circles, and observing the relations of the

the lower to the upper, all kinds of computations were easily performed. Mahudel, in Hist. Acad. R. Inscr. t. iii. p. 300.

The Roman *Abacus* was much the same with the Grecian, except that instead of strings, or wires, and beads in the Roman, we find plain and grooves for them to slide in. It is described by several authors; but notwithstanding all their descriptions, we should have had a very obscure idea of the ancient manner of reckoning, had there not been figures of it found among the ancient marbles. Phil. Trans. N° 180.

The Chinese *Abacus* equalizes, like the Grecian, of several series of beads strung on brass wires, extended from the top to the bottom of the instrument, and divided in the middle by a cross piece from side to side; so that in the upper row each string has two beads, which are each reckoned for five; and in the lower row each string has five beads of common values; the full being reckoned as 1; the second, as 10; the third, as 100; and so among us. Add, that instead of four pins for signs, or units, in the Roman *Abacus*, the Chinese have five beads. We have two different figures, and descriptions, of the Chinese *Abacus*, one given by P. Martinius, who had lived many years in China; the other by Dr. Bell, who copied it from a Chinese dictionary of the court-language. See Sand-Pan.

ABACUS *pythagoricus* is a rectangular table, or square, forming the right angle, wherein the numbers from 1 to 60, and its area, are produced in each row of the opposite numbers. This table is called a MULTIPLICATION.

ABACUS *of palmetta*, in the *Roman Mode*, denotes the machinery, wherein the strings of the polyplectra, or instruments of many strings, were strung, with a plectrum made of quills.

ABACUS *harmonicus* is used by Kircher for the structure and disposition of the keys of a musical instrument, whether they are to be touched with the hands or the feet.

ABACUS *Mobile*. A trough used in the mines, wherein the ore is washed.

ABACUS, or ASTRAGALUS, in *Architecture*, is the uppermost member of the capital of a column, serving as a kind of crowning, both to the capital and the whole column.

Many of our dictionary writers very erroneously make the *Abacus* to be the capital itself.

Vitruvius, and others after him, who give the history of the orders, tell us, the *Abacus* was originally intended to represent a square tile laid over an urn, to gather down a better than, covered over the top of an ancient; the plain flooring up the following forms, contemplated the bodies all around, till meeting with the tile, it curled back in a kind of scroll. Callimachus, an ingenious sculptor, pulling by, took the hint, and immediately executed a capital on this plan; representing the tile by the *Abacus*, the leaves by the volutes, and the basket by the vase, or body of the capital.—See *Tab. Archit. fig.* 21.

There is some difference in the form of the *Abacus* in different orders. In the Tuscan, Doric, and ancient Ionic, it is a flat, square member, well enough representing its original tile; whence the French call it *tailloir*, *tranchoir*. See *fig.* 22. & 27. See also TUSCAN, DORIC, and IONIC.

In the richer orders it loses its native form; its four sides or faces, being arched, or cut inwards, with some ornament, as a role, or other flower, or a fillet, in the middle of each arch.—See *fig.* 25. & 30. See CORINTHIAN and COMPOSITE.

But some architects take other liberties in the *Abacus*, both in respect of its figure, and other. Thus, in the Tuscan order, where it is the largest, and most massive, we taking up one third of the height of the whole capital, it is sometimes called the eye of the capital.—In the Doric it is not always the uppermost member of the capital; a cymatium being frequently placed over it.—In the Ionic, some make it a perfect ogee, and crown it with a fillet.

The proportion of the *Abacus*, as prescribed by Vitruvius, is, that its diagonal (from corner to corner) be twice its height. A rule which the moderns make no difficulty of dispensing with.

ABACUS is also used by Scamozzi for a concave moulding in the capital of the Tuscan pedestal.

ABACUS likewise, in the *Antient Architecture*, is used to denote certain compartments in the incrustation or lining of the walls of state-rooms, mosaic pavements, and the like. These were *Abaci* of marble, porphyry, jasper, alabaster, and even glass; shaped variously, square, triangular, and the like.

ABADIR, in the Roman *Theology*, the stone which Saturn swallowed, believing it his new-born son Jupiter, and which at length became deified, and the object of religious worship.

ABAFT, in the *Sea Language*, is used in speaking of things placed or done toward the stern, or under-part of a ship; called also *aft*, and stands opposite to *afore*. Thus they say a thing is *abaft* the fore-mast, when it is behind it, or nearer the stern than the fore-mast is. The post of the master, captain, and other officers, is *abaft* the main-mast.

The stern, strictly speaking, is only the outside; but *abaft* includes both inside and out.

ABAFT, the same thing with ABASE, although of different value; it is worth at Dublin, and throughout all Georgia, about 36 sols French money; four *chaouses*, which are also called Turks, make one *abaft*.

ABALIENATION, from *ab* and *alienare*, to *alienate*, in the Roman Law, denotes a species of alienation; whereby those goods called *res mancipi*, such as cattle, slaves, lands, and possessions, within the territory of Italy, were transferred to persons legally capable thereof, either by a *mancipation*, called *mancipatio vera*, or a surrender in open court.

ABALIENATIO, alienated from, a medical term, which, when applied to the body, signifies that the part is lessened, or in a manner destroyed; as a member is said when applied to the bodies, diseases their vast destruction.

ABANGA, the name which the inhabitants of the island of St. Thomas give to the fruit of the *cynomorium*, which is about the size of a quince, to which it bears great resemblance; it is also used as the lemon is generally, by the Greeks and Arabians. See ADU.

ABAPTISTON, or ANAPTISTON, is used to denote an instrument for the more expeditious and perfect cutting of the feathers, or preparing part of the instrument, called the *nib*, because it is generally contrived in such a manner as to prevent its cutting too deeply into the skull, and wounding the brain, when the bone is cut through.

It is derived from the negative *a*, and *baptizo*, *I immerge*. See TESTRAW.

ABARCA, an ancient kind of shoe used in Spain to pass the mountains, made of raw hides, and bound with cords, which secured them upon the foot.

ABARNABAS, is a term used by some of the alchemists, particularly *Zadith*, in the *Tabularium Chymi*, who tells us that it is the same as the *lac virginis*, or MAGNESIA.

ABARTAMES, hail.

ABARTICULATIO, in *Anatomy*. See DIARTHROSIS.

ABAS, a weight used in Persia for weighing pearls; being an eighth part lighter than the European CARAT.

ABAS sometimes signifies the EYE-SHOT. See TIMEA.

ABASED, ABASING, in *Heraldry*, is applied to the sun, or when it declines, when there are eight rays, four upon each hand towards the point of the shield; or when the wings are that are turned every way of bearing them being spread, with the tip pointing to the chief, or the middle.

A chevron, pale, bend, &c. are alſo ſaid to be *abaſed* when their points terminate in, or below the centre of the ſhield.

A gate, or ordinary is ſaid to be *abaſed*, when below its due ſituation.

ABASSI, a ſilver coin current in Perſia, worth two mamoudis, or four chayes; the chaye being eſtimated at nine ſols ſix deniers of French money, makes the *Abaſſi* worth thirty-eight ſols; ſeventeen ſols of Holland, or near eighteen pence Engliſh. It derives its name from Schah Abbas II. King of Perſia, under whom it was ſtruck.

ABAT-CHAUVRE, a name given in Poitou, Angoumois, Saintonge, Le Marche, and Limoſin, in France, to a ſort of very ordinary wood: much like that called by the French *peuplier*, and *tremble*.

ABATE, in *Law*, ſignifies to throw down; as, to *abate* a houſe.

In this ſenſe uſed to denote the act of one who ſteps into an eſtate, void by the death of the laſt poſſeſſor, before the heir can enter; and by that means keeps him out.

ABATE alſo denotes a defeat or overthrow, on account of ſome error or exception. See ARRAIGNMENT.

ABATE, in the *Manage*. A horſe is ſaid to *abate*, or take down his curvets, when he puts both his hinder legs to the ground at once, and obſerves the ſame cadences in all the turns.

ABATTEMENT, in *Commerce*, (from the French *abattre*) a term uſed for a retribution of trade to all French merchants in the ports of the Levant, who will not ſtand to their bargains, or who refuſe to pay their debts. It is a Cuſtom of the French conſul, which muſt be taken off, before they can ſue any perſon for the payment of their debts.

ABATEMENT, in *Heraldry*, ſomething added to a coat-armour, to diminiſh its proper value and dignity, and note ſome diſhonourable action, or ſtain, in the character of the perſon who bears it. It may be made by retention or diminution.

Retention is either turning the whole eſcutcheon aſide-down-

down; or the adding another escutcheon, inverted, to the former.

Diminution is the blemishing any part by adding a flaw, or mark of diminution: such are the delf, a point dexter, a point champaign, a plain point, a gore sinister, and a gusset. See each under its proper article.

It may be added, that the field is azure and always be either tawney or murrey; otherwise, instead of diminutions, they become additions of honour.

The last edition of Guillim affirms the whole system of *diminutions*, as a chimera. He alledges that no one instance is to be met with of such bearing; and that it implies a contradiction to suppose it. Arms, being assigned *ambitiosis & honoris*, cannot admit of any mark of infamy, without ceasing to be arms, and becoming badges of disgrace, which all would covet to lay aside. Add, that as an hereditary honour can be actually transmitted to another on the marks thereof. Both indeed may be forfeited; as in the case of treason, where the escutcheon is usually reversed, to intimate a total suppression of the honour.

Some authors, however, are produced to the contrary by Columbiere and others. But these, though they may owe some extraordinary testimonials of favour to offences committed in their practices, do not amount to a proof of such matter as justifies a mark to authorize the being of particular badges in the lands of inferior officers, or beings of arms.

In a word, as arms are rather the titles of the deed, than of the being, a special term, that they can neither have diminution nor offence; for thus an equal indignity would be put upon the gazelle and the dolphinden. Diminutions, therefore and *honoraries*, can only affect simple beings, and solely when the person who attaines them, is yet alive, and has furnished his former glass by his after misbehaviours. Even in this case, where *honoraries* may properly take place, it can only be made by the *suppression* of some honourable badge, and not by the introduction of any dishonouring emblem.

ABATEMENT, in *Law*, is the frustrating, or letting aside a suit, on account of some fault, either in the matter, or proceeding thereof. See *Plea in*.

ABATEMENT, is some exception alledged, either against the plaintiff's writ, as wanting due form, or against his count or declaration, as being insufficient, or varying from the writ, specialty, or record; or against the matter of either, as insufficient, or being before another court; or against the allegations, as being uncertain, or account of some misnomer, or the death of one of the parties, or the marriage of the plaintiff, being a woman; to which count and disability.—Upon any of these, the defendant prays, that the plaintiff's writ or plaint may *abate*, i. e. that his suit may cease for that time: if it be granted, all writs and proceedings must begin de novo.

The *death* of a party to a suit rules equally the writ before judgment, until the statute 8 and 9 W. III. c. 11. by which neither the death of the plaintiff or defendant shall *abate* it, if the action might be originally prosecuted by and against the executors or administrators of the parties; and if there are two or more plaintiffs or defendants, and one, or more, die, the writ or action shall not *abate*, if the cause of action survives to the surviving plaintiff, against the surviving defendant, &c. It also ceases an irregular entry upon lands.

ABATEMENT, in *Commerce*. See DISCOUNT and REBATE.

ABATEMENT, in the *Customs*, is an allowance made upon the duty of goods, when the quantity damaged is ascertained by the judgment of two merchants upon oath, and ascertained by a certificate from the surveyor and landwaiter.

ABATIS, or ABATIS, in *Writers of the Roman Art*, denotes an officer in the tables, who had the care and distribution of the provender. The name is derived from *Abatus*, the name of a master-worker of arms. Du Cange.

ABATIS, or ABATIS, from the French, *abattre*, to *fell* down, in the *Military Art*, denotes a heap of large trees thrown together, either lengthways or with their boughs, and disposed in guard entrenchments, to cover the passage of a river, or obstruct roads, &c.

ABATOR, in *Law*. See ABATE.

ABAVI, ABAVO, or ATAVISMI; large ears of hilleyes, which bear a fine like a gourd.

ABB, among Cartiers, denotes the yarn of a weaver's warp, or woof the wool of which it is made is called *Abb*.

ABBA, in the Syriac and Chaldaic languages, literally signifies a father; and figuratively, a superior, reputed as a father in respect of age, dignity, or office.

It was also commonly used as a title of honour, which some give to God, as he still retains it in the Protestant communion.

ABBA, ABB, or ABBE, a term, particularly used in the Syriac, Coptic, and Ethiopic churches, as a title which the people give their bishops.

The bishops themselves bestow the title *Abba*, more eminently on the patriarch of Alexandria; which also caused the people to give him that of *Baba*, or *Papa*, that is, grandfather; a title which he bore before the bishop of Rome. It is a jewish title of honour, given to certain of their chief Rabbins, called Tannites; and it is also particularly used by some writers of the middle age, for the superior of a monastery, usually called ABBOT.

ABBAISSEUR, in *Anatomy*, a name given by Winslow, and other French writers, to one of the muscles of the eye, called by others the *depressor* and *tormens*; and by Fabricius, the *cellus inferior*. Cowper and Albinus call it the *depressor oculi*; and it is one of the *recti oculi* of the last author.

ABBEY, the superior of an ABBEY, or convent of monks. The *Abbot* has the same rights and authority over the nuns, that the ABBOTS regular have over their monks. His law, indeed, does not allow him to perform the spiritual functions annexed to the priesthood.

F. Marsollier, in his treatise on the rights of the church, observes, that some *Abbots* have claimed a jurisdiction even over bishops, that their sacred character might exempt them from being the object of a secular or civil power.

St. Basil in his rule, allows the *Abbot*, to be present with the priest, at the confession of his sins.

ABBEY, or ABBY, a monastery, or religious house, governed by a superior under the title of ABBOT, or ABBESS.

In our ancient history, the word is sometimes also written MONKERY. By 31 H. VIII. c. 13. *Abbeys* are given to the king.

ABBEYS, mitre lands, or BISHOPRICS, in that case are to be under the direction of an *Abbot*, and the other of 1 priest, but about one prior two more a priest conventual, or much the same thing, and after in like sort the rest.

One third of the lesser benefices in England were anciently, by the popes grants, appropriated to *Abbeys*, and other religious houses; which, upon their dissolution in the 27th Henry VIII became forfeited. For an estimate of the number and value of religious houses, abolished and forfeited in this reign, see MONASTERY.

ABBOT, or ABBAT, originally derived from the Hebrew *Ab*, *father*, signifies the superior or governor of monks united into an abbey or priory.

Abbots were really distinguished from the clergy, though frequently confounded with them; because a degree above bishops. St. Jerom, writing to Heliodorus, says expressly, *nos monachos non ab ordine, sed a vocabulo*.

In the early days the *Abbots* were subject to the bishops, and the ordinary parish. Their monasteries being remote from cities, and built in the farthest islands, they had no other to be ordained abbots. They went out themselves to the parish-church with the rest of the people, and if they were too remote, which kept them from, in attendance the forenoons, till, at length, they were allowed to have priests of their own body. The *Abbot*, or archimandrite, himself was usually the priest; but his function exempted no further than to the outward observance of his monastery, and he remained still in obedience to the bishop.

The *Abbots* first wore off their former plainness and simplicity, and endeavoured to be independent of the bishops, which occasioned them divers laws to be made against them at the council at Chalcedon; insomuch arising thus, in time, many of them carried the point of independency, and got the appellation of *mitred*, with other badges of the episcopate, particularly of the staff.

Hence arose two species and distinctions of *Abbots*, *mitred*, and not *mitred*; *crosiered*, and not *crosiered*; *benedictine*, and *cluniac*, &c.

Abbots, *Mitred*, were those privileged to wear the *mitre*; and who allowed a full episcopal authority within their several precincts.—Among us, these were also called *Abbots of baronial degree*; and they were lords of parliament. Of these Sir Edward Coke reckons twenty-seven in England, whilst two mitred priors.

The rest, who were not mitred, were subject to the bishops.

Abbots, *Crosiered*, are those who bear the CROSIER, or pastoral staff.

Abbots were likewise distinguished into *Abbots regular*, and *abbots secular*; but are now chiefly distinguished into *titulary* and *commendatory*.

Abbots, *Regular*, are real monks, or religious, who have taken the vows, and were the heads of the ORDER.

Such all others professed to be; it being expressly provided by the canons, that none but *Abbots* have the command over monks.—But, in fact, it is found far otherwise; in France, as it is, there are now but six regular abbeys.

Abbots in commendam, are freedom though they have undergone

dergone the ordeale, and are obliged, by their bulls, to take orders when they come of age.

Though the same ceremonies subsisted, that they have in the administration of their abbeys for a time; yet do they lord, and reap the fruits of them for ever, as well the regular abbots.

Their BULLS give them a full power *hora ac die quibus quos ac quotiescunque*; and yet it is true that the common duties of office do not perform any spiritual offices; nor have they any spiritual jurisdiction over their monks. So that the phrase *in spiritualibus*, is rather founding of the Roman bulls, than a reality.

The ceremonies whereby abbots are created, is properly called benediction; or consecration, though chiefly, consecration.

It anciently consisted in clothing him with the habit called *cuculla*, a cowl; putting the pastoral staff in his hand, and the shoes called *pedalia*, or *sandalia*, on his feet. These particulars we learn from the *Ordo Romanus* of Theodore, archbishop of Canterbury.

ABBOT is also a title, which has been given to certain bishops, because their sees had originally been abbeys; and they were even elected by the monks: such are those of Canons and Montreal in Sicily.

ABBOT is also an appellation sometimes given to the superiors or generals of some congregations of regular canons; as that of St. Genevieve at Paris.

ABBOT is also a title borne by several magistrates, and other lay-persons. Among the Grecians, one of these principal magistrates was called the abbot of the people.

In France, particularly about the time of Charlemagne, there were several lords and countries, who having the superintendence of certain abbeys committed to them, were called *commendatory* abbots, or abbey-counts.

ABBREVIATION, in Antiquity, is the contraction of a word, or phrase, made by dropping some of the letters, or by substituting certain marks, or characters, in their place.

Lawyers, physicians, &c. are abundance of *abbreviators*, partly for the sake of expedition, and partly for that of secrecy. A full of the principal *abbreviations*, in the several arts and faculties, see under CHARACTER.

Of all people, the Romans are the most remarkable for this practice: in the their writings are unintelligible, without an explanation of the Hebrew *abbreviators*. The Jewish rabbins and copyists do not content themselves to *abbreviate* words, like the Greeks and Latins, by retrenching some of the letters, or syllables thereof; but they frequently take away all except the initial letters. Thus, for instance, for *rabbi*, they write RB. or RBI, or RBN, according to the place it is found in.

But still further, they frequently take the initial letters of several succeeding words, join them together, and adding points to them, make a barbarous sort of word, representative of all the words that produced them. Thus, *Kadisch Jaroch*, the title of Hebrew morning *prayers*, is called *Kaj*; and *Rabbi Abba ben Mamon*, is *Rambam*. Mercerus, David de Pomis, Schindler, Buxtorf, &c. have given explications of such *abbreviations*. The most copious collection of Roman *abbreviations*, is that of Sertorius Ursatus: *Notarum Explan. quam, ex variis Romanorum commentariis*.

ABBREVIATOR is more particularly used for an officer in the court of Rome, appointed as assistant to the vice-chancellor, for drawing up the popes briefs, and reducing petitions, when granted by the pontiff, into proper form, by being converted into bulls.

The *abbreviators* are supposed by Crompton, to be the successors either of the secretaries in the imperial household, or of the *breve scribæ*, said to have been placed by pope Clement I. in the seven quarters of Rome, to write down the acts of the martyrs within their respective districts. They are said to have taken those names, either from their writing the *breves*, *briefs*, or shorter epistles of the popes; or from their making use of notes, or abbreviations in writing. The latter opinion may seem the more probable, because the name is sometimes used by writers of the middle age, as synonymous with *notarius*, or *tachygraphus*.

The *abbreviators* at present make a college of seventy-two persons, divided into two ranks; one called *abbreviatores de parco minori*, who are twelve in number, all prelates; the other, *abbreviatores de parco majori*, called also *communes*, who may be as many. Crompton has two volumes on the institution, office, privileges, customs, &c. of the *abbreviators*.

ABBREVIATURE is also a term given by some authors to an ancient literary academy, supposed to have been at Rome, in the fifteenth century, and composed of the chief men of letters of the age, as Pomp. Lætus, Platina, Pontanus, Inessuretus, Sabellicus, &c. who, by the title of the society, changed their names at their admission: but for their so doing ancient Greek or Roman; but the existence of such an academy is very doubtful.

ABBREUVOIR, in *Heraldry*, the joint, or junction of two pieces; or the intention of space between two pieces, and filled up with mortar.

It is used in French, and literally denotes a watering-place.

ABECEDARY, ABECEDARIAN, or ABECEDARIUS, is sometimes applied to compositions whose parts are disposed of the order of the letters of the alphabet.

In the first ecclesiastics it is synonymous with *agnoscendi*. Thus we meet with abecedarian psalms, lamentations, prayers, and the like; chiefly among Hebrew writers; which makes it probable they were the inventors of this species of writ.

ABDALS, in the Eastern countries, a kind of saints supposed to be inspired to a degree of madness. The word comes, perhaps, from the Arabic, signifying the servant of God. The Persians call them *abdaldschi*, and speak of the Latins as of speaking of their prophets and *abdals*, *qui fecerunt Deum ex nihilo*, &c.

The *abdals* are often carried by crowds of mad, especially in the Indies, to run almost the streets, and kill all they meet of a different religion. The English sailors call this running a muck, from the name of the instrument, a sort of poignard, employed on this occasion. D'Herbel. Bib. Orient.

ABDELAVI, an Egyptian plant said to have a narcotic, except that the root is more cooling, and acute in the extremities.

ABDEST, among the *Mahometans*, a peculiar manner of washing, before prayer, entering the mosque, or reading the Alcoran; practised with many ceremonies both by Turks and Persians. The world is compounded of the Persian *ab*, water, and *dest*, hand.

ABDICARIA *propositio*, in Logic, is used for a negative proposition.

ABDICATION, ABDICATING, formed from *abdicare*, to renounce, the act whereby a magistrate, or person in office, renounces, and gives up the same, before the legal term of service is expired.

Abdication is frequently confounded with *resignation*, but, strictly speaking, there is a difference: *abdication* being done purely and simply, whereas *resignation* is done as in favour of some third person.

In this trade, Diocletian is said to have *abdicated* the empire; and Philip IV. of Spain *resigned* it. The parliament of England voted king James's visitation of the laws, and his quitting the kingdom, without providing for the due administration of affairs in his absence, to import an *abdication* of the crown. The lords would have had the word *desertion* made use of; but the commons thought it was not comprehensive enough, because the king might desert from the liberty of returning.

The lords call it a *forfeiture* of the crown, from the vote of commons.

ABDICATIVE, among Roman lawyers, is more particularly used for the act whereby a father disowned or disinherited his son, and expelled him the family.

In this sense, the word is synonymous with the Greek *αποκηρυξις*, and the Latin *exheredatio*, or sometimes *abjectio*, and *ejectio*; and stands opposed to *adoption*. It is distinguished from *interdictio*, or *abdicatio*, in that the former was done in the father's lifetime, and latter by will or his heirs, in that whenever was effected, was also disinherited; but not vice versa.

ABDITE *Causes*, are the secret or remote causes of distempers, which physicians of the dogmatic, or rational sect, attempt, were necessary to be known, in order to establish a right method of cure.

ABDOMEN, in Anatomy, the belly, or lower cavity or the part of the body comprehended between the thorax and the rump.

The word is derived from *abdo*, to hide.

Anatomists usually divide the whole trunk of the human body, which consists of the three principal regions, or cavities, the head, the thorax or breast, and the abdomen, which makes the largest part of the trunk, being terminated by the diaphragm above, and by the *ossa ilei* below.

The abdomen is lined internally with a thin, fine membrane, which, investing all the other viscera mentioned, is called the *peritonæum*, which see.

The abdomen contains the stomach, the liver, the spleen, the pancreas, the kidneys, the bladder, the intestines, the mesentery, the lacteal vessels, the lymphatics, the vena cava, the aorta, the emulgent vessels, the vena portæ, the receptaculum chyli, the ureters, the urinary bladder, and the organs of generation.

The abdomen is supported by the muscles of the back, the *musculi recti*, the *pyramidales*, the *obliqui descendentes*, and the *transversales*.

The abdomen is also covered with the *cutis*, the *membrana adiposa*, and the *tunica communis*.

The abdomen is subject to many diseases, as the *ascites*, the *tympanites*, the *hernia*, the *colica*, the *passio iliaca*, the *dysenteria*, the *diarrhœa*, the *cholera*, the *lienteria*, the *jaundice*, the *hæmorrhoids*, the *iliac passion

These muscles are the OBLIQUI *descendentes* and *ascendentes*, the RECTUS *transversalis* and PYRAMIDALES. See descriptions of the veins, arteries, and muscles, &c. of the *abdomen*, under their respective names.

The *abdomen* is subdivided into leſſer regions, or cavities; of which three are anterior, the uppermoſt, called the epigaſtric, commences from the diaphragm and *cartilago ensiformis*, and terminates two fingers breadth above the navel; the ſecond, called the umbilical, begins where the former ends, and terminates two fingers breadth below the navel; the third, called the hypogaſtric, deſcends as low as the *os pubis*. Each of theſe ſubdiviſions the moſt accurate writers divide farther into three parts; a middle, and two lateral ones; called the HYPOCHONDRIA. The middle part of the umbilical is called the *umbilicus*, or navel; and its lateral parts the *lumbi*, or loins: the middle of the hypogaſtric is called the *pubes* or *mons veneris*, and its ſides the *inguina*, or flanks. The whole may be called the *regions*, *abdominis*, *ſcilicet* regiones, and HYPOCHONDRIA, ſometimes called the lumbar regions. There is but one poſterior region, called *regio lumbaris*, which, is the poſterior part of the *abdomen*, comprehending all that ſpace which reaches from the loweſt ribs on each ſide, and the laſt *vertebræ* of the back to the *os ſacrum*, and the neighbouring parts of the *ilia* or *ossa*. Authors however are not agreed whether the hindpart be properly included in the *abdomen*, which ſome reſtrain to the anterior, or fore-part only.

ABDOMEN, *pathology of the*, or inflammations, abſceſſes, *fiſtulæ*, indurations, inflations, ſpaſms, &c. Hence the *abdomen* becomes the ſeat of divers operations; as perforations, ſutures, ſections, &c.

ABDOMEN, *wounds of the*, may be conſidered as of two kinds:

1. Such as affect the integuments only.

2. Such as affect the muſcles, together with the integument, without penetrating the *peritonæum*.

3. Such as with the other accidents penetrate into the cavity, without wounding any of its contents.

4. Such as penetrating into the cavity, wound ſome or other of its contents.

The firſt ſort, or ſuperficial wounds of the *abdomen*, are not eſteemed dangerous, and require no treatment different from other wounds. However Arnaud (lib. 3. cap. 4.) and Vigo (lib. 3. cap. 11.) agree in pronouncing ſmall mere bladder-like accidents, which are received within two or three fingers breadth of the navel.

The ſecond ſort are diſtinguiſhed from the firſt by the probe; for if the patient is carefully placed in the ſituation in which the wound was given, and the probe be introduced, it will generally paſs into the cavity of the *abdomen*, if the *peritonæum* is not injured. Another way of diſtinguiſhing theſe wounds fully is injecting warm water into them, and if it returns immediately, through, or near to the wound, to be only mucilage; but if any conſiderable quantity remain in the wound, the cavity is certainly penetrated. If the wound is large, great ſkill is required in the ſurgeon, eſpecially if it is neceſſary a tranſverſe, or oblique direction for the future be neceſſary, to keep the gaping lips of the wound together. Having taken theſe precautions, to preſerve the inteſtines and *peritonæum* in their natural ſituation, the wound is to be dreſſed with vulnerary baſſilicon, and an adheſive plaiſter; the patient muſt alſo be enjoined abſtinence, muſt have reſt, and his bowels muſt be kept open. In wounds of the *abdomen*, that penetrate into its cavity, the ſurgeon is firſt to examine very carefully, whether any of its contents partake of the injury. It will be found that this is not the caſe, if there is no great degree of weakneſs, hæmorrhage, pain, fever, &c. if on laying the patient upon the wounded ſide, there is no diſcharge of chyle, gall, excrement, or urine; if milk being injected warm, returns without any laceration in its colours; if the injecting inſtrument has not been very ſharp; and laſtly, if there is no vomiting or diſcharge of blood by the mouth, ſtool, or urine, nor ſwelling or hardneſs of the belly.

We have ſome very valuable remarks on the ſpontaneous ruptures of the *abdomen*, in the Medical Eſſays of Edinburgh, vol. v. art. 59.

There is a ſmall tendinous ſeam of the *cartilago enſiformis*, between the muſcles called *recti* and *tranſverſales*, into which on the left ſide, by violent vomiting, the ſtomach is ſometimes ruptured. This accident excites pain, which is greater when the patient is up, and ſuſpended by lying in a horizontal poſture; this circumſtance is the pathognomonic ſign of the diſeaſe, wherein which, in caſe of its continuing obſtinate, the ſkin muſt be laid open, and the rupture reduced in the ordinary manner.

ABDOMINALES, in the *Linnæan Syſtem of Ichthyology*, an order of FISH, having the ventral fins placed behind the pectoral in the abdomen, and comprehending fourteen genera and one hundred and ſeventy-ſeven ſpecies.

ABDUCENS *oculum*, [illegible] a name given by Spigelius to a muſcle, [illegible] called the *ſixth pair of nerves*.

oculum. This is the *locator oculi* of Albinus, the *commune et externum oculorum communis* of others.

ABDUCENT, *adjective*. See ABDUCTOR.

ABDUCTION, in *Logic*, a kind of argumentation, by the Greeks called *apagoge*; wherein the greater extreme is evidently contained in the medium, but the medium not ſo evidently in the leſſer extreme as not to require ſome further medium, or proof, to make it appear.

It is called *abduction*, from the *greater* extreme's being drawn from the conſideration; a draw'd name to prove the propoſition aſſumed.

Thus in the ſyllogiſm, "All whom God abſolves are free of ſin; but God abſolves all who are in Chriſt: therefore, all who are in Chriſt are free of ſin." The major is evident: but the minor, or aſſumption, is not ſo, without ſome other propoſition to prove it; as "God receives all ſatisfactions for ſin by the ſuffering of Jeſus Chriſt."

ABDUCTION, in *Surgery*, denotes a ſpecies of EXARTICULATION, wherein the bone moves in the manner of a door upon its hinges.

ABDUCTOR, or ABDUCENS, in *Anatomy*, a name common to ſeveral muſcles, whoſe office is the withdrawing, opening, or pulling back, the parts they are fixed to.

The names and compounds of *ab*, *from*, and *duco*, *to draw*. Theſe muſcles are called ABDUCENTES.

ABDUCTOR *auriculæ*, or of the little finger, ariſes from the annular ligament, and the third and fourth bones of the carpus in the ſecond rank; and is inſerted externally into the firſt bone of the little finger: it ſerves to draw that finger from the reſt; and alſo to bend it a little. See *Tab. Anat.* [illegible] *fig.* 3. *n.* 23.

In ſome ſubjects it appears divided into two or three muſcles, conſiſting of ſo many different ſeries of fibres.

ABDUCTOR *indicis*, or of the fore-finger, ariſes from the inſide of the baſe of the thumb, and is inſerted into the firſt bone of the fore-finger, which it draws from the reſt towards the thumb. See *Tab. Anat.* (Muſcl.) *fig.* 1. *n.* 12. *fig.* 2. *n.* 21. *fig.* 3. *n.* 8.

ABDUCTOR *minimi digiti manus*. See ABDUCENS *auriculare*.

ABDUCTOR *minimi digiti pedis*, or of the little toe, ariſes from the outſide of the *os calcis*, near the tuberous bone of the *metatarſus*, and is inſerted laterally into the outſide of the firſt bone of that toe, which it pulls from the reſt. See *Tab. Anat.* [illegible] *fig.* 3. *n.* 45.

ABDUCTOR *oculi*, or of the eye, is one of the four *recti*, or ſtraight muſcles, ariſing from the bottom of the orbit, and ſpread over the fore-part of the eye, ſerving to draw the eye towards the outer canthus.

ABDUCTOR *pollicis manus*, or of the thumb, ariſes from the annular ligament and firſt bone of the carpus; from whence paſſing the thumb, it is inſerted into the bone called *os ſcaphoides*. It draws the thumb from the fingers. See *Tab. Anat.* [illegible] *fig.* 3. *n.* 31. *Tab. Anat.* [illegible] *fig.* 2. *n.* 21. *Tab. Anat.* [illegible] *fig.* 3. *n.* 15. *Tab.* [illegible].

ABDUCTOR *pollicis pedis*, or *hallucis*, a name given by Albinus to a muſcle of the hand called by Winſlow, Cowper and others, EXTENSOR *primi internodii*.

ABDUCTOR *ſecundi internodii pollicis manus*, or *extenſor primus*, a name given by Albinus to a muſcle of the hand called by Winſlow, and ſome others, the EXTENSOR *primi*; and by the generality of Authors, by names but little expreſſive, as ANCÆUS or ULNÆ. Bidloo calls it *carpo-phalangæus primus*, and Spigelius, *cubito-ſub-phalangæus*. Cowper calls it the *extenſor communis alterius digiti*, and Douglas, the *ſecond pair commonly ſo named*.

ABDUCTOR *pollicis pedis*, or of the great toe, ſpring from the inſide of the *os calcis*, and the greater *os cuneiforme*, and is inſerted into the outſide of the cartilage of the firſt bone of the great toe. It ſerves to draw the great toe from the reſt. See *fig.* 1. *n.* 39. *fig.* 2. *n.* 39.

Some anatomiſts likewiſe reckon four *abductores* of the thigh. ABDUCTOR *femoris*, *primus*, *ſecundus*, or *tertius*, and *quartus*. The office of theſe four muſcles is to withdraw the thigh-bone, according to their different directions.

ABECEDARIAN. See ANABAPTISTS.

ABEL TREE, or ABELE-TREE, a ſpecies of poplar, with large leaves. This tree may be propagated by layers or cuttings, and alſo by ſuckers. Many advantages might be derived from planting it in boggy ſoils, where few other trees will thrive. The wood of it is uſeful for flooring or wainſcoting rooms; and it is preferred for cutlers uſes to any other, on account of its peculiar whiteneſs. The quick rate of its growth, is another that it will yield ſtems of eighteen or twenty feet long in a year, renders it eligible in plantations that are deſigned for ſhade or ſhelter.

ABELIANS, ABELONIANS, or ABELOITES, a ſect in Africa, not far from Hippo, which diſtinguiſhing ſect and practice were in many, and yet live with their wives

in

in a professed abstinence, without having any carnal commerce together. 1 Cor. vii. 29. "The learned have given points to discern the principle they went upon, and the reason of their abstinence, to each sex's peculiar. But, in effect, it is more than probable, they took their measure from Adam for no other reason, but because, like that patriarch, they had no (flesh) marriage to consummate after marriage; but because he was killed before he left married."

ABELICEA, the name of a very tall tree, growing principally in Crete, called alſo cupreſſus monſtrosa, and pinus cretenſis.

ABELMOSCH, a ſpecies of the okra, or Pelusa Cretica.

ABELMUSCH, or Abrumusk, the muſk-ſeed, a ſmall odoriferous ſeed brought from Egypt, chiefly uſed in perfumes. The beſt comes from Martinico.

ABELUITES, } See Abelians.
ABELONIANS, }

ABENSI, *Gaius*, a freed-man of the ſecond or third century, mentioned in the firſt book of the conſtitutions Liber.

ABERRATURIRE, Abberuncare, in *ſecond Lexicons*, ſignifies to murder that has been planned, or made private by a ſubſequent proceſs.

The word is Aper-ſcatere, compounded of *aper*, *proved* as cave; and *ſcatere*, *throw* or *remove*.

In this ſenſe, *aperſcatere*, called alſo *exterminare*, amounts to the ſame with *occidere* and *necare*, or *necare occulte* and *ſtrage*; and ſtrage applied to open murder, which was not attended formerly with the authority of the law.

Lambard explains *aberruncare* by *ſubmovere* and *tollere*, and *ſcatinus*, by *occidere*, *exterminare*, and *ſubmovere*, by *aperſcatere* and *aperſcatinus* by *aperſcatere* and *aperſcatinus* by *aperſcatere* and *aperſcatinus*

lord's improvements, because they mistook upon a pre-conceived theory of his own. At last, however, convinced of their reality and importance by Mr. Clairaut, he admitted; and soon after received further satisfaction from the experiments of M. Zeuner, of Petersburgh.

M. Zeuner demonstrated, that it is the *kind*, or the composition of glass, which gives it that remarkable property; that, while the refraction of the mean rays is nearly the same, that of the extreme rays confessedly differs; and by increasing the least, he produced a kind of glass, which occasioned a much greater separation of the extreme rays, than the first glass which Mr. Dollond had made use of, and to the same proportion considered the mean refraction. M. Zeuner, in the course of his experiments, made glass of mercury and flint, with a contrary or reverse effect; and found, that this mixture greatly diminished the mean refraction, without making hardly any change in the dispersion; and at length obtained a kind of glass greatly superior to the first glass of Mr. Dollond in the construction of telescopes. Hence it occasioned less loss or great a dispersion of the rays as the common glass, while the mean refraction was only as 2 to 3.

In 1758, Mr. Dollond made a further improvement in telescopes, by introducing new object-glasses of crown glass and one of flint. See Phil. Trans. vol. L. p. 733, 743; and vol. LV. p. 36. Hill. Ac. Par. 1750, p. 185, 622. Hunt, 1760, p. 192. Gaed. Mem. for XVI. p. 322. Ac. Berl. 1762, and 1766.

For a further account of Mr. Dollond's new refracting or achromatic telescopes, see the article TELESCOPE.

ABERRATION, *aberratio*, of, is a luminous circle, surrounding the real disk of the sun, and depending on the *aberration* of the *fixed stars*, whereby his apparent diameter is enlarged.

ABERSION, diet or duty.

ABESSI, the same as ABASSI: they signify the money that remains of the demesne, after the clyde is separated from it; that is, rent-corn.

ABESTOS, or ASBESTOS, the name of one of the sacred stones in the Persian Magic, which they attribute to their great founder Zoroaster, or Zeroadish.

The description, a commentary, or exposition of two other of their original books, called Zend and Pezend, together these contain the whole system of the religion or worship of Zoroaster. D'Herbel. Bibl. Orient. p. 911. Hyde de Rel. vet. Pers. c. 21.

According to Du Perron, the *Avesta* signifies the language of the original text of Zoroaster's works. Hill. Ac. Sc. Par. 1761. See SOUDEKUT and SHASTAH.

ABESTON, See ASBESTOS.

ABESUM, unbaked, or quick-lime. See CALX.

ABETTOR, or ABETTER, in Law, one who incites or encourages another to perform felonious criminal; or by some way aids him in the performance itself.

Thus those who procure others to lie and take oaths of felony, of murder against men, to render them infamous, are particularly denominated *abettors*.

So likewise in BURGLARY, are such as advise or procure a murder to be committed, or act steadily therein.

These are stiled in STEALING, but not in TREASON: the law looking on all these concerned in action as principals.

ABEVACUATION, in *Medicine*, denotes a partial evacuation of the peccant humours, either by nature or art.

ABEYANCE, or ABEYANCY, in *Law*, denotes something that only exists in expectation, or in the understanding, or remembrance of the law.

Abeyance, in our law, amounts to much the same as *reversio penes*, among the Romans, and *penes donatorem* or *donatum*, among the Greeks; L. 2. *Lex penes donatorem* or *reposita*, or rather *penes donatum reposita*. So civilians say land and goods do *jacere*; a common lawyer say, that things in like condition are in *abeyance*.

It is a maxim in law, that of every land, either there is a fee simple in somebody, or it is in *abeyance*. If either a freehold ceases by the death of a person, the freehold is said to be in *abeyance*, till a new person be instituted: for the person has not the fee, but only the right of purchasing it, the freehold itself being in the crown or the patentee, and therefore the fee is perpetually in abeyance.

ABGIL, in *Botany*, a name given by some to *Salvia*, or sage-tree, called Sirian, well known as a pot-herb in many countries.

ABIB, in the *Hebrew Chronology*, the name of the first month of their ecclesiastical year. The month was afterwards called Nisan, and answers to part of our March and April.

ABIES, in *Botany*, See FIR-TREE.

ABIETARIUS, See *pinetum*.

ABIETINUS, See RESINOUS.

ABIGEUS, or ABACTOR.

ABILITY is used, in *Law*, for a capacity of doing any thing, relating either to the acquisition of property or the performance of it.

Ability in the former consideration, with regard to property, is applied to persons, or executors.

Every person is supposed to be able, if not to have the power of having and disposing of estates, unless it appears out of statute.

The King's alien are to be able to inherit in England, wherefore sons and children of subjects born beyond sea, may inherit, if their birth were within the allegiance of the King.

ABINTESTATE, ABSQUETESTATO, in the Civil Law, is applied to a person who deceases intestate, or without a will.

ABIRRITATING, an internal remedy, denoting a being that, or extract, from all ANIRRITATIVES, or expedients of any kind.

The Abirritating, or thinning property, is said to arise to give the principles the more active power, by the removal of others for restoring their equilibrium between the living also to exempt the fluids to their common or new state in that comedies.

ABIT, or ABITE, Corn.

ABJURATION, in a general sense, the act of denying, or renouncing a thing in a solemn manner, and even with an oath.

The word is compounded of *ab*, from or away, and *juro*, I swear.

Among the Romans, abjuration signified the denying a debt, pledge, deposit, or the like, with an oath.

In modern times, abjuration is considered with greater propriety, and is distinguished from perjury, as the one is supposed not.

ABJURATION, among lawyers, is used for a solemn renunciation or retractation of some error, or opinion, as false and pernicious.

In one sense it is, to abjure a person, is to renounce all authority or dominion of such a person.

By the act of settlement, a person is not allowed ever to act any regal authority in the person called the Pretender, or ever to any time the inheritance of a subject. 12 and 13 W. III. 1 Geo. I. The articles of the oath required by these statutes are liable to misrepresentations, &c.

The oath of abjuration, by the 5th C. III. and 6 Geo. I. c. 53. is only and expressly to renounce, and disclaim, and abjure the pretended prince of Wales during the life of the late King James the Second, and from the year of pretended reign upon himself the title and style of King of England, by the name of James the Third, or of Scotland, by the name of James the Eighth, or the title and style of King of Great Britain, both and singular, or any whatsoever, to the crown of this realm, or any other dominions thereunto belonging. And I do sincerely profess, and adjure any allegiance or obedience unto them. And I do faithfully promise, to the utmost of my power, to support, maintain, and defend against all traitorous conspiracies, and attempts whatsoever, which shall be made against his person, crown, and dignity, and his successors, by the said pretended prince of Wales, or any other person whatsoever, or persons of or from any power or authority derived, or pretended to be derived, from him or them. And I do my best endeavour to disclose and make known to his majesty, and his successors, all treasons and traitorous conspiracies which I shall know to be against him or any of them. And I do faithfully promise, to the utmost of my power, to support, maintain, and defend the succession of the crown against the descendants of the said James, and against all other persons whatsoever, which succession, by an act, intitled, *An act for the further limitation of the crown, and better securing the rights and liberties of the subject*, is and stands limited to the princess Sophia, late electress dowager of Hanover, and the heirs of her body, being protestants. And all these things I do plainly and sincerely acknowledge and swear, according to these express words by me spoken, and according to the plain and common sense and understanding of the same words, without any equivocation, or mental evasion, or secret reservation whatsoever. And I do make this recognition and acknowledgment, abjuration, renunciation, and promise, heartily, willingly, and truly, upon the true faith of a Christian. So help me God.

An ABJURATION is the oath in use among Catholics, for an oath taken by a person guilty of heresy, who, flying to a place of sanctuary, would swear to forsake it's errors, and live in those of other communities. We also find abjurations of conspiracy, of crime, &c. for three years, for one year and a day, and the like. This, in some cafe,

reason be given, is, that the wound was the husband's property, who was destroyed, by the loss, the sole object of it; to prevent his being impoſed upon in the children he was to bring up. But theſe two laſt are moſt abſurd, who had been impregnated by others than their huſbands.

The foundation on which the practice is ſaid to have been allowed, was, that the fœtus was, as it were, was reputed as a part of the mother, ſuckt as one of her own viſcera, were ſtruck by the ſame power as over the reſt; beſides, that it was not reputed as a man, becauſe no ſenſe, otherwiſe than as a vegetable; unleſs, poſſibly, the ſame comment as little more than that of ſwearing merge here from the text. V. Jurat. Art. 6. n. 300. Scotus Comment. ad Sententiar Magiſtri, l. iii. d. 3. The laſt-cited author repreſents it as a peculiar grace of Heaven, that the ſoul ſo new, the other ſo recent, eſcaped the cruel fleſhy in their beauty and ſtate, deſtroyed the fœtus in his womb. Nequaquam ſine ſpiritu ſanctificationis ſuæ, poſſet infantem ante animationem ſuam occidere non poſſet ante ſuæ rationalitatis ſuæ, ne ante ſuæ rationalitatis ſuæ creationem ſuæ animationem.

The primitive fathers, Athenagoras, Tertullian, Minucius Felix, Auguſtin, &c. proclaimed loudly againſt the practice, as a mortal murder: Homicidam feminam ſit, præſtare non eſſe quod nascatur, quis dubitet? Nec refert natum quis occidat an nascentem. Several councils have declared againſt it. Yet we are told that the moſt Roman eccleſiaſtical laws allow of abortion before 40 days. Sigaus mentions the rules by which a diſtinction may be made.

The practice of artificial abortion is chiefly in the hands of women and matrons, rarely in that of phyſicians; and, in ſome countries, are not admitted to the profeſſion without ſwearing it. Hippocrates, in the oath he would have required of all phyſicians, includes this: and giving the ſame admonitions charge elſewhere he gives the reaſon of it, ſolicitude for himſelf preſented a mark to miſchance. The time for it is generally after impregnation at leaſt within the third or fourth month of pregnancy. The manner of effecting it is chiefly by medicines of the purgative, and ſtrobiliſative kind: Rarely external preſſure of the abdomen, or violent draught, frequent vomiting them. External violences are alſo ſometimes, but uncertain as to hoping from a blow, preſcribed by Hippocrates: or Ovum collapſum, and conſequent evacuations, have been frequently practiſed for the ſame end. Yet all the powers of medicine often fail in theſe cases abortive, by reaſon of the unnatural cloſe contraction of the orifice of the uterus, which has been known to hold out againſt the moſt violent means, ſyſternutics, fellations, and the like; againſt the ſtrongeſt purgatives and evacuations; againſt the ſtrikingeſt effects of terrors, fears, fevers, &c. againſt large quantities of crocus metallorum, antimonii, myrrhæ, ſantarum, the forms of medicine ſo-reſtrictive, &c.

The moſt leaſt method is by puncture of the uterus, with a pointed inſtrument for the purpoſe; but abſolutely wanting as, and unknown to the ancients. Fabricius mentions a midwife hanged at Paris, for killing a fœtus in the womb, by ramming a bodkin, or kind of needle, up the vagina, through the orifice of the uterus; by which miſcarriage was produced, but with ſuch ill effects, that the mother was ſeized with convulſions, and died miſerably. The examined midwife ſaid ſhe had received many bribes in the ſame manner, with good effect. One new and country eſpecially a peculiar inſtance, a woman having been four years ago executed among us for the like fact. Amatilius has a paſſage, which ſhews the ſame was practiſed in thoſe days, of others among the Indians, qui ſuppoſitis in genitalia caſtoreis, aut purgationibus appoſitis, partus excutiunt ſuboles ſuas interficiunt. The operation, conſidering the tenderneſs of the part, muſt be of the utmoſt danger. Hereabouts gives an account of what he obſerved in diſſecting a girl at Nuremberg, in 1712, who died of the operation which ſhe had performed on herſelf; the neck of the uterus appeared exceedingly diſtended, the ſeveral tunicles incurred and exceriated, the uterus itſelf inflamed and putrefied, &c.

Abortion may be procured by violently compreſſing the belly, the præcordia, the membranes, or the umbilicus. When the time of miſcarriage is juſt at hand, the pains are much the ſame as thoſe in labour.

Abortion is dangerous when the time of pregnancy is far advanced, ſo that the fœtus muſt be large; where the cauſe is very violent, or the patient ſtrongly conſtituted, and where a large hæmorrhage precedes, or enſues, or the fœtus is putrified, &c. Under other circumſtances it rarely proves mortal.

Abortion is alſo uſed, ſometimes ſimilarly, for a fœtus, which, dying in the womb, continues there beyond the natural term; ſometimes ſeveral years, and even during the whole life of the mother.

ABORTIVE, ſomething early born, or in the ſtate of a fœtus that arrived at its maturity and perfection.

ABORTIVE Bee, Queen abortive, is ſometimes uſed among the naturaliſts, as ſynonymous with exeſtous or ſpurious, to denote the inſects to which the ſame are given. In this ſenſe, the name is contrary to the magnificent epithet for that which end is ſaid to be long to reign, Regnum quæ nescit habere exercitum. See Exeſtous.

Among modern phyſicians, abortive fevers are chiefly underſtood of a kind of intermittings, which ſometimes precede, and bring on abortion, or other diſeaſes, and ſooth to the act of evacuation.

The cauſe is a ſudden ſeparation of the membranes from the uterus, which was firſt found to be effected by the ſeparation of the placenta, or ſecundine, or the cord. Thence the lightning and ſtroke of the phyſician. Thence the ſhivering and horror, the ſickneſs, the ſcobilitudines, or the ſtrikings before the eyes, ſhort returns occaſioned by abortive haemorrhages.

ABORTIVE herb, a deſcription of corn mentioned by Mr Tillet, and ſuppoſed to be occaſioned by putting it to grow long before harveſt, and ever ſo known by a ſuperiority in the ſtalk, the leaves, the ear, and even the grain.

ABORTIVE ſeaſon is much of the ſame as the laſt.

ABRA, a ſilver coin in Poland, nearly equivalent to the Engliſh ſhilling. It is current through all the dominions of the Grand Seignior, at the value of one fourth of the Holland's dollar, or about Ten-Cents.

ABRACADABRA, a magic word, recommended by the ancients Sammonicus, ſuppoſed to have the virtue of a charm or amulet, in curing agues, and preventing inflammation, particularly the fever called by the phyſicians ephemera.

To have this effect, the word muſt be wrote on paper, and repeated, omitting each time the laſt letter of the former, ſo that the whole may form a kind of inverted cone, in which there is this peculiarity, that whole words appear the ſame backwards as forwards, and the ſame from the right, and from the left hand; and, as many will have it, the ſame ſtanding as it is found in the firſt whole line. According to Julius Africanus, another manner exiſted, the pronouncing of the word in the ſame manner as we do now.

ABRAHAMIANS, or ABRAHAMITES, a ſect of heretics, who aſſumed the name of the Patriarch.

They took up the name from that of one Abraham, a native of Antioch, of the Arabs called Tachiens, who was alſo the author of their peculiar tenets in point of faith. The Abrahamians were about the end of the eighth century, and were ſuppreſſed by the vigilance of Cyrenus, patriarch of Antioch.

ABRAHAMITES is alſo uſed in Cox. Hiſtory, for a race of monks, who reſiſted death on the worſhip of images under Theophilus.

ABRAMIS, in Ichthyology, a name given by Belonius and others, to the cyprinus brama, or breme.

ABRANA, among ſtonemen with cloſets or pits of the habitations; or places, where the ſtone is to remain and harden as to be faſhioned to uſe.

ABRASAXAS, an antique in the form of a ſtone. See Abraxas.

ABRASION, in Surgery, and among Medical Writers, for the act of wearing away the natural mucus which covers the membranes, and particularly thoſe of the ſtomach and inteſtines, by ſharp corroſive medicines, or tumours.

The word is compoſed of the Latin ab, and rado, to ſcrape off.

ABRAUS, in Natural Hiſtory, a name given by ſome writers, to a ſpecies of eel-pout, called in England by the name of cunners, &c. to give a late account of new authorities, and new names; but I know of no Welſh, but miſtaken Saxon or Germans and Dutch.

ABRAXAS, a fictitious word, ſignifying a number which is produced when the ſeven Hebrew letters, the number of days in the week, and Egyptian letters, the number of days in the year.

Abraxas is a word of ſeven ſyllables, formed by ancient Gnoſtics or Baſilidians from the Greek letters, conſidered as numerical characters, according to the cuſtom of the Greeks, who expreſſed their numbers by letters of the alphabet; the values of which in the preſent word ſtands thus: A 1, B 2, R 100, A 1, S 200, A 1, X 600, which added together make the number 365.

The word is variouſly written, among modern authors, abraxas, abrasax, and ſome have added, by a corrupt pronunciation of the letter B and V, the abraxas, or as is found on all the Greek remains, as well as on ancient ſtones. Iſaac Caſaubon has abraxas, but the moſt uſual is abraxas, and the chapter in which the word occurs is only extant in Latin;

ABROTANUM, or ABROTONUM. See SOUTHERNWOOD.

ABRUGI. See ARROW.

ABRUS, in the *Materia Medica*, the name of a seed produced by one of the phaselus, or kidney-beans, and commonly called Angola-seeds.

ABSCESS, in *Medicine*, a kind of inflammatory tumour, containing purulent matter, pent up in a fleshy part, and corrupting and confuming the flesh, and other substance thereof.

Abscess is the same with what the Greeks call *apostema*, and the English *imposthume*, or *impostumation*.

Although all *abscesses* are the consequences of inflammation. The ripening of *abscesses* is promoted by poultices, &c. *Abscesses* are opened either by caustic, or incision; but the latter way is in most cases preferable.

Abscesses arise often in women after delivery; and though dangerous in themselves, yet they often appear to be the *crisis* of the disease, that gave rise to them. For the cure, if they cannot be discussed, i. e. carried off by proper artificial evacuations, as phlebotomy, purging, &c. with the occasional use of calomel, and gentle peripirative fotuses, liniments, and cataplasms; recourse is to be had to the contrary method, and they muft be brought to suppuration.

ABSCISSE, ABSCISSA, in *Conics*, a part of the diameter or tranfverse *axis*, of a conic section, intercepted between the *vertex*, or some other fixed point, and a femiordinate. See CONIC *Section*.

Such are the lines A P, A P, &c. (*Tab. Conics, fig.* 20.) intercepted between the vertex A, and the femiordinates PM, PM, &c. which are called *abscisse*, of the Latin *abscindere, to cut off*; as being parts cut off from the *axis*. Others call them *segmenta*, q. d. *secta*.

In the *parabola* the *abscisse* is a third proportional to the *parameter* and femiordinate; and the *parameter* a third proportional to the *abscisse* and femiordinate.

In the *ellipse*, the square of the femiordinate is equal to the rectangle of the *parameter* into the *abscisse*, fubmitting another rectangle of the fame *abscisse*, into a fourth proportional to the *axis*, *parameter*, and *abscisse*.

In the *hyperbola*, the squares of the femiordinates are to each other as the rectangles of the *abscisse* into another line, compofed of the *abscisse* and the tranfverse *axis*.

ABSCISSION, in *Rhetoric*, is a figure of fpeech, when beginning to fay a thing, we break off short, as fuppofing the matter fufficiently fignified, by what has been already faid. Cicer. ad Heren. lib. iv. cap. 35.

For an inftance: one of her fex, age, and beauty, to be feen alone, at fuch an hour, with a man of his character.—I need fay no more.

Abscission is a fpecies of ellipsis, or fuppreffion. Scaliger diftinguifhes it from praecision, and fufpenfion.

Aftrologers alfo fpeak of an *abscission* of the light of a planet, by another planet's paffing by it, and joining a third before it. *Abscission* is held a detrimentous.

ABSCISSION, in *Surgery*, denotes the act of taking away fome morbid or fuperfluous part by an edged inftrument. In this fenfe *abscission* amounts in the fame with the Greek ἀποκοπή. Cowper fpeaks of the *abscission* of a leg; which is more properly called amputation. The *abscission of the* prepuce makes what we call circumcifion. *Abscission* of the ears is a kind of legal punifhment, inflicted on perjury. In fome countries they alfo practife *abscission* of the nofe, on traitors in an army, as a punifhment reputed worfe than death.

ABSCISSION, in more propriety ufed for the operation of cutting away fome loft part of the body, when depraved, or grown horrid.

In which fenfe, *abscission* differs from amputation, in that the latter is of whole or bony part, the former of a fleshy or membranous one; yet they are fometimes confounded.

We fay the *abscission* of a nerve, lip, cheek, or the like. Mr. Shipton gives an inftance of the *abscission* of a portion of the jugular, not being mortal. Phil. Trans. N° 263.

ABSINTHITES, ABSINTHITUM, or ABSINTHIATUM, fomething tinged or impregnated with the virtues of *abfinthium*, or WORMWOOD.

Barthelin mentions a woman whofe milk was become *abfinthiated*, and rendered bitter as gall, by the too liberal ufe of wormwood. Act. Med. tome iii.

Vinum abfinthites, or peraithes abfinthiatum, wormwood wine, is much fpoke of among the ancients, as a wholefome agreeable drink, and even an antidote againft drunkenneſs; though fome have charged it with being offenfive to the head, and liable to cauſe fevers, cephalalgies, vomitings, uterine fluxes, &c. Ray alfo makes it a preventive of scurvy. The preparation is given by many. According to the common account, it is made by infufing the leaves of the plant in a quantity of wine. But Lehr fhews that it fhould rather be prepared by fermentation, in order to correct the crudities of the plant, and call forth its volatile falt. Paulli prepares it even without *abfinthium*. Dr. Bowle preſers the *aqua abfinthites*, or wormwood-water taken in a fmall quantity after meals, to the wine; as being leſs liable to affect the head, and fill it with vapours.

ABSINTHIUM, in *Botany*. See WORMWOOD.

ABSINTHIUM is alſo a name given by other plants, by different authors; as to dwarf *pharnacia*, with leaves divided like the leaves of wormwood; alſo to the Alpine *chamaecifus*, with fouthernwood-leaves.

ABSIS. See APSIS.

ABSOLUTE, in a general fenſe, fomething that ſtands free or independent.

ABSOLUTE, in *Metaphyſics*, denotes a being whofe whole eſſence does not conſiſt in a mere habitude or relation to another.

In which fenſe *abſolute* ſtands oppoſed to *relative* or *reſpective*.

ABSOLUTE is more particularly underſtood of a thing which does not proceed from any cauſe, or does not ſubſiſt by virtue of any other being, conſidered as its cauſe.

In which ſenſe, God alone is *abſolute*.

Abſolute, in this ſenſe, is ſynonymous with *independent*, and ſtands oppoſed to *dependent*.

ABSOLUTE alſo denotes a thing's being free from conditions or limitations.

In this ſenſe, the word is ſynonymous with *unconditional*. We ſay, an *abſolute decree*, *abſolute* promiſe, *abſolute* obedience. The covenant with Noah was *abſolute*, and without conditions; that under the Goſpel, on condition of faith and obedience. The Antinomians alſo hold the goſpel-covenant *abſolute*, and that Chriſt has purchaſed our ſalvation, without any conditions to be performed on our parts.

ABSOLUTE *government*, that wherein the prince is left ſolely to his own will, being not limited to the obſervance of any laws, except thoſe of his own diſcretion.

When the Dukes made their king *abſolute*, in 1660, they declared him abſolved from his coronation oath.

ABSOLUTE *number*, in *Algebra*, is the known quantity or number which poſſeſſes one entire ſide, or part of an EQUATION; being the rectangle or ſolid whoſe root or value is to be found.

Thus, in the equation $aa + 36a = 36$, the *abſolute number* is 36; which is equal to a multiplied by itſelf, and added to 36 times a.

This is what Vieta calls *homogeneum comparationis*.

ABSOLUTE *equation*, in *Aſtronomy*, is the ſum of the optic and excentric equations.

ABSOLUTE *ablative*. See ABLATIVE.

ABSOLUTE *motion, place, ſpace*. See the reſpective ſubſtantives.

ABSOLUTELY, in a general ſenſe, ſtands oppoſed to *reſpectively*. See RELATIVE.

Thus the terms of a propoſition are ſaid to be taken *abſolutely*, that is, without relation to each other. Man, conſidered *abſolutely*, and in himſelf, is a reaſonable creature.

ABSOLUTELY is alſo uſed for *unlimitedly* or *unconditionally*. In which ſenſe, the ſchoolmen oppoſe it to *ſecundum quid*. Thus a thing is ſaid to be *abſolutely*, and ſimply, good.

ABSOLUTELY is alſo uſed by *Divines*, in oppoſition to *declaratively*.

The church of Rome holds, that a prieſt can forgive ſins *abſolutely*; the proteſtants ſay, only *declaratively*, and miniſterially.

ABSOLUTELY, in *Geometry*, is taken for entirely, or completely. Thus we ſay, ſuch a thing is *abſolutely* round; in contradiſtinction from that which is only partly ſo; as a ſpheroid, cycloid, &c.

ABSOLUTELY, in *Grammar*; we ſay, a word is taken *abſolutely*, *abſolute ſumptum*, when it has no *regimen*, or government. Thus, in the phraſe, We ſhould pray without ceaſing, the word *pray* is taken *abſolutely*, as it governs nothing.

ABSOLUTION, ABSOLUTIO, in the *Civil Law*, &c. a definitive ſentence, whereby a perſon, accuſed of any crime, is acquitted, and declared innocent.

Among the Romans, the ordinary method of pronouncing judgment was this: after the cauſe had been pleaded on both ſides, the people aſked the word *diceruat*, q. d. they have ſaid what they had to ſay; then three ballots were diſtributed to each judge, marked as mentioned under the article A; and as the majority fell of either mark, the accuſed was *abſolved* or condemned, &c. If he were abſolved, the prætor diſmiſſed him with *vadatur non poſſe, ne vadetur poſſe*.

ABSOLUTION, in the *Canon Law*, is a juridical act, whereby a prieſt, as a judge, remits the ſins of ſuch as, upon confeſſion, appear to have the conditions requiſite thereto.

The Romaniſts hold *abſolution* a part of the ſacrament of penance: the council of Trent, ſeſſ. xiv. cap. iii. and that of Florence, in the decree *ad Armenos*, declare the form

form or essence of the sacrament to lie in the words of *absolution*, I absolve thee of thy sins.

The formula of absolution, in the Romish church, is absolute: in the Greek church, it is deprecatory; and in the churches of the reformed, declarative.

In the church of Rome there are divers other political *absolutions*; as,

ABSOLUTIO *ad cautelam*, which is necessary where a person has been witness to the execution of sentence of death on a criminal, or has any other way disqualified himself for the holding of a benefice.

ABSOLUTIO *ad cautelam*, is that granted to a person who has lodged an appeal against a sentence of excommunication, by which the force of the sentence is suspended.

It being a maxim, in the papal jurisprudence, that the sentence stands good, notwithstanding any appeal; this sort of *absolution* is sometimes granted until the issue of his appeal be known; by means hereof, some articles, at least, of his excommunication, are taken off; insomuch that persons may converse with him without danger: and, besides, in case of death, the sentence is supposed to be of some avail to him.

ABSOLUTISM, the *system* of God's acting absolutely in the affair of salvation: maintained by the CALVINISTS, for which, among other doctrines, the LUTHERANS reject all union with them.

ABSORBENTS, in a general sense, is used for such things as have the faculty of *absorbing*, or swallowing up others.

Alkies are an *absorbent* in respect of water, though not in the sense supposed by Aristotle, from whom we derive a vulgar error, that a pot full of ashes will still *absorb* as much water as if empty. Cloves are so evident an *absorbent* of moisture, that we are told, if care be not taken in the inspecting, to keep all water, wine, and the like, at a good distance from them, a certain quantity of cloves will, in two days time, drain a whole hogshead of wine. M. Homberg has a discourse on the quantity of acids *absorbed* by terrestrial substances, wherein he shews how much cold any known acids will strain. M. de la Hire gives an experiment for ascertaining the quantity of water *absorbed* by plants. Mem. Acad. R. Scienc. an. 1700. p. 81.

ABSORBENTS, in *Medicine*, remedies which, by the loftiness or porosity of their component parts, become proper to discharge the asperities of sharp pungent humours; or to imbibe or dry away, as with a sponge, superfluous moistures; and are of divers kinds; simple, compound, saline, sanguineous mucous, fixed, earthy, acid, alkaline, &c. In the *Pharmacopœias*, we meet with several forms of *absorbents*; such are the testaceous powders, hartshorn, coral, crab's eyes and claws, calcined bones, burnt ivory, *terra sigillata*, and even iron itself: also divers woods; as sanders, mullin, guaiacum, sassafras; and divers roots; as china, sarsaparilla, &c.

Absorbents consume the humours without soiling them, and have sometimes the effect of strengthening; sometimes of purgatives, ofterns of calomel, to allay fermentations. They are of use for tempering acrimonies, and, after emollients and aperients, for healing tumors: some hold them necessary for preventing the ill effects of bitters: they are good in cardialgias or heats of the stomach, and hiccups; they are also given in bellies and other chronical cases, as coughs, though with great caution and reserve. *Absorbents* have also their ill effects; especially if too lavishly given, being liable to many congestions in the *viscera*: they are hurtful in the itch, bilious fevers, dysenteries, hypochondriacal and hysteric cases, quartans, &c. according to some. Juncker.

They are generally prescribed as the only remedy for the acute diseases of infants, though held by others rather hurtful to children, by loading their tender viscera, and creating obstructions in the capillaries.

Particular kinds of *absorbents* have their particular effects; old cuttlebones are preferred for children; magnesias and compositions are least suitable, as being always made fermented with acids. *Absorbents* tempered with cold juices, as of citrons, are good in coughs and exanthems prepared with cinnabar in itches; with nitre, gypsum, in the bubeus; saline, in the itch; mariner in chronical cases of the head; in which last case, the cranny are hurtful.

They are sometimes applied to ulcers; but little to be observed, that the milder terrestrious *absorbents*, such as coral, &c. put into an ulcer, where a bone is carious, can have little other effect than to imbibe the matter of the ulcer; if they fall into any convulsion of the corrupted juice, they may remain so long there, that the matter they imbibe may become acrid. Lister in an *absorbent*, which has not this disadvantage. Hamon, in Med. Eff. Lond. vol. v. art. 24.

The taking of an immoderate quantity of crab's eyes, and other *absorbents*, for the heart-burn, has sometimes been attended with fatal consequences. See Phil. Trans. N° 439. fect 2.

Van Swieten in his comment on Boerhaave's Aphorisms, observes, that these *absorbent* powders ought not to be ground too fine, but rather left somewhat coarse, as they will be less apt to concrete and prove dangerous.

It is a necessary caution to drink diluting liquors with them; also to take gentle purges; as well for some time after they are left off, as during the use of them.

Astringents are much the same with what we otherwise call driers and sweeteners. Latin writers also use the word as synonymous with *anhidrotica* and *siccantia*.

The term *absorbent* is frequently confounded with *alkalies*, alkalies having, really, the effect of *absorbents*, with respect to acids.

ABSORBENT *vessels*, a minute kind of vessels, found in animal bodies, which attract and imbibe the nutritious, and other matters brought near their mouths.

These are sometimes also called *vasa seu venæ vessels*, and sometimes *absorbent pores*.

Absorbent vessels are found in all parts of the body, especially where the membranes lie open to cavities, as in the mouth, œsophagus, stomach, intestines, &c. A late author computes no less than 7000,000,000 in one square foot of the surface of the stomach; by these, mercury, plasters, and the like medicines externally applied, enter the habit of the body; to these are also owing the instantaneous effects of spirits, drams, water, &c. upon the body. The like vessels are also numerous in the skin; where they are supposed to imbibe the fluid matter floating in the ambient air, and convey them into the body. Mortimer. Exerg. Inaug. de Ingref. Humor. in Corp.

It has been said that there are no *absorbent* veins, and that absorption is performed entirely by the valvular *lymphatics*. But if this were the case, we should be continually subject to a *hydrocephalus*; because in the head no valvular *lymphatics* are found. It is plain that there are *absorbent* veins that open into the cavities of the body, because in the ulcers the extravasated water is frequently received into the circulation, and discharged by urine or stool. Dr. Hunter ascertains it by the following experiment on a living dog; an opening was made in the cavity of his belly, and three quarts of warm water injected and secured; five hours after he was examined, and not above four ounces of the water remained.

For farther satisfaction on this subject, consult Hunter's Commentaries, and Dr. Garnet's Observations on them, in the Medic. Mus. vol. ii. p. 229; and also Dr. Wilkinson, ibid. p. 217, &c.

Absorbent vessels are more particularly used for those lacteals which open into the sides of the intestinal tube, to imbibe the chyle in its descent from the stomach, and convey it into the mesenteric veins.

Nasmyth, Malpighi, Leeuwenhoeck, De la Hire, &c. speak of the like *absorbents* in plants; the fibrous or hairy roots of which are considered as a kind of *vasa absorbentia*, which attract and imbibe the nutritious juices from the earth.

ABSORDING, the act of sucking up, or imbibing another body. Sir Isaac Newton shews that black bodies *absorb* all the rays they receive, and that those rays of light which impinge against the solid particles of bodies are *absorbed* and lost: but it appears from some later experiments and observations of M. Bouguer, that this effect is to be attributed, not to the impact of light on the solid parts of bodies, but to the action of those power diffused over their surfaces. He found by repeated trials on the reflection of light, from the surface of water, and of different pieces of crystal, that a considerable quantity of light, when the angles of incidence were small, was actually extinguished. This effect, he observed, was diminished by increasing the incidence; to that, at an inclination to crystal or above 45° 49', a very small part of the rays were *absorbed*, though some few were lost, when they fell perpendicularly on the reflecting surface. See his Traité d'Optique. Paris, 1760.

ABSORPTION, in the *Animal Oeconomy*, is used for that power whereby the small open orifices of vessels imbibe liquors lodged in the cavities of the animal bodies. This, according to Dr. Monro, is observed to increase or diminish proportionably to the strength or weakness of the arteriole. Med. Ess. Edinb. vol. ii. p. 6, 2.

Fluids applied to the surface of the body are also absorbed through the minute pores of the skin, and the mouths of a set of vessels appropriated for this action; which, besides the property of capillary tubes, possess also a contractile power from irritation.

ABSORPTION *of the earth*, a term used by Kircher and others, for the sinking in of large tracts of land, by means of subterraneous commotions, and many other accidents.

Pliny tells us, that in his time the mountain Cymbetus, with the town of Eurine, which stood on its side, were wholly *absorbed* into the earth, so that not the least trace of either remained; and he records the like fate of the city Tamasia in Magnesia, and also it of the moun-

tain Sypelus, hath thus *absorbed* by a violent opening of the earth. Cabira and Garnaim, towns once famous in Phœnicia, are recorded to have flagged the same fate; and the vale promontory, called Hilegium, in Achaia, after a violent earthquake in the night-time, was not to be seen in the morning, the whole having disappeared, and the earth closed over it. These and many other histories, attested by the authors of great credit among the ancients, abundantly prove the fact in the earlier ages; and there have not been wanting such many instances of more modern date. Kircher's Mund. Subter. p. 57.

The mountain Picus, in one of the Moluccs Isles, was so lofty, that it appeared at great distances as an immense column reared erect in the air, and served as a land-mark to sailors; an earthquake in this island destroyed it, at one instant the whole mountain was *absorbed* into the bowels of the earth, and no mark of its place remained, but a salt lake of water exactly answering to the shape of the base of the mountain. A like accident, but of a more terrible kind happened in China, in the year 1556, when a whole province of the mountainous parts of that kingdom was in one moment *absorbed* into the earth, and all the towns buried, the whole number of the inhabitants sinking with it, and an immense lake of water remaining in its place to this time. Of much later date is the destruction of a city in the confines of Switzerland; but this, though gradually said to have been swallowed up into the earth, was not precisely an *absorption*, for the whole city was buried by the fall of a mountain upon it.

The burning mountains, Vesuvius and Strongylus, both once very high, have in length of time lost half their height, the upper part having been undermined by the burning, and having fallen into, and been *absorbed* by the under part. And in the year 1646, during the terrible earthquake in the kingdom of Chili, several whole mountains of the Andes disappeared, and were one after another wholly *absorbed* in the earth.

These, and a thousand other accidents of the like kind, prove the truth of *absorption* in general; some of them leaving level ground in the place of the things *absorbed*, some immense chasms and cracks, and some lakes of fresh or salt waters; and it may be that many immense lakes were formed in ages, of which we have no histories by the like *absorptions*.

Pliny gives many accounts of the restoring of places thus *absorbed*, but later observations do not give an equal credit to those parts of this history.

There are instances, however, of islands being produced, though we cannot affirm them to have appeared in the place of any which have been *absorbed*.

In the year 1638, an island was raised near St. Michael's in the Atlantic ocean, by subterraneous fires, which threw up stones and other subterraneous productions, in such quantities that they formed an island of five miles in length. The mountain raised in one night, in the sea near Pozzoli, is another instance of this sudden production of such mountains; this appeared after one night's violent subterraneous conflict, and still keeps its place, and is known by the name of Mons Sanctus.

ABSTEMIOUS, is properly understood of a person who refrains absolutely from all use of wine.

It is compounded of *abs*, *from*, and *temetum*, *wine*.

The history of Mr. Wood, in the Medic. Transf. vol. ii. p. 362. art. 18. is a very remarkable exemplification of the very beneficial alterations which may be effected on the human body, by a strict course of abstemiousness.

The Roman ladies, in the best ages of the republic, were all enjoined to be *abstemious*; and that it might appear, by their breath, whether or no they kept up to the injunction, it was one of the laws of the Roman civility, that they should kiss their friends and relations whenever they accosted them.

ABSTENTUS, among *Civilians*, is understood of an heir who holds by his time from taking on him an inheritance. Among *Ecclesiastical Writers*, the word is also used for a person excommunicated.

ABSTERGENTS, or ABSTERSIVES *medicines*, more usually called among physicians DETERGENTS, are cleansing *medicines* of a phlegmatic nature, capable of dissolving concretions formed of serum and oil, which some imply, to an obscure, cannot effect.

ABSTINENCE, in a general sense, the act or habit of refraining from something which we have a propensity to, or find pleasure in.

The word is derived from *abstinere*; formed of *abs*, *from* and *teneo*, *to hold*.

The Jews were obliged to abstain from their wives at certain times. The same is enjoined, in the Apostolical Constitutions, on all fasts and meagre days; the church of England recommends certain days of fasting and *abstinence*.—*Abstinence from fish* has been enjoined by statute ever since the Reformation, particularly on Fridays and Saturdays, and on vigils, and all commonly called fish-days, 2 and 3 Ed. VI. c. 19.—The like injunctions were renewed under queen Elizabeth, but at the same time it was declared, that this was done, not out of motives of religion, as if there were any difference in meats, but in favour of the consumption of sea-fish, and to multiply the number of fishermen and mariners, as well as store the stock of sheep. 5 Eliz. c. 5. The great fast, says Augustine, is to *abstain* from flesh.

The ancient athletæ lived in a perpetual *abstinence* from all kind of sensible pleasure to render their bodies more robust and hardy.

ABSTINENCE is more particularly used for a spare DIET, or a slender parsimonious mode of food.

The physicians relate wonders of the effects of *abstinence* in the cure of many disorders, and in protracting the term of life. The noble Venetian Cornaro, after all imaginable means had proved vain, by that his life was despaired of as forty, recovered, and lived to near a hundred, by mere dint of *abstinence*; as he himself gives the account.

Most of the chronical diseases, the infirmities of old age, and the short lives of Englishmen are owing, according to Dr. Cheyne, to repletion; and may be either cured, prevented, or remedied, by *abstinence*.

Among the brute creation, we see extraordinary instances of long *abstinence*.—It is the natural course of divers species to fast four, five, or six months every year, without either eating or drinking: accordingly the tortoise, dormouse, serpent, &c. are observed regularly to expire, at certain seasons, to their respective cells, and hide themselves: some get into the caverns of rocks, of trees; others go holes under ground; others get into the mud, and lay themselves up in the slime of rivers; others bury themselves under water, &c.

The serpent kind bear *abstinence* to a very great degree. We have seen rattle-snakes that have subsisted many months without any food, yet still retain their figure and sprightliness. Dr. Shaw speaks of a couple of *aspides* (a sort of Egyptian serpents), which had been kept five years in a bottle close corked, without any sort of food, unless a small quantity of sand, wherein they coiled themselves up in the bottom of the vessel, may be reckoned as such; yet, when he saw them, they had cast their skins, and were as brisk and as lively as if just taken.

In effect, several species of birds, the whole tribe almost of insects, and many among the other tribes, are able to subsist all winter, not only without food, but many of them without respiration too.—This furnishes an admirable instance of the wisdom of the Creator: the proper food of those creatures, especially the insect tribe, being then wanting, there is a provision for them to live without it. When the fields are divested of their flowery furniture, and the trees and plants are stripped of their fruits, what would become of such animals as are subsisted only by the produce of the spring and summer, and of others which are incapable of bearing severe colds? To prevent the total destruction and extirpation of many species of animals, the Author of nature has provided, that creatures, that have served of their food, should be likewise impressed with a power, to lead them thus to shelter themselves out of the way of danger; and that, when there arrived, the natural texture and viscidity of their blood should dispose it, by a further degree of cold, to log and stagnate in the vessels: so that the circulation stopping, and the animal functions being, in a great measure, suspended, there is no sensible waste or consumption of parts, but they remain in a kind of drowsy neutral state, between life and death, till the warm sun restores both them and their food together, by thawing the congealed juices, both of such animals and vegetables. The fact, however, is questionable; and will be more particularly considered hereafter.

It is more than probable, that all motion of the animal juices is extinct in flies, and other insects, when thus asleep; in that, though cut in pieces, they do not awake, nor does any fluid come out at the wound, unless some extraordinary degree of warmth hath been first applied to unbind the congelation.—The sleep of such animals is little else than death, and their waking a resurrection.—For if life does not consist in a circulation of the blood, we do not know what it consists in.

Hence it is no wonder that tortoises, dormice, &c. are found so fat and flashy, after long months *abstinence*, as before. Sir C. Lyttelton weighed his tortoise several years successively, as its going to earth in October, and coming out again, in March; and found that of four pounds four ounces, it only used to lose about one ounce. Vide Phil. Transf. N° 194.

It is to be added, that in most of the instances of long *abstinence* related by naturalists, there were apparent marks of a texture of blood and humours, much like that of summer beasts and insects; though it is no improbable opinion, that the air itself may furnish something for nutrition. It is certain, there are substances of all kinds, animal, vegetable, &c. floating in the atmosphere;

mosphere; which must be continually taken in by respiration: and that an animal body may be nourished thereby, is evident in the instance of vipers; which, if taken when first brought forth, and kept from every thing but air, will yet grow very considerably in a few days. So the eggs of lizards are also observed to increase in bulk, after they are produced, though there be nothing to furnish the increment but air alone: after the like manner as the eggs or sperm of fishes grow, and are nourished with the water. And hence, some say, it is, that cooks, turnspits dogs, &c. though they eat but little, yet are usually fat.

ABSTINENCE is also used sometimes to signify a *suppression*. Thus in Cœlius Aurelianus, *abstinentia fœtoris*, signifies a suppression of sweat. Sometimes in this author it means a *compression*; as *Spiritus ab abstinentiam clunium*, means the wind shut up in the intestines by compression, thereby causing the ILIAC *passion*.

ABSTINENTES, in *Ecclesiastical History*, a sort of people, in the ancient church, who carried *abstinence* and mortification so far, that they have been put in the catalogue of heretics; though wherein their error consisted is little agreed on.

Some represent the *Abstinentes* as the same with those otherwise called *Continentes*, and that they particularly enjoined *abstinence* from the use of marriage: others say, from flesh, and others from wine. Others will have them a branch of the GNOSTICS, and that their heresy consisted in holding flesh evil in itself, and created by the devil. Some make them the same with the *Hieracites*; others with the *Encratites*. They are said to have risen in Spain and the Gauls in the last century.

ABSTRACT, ABSTRACTUM, in *Philosophy*. See ABSTRACTION.

ABSTRACT *idea*, among *Logicians*, denotes an idea formed in the mind, when we consider a thing simply in itself, without respect to the subject wherein it resides; or it is a simple idea detached and separated from any particular subject or complex idea, for the sake of viewing and considering it more distinctly.

Thus, magnitude and humanity are *abstracts* or *abstract* ideas, when considered in themselves, and without being attached to any particular body, or person; though they cannot have any real subsistence without such subjects, nor the subjects without them.

Whiteness is an *abstract*, inasmuch as it does not denote any one white object, but that colour, or idea in the general, wherever found.

Abstract ideas are opposed to those which are concrete: the concrete denoting a general or *abstract* idea's being attached to some particular subject, or considered as combined with some other ideas: as, *great-house*, *white wall*. All one simple ideas, says Mr. LOCKE, have *abstract*, as well as *concrete* names: as *whiteness*, *sweetness*, *sweet*, &c. The like also holds in most ideas of modes, and relations: as, *colour*, *sin*: *equality*, *equal*, &c.

But as to our ideas of substances, we have very few *abstract* names at all. Those few that the schools have forged, as *humanitas*, *Homoeitas*, &c. bear no proportion to the infinite number of names of substances; and could never get admittance into common use, or obtain the licence of public approbation; which seems to intimate a confession of mankind, that they have no ideas of the real essences or substances; since they have not names for such ideas.

Indeed the reality and existence of all *abstract* ideas, and of any such faculty in the mind as *abstraction*, has of late been controverted.

ABSTRACT *terms*, are those made use of to denote *abstract* ideas. To which sense the words *whiteness*, *paternity*, *animality*, *justice*, *cowardice*, &c. are *abstracts*, or *abstract terms*.

ABSTRACT is also extended to divers other things, in respect of their purity, simplicity, subtility, &c. In which sense we say,

ABSTRACT *numbers*, which are allemblages of units considered in themselves, and not applied to denote any collections of particular sorts of things.

ABSTRACT *mathematics* are those branches employed about quantity considered absolutely, or in the general, without restriction to any certain kind, or species of it.

Such are *Geometry* and *Arithmetic*.

In this sense, *abstract* mathematics stand opposed to mixed mathematics; wherein simple and *abstracted* properties and relations of quantity delivered in the former, are applied to sensible objects; and by that means become intermixed with physical considerations. Such are *Hydrostatics*, *Optics*, *Navigation*, &c.

ABSTRACT is also used in matters of *Literature*, for a compendious view, or EPITOME of a larger work.

An *abstract*, is supposed to be a degree shorter, and more superficial than an abridgment.

ABSTRACTI, *abstracted*, in *Church History*, is a name given to a sect among the Lutherans, under the lead of Illyricus, a Pannian bishop, who stirred against Beza, "that Christ was to be adored not only in the concrete, "as the son of God, but that his flesh in the abstract was "an object of adoration," Wigandus prevailed so far against Hesshusius as to get him deposed; after words the *abstracti* gained the ascendant, and Wigandus was silenced. Micræl. Hist. Eccl. l. iii. f. 2. &c. Budd. Ing. Hist. Theol. l. ii. c. 7.

ABSTRACTION, an operation of the mind, whereby we separate things naturally conjunct, or existing together; and form, and consider, ideas of things thus separated. The faculty of *abstracting* stands directly opposite to that of compounding. By composition we consider those things together, which in reality are not joined together in one existence. And by *abstraction* we consider those things separately and apart, which in reality do not exist apart. *Abstraction* is chiefly employed these three ways. First, when the mind considers any one part of a thing in some respect distinct from the whole: as a man's arm, without the consideration of the rest of the body.

Secondly, when we consider the MODE of any substance, omitting the substance itself, or when we separately consider several modes which subsist together in one subject. This *abstraction* the *Geometricians* make use of, when they consider the length of a body separately, which they call a LINE; omitting the consideration of its breadth and depth.

Thirdly, it is by *abstraction*, that the mind frames general, or universal ideas: omitting the modes and relations of the particular objects whence they are formed. Thus, when we would understand a thinking being in general, we gather from our self-consciousness what it is to think; and omitting the consideration of those things which have a peculiar relation to our own mind, or to the human mind, we conceive of a thinking being in general.

Ideas framed thus, which are what we properly call *abstract ideas*, become general representatives of all objects of the same kind; and their names applicable to whatever exists conformable to such ideas. Thus, the colour that we receive from chalk, snow, milk, &c. is a representative of all of that kind; and has a name given it, *whiteness*, which signifies the same quality, wherever found or imagined. It is this faculty, or power of *abstracting*, according to Mr. Locke, that makes the great difference between men and brutes; even those latter must be allowed to have some share of reason; that they really reason in some cases, seems almost as evident as that they have sense; but it is only in particular ideas. They are tied up to those narrow bounds; and do not seem to have any faculty of enlarging them by *abstraction*. Essay on Human Understanding, lib. ii. cap. 11. lib. iii. cap. 3. Such is the doctrine of *abstract* ideas, under the improvements of that excellent author. In effect, it is the standing opinion, that the mind has such a power or faculty of framing *abstract* ideas or notions of things; and on such very ideas do a great part of the writings of philosophers turn. These are supposed in all their systems; and without them there would be nothing done. They are more especially reputed the object of logic, mathematics, and metaphysics, and all that passes under the notion of the most *abstracted* and sublime learning.

Yet has a late eminent and ingenious author, Dr. Berkeley, controlled the reality of any such ideas: and gone a good way towards overturning the whole system, and consequently towards setting philosophy on a new foundation. See a Treatise concerning the Principles of Human Knowledge, first printed in 1710.

The qualities or modes of things, it is on all hands agreed, do really never exist apart, and separated each from all others; but are constantly mixed and combined together, several in the same object. But, say the philosophers, the mind being able to consider each quality, singly, or *abstracted* from other qualities with which it is united, does by that means frame to itself *abstract* ideas, of a different nature and kind from the sensible ones.

For an example hereof; the eye perceiving an object extended, coloured, and moved, resolves this compound idea into its simple constituent ones; and viewing each by itself, exclusive of the rest, frames *abstract* ideas of extension, colour, and motion themselves, or in their own nature. Not that it is possible for such colour and motion to exist without extension; but only that the mind can frame to itself, by *abstraction*, the idea of colour exclusive of extension; and of motion, exclusive both of colour and extension.

Again, say the same philosophers, the mind having observed that in the particular extensions perceived by sense, there is something common, and alike in all; and some other things peculiar: as, this, or that figure, or magnitude, which distinguish them one from another: it can consider apart, or single out by itself, what is common; making thereof a general *abstract* idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude, but is an idea entirely prescinded from them all. So, likewise, by leaving out of the several colours perceived by sense, that which distinguishes them one

from another, and only retaining what is common to all, it makes an idea of colour in the *abstract*, which is neither red, nor blue, nor white, &c.—After the same manner by considering motion *abstractedly*, both from the body moved, and from the figure it describes, and all particular directions and velocities; an *abstract* idea of motion is framed, which equally corresponds to all motions whatever.

They add, that as the mind frames *abstract* ideas of qualities or modes, so does it, by the same faculty, obtain *abstract* ideas of the more compound beings, which include many co-existent qualities. For an example: Having observed that Peter, James, John, &c. resemble each other in shape, and other qualities; we can leave out of the complex idea we had of Peter, James, &c. that which is peculiar to each, retaining only what is common to all, and so make an *abstract* idea, wherein all the particulars equally partake. And thus it is we are supposed to obtain the *abstract* idea of man, or of humanity, or human nature; wherein there is indeed included colour, because no man but has some colour; but it is neither white, nor black, nor brown; because there is no one particular colour wherein all men partake. So likewise there is included stature, but then it is neither tall nor low, nor yet middle stature, but something *abstracted* from all these; and so of the rest.

Farther yet, there being a general variety of other creatures, which partake in some parts, but not all, of the complex idea of man; the mind leaving out those parts which are peculiar to men, and retaining only those which are common to all living creatures, frames the idea of animal; which *abstracts* or participates not only of all men, but all birds, beasts, fishes, and insects.

The constituent parts of such *abstract* idea of animal, are body, life, sense, and spontaneous motion. By body is meant, body without any particular shape or figure; there being no one common to all animals; without covering, either of hair, or feathers, or scales; nor yet naked; hair, feathers, scales, and nakedness, being the distinguishing properties of particular animals, and for that reason left out of the *abstract* idea. Upon the same account, the spontaneous motion must be neither walking, nor flying, nor creeping; it is nevertheless a motion. But what the motion is, it is not easy to conceive. "I will not affirm, says Dr. Berkley, that other "people have not this wonderful faculty of *abstracting* "their ideas; but I am confident I have it not myself. "I have, indeed, a faculty of imagining, or representing "to myself the ideas of things I have perceived, or of va"riously compounding or dividing them: I can imagine "a man with two heads, or the upper parts of a man "joined to the body of a horse. I can consider the hand, "the eye, the nose, each by itself, *abstracted* or separated "from the rest of the body. But then, whatever hand "or eye I imagine, it must have some particular shape "and colour. So again, the idea of a man I frame to "myself, must be either of a white, or a black, or a "tawny, a straight, or a crooked, a tall, or a low, or a "middle-sized man.

"I cannot, by any effort of thought, conceive the *abstract* "idea above described: and it is equally impossible for "me to form the *abstract* idea of motion, distinct from "the body moving, and which is neither swift nor slow, "curvilinear nor rectilinear. And the like may be said "of all other *abstract* general ideas whatever."

Since all things that exist are only particulars, "Whence, "says Mr. Locke, is it, that we come by general words, "or terms of a thousand individuals." His answer is, terms only become general, by being made the signs of *abstract* and general ideas; so that the generality of *abstract* ideas should follow from the reality of general words.—But, according to Dr. Berkeley, a word becomes general, by being made the sign, not of an *abstract* general idea, but of several particular ones, any of which it indifferently suggests to the mind.—For an example, when I say, that whatever has extension is divisible; the proposition is to be understood of extension in general; not that I must conceive any *abstract* general idea of extension which is neither line, surface, nor solid, neither great nor small, &c. To make this more evident, suppose a geometrician to be demonstrating a method of dividing a line into two equal parts: in order hereto, he draws, for instance, a black line, an inch long; and this, which in itself is a particular line, is nevertheless, with respect to its signification, general; since it represents all lines whatever; so that what is demonstrated of this one, will hold of all others.—And as that particular line becomes general by being made a sign; so does the name *line*; and as the former owes its generality, not to its being the sign of an *abstract* or general line, but of any of all particular right lines that may possibly exist; so must the latter derive its generality from the same cause.

But to this reasoning it has been replied, that the universality consists in the idea; and not merely in the name as used to signify, and recall into the mind, a variety of particular things, forasmuch that which is the immediate object of reflection; because how we no previous fixed notion what the name signifies, we could not know what particular things to apply it to, or assign any reason for applying it to one thing, rather than another. All that can be pictured in the imagination, as well as all that we take notice of by our senses, is indeed particular. And whenever any general notions are present in the mind, the imagination, at the same time, is commonly engaged in representing to itself some of the particulars comprehended under them. But it would be a very strange inference from hence, that we have none but particular ideas. As well might we conclude, that we have no other notion of any thing than of its name, because they are so associated in our minds, that we cannot separate them; or of the sun, than as a white bright circle, such as we see in the heavens, because this idea or phantasm is apt to accompany all our thoughts of it. See Dr. Price's Review of the principal Questions and Difficulties in Morals, p. 43.

Dr. Cudworth observes, that *abstract* ideas are implied in the cognoscitive power of the mind; and he pronounces the opinion, that they are only singular ideas annexed to a common term; or in other words, names without any meaning; to be so ridiculously false, as to deserve no confutation. See Eternal and Immutable Morality, book iv.

Mr. Locke speaking of the difficulty of forming *abstract* ideas, says: "And does it not require some pains and "skill to form the general idea of a triangle, (which yet "is none of the most *abstract* and comprehensive) for it "must neither be oblique, nor rectangular; neither equi"lateral, isosceles, nor scalenum, but all, and none of "these at once."—Now, let any man look into his thoughts, and try whether he has, or can attain to an idea of a triangle, correspondent to this description.

Dr. Campbell, in his Philosophy of Rhetoric, vol. ii. p. 195, exercises his apprehension, that the bare mention of this hypothesis is equivalent to a confutation of it, since it really contains nothing. He adopts the sentiments of Berkeley on this subject, and will allow to the mind no other power of *abstraction*, if the term be retained, beside that, by which a particular idea is regarded, as representing a whole order. Mr. Locke, he says, has, on some occasions, evidently inclined to the same opinion; in proof of which he refers to his Essay, book iii. cap. 3. § 11.

From the notion of *abstract* ideas, Dr. Berkeley endeavours to shew, it was, that bodies first came to be supposed to have an existence of their own exclusively and independent of the mind perceiving them.—"Can there be "a greater train of *abstraction*, says he, than to distinguish "the existence of sensible objects from their being perceived, so as to conceive them existing unperceived?

If there were external bodies, he says, it is impossible we should ever come to know it; and if there were not, we might have the very same reasons to think there were that we have now. His principal argument may be reduced to the following syllogism: Whatever is immediately perceived by sense, is an idea: sensible things are immediately perceived by sense: for the proof of which he appeals to experience: therefore sensible things are ideas; and consequently exist only in the mind. See his Dialogues between Hilas and Philonous.

The late lord Bolingbroke likewise controverted the existence of *abstract* ideas; and Mr. Hume, in his Essays, asserts that it is unintelligible and absurd to conclude, that the ideas of primary qualities are obtained by *abstraction*; and he has pursued Berkeley's reasoning to an extent, which he himself never intended, and represented all his arguments as merely sceptical, "because they admit of "no answer, and produce no conviction." He concurs with Dr. Berkeley in denying the existence of matter; and advances a step further, maintaining that the soul is merely a bundle of perceptions, and that there is nothing in the universe but impressions and ideas.

Some late Scotch writers, Doctors Reid, Beattie, and Stone, Oswald, with a view of obviating those sceptical inferences, which had been deduced from the principles of Mr. Locke, have, in opposition to these, asserted a new system respecting the nature and origin of our ideas, the outlines of which, with remarks, will be inserted under their proper heads, in the course of this work. See Ideas, Intuition, and Common Sense.

We shall only add, that *abstraction*, on the common system, is no more than generalising: it is making one thing stand for a hundred, by omitting the consideration of the differences between them: it is taking several differents, i. e. different combinations, setting aside the peculiarity

liarities in each, and considering only what is found alike in all.—Thus it is that I say, I love my friend, love my mistress, love myself, my bottle, my book, my ease, &c. —Not that it is poſſible I ſhould have the ſame perception with reſpect to any two different ſorts of things, things that ſtand in different relations to me; but only that there is ſomething in them all that bears a reſemblance to myſelf, in ſome circumſtances or other, I chuſe to call it by one name, *love*. For if I conſider the nature and effects of them all, I ſhall find they lead me to different ways, to very different actions; all the reaſon of which is between them, as a ſort of pleaſure or [illegible] ſtriking upon the application of the particular [illegible] proper organ, or ſenſe.—The *abſtract* idea [illegible]on, will terminate in the idea of pleaſure: but it is certain, there can be no idea of pleaſure without a thing pleaſant to excite it. Any other *abſtract* idea of pleaſure, will amount to no more than a view or perception of the circumſtances where with our pleaſures have been attended; but theſe are mere externals foreign to the pleaſurable ſenſation itſelf; which nothing but an object applied in ſuch and ſuch a manner can excite.—I ſuppoſe an idea of pleaſure produced indirectly, by any other than by the proper cauſe, is as abſurd as to ſuppoſe an idea of ſound, produced without a ſonorous object. The mind has no power of making any ideas, call them what you will, whether *abſtract* or *concrete*, or *general*, or *particular*: its activity goes no farther than to the perceiving of ſuch as are preſented to it, ſo that its action is really no other than a degree of paſſion.

ABSTRACTION, in *Chemiſtry*, denotes the drawing off, or exhaling away, a menſtruum from the ſubject it had been put to diſſolve.

Some alſo uſe the word as ſynonymous with DISTILLATION, or even CIRCULATION.

ABSTRACTITIOUS, or ABSTRACTIVE, is applied by ſome modern *Chemiſts* to a ſpirit drawn from vegetables without fermentation.

In which ſenſe *abſtractitious* ſpirits are ſynonymous with natural ſpirits, and ſtand oppoſed to fermentative or artificial ones.

Such ſpirits are chiefly procured from plants which abound in volatile ſalt. The *abſtractitious* ſpirit of ſcurvygraſs is preferred to that procured by fermentation.

All the native ſpirits of aromatic plants are called *abſtractitious*.

ABSTRUSE, denotes ſomething deep, hidden, or far removed from the common apprehenſions, and ways of conceiving; in oppoſition to what is obvious and palpable.

The word is of Latin original, *abſtruſus*; formed of *abs*, *from*, and *trudo*, *I thruſt*.

In this ſenſe *Metaphyſics* is an *abſtruſe* ſcience; and many ſpeculations of *Mathematics* are likewiſe *abſtruſe*.

ABSURD, ABSURDUM, a term applied to any action or ſentiment that thwarts, or goes contrary to ſome evident truth.

Thus, a propoſition would be *abſurd*, that ſhould affirm, that two and two make five; or that ſhould deny them to make four.

The *Logicians* and *Mathematicians* have a way of proving the truth of a propoſition, by ſhewing that the contrary is *abſurd*.

This they call

Reductio ad ABSURDUM, or *argument ab abſurdo*.

Abſurd, when applied to actions, is ſynonymous with *ridiculous*.

ABSURDITY, a kind of error or offence againſt ſome evident or generally allowed truth or principle.

The greateſt of all *abſurdities* is CONTRADICTION.

The ſchoolmen make two ſpecies of *abſurdities*.—The one, *abſolute*, *actual*, which contradicts the common ſenſe of mankind; the other *relative*, *real*, which gives the lie to ſome one or more philoſophers, or perſons of great weight and authority.

In this ſenſe the doctrine of a vacuum is an *abſurdity*; as being contrary to Ariſtotle: and that of a vacuum, as being contrary to Sir Iſaac Newton.—In effect, there is ſcarce one truth of any moment, that is not an *abſurdity* in ſome ſenſe; as being repugnant to the ſyſtem of ſome ſect, or party.

As reaſon conſiſts in the due uſe of names and words, *abſurdity* conſiſts in the abuſe of them. The higheſt of all our faculties, and our failings, take their riſe from the ſame thing, language: and are as it were coupled together, to temper each other, and reduce human nature to a kind of mediocrity.

Hobbes aſſigns *abſurdity* as a privilege peculiar to man, and which no other creature is capable of: he adds, that of all men, thoſe called philoſophers are moſt expoſed to it. Whence the ſaying of Cicero, there is nothing ſo *abſurd* but has been ſaid by a philoſopher, *nihil tam abſurdè dici poſſit, quod non dicatur a philoſopho*. The reaſon ſeems to be, that of all men they reaſon, and diſcourſe moſt. Yet a nearer and more apparent cauſe may be aſſigned, *viz.* their neglect, at leaſt in part, to examine the terms they make uſe of, i. e. to affix the preciſe idea each is made to repreſent; which is much like a man's undertaking to number, without knowing the value of the numeral figures; reaſoning, according to the author firſt cited, being no other than computing. Divers *abſurdities* alſo ariſe from the wrong connecting of names into propoſitions; as firſt, when the names of bodies are applied to accidents; or the names of accidents to bodies: as in that propoſition, "faith infuſed, or inſpired" ſince nothing is either infuſible, or inſpirable, but body: and the ſame *abſurdity* the Cartheſians fall into, when they make extenſion to conſiſtute body, &c. Secondly, when the names of accidents inherent in external bodies are attributed to accidents of our own bodies: as when it is ſaid, that colour is in the object, ſound in the air, &c. Thirdly, when the names of bodies are attributed to words, or conceptions; as is done by thoſe who aſſert that there are univerſal things, that animal is a genus, &c. Fourthly, when the names of accidents are given to words, and propoſitions; as when it is ſaid, that the definition is the eſſence of the thing, or a perſon's command is his will. Fifthly, when in lieu of proper words, metaphors and tropes are made uſe of: as, the way leads to ſuch a place, the proverb ſays this or that; whoſe uſe though allowable on ordinary occaſions, yet is of miſchievous conſequence in reaſoning and ſearching after truth. Laſtly, when names are taken at random, and uſed without meaning; as tranſubſtantiation, conſubſtantiation, *entechies*, &c.

He that can avoid theſe rocks will not eaſily fall into an *abſurdity*, except in a very long chain of reaſoning, when he may be apt to forget ſome propoſition before laid down. Hobb. Lev. P. 1. c. 5. p. 22.

ABSUS, the Egyptian LOTUS. Ray.

ABSYNTHIUM, or ABSINTHIUM, a medicinal plant of conſiderable efficacy in quality of a bitter, and ſtomachic, commonly called WORMWOOD.

The word ſeems compounded of the privative particle *a* and *δοκω*, *dulcedo*, *pleaſure*; alluding to the diſagreeable taſte of this plant.

ABSYNTHUS, in *Natural Hiſtory*, the name of a ſtone, deſcribed by ſome old authors as being of a black colour, variegated with ſpots and veins of red. They ſay that when once heated, it retains the warmth for ſeven days. The account ſeems ſuperſtitious and imaginary, and the deſcription they give to ſhort, that it is not eaſy to gueſs what ſtone, if any in nature, was meant to be pointed out by them. Probably the word is only a corruption of the AHICTOS, or *aſſites*, of Pliny.

ABUCCO, or ABOCCO, or ABOCCIS, a weight uſed in the kingdom of Pegu. One *abucco* is twelve teccelis and a half; two *abuccos* make an agiso, which really called gito; two gito make half a tuna; and a tuna weighs a hundred teccelis; that is to ſay, two pounds and five ounces the heavy weight, or three pounds nine ounces light weight of Venice.

ABUKESB. See ASLENI.

ABUNA, among the *Chriſtian Arabs*, is the title or appellation of a religious character.

The word, which is Arabic, is ſometimes alſo written *abouna*, ſometimes *abonna*, and by ſome *aboona*, or *aboona*; it literally denotes *father*, and is more particularly uſed for the archbiſhop or metropolitan of the Abyſſinian church. Fabr. Lux. Evang. c. 45. Ludolf. Hiſt. Æthiop. lib. iii. c. 7.

ABUNDANT *Numbers*, are thoſe whoſe quota parts, added together, exceed the NUMBER itſelf whereof they are parts.

Thus the number 12 is *abundant*, its quota-parts, 1, 2, 3, 4, and 6, amounting to 16.—In oppoſition to *abundant* numbers ſtand DEFICIENT ones.

ABUNDANT *Notion*, in *Logic*, is that which includes more marks and characteriſtics than are neceſſary to diſtinguiſh it from others.

Thus, we may be ſaid to give an *abundant* notion of a rectilineal triangle, when we deſcribe it as a ſpace terminated by three right lines, and containing three angles. Inaſmuch as the number of its angles is determined by that of its ſides; ſo that the bare mention of its three ſides was ſufficient to have defined it.

ABUSE, an irregular uſe of a thing, or the introducing of ſomething contrary to the true intention thereof.

The word is compounded of *ab*, *from*, and *uſus*, *uſe*.

In *Grammar*, to apply a word *abuſively*, or in an *abuſive* ſenſe, is to miſapply, or pervert its meaning.

A perſon is alſo ſaid to *abuſe* his benefices, without the conſent of the biſhop, is deemed *abuſive*, and conſequently is null.

ABUTILON, in *Botany*, the name of a genus of plants, allied to the MALLOW kind. Dr. Linnæus calls it *Sida*, and ranges it in the claſs of *monadelphia polyandria*.

The

The characters are these: the flower wholly resembles that of the mallow; but the fruit resembles a sort of head composed of several capsules, so disposed round an axis, that every *brin* of that receives one of these. These capsules are bivalve, and usually contain kidney-shaped seeds.

Miller enumerates fifteen species of this plant; which is aperient and vulnerary. The leaves externally applied cleanse ulcers; the seed provokes urine, and expels gravel. See *Indian* MALLOW.

ABUTTALS, ABUTTALS, ABUTAES, among *Law-writers*, denote the buttings or boundings of a piece of land; expressing on what other lands, highways, or the like, the several extremes thereof do *abut*, or terminate.

In this sense, the word is sometimes also written corruptly *abuttals*, or *abutals*.—In old surveys, we often find them called *bendlands*. *Abuttals* amounts to the same with what Latin writers call *capita*; Marculfus, *fronts*; the French, *bouts*. In Coke, the plaintiff is said to fail in his *abuttals*, that is, in setting forth how the land is bounded.

ABYSS, is a general sense, denotes something profound, and, as it were, bottomless.

The word is originally Greek, ἄβυσσος; compounded of the privative α, and βυσσος, *bottom*; q. d. *without a bottom*.

We say, the *abyss* of a mountain, an *abyss* of waters, the great *abyss*, the Mosaic *abyss*, an unfathomable *abyss*, &c.

ABYSS, in a more particular sense, denotes a deep mass, or fund of waters.

In this sense, the word is particularly used, in the Septuagint, for the water which God created at the beginning with the earth, which encompassed it round, and which our translators render by the *deep*. Thus it is that darkness is said to have been on the face of the *abyss*.

ABYSS is also used for an immense cavern in the earth, where God collected all those waters on the third day; which, in our version, is rendered the *deep*, and elsewhere, the *great deep*.

Dr. Woodward has made several observations and conjectures with reference to this great *abyss*, in his Natural History of the Earth. He asserts, that there is a vast collection of waters enclosed in the bowels of the earth; constituting a huge orb in the interior or central parts of it; and over the surface of this water he supposes the terrestrial strata to be expanded. This, according to him, is what Moses calls the *great deep*, and what most authors render the *great abyss*.

That there is such an assemblage of waters lodged in the depths of the earth, is confirmed by abundance of observations. See EARTH and DELUGE.

The water of this vast *abyss*, he asserts, does communicate with that of the ocean, by means of certain histories, or chasms passing between it and the bottom of the ocean: and this and the *abyss* he supposes to have one common centre, around which the water of both is placed; but so that the ordinary surface of the *abyss* is not level with that of the ocean, nor at so great a distance from the centre, as the other, it being, for the most part, restrained and depressed by the strata of earth lying upon it. But wherever those strata are broken, or are so lax and porous, that water can pervade them, there the water of the *abyss* ascends, fills up all the clefts and fissures into which it can get admittance, and saturates all the interstices and pores of the earth, stone, or other matter, all round the globe, quite up to the level of the ocean.

The existence of an *abyss*, or receptacle of subterraneous waters, is controverted by Cumberland, and defended by Dr. Woodward, chiefly by two arguments; the first, drawn from the vast quantity of water, which covered the earth in the time of the deluge; the second, from the consideration of earthquakes, which he endeavours to shew are occasioned by the violence of the waters in this *abyss*. A great part of the terrestrial globe has been frequently shaken at the same moment; which argues, that the waters, which were the occasion hereof, were co-extended with that part of the globe. There are even instances of universal earthquakes; which shew that the whole *abyss* must have been agitated: for to general an effect must have been produced by as general a cause; and that cause can be nothing but the subterraneous *abyss*. For the true cause of earthquakes, see EARTHQUAKE.

This *abyss* is no useless thing; when once established, it serves to solve several difficult phenomena; as the origin of springs and rivers; the level maintained in the surface of different seas, and their not overflowing their banks. To the effluvia emitted from this *abyss* some even attribute all the diversities of weather, and changes in our atmosphere; and, what is more, the origin of every thing in the earth, or on its surface. Dr. Woodward has an epistle on the ceremony of the great *abyss* hid in the bowels of the earth, and the perpetual communication between it and the atmosphere. Ray, and other authors, ancient as well as modern, suppose a communication between the Caspian sea and the ocean, by means of a subterranean *abyss*; and to this they attribute it, that the Caspian does not overflow, notwithstanding the great number of large rivers it receives; of which Kempfer reckons above fifty in the compass of sixty miles. But the daily evaporation may be sufficient for this purpose. See EVAPORATION, SEA, and SPRING.

ABYSS is also used to denote the cavern or belly of a hollow mountain.

In which sense Mr. Tournefort describes the *abyss* of mount Ararat, a horrible spectacle.

ABYSS is also used to denote HELL. In which sense the word is synonymous with what is otherwise called Barathrum, Erebus, and Tartarus; in the English Bible, the *bottomless pit*.

ABYSS is more particularly used, in *Antiquity*, to denote the temple of Proserpine.

It was thus called, on account of the immense fund of gold and silver deposited there; some say hid under ground.

ABYSS is also used in *Heraldry*, to denote the centre of an *escutcheon*.

In which sense, a thing is said to be borne in *abyss*, or *abysme*, when placed in the middle of the shield, clear from any other bearing: he bears azure, fleur de lis, in *abyss*. Columbiere.

ABYSS is also used, by some *Alchemists*, for the immediate receptacle of seminal matter; by others, for the first matter itself.

ABYSS is also used metaphorically, for a thing not to be known or comprehended, on account of its immense extent, or profundity.

In which sense it coincides with secrecy, inscrutable, incomprehensible, &c.—The judgments of God are called a great *abyss*.

ABYSS, in *Typography*, is synonymous with QUERE.

ABYSSINIAN is used as the name of a sect, in the Christian church, established in the empire of Abyssinia.

The *Abyssinians* are a branch of the Cophts, or Jacobites, with whom they agree in admitting only one nature in Jesus Christ, and rejecting the council of Chalcedon; whence they are also called MONOPHYSITES, and EUTYCHIANS.

The *Abyssinian* church is governed by a bishop, or metropolitan, styled ABUNA, sent them by the Coptic patriarch of Alexandria residing at Cairo, who is the only person that ordains priests.

They have canons also, and monks; the former of whom marry, the latter at their admission vow celibacy, but with a reservation. Le Grand says, they make a promise aloud, before their superiors, to keep chastity, but add in a low voice, in my *heart*. The emperor has a kind of supremacy in ecclesiastical matters.

The *Abyssinians* have always expressed an inclination to be reconciled to the see of Rome; but rather out of interest of state than any other motive.

Meanwhile, and other circumstances, despite the *Abyssinians* of Judaism, in regard to the many Jewish observances still in use among them: some have even doubted, whether they are more Christians, or Jews. Lobo says expressly, they are only Christians in name: they practise circumcision on females, as well as males. They eat no meats prohibited by the law of Moses. Women are obliged to the legal purifications. Brothers marry their brothers wives, &c. They abstain from hog's flesh, blood, meats strangled, &c. and observe both Saturday and Sunday sabbaths, according to the custom of the primitive church: also divers marks of Judaism; though by some reduced into mere human institution, and usage. They celebrate the Epiphany with peculiar solemnity, in memory of Christ's baptism; when they plunge and sport in ponds and rivers: which has occasioned some to affirm that they were baptized anew every year. Among the saints-days is one consecrated to Pilate and his wife; because Pilate washed his hands before he pronounced sentence on Christ; and his wife declared him to have nothing to do with the blood of that just person. They have four lents: the great one commences ten days earlier than ours, and is observed with much severity, many abstaining therein even from fish, because St. Paul says there is one kind of flesh of men, and another of fishes. They allow of divorce, which is easily granted among them, and by the civil judges: nor do their civil laws prohibit polygamy. They have at least as many miracles, and legends of saints, as the Romish church; which proved no small embarrassment to the Jesuit missionaries to whom they produced so many miracles, wrought by their saints, in proof of their religion, and those so well

circum-

circumstantiated and attested, that the Jesuits were obliged to deny miracles to be any proof of a true religion; and in proof hereof to allege the same arguments against the [illegible] which protestants in Europe allege against the [illegible]. Audoli allows that they believe the real presence [illegible] Lutheran manner, but denies that they hold [illegible] station; though Renaudot asserts, that they [illegible]. They pray for the dead, and invoke saints [illegible] and have so great a veneration for the Virgin, [illegible] charged the Jesuits with not tendering her [illegible] enough. Images in painting they venerate, but [illegible] in relievo, except the cross. They hold that [illegible] first man is not created, because, say they, God [illegible] his work on the sixth day. They admit the apocryphal books, and the canons of the apostles, as well as the apostolical constitutions, for genuine. Their liturgy is given by Alvarez, and in English by Pegit; their calendar by Ludolf; the answers of abbe Gregory to certain questions, propoled by the author last cited, are published by Fabricius, under the title of Theologia Æthiopica.

ACACALIS, in the *Materia Medica*, the name given by some authors to the *succus hibernus*, or wild carob.

ACACALOUI, in *Ornithology*, the name of an American bird called by some corvus *aquaticus*, or the water raven. The male is four inches long from his beak to the end of his tail, and is moderately fleshy; his legs are a span and a half long. Its beak is two hands breadth long, is bent like a bow, and of a blue colour: his head is small: it is of a mixt brown and red colour on the breast and belly, and of a finely variegated hue on the back, made up of a shining purple, black, and green; its wings are of a fine green, which looks very bright and glossy in the sun. It is a native of Mexico, and is common about lakes and rivers, feeding on fish; it is eaten, but is coarse, and of a rank fishy taste.

ACACIA, in *Botany*, the name of a genus of trees, the characters of which are these: the flower consists only of one leaf, and is of the funnel-fashioned kind, and usually contains a great number of stamina; and the flowers are commonly collected in clusters, or little heads: the pistil arises from the bottom of the flower, and finally becomes a bivalvous fruit divided into several hollows, and containing a number of roundish seeds. The *acacias* belong to the *polygamia monœcia* class of Linnæus.

The species of *acacia* enumerated by Mr. Tournefort are twelve; and by Miller, twenty two.

The Arabian pepper of Matthiolus seems to belong to this genus of plants.

The flowers of the *acacia* are used by the Chinese in making that yellow, which, we see, they use in their silks and stuffs; and appears with much elegance in their painting on paper. The method is this:

They gather the flowers before they are fully open; these they put into a clean earthen vessel over a gentle heat, and stir them continually about, as they do the tea-leaves, till they become dry and of a yellow colour; then to half a pound of the flowers they add three spoonfuls of fair water, and after that a little more, till there is just enough to hold the flowers moistened and together: they boil this for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; then they take it from the fire, and strain it through a piece of coarse silk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyster-shells reduced to a fine powder. All is then well mixed together; and this is the fine lasting yellow they have so long used.

The dyers of large pieces use the flowers and seeds of the *acacia* for dying three different sorts of yellow. They roast the flowers, as before observed, and then mixing the seeds with them, which must be gathered for this purpose when full ripe: by different admixture of these, they give six different shades of colour; only for the deepest of all, they give a small admixture of Brasil wood.

Mr. Geoffroy, with great probability, attributes the origin of bitumen to the juices of this plant; which being brought by certain animals, and vellicating the stomach by their great roughness and astringency, cause a copious secretion of the bile, till at length they become costed over with a slimy matter, which we call BEZOAR, or BEZOARD.

ACACIA *fistularis*, signifies TABASHEER.

ACACIA, *bastard* or *true*, *vulgaris*, in *Botany*, a genus of the *Monadelphia decandria* class. Its characters are these: the empalement of the flower is small, and divided into four parts, the three under segments being narrow, but the upper one broad; the flower is of the PEA-*flower* kind, the standard is large, roundish, obtuse, and spreads open; the two wings are oval, and have short appendices, which are obtuse; the keel is roundish, compressed, obtuse, and is extended the length of the wings; in the centre are situated ten stamina, nine joined together, and the other standing single, terminated by roundish summits; it hath an oblong cylindrical germen, supporting a slender style, crowned by a hairy stigma; the germen afterward becomes an oblong compressed pod, including kidney-shaped seeds. Miller enumerates ten, and Linnæus seven species.

ACACIA *Britannica*, signifies LOGWOOD.

ACACIA, in *Medicine*, an inspissated juice of a shrub of the thorn kind, used as an astringent.

It is prepared by inspissating, to a due consistence, the juice expressed from the unripe pods of a large prickly tree of this name.

There are two kinds, the *vera*, and *Germanica*.

The ACACIA *vera* is brought from the Levant in round balls, of different sizes, in tine bladders; and supposed to be the juice of the pods of a large thorny tree, growing in Egypt and Arabia. Some naturalists will have it the same tree that yields the gum arabic.

This is very auftere, and binding; and, on that account, good against fluxes. Choak that of a cat-skin, smooth and shining; and of an aftringent disagreeable taste. It is, or should be, an ingredient in the *Tincture Ambrosiaca*.

The *German* ACACIA is a counterfeit of the former; being made of the juice of unripe sloes, boiled to the consistence of a solid extract, and put up in bladders like the former. It is distinguished from it chiefly by its colour, which is as black as that of Spanish liquorice. It is used as a substitute to the true *acacia*.

ACACIA, among *Antiquaries*, denotes something resembling a kind of roll or bag, seen on medals in the hands of several of the consuls, and emperors, from the time of Anastasius.

According to Du-Cange, the *acacia*, properly so called, was a purple bag, filled with earth, or sand, and borne by the prince in his left hand, to remind him of his frailty and mortality; in prevent his being too much elated with his station.

But authors are not agreed, either about the use of this roll, or about the substance whereof it consists; some taking it for a handkerchief rolled up, which the person who presided at the games threw out as a signal for their beginning; whilst others rather imagine it intended to represent a roll of memoirs, or petitions.

ACACIANS, in *Church History*, the followers of Acacius, bishop of Cæsarea, who flourished about the middle of the fourth century. Some of them maintained, that the Son was not of the same, but of a similar substance with the Father: others held that he was of a different substance from the Father. This was likewise the denomination of another sect, derived from the name of their leader, a patriarch of Constantinople, in the fifth century, who favoured the opinion of Eutyches. See EUTYCHIANS.

ACADEMICS, a sect of philosophers, who followed the doctrine of Socrates and Plato, as to the uncertainty of knowledge, and the incomprehensibility of truth.

Academic, in this sense, amounts to much the same with Platonist; the difference between them being only in point of time. They who embraced the system of Plato, among the ancients, were called *Academics*; whereas those who did the same, since the restoration of learning, have assumed the denomination of Platonists.

We usually reckon three sects of *Academics*; though some make five. The ancient *Academy* was that whereof Plato was the chief. See PLATONISM.

Arcesilas, one of his successors, introducing some alterations into the philosophy of this sect, founded what they call the *second Academy*.

The establishment of the third, called also the *new Academy*, is attributed to Lacydes, or rather to Carneades.

Some authors add a fourth, founded by Philo; and a fifth by Antiochus, called the *Antiochian*, which tempered the ancient *Academy* with STOICISM.

The ancient *Academy* doubted of every thing; and went so far as to make it a doubt whether or no they ought to doubt. It was a first of principle with them, never to be certain, or satisfied of any thing; never to affirm, or deny any thing, either for true or false. In effect, they asserted an absolute ACATALEPSIA.

The *new Academy* was somewhat more reasonable; they owned several things for truths, but without attaching themselves to any with entire assurance. These philosophers had found, that the ordinary commerce of life and society was inconsistent with the absolute and universal doubtfulness of the ancient *Academy*: and yet it is evident, they looked upon things rather as probable, than as true and certain: by this amendment, thinking to secure themselves from those absurdities into which the ancient *Academy* had fallen. See the *academical* questions

queſtions of Cicero; where that philoſopher explains and unravels the ſentiments of thoſe who in his days called themſelves followers of the new and old *academy*, with great clearneſs and addreſs.

ACADEMICS, or rather ACADEMICKS, it alſo uſed among us for the members of the modern *academies*, or inſtituted ſocieties of learned perſons.

ACADEMY, ACADEMIA, in *Antiquity*, a fine villa, or pleaſure-houſe, ſituate in one of the ſuburbs of Athens, about a mile from the city; where Plato, and the wiſe men who followed him, held aſſemblies for diſputes and philoſophical conferences; and which gave the denomination to the ſect of ACADEMICS.

It took its name, *academy*, from one Academus, or Ecademus, a citizen of Athens, to whom it originally belonged; and who uſed to have gymnaſtic ſports or exerciſes therein.—He lived in the time of Theſeus.

Some, miſtakenly, derive its name and origin from Cadmus the Phœnician, as being the firſt who introduced learning, and the uſe of letters, among the Greeks.

The *academy* was farther improved and adorned by Cimon, with fountains, trees, ſhady walks, &c. for the convenience of the philoſophers, and men of learning, who here met to converſe, diſpute, &c.—Hipparchus, the ſon of Piſiſtratus, built a wall round it; and in order to defray the charges, laid ſo heavy a tax on the people, that ever after Lycurgus tuition, was uſed proverbially for any expenſive buſineſs.—It was alſo the burying-place of illuſtrious perſons, who had deſerved well of the republic.

Here it was that Plato taught his philoſophy; and from him all public places, deſtined for the aſſemblies of the learned and ingenious, have been ſince called ACADEMIES.

Sylla ſacrificed the delicious groves and walks of the *academy*, planted by Cimon, to the uſes of war; and employed thoſe very trees to make machines wherewith to batter the city. Cicero alſo had a villa, or country retirement near Puzzuoli, which he called by the ſame name, *academia*; where he uſed to entertain his philoſophical friends.—It was here he compoſed his Academical Queſtions, and his books De Natura Deorum.

ACADEMY is more frequently uſed among the moderns, for a regular ſociety, or company of learned perſons inſtituted under the protection of a prince, for the cultivation and improvement of arts or ſciences.

Some authors confound *academy* with univerſity; but though much the ſame in Latin, they are very different things in Engliſh.—An univerſity is, properly, a body compoſed of graduates in the ſeveral faculties; of profeſſors, who teach in the public ſchools; of regents or tutors, and ſtudents who learn under them, and aſpire likewiſe to degrees. Whereas, an *academy* is not intended to teach, or profeſs any art, ſuch as it is, but to improve it: it is not for novices to be inſtructed in, but for thoſe that are more knowing; for perſons of diſtinguiſhed abilities to confer in, and communicate their lights and diſcoveries to each other, for their mutual benefit and improvement.

The firſt *academy* we read of, was eſtabliſhed by Charlemagne at the motion of Alcuin: it was compoſed of the chief wits of the court, the emperor himſelf being a member.—In their *academical* conferences, every perſon was to give an account of what ancient authors he had read; and each of them aſſumed the name of ſome ancient author, who pleaſed him moſt, or ſome celebrated perſon of antiquity. Alcuin, from whoſe letters we learn theſe particulars, took that of Flaccus, the ſurname of Horace; a young lord, named Angilbert, took that of Homer; Adalard, biſhop of Corbie, was called Auguſtin; Riculfe, biſhop of Mentz, was Dametas; and the king himſelf, David.

Moſt nations have now their *academies*, Ruſſia not excepted.

Of theſe uſeful inſtitutions we ſhall give an account in the following order.

ACADEMIES of *Antiquities*, as

The *Academy* at Cortona, eſtabliſhed for the ſtudy of the Hetrurian antiquities, which are numerous and extenſive. Their head is called Lucumon, a name taken from the ancient governors of Hetruria. One of their laws is, to give audience to poets only one day in the year; another is, to fix their ſeſſions, and impoſe a tax of a diſſertation on each member in his turn.

The *Academy of Antiquities* at Upſal, owes its riſe to queen Chriſtina, but its eſtabliſhment chiefly to Charles Guſtavus her ſucceſſor. Its deſign is for illuſtrating the northern languages, and the antiquities of the country, its ſtones, coins, and the like monuments; in which notable diſcoveries have been made by it. The more eminent of its members have been Verelius, Loccenius, Scheffer, Rudbeck, Keder, Salin, Peringſkiold, &c.

ACADEMY *of Architecture* was eſtabliſhed at Paris by M. Colbert, in 1671.

ACADEMY, *Royal, of Arts*, was inſtituted in London for the encouragement of *Deſigning*, *Painting*, *Sculpture*, &c. in the year 1768. This *academy* is under the immediate patronage of the king, and under the direction of *forty* artiſts of the firſt rank in their ſeveral profeſſions. It ſupplies, in winter, living models of different characters, to draw after; and, in ſummer, models of the ſame kind to paint after. Out of the ſaid *academicians*, are annually elected out of the forty, whoſe buſineſs is to attend by rotation, to fix the figure, to examine the performances of the ſtudents, and to give them neceſſary inſtructions. There are likewiſe *four* profeſſors, of *Painting*, of *Architecture*, of *Anatomy*, and of *Perſpective* who annually read public lectures on the ſubjects of their ſeveral departments; beſides a preſident, a council, and other officers.

The admiſſion to this *academy* is free to all ſtudents properly qualified to reap advantage from the ſtudies cultivated in it; and there is an annual exhibition of paintings, ſculptures, and deſigns, open to all artiſts of diſtinguiſhed merit.

ACADEMIES of *Belles Lettres*, thoſe wherein eloquence and poetry are chiefly cultivated. Italy is full of theſe; and France has its three; ſuch are

The *academy of Umidi* at Florence, called afterwards La Florentina, in honour of the grand-duke Coſmo I. who declared himſelf its protector in 1540; it flouriſhes both for the works it has produced, and its members; of which ſix theſe two laſt ages have included moſt of the famous men, not only in Tuſcany, but in all Italy. Their chief attention is to the Italian poetry.

ACADEMY *of Humoriſts*, *Umoriſti*, firſt had its origin at Rome, from the marriage of Lorenzo Maſcardi, a Roman gentleman, at which ſeveral perſons of condition were gueſts; and it being carnival-time, to give the ladies ſome diverſion, they took themſelves to the reciting of verſes, ſonnets, ſpeeches, and comedies, firſt, *ex tempore*, and afterwards premeditatedly; which gave them the denomination of *Beſtioni*. After ſome experience, coming more and more into the taſte of theſe exerciſes, they reſolved to form an *academy of Belles Lettres*; and changed the title of *Beſtioni* for that of *Humoriſti*; chooſing for their device a cloud, which, after being formed of the ſaline exhalations of the ſea, returns in a gentle ſweet ſhower, with the motto from Lucretius, *redit agmine denſo*.

ACADEMY *of Arcadia* was eſtabliſhed at Rome in 1690, for reviving the ſtudy of poetry, and the *belles lettres*; and comprehends moſt of the politer wits in Italy, of both ſexes; many princes, cardinals, and other eccleſiaſtics: to avoid all diſputes among whom, about pre-eminence, it is wiſely prohibited, that all appear without, after the manner of ſhepherds of Arcadia. Within ten years from its firſt eſtabliſhment, the number of *academiſts* amounted to ſix hundred. They hold aſſemblies ſeven times a year, in a mead or grove; or late in the gardens of the duke of Salviati. Six of theſe meetings are employed in the recitation of poems, and verſes of the *Arcadi* reſiding at Rome, who read their own compoſitions; except ladies and cardinals, who are allowed to make uſe of other ſhepherds for this office. The ſeventh meeting is ſet apart for the compoſitions of foreign, or abſent members; in which there is more entertainment than in all the reſt, becauſe the pieces produced here are written in all the different ſtyles and dialects of Italy.

The government of this *academy* is wholly democratical, allowing of no prince or protector, but only a *cuſtos*, who repreſents the whole ſociety, choſen each olympiad, that is every four years, with a power of electing twelve others yearly, to aſſiſt him in the adminiſtration. Under theſe are two *ſubcuſtodes*, one vicar or *preſident*, and four *deputies* or aſſiſtants, annually choſen. There are five ways of electing members; the firſt called *acclamation*, uſed when ſovereign princes, cardinals, and ambaſſadors of kings, deſire to be admitted; in which caſe the votes are given *viva voce*; the ſecond *examination*, introduced in favour of ladies and gentlemen of colonies; where the votes are taken privately: the third *coöptation*, eſtabliſhed in favour of colleges and univerſities, where the young gentry are bred, who have each a privilege of recommending one, or two members privately to be balloted for: the fourth *ſurrogation*, whereby new ſhepherds are ſubſtituted in the room of thoſe dead, or expelled: the laſt *delineation*, whereby, when there is no vacancy of members, perſons of poetical merit have the title *Arcadi* conferred on them, till ſuch time as a vacancy ſhall happen. All the members of this body, at their admiſſion, aſſume new paſtoral names, in imitation of thoſe of ancient Arcadians. The *academy* has divers colonies of *Arcadi* eſtabliſhed

in other cities in Italy, all regulated after the same manner.

ACADEMY, [illegible] established by letters patent in 1[illegible] fifty years earlier in private conference[illegible] house of M. de Beleux. M. de Segrais[illegible], to spend the rest of his days, reso[illegible]sire to their meetings. In 1707, M. [illegible] of the generality of Caen, procured th[illegible]t for exciting them into a perpetual [illegible] Foucault was to be protector for th[illegible]e afterwards left to the members, th[illegible] was fixed to thirty, and the choice o[illegible] left to M. Foucault. Beside the thi[illegible] to add some supernumerary members[illegible], from the ecclesiastical commo[illegible]

An assembly of [illegible]rsons, are said only to want letters patent to form a royal *academy*, inferior to few in France. It consists of twenty *academists*, with a director at their head, and a secretary who is perpetual. V. Lombard, *Johnie*, one of the members, here read a learned dissertation on infinity.

ACADEMIES *Chirurgical*; so that first instituted at Paris in 1731, and finally established by letters patent from the king in 1748; the members of which are not only to publish their own and correspondents observations and improvements, but to give an account of all that is published in surgery, and to compose a complete history of this art, by their extracts from all the authors, ancient and modern, who have wrote on it. A question in surgery is to be proposed by the *academy* yearly; and a prize of a gold medal of five hundred livres value to be given to him who furnishes the most satisfactory answer.

ACADEMIES *Geographical*; as that of the Argonauts at Venice, instituted at the solicitation of F. Coronelli, for the improvement of *Geography*. The design of the *academia argonautica* is to procure exact maps, geographical, topographical, hydrographical, and chorographical, of the celestial as well as terrestrial globe, and the several regions and parts thereof, together with geographical, historical, and astronomical descriptions, accommodated thereto, to be made and published in order to which, the several members obliged themselves, by their fidelity oaths, to take one or more copies of each piece, published under the direction of the *academy*, and to advance the money or part of it in order to defray the charge of publication. To this end, there are three societies formed at Venice, Paris, and Rome; the first under F. Bucco, provincial of the Minorites of Hungary; the second, under the abbot Bignon; and Le Payenne au Marais; the third, under F. Ant. Baldigiani, Jesuit, professor of mathematics in the Roman college; to whom those admitted themselves, who are willing to engage in this design. The Argonauts number 150 members in the several countries of Europe; their device is the terraqueous globe, with the motto, *non ultra*. At the expence of this *academy*, all the globes, maps, and geographical writings, of F. Coronelli have been published.

ACADEMY *of Dancing*. One of this kind was instituted by Lewis XIV. with extraordinary privileges.

ACADEMIES *Ecclesiastical*; as that at Bologna, employed in the examination of the doctrine, discipline, and history of each age of the church.

ACADEMIES *Historical*; as the *Royal Academy of Portuguese History* at Lisbon, was instituted by king John V. in 1720, as appears by a medal struck by the *academy*, on the front whereof is that prince's effigy, with the inscription *Johannes V. Lusitanorum Rex*; and on the reverse, the same prince standing in repentance supporting and raising History, almost prostrate before him, with the legend *Historia Resurgens*; underneath are the following words in three lines, RESUS ACADEMIA HIST LUSIT. LVSITANI INSTITUTA VI. Idus Decembres MDCCXX. This *academy* consists of a director, four censors, a secretary and nine members; to each of whom is assigned some part, either of the ecclesiastical, or civil history of the nation; which he is to treat either in Latin, or Portuguese.

ACADEMY *of Sacred History*, at Tubingen, was lately established by some learned men, for publishing the best historical writings, the lives of the chief historians, and compiling new histories, on the several points and periods thereof.

ACADEMIES *of Languages*, are called by some, *Grammatical academies*, as

The *Academy della Crusca*, at Florence, famous for its vocabulary of the Italian tongue, was founded in 1582, but lasted scarce above the next 15, when it became ruined for a dispute between Count Salviati and several of its members. Many authors at most confound this with the Florentine *academy*.

ACADEMIES *of Emulation* had their rise in 1617, at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen presidents. In 1668, the number of members arose to upwards of nine hundred.

ACADEMY, *French*, had its rise in a private meeting of men of letters, in the house of Mr. Conrart, in the year 1628. Cardinal Richlieu, in 1635, at the instance of Mr. Chapelain, erected it into an *academy* for refining and ascertaining the French language and style. The number of the members was limited to forty, out of whom a director, a chancellor, and secretary, are to be chosen; the two former hold their post for two months, the secretary is perpetual. Several privileges and immunities were conferred on the new *academy*, particularly the *droit de committimus*, or a privilege of not appearing to answer before any court, but that of the king's household. Their first assemblies were held in the cardinal's apartment; after his death, in that of the chancellor Seguier. At last an apartment was given them in the Louvre, now called *l'Academie Francoise*. They meet three times a week in the Louvre; at meeting up, forty silver medals are distributed among them, having on one side the king of France's head, and on the *revers*, *protector de l'academie*, with a laurel and this motto, *a l'immortalité*. By this distribution, the attention of the *academists* is secured; those who are present receiving the surplus, otherwise intended for the absent.

As to the employments of the *academy*; its design being not only to give rules, but examples of good writing; they began with making Eloges on subjects taken at pleasure, each member in his turn; twenty of these have been printed. Their next work was a critique of the Cid of P. Corneille, which enjoined them by the cardinal. They next fell about a dictionary of the French tongue, which after about fifty years pains in it, in order to settle the words and phrases to be used in writing, &c. was published in 1694, having in the mean while given occasion to some smart disputes with M. l'Abbé Furetiere, one of their own members.

Their history is written with great elegancy to the year 1652, by M. Pelisson; improved and continued to the year 1700, by M. l'Abbé d'Olivet: the same is given chronologically, by P. le Caseau.

ACADEMY, *Royal Spanish*, is an *academy* for cultivating the Castilian tongue, established at Madrid, on the model of the French *academy*. The design of this was laid by the duke d'Escalona, and approved of by the king in 1714, who declared himself protector thereof.—It consists of twenty-four *academists*, including the director and secretary.

Its device is a crucible on the fire, with this motto, *limpia, fija y da esplendor*; i. e. it purifies, fixes, and gives brightness; which same have embellished. Their object, as marked out by the royal declaration, is to cultivate and improve the national language; in order to which, they are to begin with choosing carefully such words and phrases, as have been used by the best Spanish writers; noting the low, unharmonious or obsolete ones, and compiling a dictionary, wherein these may be distinguished from the former, &c. by which means, adds this prince, it will clearly appear, that the Castilian tongue is inferior to none of those most esteemed in the world; and may be employed with advantage either in teaching the arts and sciences, or in expressing the most perfect Latin or Greek originals in exact translations. The number of members is limited to twenty-four; the duke d'Escalona to be director for life; but his successors chosen yearly. The secretary to be perpetual. The *academy* to have its own printer, not to put any thing to press without the permission of the council. For further encouragement, all privileges and immunities enjoyed by the domestic officers, actually in the king's service, and the royal palace, are granted the *academy*.

ACADEMIES *of Law*; as that famous one at Berytus, and that of the Sinenses at Bologna.

ACADEMIES *of Medals and Inscriptions*, was erected for the study and explanation of ancient monuments; and to enumerate great and memorable events to posterity, by ancient monuments, as medals, statues, inscriptions, &c. The *academy of Medals and Inscriptions* at Paris, was settled first by Mr. Colbert in 1663, for the study and explanation of ancient monuments, and perpetuating of great and memorable events, especially those of the French monarchy, by coins, reliefs, inscriptions, &c. The number of members at first was confined to four or five, but in 1701 was increased to forty; whereof ten to be honoraries, ten pensionaries, ten associates, and the same number of novices or elevez. The king nominates their president and vice-president yearly; but their secretary and treasurer are perpetual. The rest are chosen by the members themselves, agreeable to the conditions given them

them on that behalf. Their chief work is a kind of medallic history of the reign of Louis XIV. Beside which we have several volumes of their essays, under the title of Memoirs: and their history, written and continued by their secretaries. Their motto is *ingenia moti*.

ACADEMIES, *Medical*; as that of the Naturæ Curiosi in Germany; that founded at Palermo, in 1645; another at Venice, in 1701, which meets weekly in a hall over the grand hospital; another at Genoa, in 1715, in the house of M. le Clerc. The college of physicians at London is also by some ranked in the number of medical academies.

ACADEMY, *Mystical*; this consists of the managers and directors of the opera.

The French have also considerable academies in most of their great cities; as, at Montpellier, a royal academy of sciences, on the like footing as that at Paris, being, as it were, a counterpart thereof: at Thoulouse, an academy under the denomination of Lanternists: others at Nismes, Arles, &c.

ACADEMY *of Natural Curiosities*, in Germany, was first founded in 1652, by M. Bausch, a physician, and taken into the protection of the emperor Leopold.

This academy differs from all others, in that it has no fixed residence, or regular assemblies; instead whereof is a kind of bureau, or office, first established at Breslaw, afterwards removed to Nuremberg, where letters, observations, &c. from members and correspondents are taken in. The academy consists of a president, two adjuncts, or secretaries, and fifty-eight members. The colleagues, at their admission, oblige themselves to two things; first, to choose some subject out of the animal, vegetable, or mineral kingdom to handle, provided it had not been treated of by any colleague before; the second, to apply themselves to furnish materials for the annual Ephemerides. Each member to bear a symbol of the academy, viz. a gold ring, wherein, instead of a stone, is a book open, and on the face thereof an eye: on the other side the motto of the academy, *nunquam otiosus*, i. e. never idle. See the Military laws, &c. of this academy, with the names of the members, and the titles of its pieces, in Ephem. Germ. dec. 1, an. 1. & 2. Prof. and the continuation of the same in the prefaces and appendices to the ensuing volumes.

ACADEMY, *Noctule*; as that of Petersburgh.

ACADEMIES *of Painting, Sculpture, and Architecture*; as those celebrated ones anciently at Florence and Milan, called also *schools*; and that other at Bologna, lately incorporated into the new institute; to which may be added the academy of painting and sculpture at Paris and Vienna; another of sculpture at Rome.

ACADEMY *of Painting and Sculpture* at Paris was first projected by Le Brun, Stracni, Corneille, &c. for which they obtained an arret of council in 1663, and established in 1664 and 1665, under the cardinal Mazarine, first protector thereof; and the chancellor Seguier vice-protector. It consists, besides, of a director, a chancellor, four rectors, a treasurer, 12 professors, adjuncts to the rectors and professors; 6 counsellors; 2 secretary; a professor for anatomy, and another for geometry and perspective.

Persons are here admitted either in quality of painters or sculptors. The painters are admitted according to their respective talents; as being a distinction made between those who work in history, and those who only paint portraits, or landskapes, or beasts, or fruits, or flowers, or paint in miniature; or only design, or engrave, or carve, &c. An account of it has been published by Cochin, under the following title, Defcripti de l'Acad. Roy. de Peinture & Sculpt.

There is also a French academy of painting, sculpture, &c. at Rome, established by Louis XIV. wherein those who have won the annual prizes in the like academy at Paris, are received and entertained for three years, to give them an opportunity of perfecting themselves.

ACADEMY, *Diplomatic*, is composed of six persons, who meet on certain days each week at the Louvre, in the chamber where the papers relating to foreign affairs are lodged. Here they peruse such papers as are put in their hands, by order of the secretary for foreign affairs, who acquaints the King with the progress they make, and the capacities of each, that his majesty may employ them accordingly.

ACADEMIES *of Sciences*, chiefly denote those erected for improving natural and mathematical knowledge, otherwise called philosophical and physical academies; such as the *academy del cimento*, or *of experiments*, formed at Naples, in the house of Baptista Porta, about the year 1560, the first academy of the philosophical kind. It was succeeded by the

ACADEMY *of Lynxes*, founded at Rome by prince Frederic Cesi, towards the close of the same century; several of whose members rendered it famous by their discoveries: the celebrated Galileo Galilei was of the number.

Divers other academies contributed also to the advancement of these sciences; but it was by speculations, rather than by repeated experiments on the phenomena of nature: such were the *academy of Bellisians* at Rome, and that of Laurence de Medicis at Florence, in the fifteenth century; in the sixteenth, that of *Incogniti* at Padua, of *Vegni Inuti* at Rome, of *Ordinati* at Piacenza, and of *Umidi* at Florence. The last of these studied fire and pyrotechnia; the second, music; the fourth, poetry; the third, gardens and portraits; the fourth, mines and hydraulics. Add to these, that at Venice, called *Della Crusca*, founded by Frederic Badoaro, a noble Venetian; another in the same city, whereof Compagni, native of Feltro, appears to have been the chief; and that of *Ricovrati*, or la Concezione, whereof Bernardo Tasso, Sperone Speroni, Quarantotti, Paulus Aemilius, Julio Cesar Scaliger, and Fabio Cicali, celebrated philosophers, were the chief members.

The compositions of all these academies of the fifteenth century were good in their kind, but those of them comparable to those of the Lyncæi.

ACADEMY *del Cimento* made its appearance at Florence some years after the death of Torricelli, under the protection of prince Leopold, afterwards cardinal de Medicis: Redi was one of its chief members. Count Laurence Magalotti, secretary of this academy, published a volume of its experiments in 1677, under the title of Saggi di Naturali Esperienze; a copy of which being presented to the Royal Society, was translated into English by Mr. Waller, and published at London, in quarto.

ACADEMY *degl' Inquieti*, at Bologna, incorporated afterwards into that *delle Scienze* in the same city, followed the example of that *del Cimento*; their meetings were at the house of the abbot Antonio Scarpini. Here Gentilino Montanari, one of the chief members, made a succinct discourse on physical and mathematical subjects, part whereof was published in 1667, under the title of Pendarti Fisico-Matematici. This academy afterwards rose in the apartment of Lodovico Manfredi; and afterwards, in that of Jacob Sanuti, but never at a higher date, when its assemblies were held in the palace Magilli.

ACADEMY *of Researches*, in the kingdom of Naples, called *La Società Reale accademica di Napoli*, was founded about the year 1540, under the name of *Neocyrani*, and revived under that of *Secretorum* by Camillo Tuttano, about the year 1600. It was transformed from an academy of belles lettres into an academy of sciences, at the solicitation of the learned Don Gregorio Grimea; who being made president under the title of promotor-general thereof, in 1695, gave a new fit of regulations. He divided the *academicks* into several classes, viz. grammarians, rhetoricians, poets, historians, philosophers, physicians, mathematicians, lawyers, and divines, with a certain number of usuals and persons of quality. To be admitted a member, a man must have degrees in some faculty. The members are not allowed to take the title of *academicks*, in the beginning of their books, without a written permission from the president, which is not granted till the work has been examined by the censors of the academy. This permission is the greatest honour the academy can confer; since hereby they, as it were, adopt the work; and are answerable for it against all censures which may be made of it. The president or promotor himself is subject to this law. Add, that no academick is allowed to publish any thing against the writings of another, without leave from the society.

There have been several other *academies* of sciences in Italy, which have not subsisted long, for want of being supported by the princes. Such were at Naples that of the *Investiganti*, founded about the year 1679, by the Marquess d'Arena, Don Andrea Concubletto; and that which met in 1698, in the palace of the duke de Medina, Don Lewis della Cerda, viceroy of Naples. At Rome, that of *Fisico-Matematici*, which met in 1680, in the house of Sig. Ciampini: at Verona, that of *Filaleti*, founded the same year by Sig. Joseph Grezoli, which met in the house of the count Serenghi della Cuera: at Venice, that of *Filoleti*, founded the same year for the cultivation of physics and mathematics, and ended the year following: that of F. Francisco Lana, a Jesuit, of great skill in those sciences: lastly, that of *Fisici Critici*, at Sienna, founded in 1691, by Sig. Peter Maria Gabrielli. Some other academies still subsisting in Italy, equal with advantage the best of the former. One of the principal is the *academy of Filarmonici*, at Verona, supported by the Marquis Scipio Maffei, one of the most learned men in Italy. Though the members of this body apply themselves to the belles lettres, they do not neglect the sciences. The *academy of Ricovrati*, at Padua, still subsists with reputation; in it, learned discourses are held from time to time on physical subjects; such, for instance, is that which the celebrated Sig. Antonio Vallisnieri, first professor of physic in the university of that city, delivered here on the origin of springs, since printed. The like may be said of the *academy of the Muti de Reggio*, at Modena; to which the same Sig. Vallisnieri, a native of that city, presented an excellent discourse on the scale of created beings, since inserted in his History of the Generation

bertion [illegible] painted at Venice in 1711. [illegible]cie *academici* may also be ranked [illegible]med men, which of late years [illegible]ouse of Sig. Christino Marcello, [illegible]d great patron of learning. Among [illegible]e first rate, after the institute of [illegible]hat of the countess Dunnoyer, Clelia Gr[illegible]the most learned ladies of the age, [illegible]dethatic, his Literary History of It[illegible]inhabited an academy of experimental [illegible]plated at Milan; of which Sig. Vallisn[illegible]presiding, and had already drawn up [illegible]e likewise many other *academies* of [illegible]ucibus enumerates 530; of which the [illegible]arcely.

F. Mersenne is said to have given the first idea of a philosophical *academy* in France, towards the beginning of the seventeenth century, by the conferences of naturalists and mathematicians, occasionally held at his lodgings; at which Gassendi, Des Cartes, Hobbes, Roberval, Pascal, Blondel, and others, assisted. F. Mersenne proposed to each, certain problems to examine, or certain experiments to be made. These private assemblies were succeeded by more public ones, formed by Mr. Montmort and Mr. Thevenot, the celebrated traveller. The French example animated every Englishman of distinction and learning to erect a kind of philosophical *academy* at Oxford, towards the close of Cromwell's administration; which, after the Restoration, was erected by authority into a Royal Society. The English example in its turn animated the French. Lewis XIV. in 1666, assisted by the counsels of M. Colbert, founded an *academy* of sciences at Paris, called the

Academy, *Royal, of Sciences*, for the improvement of physics, mathematics, and chemistry. In the year 1699, it had as it were a female birth; the same prince, by a regulation dated the 26th of January, giving it a new form, and putting it on a new and more solemn footing. In virtue of that regulation, this *academy* was to be composed of four kinds of members, viz. *honorary*, *pensionary*, *associates*, and *scholars*. The first class to consist of ten persons; and the rest of twenty each.—The honorary *academists* to be all inhabitants of France; the pensionaries all to reside at Paris; eight of the associates allowed to consist of foreigners; and the scholars all to live at Paris.

The officers, to be a president, named every year by the king, out of the class of honorary *academists*; and a secretary and treasurer, to be perpetual.

Of the pensionaries, three to be geometricians, three astronomers, three mechanics, three anatomists, three chemists, three botanists; the remaining two, secretary and treasurer.—Of the twenty associates, two to apply themselves to geometry, two to botany, and two to chemistry.—The eleves to apply themselves to the same kind of science with the pensionaries they are attached to; and not to speak, except when called thereto by the president.—No regular or religious to be admitted, except into the class of honorary *academists*; nor any person to be admitted, either for associate or pensionary, of which known by some considerable printed work, some machine, or other discovery.—Further, no person to be allowed to make use of his quality of *academist*, in the title of any of his books, unless such book have been read to, and approved by the *academy*.

In the year 1716, the duke of Orleans, then regent, made an alteration in their constitution; augmenting the number of honoraries, and of associates capable of being foreigners, to twelve; admitting regulars among such associates; suppressing the class of eleves, and establishing, in lieu thereof, a new class of twelve adjuncts, in the six several kinds of sciences cultivated by the *academy*; and, lastly, appointing a vice-president, to be chosen yearly by the king, out of the honorary members; and a director, and sub-director, out of the pensionaries.

This *academy* has done great things for the service of learning, by the continuation of the MEMOIRS, by the sending persons to different parts of the world for making observations; but especially by the excellent writings they have published, either in a separate, or a joint capacity; particularly their MEMOIRS. Indeed they have an advantage over most *academies*, in being defrayed their expences, and even paid for care and attendance. Nevertheless, they have undergone some imputations; particularly that of plagiarism, in borrowing their neighbours inventions with what fetches, we do not know. They have the distribution of annual prizes. Their history to the year 1697 was written by Mr. Du Hamel; and since that time continued from year to year by Mr. Fontenelle, under the following titles: Du Hamel Historia Regiæ Academiæ Scientiarum, Paris, 4to. Histoire de l'Academie Royale des Sciences, avec les Memoires de Mathematique & de Physique tirez des Registres de l'Academie, Paris, 4to. Hist. de l'Acad. Roy. des Sciences depuis son Etablissement en 1666, jusqu'en 1699, en 13 tomes, 4to.

A new history, from the institution of the *academy*, to the period from whence Mr. de Fontenelle commences, has been formed; with a series of the works published under the name of this *academy*, during that first interval. Their motto *invenit & perfecit*.

Academy, *the Royal Society of Berlin* was founded by the late king Frederic of Prussia in 1700, on the model of that of England, excepting that besides natural knowledge it likewise comprehends the belles lettres. A new form, and a new set of statutes were given it in 1740; by which it is ordained, that the president shall be one of the counsellors of state, and nominated by the king. The members to be divided into four classes; the first, for professing physics, medicine, and chemistry; the second for mathematics, astronomy, and mechanics; the third, for the German language, and the history of the country; the fourth, for oriental learning, particularly as it may concern the propagation of the Gospel among infidels. Each class to elect a director for themselves, who shall hold his post for life. Their meeting to be in the castle called New Marshal; one class to meet every week in their turn. The members of any of the classes to have free admission into the assemblies of any of the rest. The great promoter of this institution was the celebrated M. Leibnitz, who accordingly was made the first director. The *academy* has published several volumes of its transactions in Latin, under the title of Miscellanea Berolinensia. This *academy* has since been renewed; and several volumes of its transactions published in French, under the title of Histoire de l'Academie Royale des Sciences & Belles Lettres, à Berlin. There are other *academical* institutions at Berlin, and other parts of the North; several of which having distinguished themselves by their journals, ephemerides, &c. the reader will find some account of them under the article JOURNAL.

Academy *of Petersburgh* was founded, or rather projected, by the late czar, Peter the Great, and happily executed by the munificence of the czarina, Catherine, his wife, and successor, on the model nearly of the *academy* of Paris, whereof the czar was a member. Hither that prince invited learned men from all parts of Europe. The *academy* held its first public meeting in December, 1725, in the presence of the duke of Holstein, and a large appearance of persons of distinction. The ordinary assemblies are held twice a week, and public or solemn ones thrice in the year; wherein an account is given of what has been done in the private ones. The building, apparatus, &c. of this *academy* are extraordinary. They have a fine library, an observatory, &c. In effect, it partakes much of what we call an UNIVERSITY; having regular professors in the several faculties, who read lectures as in our schools. Several volumes of the works of this *academy*, under the title of Commentarii Academiæ Scientiarum Imperial. Petropolit. have been published; besides several mathematical pieces, composed by particular members of it. Their motto is *paulatim*.

Academy, *Royal, of Sciences*, at Stockholm, was instituted in 1739, and has since that time to 1783, by quarterly publications, given 42 volumes of transactions in 8vo. in Swedish. See SOCIETY.

Academy *of Sciences*, called *the Institute of Bologna*, was founded by count Marsigli, in 1712, for the cultivating of physics, mathematics, medicine, chemistry, and natural history. Its history is written by M. de Lemeri, from memoirs furnished by the founder himself.

For a further account of similar institutions, see SOCIETY.

Academy, is also used among us as a kind of collegiate school or seminary; where youth are instructed in the liberal arts and sciences in a private way; now indeed it is used for all kinds of schools.

Frederic I. king of Prussia, established an *academy* in Berlin in 1705, for the education of the young nobility of the court, suitable to their extractions. The expence of the students was very moderate, the king having undertaken to pay the extraordinaries. This illustrious school, which was then called the *Academy of Princes*, has now lost much of its ancient splendor.

The Romans had a kind of military *academies*, established in all the cities of Italy, under the name of *Campi Martii*. Here the youth were exercised to be trained for war at the public expence. The Greeks, beside *academies* of this kind, had military *academies*, called *Pallæ*, who taught all the higher objects of war. See GYMNASIUM.

We have two royal *academies* of this kind; one at Portsmouth, for teaching navigation, drawing, &c. which may be called a naval or maritime *academy*; and another at Woolwich, where youth are taught fortification, gunnery, and such branches of the mathematics as are necessary to qualify them for engineers.

The non-conformist ministers, &c. are bred up in private *academies*, as not approving the common university edica-

education. The principal of their *academies* are those in London, Dissenting, and Warrington.

ACADEMY is likewise a name given to a riding school, where young gentlemen are taught the great horse, and other suitable exercise; as fencing, &c. See MANEGE.

ACADEMY is also used in speaking of the schools of the Jews; i. e. those seminaries where the rabbins, or doctors, instruct the youth of their nation in the Hebrew tongue, explain to them the Talmud, teach them the Cabbala, &c.

ACADEMY, or ACADEMY *Figure*, in *Painting*, is a drawing, or design made after a model, with a crayon, or pencil. Or the copy of such a draught.

ACÆNA, *ακαινα*, in *Antiquity*, a Grecian decempeda, or ten-foot rod, used in measuring of their lands. Bertrin. Syntag. de Comitiibus, &c. p. 373. Rectol. Geog. l. ii. c. 2. Scalmas. ad Solin. p. 282.

ACAIABA, in *Botany*, a name by which some authors have called the tree which produces the cashew nut: the avadou of other writers. Plin.

ACAJOU, in *Botany*, the name of a genus of plants, the characters of which are these: the empalement is of one leaf erect, and six-toothed; the segments: the flower is also of one leaf, having a short tube, and cut into five parts at the top: the stamina are as long as the petals, and crowned with small summits: in the centre is a round germen, supporting an awl-shaped style, crowned with an acute stigma: the germen becomes a large oval fleshy fruit, having a large kidney-shaped nut growing to its apex. Miller.

There is only one known species of this genus, viz. the tree which produces the cashew nut, or West Indian ANACARDIUM.

Of the juice of this fruit they make a drink, which, duly fermented, intoxicates like wine. The Indians eat the nuts, slightly roasted, dipped in water, or wine, and sprinkled with salt, as a provocative to exercy. The juice is said to take away warts, and cure a madness. From the fleshy fruit or covering of the two shells, the Indians extract an oil, used by painters, to give their colours a lasting block, and to preserve wood from putrefaction.

ACALEPHE, a name given by Linnæus to a certain tribe of fish of which is very tender. Leaves us a few animals mentioned by Neander, and a few animals, mentioned by Gesner.

ACALYPHA, in *Botany*, the name of a genus of plants, of the *decandria trigynia* class, called by Boerhaave, and others, *ricinus*, *q. v.*

The characters are these: the male and female flowers are diffused, but they are produced on the same plants; the male ones usually standing immediately over the female ones, both without petals; the male flowers have an empalement, composed of three roundish concave leaves; the female also have a three-leaved empalement, in the centre of which is a round germen with three styles, which, when the flowers decay, turns to a roundish vessel divided into three cells by deep furrows, each containing one large round seed. Miller reckons there are Linnæus four species.

ACALCOSE, in

ACAMATOS, among *Physicians*, means that disposition of a body, which is easily distant from friction and exertion.

ACANACEOUS, *See* ACANTHACEOUS.

ACANAPHORA, in *Botany*, a name given by some to the common knapweed or poca, a common wild plant. See CENTAURY.

ACANOR, a particular sort of chemical furnace. See FURNACE.

ACANTHA, in a general sense, a spine or prickle, chiefly of plants of the thorny kind.

The word is formed from *ακη*, *point*, and *ανθος*, *flower*.

ACANTHA, in a more particular sense, denotes a spine, or part of certain fishes, as the echinus marinus, or hedge-hog, the fish, the thorn-back, a species of the genus, so peculiarly called a *thorn*, from the two prickles on its back. Rondelet. de Piscib. lib. viii. c. 2.

ACANTHA, among *Surgeons*, is applied to the head or point of those instruments of the VULSELLA or the forceps, formerly so called, but now called the FORCIPES *dentati*.

ACANTHABOLUS, a surgeon's instrument, wherewith to extract foreign bodies, which by the sharpness of the points have penetrated, and severed the parts of the body.

The word is compounded of *ακανθα*, a *thorn*; and *βαλλω*, to *cast away*.

The *acanthabolus* is the same with the instrument which is otherwise called *capreas*. Its chief use is for extracting fishbones, or the like, sticking in the œsophagus; as also the fragments of weapons, bones, hair, &c. remaining in wounds. Its figure resembles that of a pair of pincers; sometimes it is also made crooked, for more commodious application to the fauces. Celsus, lib. vii. c. 3.

ACANTHAS of Ægina, is also sometimes used for an instrument, wherewith people pull out the hairs from their eyebrows.

ACANTHACEOUS, among *Botanists*, a term applied to a class of plants, popularly known under the name of the THISTLE *kind*.

ACANTHALZUCA, *the same as echinopus, or the* THISTLE.

ACANTHE, in the *Materia Medica* of the ancients, a name given to the plant we now call the ARTICHOKE.

ACANTHE *Arabica*, in *Botany*, a name given by some of the Greek writers to a plant called *acanthe*, and by the Arabian physicians *acacia*. It is a prickly plant, whose roots were somewhat like those of the asparagus, and composed of several kinds of gums, one of a bitter taste. It was brought for medicinal use from the East Indies, and some parts of Arabia, but was the root of the *amomum* of Avicenna and others.

ACANTHAS, in *Ichthyology*, a name given by some authors to the 6th, the skin of which is used by our artificers in polishing, and called by them simply fish-skin. See GALEUS.

ACANTHICE, *mastich*, among ancient *Naturalists*, a kind of gum, yielded by the herb helxine. Gesner explains it by *spinalis multifida*. Plin. Hist. Nat. Lib. xxiv. c. 19. Hard. Not.

See *Distaff*-THISTLE.

ACANTHINE, *acanthina*, denotes a thing relating to, or resembling the herb ACANTHUS.

In this sense, we read of *acanthina opificiosa*, *acanthine garments*, of which we have two different explications. Some understand by it a kind of embroidery, wrought in imitation of the Egyptian *acanthine* dress, whose small turnips are much interlaced. Others will have it a peculiar kind of silken stuff, made of the lanugo, or down of a plant of the thistle kind, growing in Sicily and the East. Plin. Hist. Nat. Lib. xix. c. 19. Hard. Not.

ACANTHITE, a name used by some writers for BASTARD wood.

ACANTHOS, among *Naturalists*, a plant of the thorn, or rather of the thistle kind: wanne down, being cleansed from the prickles, was manufactured into a kind of stuff, not unlike silk. Plin. ubi supra.

ACANTHIS, in *Ornithology*. See GOLDFINCH.

ACANTHOPTERYGII, in *Natural History*, a term used to express one of the general classes or families of fishes; the character of which is, that all the rays of the *fins* are bony, and some of them prickly at the extremities.

The word is derived from *ακανθα*, a *thorn*, or *prickle*, and *πτερυξ*, a *fin*.

Under this class are contained seventeen GENERA; viz. the *coracinus*, *chætodon*, *sciæna*, *scarus*, *labrus*, *sparus*, *lobotes*, *zeus*, *sparus*, *chætodon*, *mugil*, *gasterosteus*, *xiphias*, *trichiurus*, and *echeneis*.

ACANTHUS, in *Botany*. See BEAR'S-BREECH.

The ancients have not only called the herb bear's breech by this name, but also a thorny tree growing in Egypt. An accurate examination of the ancient writers will, however, shew very plainly, that they meant two very different vegetables under this name: the *acanthus* of Virgil and the Egyptian *acanthus* of Theophrastus, being two wholly different plants. Virgil mentions the *acanthus* as being an ever-green plant, and producing berries, or a small round fruit, *baccas semper frondentis acanthi*, are his words: and Theophrastus tells us, that his Egyptian *acanthus* is a prickly tree, and bears pods like those of beans. The Greek sculptors adorned their works with the figure of the latter; as the Gothic did with that of the former, whom they represented not only in their capitals, but also in other ornaments. It is plain, that the *acanthus* of Theophrastus is the *acacia*, a tree, from some species of which we have the gum arabic now in use; and the *acanthus* of Virgil, mentioned in this place, seems to be the Cyrenian *lotus*, which Herodotus says is like the Egyptian *acanthus*.

ACANTHUS, in *Architecture*, an ornament in the Corinthian and Composite orders: being the representation of the leaves of an acanthaceous plant, in the capitals thereof. See *Tab. Architect. fig. 21.*

ACANUS, a species of thistle, called *acanus Theophrasti*. See CARDUUS.

ACAPATLI, in *Botany*, a name used by some authors for the plant which produces the long pepper, used in medicine. De Last. Ind. Occ. p. 231.

ACAPNOS, *ακαπνος*, a name of the CAMPANULA, or MARSH-WORT; also of dry wood.

ACARA, in *Ichthyology*, the name of a fish caught in the fresh waters in the Brasils, and esteemed a very delicate and well-tasted one. It seldom exceeds three or four inches in length, and has a high back like the BRACEM. Its mouth is small, and its jaws rough like a file. It has one long back-fin, which is supported by a great number of slight and prickly rays, and reaches to the tail. Its scales are large; its back is of a glossy brown; its sides and belly white; its tail is not forked. It has a large black spot on the middle of each side, and another near the tail. Its fins are all brown. Margrave. Brasil.

ACARAAYA, in *Ichthyology*, the name of a fish caught on the Brasilian shores, and by some called also GARANNA. It grows to three feet in length, and is of the shape of our carp. Its lower jaw is furnished with an even range of sharp teeth, like little needles. Its upper jaw has two very long ones, and besides these, a multitude of other very short ones. Its eyes are large, and their iris red. Its tail is broad, and a little forked. Its scales are of a moderate

moderate [illegible] silver hue, with an admixture of purple [illegible] the under part of its head, are whitish [illegible] as all of a fine pale red, except those are white, with a slight edge of red. [illegible] Brasil, both sizes and salted. Margrave.

ACARA [illegible]gy, the name of a fish found in the wells [illegible] some other parts of the world. It is a [illegible] remarkable animal. It is of a flatted bo[illegible] not thick. It is usually of about ei[illegible] breadth long, and about four broad. I[illegible], but very small, scarce admitting th[illegible]le finger. In the fore-part of the mu[illegible] and below, there are triangular and flat[illegible] on each side, just below the eyes, there are [illegible], which serve in the place of gills; a[illegible] of the back, directly behind the eyes, [illegible] fine slender pointed horns, which fingers nearly erect, but bending a little backward; this is of a cylindrical shape, and four fingers breadth long. It has no scales, but a smooth skin, and is of a mixed greyish and brownish colour. It feeds on sea-weeds; and its flesh is not eatable. Margrave.

ACARAPEBA, in *Ichthyology*, the name of an American fish, called also by some *bersone*. It has a somewhat broad and flat body, covered with large scales of a fine silver whiteness. It grows to a foot in length, and to four or five fingers in breadth. It has a large mouth, but without teeth; and its tail is forked. It has one long black fin, the anterior rays, or naves, of which are rigid and prickly, the hind naves soft and flexile. The fins are all like the rest of the body, of a pure white. The fish seems a kind of SPARUS. Margrave.

ACARAPUNIMA, in *Ichthyology*, the name of a Brasilian fish, of the CARANX kind, and seeming of the same species with the *caranxus* of the Mediterranean. Ray.

ACARARIYAMBA, in *Ichthyology*, the name of a fish caught in the Brasilian seas, of an oblong figure, resembling the MULLETS, and growing to two feet or more in length. Its mouth and teeth are very small. It has one long fin on the back, running very nearly to the tail, which is supported by rigid and prickly rays. Its tail terminates in two oblique horns. Its scales are large, and of a purplish colour, with a fine admixture of blue; and along the middle of each side there runs, from the gills to the tail, a very broad and beautiful gold-coloured line. Its back, down to this line, is variegated also with small gold-coloured spots; and the sides under the line are very beautifully variegated with small and fine longitudinal, but short gold-coloured lines, of a somewhat paler colour than the broad one. Its belly is white, and its fins yellow. Margrave and Willughby.

ACARAPUCU, in *Ichthyology*, the name of a Brasilian fish, caught in the fresh waters, and growing to eighteen inches in length. It is of a rounded body; and its mouth is small and not protuberant. It has lips, which it can hide, or suffer to appear at pleasure, and has no teeth. Its tail is long and forked; its scales are of a silvery hue. On the back it has a fine golden gloss, shining in the whitish rays; and on the sides five or six large blue spots. Its back and side fins are of a pale blue, as is also the tail: the belly fins are yellowish. It is a well-tasted fish. Margrave.

ACARAUNA, in *Ichthyology*, an American fish, of which there are two species; the one called *acarauna*, without any addition; and the other the *acarauna quadrata*, or square *acarauna*; and by our sailors, the *sole-fish*.

The *acarauna*, simply so called, grows to about four or five inches long, and is considerably broad and flat. It is covered with small blackish scales; its tail is large and forked. It has two fins under the gills, two more under the belly, and a long one running all along the back, and another answering it from the anus to the tail. Its mouth is small and narrow, and its teeth very small. Its eyes are but small; and on each side near the tail, it has an extremely sharp thorn, or prickle: these it can draw in at pleasure into its sides, and occasionally throw them out to annoy other fishes.

The *acarauna quadrata*, or square *acarauna*, or *sole-fish*, is much of the same size with the former species. It is frequently preferred to the sublimer of the curious, and is found there, of a pale brown, with its tail and the fore-part of the body of a pale yellow, or straw colour. It is covered with scales, furnished with slight parallel lines, except that the anterior part of its head is covered with a naked, but rough skin. The top of the head rises into an acute angle; the forehead is flat; and the eyes round and large, and placed high. Its mouth is very small; and its teeth are very slender, and stand close together. The upper jaw has on each side four sharp thorns growing from it, and the lower two very large and sharp ones, bending downward, and in shape and structure resembling a cock's spur, and from these there runs up a row of small thorns to the eye. Willughby, Hist. Pisc.

ACARI, or ACARUS, in *Natural History*, an animalcule bred in wax; said by Aristotle to be the least object of human sight.

ACARI, or ACARUS, is also used for a kind of vermin lodged under the cutis, where preying on the parts, it excites an itching, and raises pimples.

A German physician has traced their origin: he finds the *acari* arise from milk-mites turning flesh and four. Their seat is chiefly in the hands or feet, rarely in the arms or legs. Linlov. in Ephem. Germ. dec. 10. p. 109. See ITCH.

ACARUS is also used by some *Naturalists* as the classical name of the lice of animals, which are indeed of as many various genera as the animals on which they breed. In the Linnæan system, it is a genus of *aptera*, with eight feet, two eyes at the sides of the head, and two jointed tentacula, comprehending thirty-five species.

ACARNA, in *Botany*, a name by which Theophrastus, and some other writers, express the common ARTICHOKE. Mem. Vaillant gives the name *acarna* to one of the genera of the *cynarocephalous*, or artichoak-headed class of plants.

ACARNAN, in *Ichthyology*, the name of a small sea-fish very common in the Mediterranean, and brought to market among the *rubellios*, or RED MULLETS, and called by the fishermen by the name *fragolino*, or *glareolino*. It very much resembles the erythrinus in shape; but as that is of a fine red, this, on the contrary, is of a silvery white. Its mouth is moderately large; its teeth slender and pointed; and its eyes large, having fine yellow irises. Its fins are white, but have each a black spot at their origin. It seems doubtful whether this be really any way different from the erythrinus, except in colour, which alone is not distinction sufficient to make a species. Rondelet.

ACARON, the wild MYRTLE.

ACARTUM, red lead; called also *azemaphor*.

ACARUS. See ACARI.

ACATALECTIC, ACATALECTICUS, in the *Ancient Poetry*, a term applicable to such VERSES as have all their FEET and SYLLABLES; and are in no wise lame or defective at the end.

The word comes from *κατα* and *λήγω*, *to cease* or *end*; whence *καταλεκτικος*, *which wants something at the end*; and the privative *α* being prefixed *ακαταλεκτικος*, *which wants nothing at the end*. See CATALECTIC.

In the following strophe of Horace, the two first verses are *acatalectic*, and the last *catalectic*.

Soracte nivis specta, grata vice
Veris & Favoni:
Trahuntque siccas machinæ carinas——

ACATALEPSIA, ACATALEPSY, in *Philosophy*, an impossibility of a thing's being conceived or comprehended. The word is compounded of the privative *α*, and *καταλαμβανω*, *deprehendo*, *to find out*.

Scepticism is synonymous with incomprehensibility.

ACATALUS, a JUNIPER *berry*.

ACATASTOS, *incertus*, in a physical term, applied to irregular fevers, whose paroxysms are uncertain, and which are indicated by frequent changes in the urine. It is likewise applied to those shivering fits in fevers, which have no constant return, and to turbid urine, that deposits no regular sediment.

ACATERY, ACCATRY, in the king's household, a kind of check betwixt the CLERKS of the kitchen, and the PURVEYORS.

ACATHISTUS, *acathistus*, in an ecclesiastical sense, a solemn hymn, or vigil, anciently sung in the Greek church, on the Saturday of the fifth week in Lent, in honour of the Virgin, for having thrice delivered Constantinople from the invasions of barbarous nations.

It was called *acathistus*, i. e. *without sitting*, because it was celebrated standing: the people stood all night, singing the praises of their deliverer.

The same name is also given to the day wherein it was performed, which is called the fifth *acathistus*.

ACATIUM, in the ancient *Navigation*, a kind of boat or pinnace used for military purposes.

The *acatium* was a species of those called *actuaria naves*. Each had an oar wrought with nine. It was sometimes made use of in battle: Strabo represents it as a kind of privateer, or pirate sloop.

ACAULIS, in *Botany*, a term applied to certain plants, the flowers of which have no stalk or pedicle to support them, but rest immediately on the ground: of this kind are the carline thistle, and some others.

ACAULOSE, or ACAULOUS, is applied, by *Botanists*, to those plants which have no proper stem or CAULIS. Ray.

ACBAR, in *Natural History*, a name given by the people of the Philippine islands to a bird, very like our common hen, which is very frequently wild among them. It lives on rice, and other vegetables, and does a great deal of mischief; but is shot wanded, and does not fly well, so that it is easily destroyed.

ACBAR, the name of an idol of enormous size, which the Arabians are said formerly to have worshipped. It was with difficulty that Mahomet restrained them from this species of idolatry. Hyde's Diff. vol. i. p. 257.

ACCADEMIA, among *Mechanics*, fignifies a concert.

ACCALIA, in *Antiquity*, folemn feaſts, held in honour of Acca Laurentia, nurſe, or foſter-mother of Romulus. Theſe were otherwiſe called *Larentalia*.—To the ſame Acca is alſo attributed the inſtitution of the FRATRES ARVALES. Varro, de Ling. Lat. & Scalig. Comment. in Varro.

ACCAPITARE, ACCAPTARE, ACAPTARE, in ancient *Law*-books and records, the act of becoming vaſſal of a lord, or of yielding homage and obedience to him.

The word is compounded of the Latin *ad*, *to*, and *caput*, *head*; by reaſon vaſſals own their lords for their head. Whence alſo the lords are ſometimes called *domini capitales*; as thoſe who command in an army are called *capitanei*, *capitanii*, and in old French, *chefs-taines*, *chefteins*, in reſpect of their ſoldiers.

ACCAPITIUM, a ſum of money paid to a vaſſal, upon his admiſſion to a FEUD.

The word is alſo written *accapitium*, *accapitentum*, *acceptio*, *acceptatio*, and *acceptegium*.

ACCAPITUM, in our ancient *Law*-books, ſignifies RELIEF due to the chief lord.

ACCARY. See ACATERY.

ACCATUM, the ſame as *accetum*, or AURICHALCUM.

ACCAZDIR, denotes fir.

ACCEDAS *ad Curiam*, an original writ, which lies for removing ſuits in any court baron, except the county court, into the king's court; upon apprehenſion of partiality or falſe judgment in the other.

A like writ lies for him who has received falſe judgment in the county court, wherein it is called *de falſo judicio*.

An *Accedas ad Curiam* lies alſo for juſtice delayed, as well as falſely given; and is a ſpecies of the writ RECORDARI.

ACCEDAS *ad Vicecomitem*, is a writ directed to the coroner, commanding him to deliver a writ to the ſheriff, who having a PONE delivered to him, ſuppreſſes it.

ACCELERATION, in *Mechanics*, the increaſe of velocity in a moving body.

Accelerated motion is that which continually receives freſh acceſſions of velocity, and is either equally or unequally *accelerated*.

Acceleration ſtands directly oppoſed to *retardation*, which denotes a diminution of velocity.

ACCELERATION is chiefly uſed, in *Phyſics*, in reſpect of falling bodies, i. e. of heavy bodies tending towards the centre of the earth by the force of GRAVITY.

That natural bodies are *accelerated* in their deſcent is evident from various conſiderations, both *a priori* and *poſteriori*.—Thus, we actually find, that the greater height a body falls from, the greater impreſſion it makes, and the more vehemently does it ſtrike the ſubject plane, or other obſtacle.

Various are the ſyſtems and opinions which philoſophers have produced to account for this *acceleration*. Some attribute it to the preſſure of the air: the farther, ſay they, a body falls, the greater load of atmoſphere is of conſequence incumbent on it; and the preſſure of a fluid is in proportion to the perpendicular altitude of the column thereof.—Add, that the whole body of the fluid preſſing in innumerable right lines, which all meet in a point, viz. the centre, that point, by the meeting of thoſe lines, ſuſtains, as it were, the preſſure of the whole maſs: conſequently, the nearer a body approaches to it, the effect or preſſure of more united lines muſt it ſuſtain.

But what overturns this account, is, that as the preſſure of the air downwards increaſes ſo, by the known laws of ſtatics, does the reſiſtance, or the force wherewith the ſame fluid tends to repel, or drive the body upwards again. Others inſiſt, that the incumbent air is the groſſer and more vaporous, the nearer the earth; and filled with more heterogeneous particles, which are not ſtrictly elaſtic air; and hence, ſay they, a deſcending body, meeting continually with leſs reſiſtance from the elaſticity of the air, and having the ſame force of gravity ſtill acting on it, muſt neceſſarily be *accelerated*. Hobbes (Philoſ. Probl. cap. 1. p. 2.) attributes *acceleration* to a new impreſſion of the ſame which makes bodies fall; which, on his principles, is alſo the air. As part of this mounts, part alſo muſt deſcend; for reaſons drawn from the motion of the earth, which is compounded of two motions, one circular, the other progreſſive; conſequently the air aſcends, and circulates at once. As the body, in its fall, receives a new preſſure in every point of its deſcent, its motion, he ſays, muſt needs be accelerated.

But what overturns all accounts where the air or atmoſphere is concerned, is, that the *acceleration* holds in *vacuo*, and even more regularly than in air. See VACUUM.

The Peripatetic account is worſe than this: the motion of heavy bodies downwards, ſay they, ariſes from an intrinſic principle, which makes them tend to the centre, as their proper ſeat, or element, where they would be at reſt: hence, add they, the nearer a body approaches thereto, the more is their motion accelerated.

The Gaſſendiſts, on the other hand, ſuppoſe that the earth emits a ſort of attractive effluvia, or inviſible threads, whereof continually aſcend and deſcend, which threads, proceeding like radii from a common centre, diverge the more, the farther they go: ſo that the nearer a heavy body is to the centre, the more of theſe magnetic threads it receives; and hence the more ſwift motion *accelerated*. But this is refuted by an eaſy experiment: for if a ball be let fall out of the loweſt window of a high tower, and alſo out of the higheſt, the *acceleration* will be the ſame in both caſes, notwithſtanding the greater vicinity to the centre in the one, than in the other caſe.

The Carteſians account for *acceleration*, from the repeated pulſes of a ſubtil etherial matter, which is continually acting on the falling body, and impelling it downwards.

After all, the immediate cauſe of *acceleration* is nothing myſterious; the principle of GRAVITATION, which determines the body to deſcend, determining it to be *accelerated* by a neceſſary conſequence.

Suppoſe a body let fall from on high: the primary cauſe of its beginning to deſcend, is doubtleſs the power of gravity; but when once the deſcent is commenced, that ſtate becomes in ſome meaſure natural to the body; ſo that if left to itſelf, it would perſevere in it for ever, even though the firſt cauſe ſhould ceaſe: as we ſee in a ſtone caſt with the hand, which continues to move, after it is left by the cauſe that gave it motion.

But, beſide the propenſity to deſcend, impreſſed by the firſt cauſe, and which of itſelf were ſufficient to continue the ſame degree of motion once begun, *in infinito*; there is a conſtant acceſſion of ſubſequent efforts of the ſame principle, gravity, which continues to act on the body already in motion, in the ſame manner as if it were at reſt. Here, then, being a double cauſe of motion; and both acting in the ſame direction, viz. directly towards the centre of the earth; the motion they jointly produce muſt neceſſarily be greater than that of any one of them.—And the velocity thus increaſed having the ſame cauſe of increaſe ſtill perſiſting, the deſcent muſt neceſſarily be continually *accelerated*.

For, ſuppoſing gravity, whatever it be, to act uniformly on all bodies, at equal diſtances from the earth's centre; and that the time in which a heavy body falls on the earth be divided into equal parts infinitely ſmall; let this gravity incline the body towards the earth's centre, while it moves in the firſt infinitely ſmall part of the time of its deſcent; if after this, the action of gravity be ſuppoſed to ceaſe, the body would proceed uniformly on towards the earth's centre, with a velocity equal to the force of the firſt impreſſion.

But now, ſince the action of gravity is here ſuppoſed ſtill to continue; in the ſecond moment of time, the body will receive a new impulſe downwards, equal to what it received at firſt; and thus its velocity will be double of what it was in the firſt moment: in the third moment it will be triple; in the fourth quadruple, and ſo on continually: for the impreſſion made in one moment is not at all altered by what is made in another; but the two are, as it were, aggregated, and brought into one ſum.

Wherefore, ſince the particles of time are ſuppoſed infinitely ſmall, and all equal to one another; the *impetus* acquired by the falling body will be every where, as the times from the beginning of the deſcent.—And hence, ſince the quantity of matter in the body given continues the ſame, the velocity will be as the time in which it is acquired.

Further, the ſpace paſſed over by a moving body in a given time, and with a given velocity, may be conſidered as a rectangle made by the time and the velocity.—Suppoſe *A* (*Tab.* IV. *Mechan. fig.* 64.) a heavy body deſcending, and let AB repreſent the time of its deſcent; which line ſuppoſe divided into any number of equal parts, AC, CE, EG, &c. repreſenting the ſeveral ſucceſſive moments of the given time.—Let the body deſcend through the firſt of thoſe diviſions, AC, with a certain equable velocity ariſing from the propoſed degree of gravity; this velocity will be repreſented by AD; and the ſpace paſſed over, by the rectangle CAD.

Now, as the action of gravity in the firſt moment produced the velocity AD, in the body before at reſt; in the ſecond moment, the ſame will produce, in the body ſo moving, a double velocity, CF; in the third moment, to the velocity CF will be added a further degree, which together therewith will make the velocity EH, which is triple of the firſt, and ſo of the reſt. So that in the whole time AB, the body will have acquired a velocity

BK

BK … the divisions of the line, e.g. AC CE … the spaces gone through will be the … CD, EF, &c. So that in the … space described by the moveable … rectangles, I, e, to the desired … Suppose, if the accessions of velocity only … given points of time, as C, in E, … degree of motion should continue … accessions of acceleration came up.—I … of time were supposed less, e.g. … tures of the figure would be pro… it would approach so much … If they were infinitely small, … velocity were supposed to be … every point of time, as is really … thus successively produced will … ABE, &c. 65 1/2—Here, the whole time AE consisting of the little portions of time … and the area of the triangle ABE, of … the spaces answering to … triangles answering to … the whole area or triangle ex… the space moved through in the whole time AB; … the little triangles BIK, &c. the spaces gone … the divisions of time I, &c.

But these triangles being similar, their areas are to one another, as the squares of their homologous sides AB, … &c. and consequently, the spaces moved are to … as the squares of the times.

Hence we may easily infer the great law of *acceleration*, viz. "That a descending body, uniformly *accelerated*, de… "scribes, in the whole time of its descent, a space which "is just half of what it would have described in the "same time, with the *acquired* velocity it has acquired "at the end of its fall." For, the whole space the falling body has moved through in the time AB, we have already shewn, will be represented by the triangle ABC; and the space the same body would move through in the same time, with the velocity BI, will be represented by the rectangle BIHF.—But the triangle is known to be equal to just half the rectangle.—Therefore, the space moved is just half of what the body would have moved with the velocity acquired at the end of the fall.

Hence we infer, 1. that the space moved with the last acquired velocity BI, is half the time AB, is equal to that really moved by the falling body in the whole time AB.

2. If a falling body describe any given length in a given time, in double that time it will describe four times that length; in three the time, nine times, &c. and universally, if the times be in arithmetical proportion, 1, 2, 3, 4, &c. the spaces described will be, 1, 4, 9, 16, &c.

3. The spaces described by a falling body in a series of equal moments or intervals of time, will be as the uneven numbers 1, 3, 5, 7, 9, &c. And hence the velocities acquired in falling are as the times; the spaces will also be as the squares of the velocities; and both times and velocities in a subduplicate ratio of the spaces.

The motion of a body ascending, or impelled upwards, is diminished or retarded from the same principle of gravity acting in a contrary direction, in the same manner, as a falling body is *accelerated*. See RETARDATION.

A body, thus projected upwards, tires till it has loft all its motion: which it does in the same time that a body falling would have acquired a velocity equal to that wherewith the body was thrown up.

Hence, the same body thrown up, will rife to the same height from which falling, it would have acquired the velocity wherewith it was thrown up.

And hence, the heights which bodies thrown up with different velocities do afcend to, are to one another as the squares of those velocities.

ACCELERATION *of bodies on inclined planes.*—The same general law obtains here, as in bodies falling perpendicularly: the effect of the plane is to make the motion flower; but the inclination being every where equable, the retardation arising therefrom will proceed equally in all parts, at the beginning and the ending of the motion. —The particular laws, fee under Inclined Plane.

ACCELERATION *of the motion of projectiles.*—The motion of projectiles bodies is *accelerated* in their defcent, but in a less ratio than that of bodies falling perpendicularly. See the laws of this motion under PROJECTILE.

ACCELERATION *of the motion of projectiles.* See PROJECTILE.

ACCELERATION *of the motion of compreffed bodies*, in expanding or leffening themselves. See DILATATION.

That the motion of compreffed air, expanding itself by its elafticity to its former dimensions, is *accelerated*, is evident from various considerations.

ACCELERATION is alfo applied in the ancient aftronomy, in respect of the fixed ftars.—Thus, *acceleration* was the difference between the revolution of the *primum mobile*, and the fixed revolution; which was computed at 3 minutes, and 56 seconds.

ACCELERATION *of the Moon*, is a term used to express the increase of the moon's mean motion from the fun, compared with the diurnal motion of the earth; fo that it is now a little fwifter than it was formerly. Dr. Halley was the firft who made this difcovery; and he was led to it by comparing the ancient eclipses obferved at Babylon, with thofe obferved by Albatenius in the ninth century, and fome of his own time. He was not able to afcertain the quantity of this *acceleration*, becaufe the longitudes of Bagdat, Alexandria, and Aleppo, where the obfervations were made, had not been accurately determined. But fince his time the longitude of Alexandria has been afcertained by Chazelles; and Babylon, according to Ptolemy's account, lies 30° eaft from Alexandria. From thefe data, Mr. Dunthorne compared feveral ancient and modern eclipses, with the calculations of them by his own tables, and hereby verified Dr. Halley's opinion; for he found, that the fame tables repreſent the moon's place more backward than her true place in ancient eclipses, and more forward than her true place in later eclipses; and thereby fully inferred, that her motion in ancient times was flower, in later times quicker than the tables give it. But he did not content himself with merely afcertaining the fact. In proceeding to determine the quantity of the *acceleration*, and by means of the moſt ancient eclipſe, of which any authentic account remains, obferved at Babylon, in the year before Chriſt 721, he concluded, that the obferved beginning of this eclipſe was not above an hour and three quarters before the beginning by the tables; and therefore the moon's true place could precede her place by computation but little more than 30′ of a degree at that time. Admitting the *acceleration* to be uniform, and the aggregate of it as the fquare of the time, it will be at the rate of about 10″ in 200 years. Phil. Trans. N° 218. N° 492, or vol. xlvi. p. 161.

Dr. Long attributes the *acceleration* above delcribed, to one or more of theſe caufes; viz. 1. the annual and diurnal motion of the earth continuing the fame, the moon is really carried round the earth with a greater velocity than heretofore is; 2. the diurnal motion of the earth, and the periodical revolution of the moon continuing the fame, the annual motion of the earth round the fun is a little retarded; which makes the fun's apparent motion in the ecliptic a little flower than formerly, and, conſequently, the moon in paſſing from any conjunction with the fun, fpends lefs time before fhe again overtakes the fun, and forms a fubfequent conjunction: in both theſe cafes, the motion of the moon from the fun is really *accelerated*, and the fynodical month actually fhortened: or, 3. the annual motion of the earth, and the periodical revolution of the moon continuing the fame, the rotation of the earth round its axis is a little retarded; fo this cafe, days, hours, minutes, feconds, &c. by which all periods of time muſt be meaſured, are of a longer duration; and conſequently the fynodical month will appear to be fhortened, though it really contains the fame quantity of abſolute time as it always did. If the quantity of matter in the body of the fun be leſſened by the particles of light continually ſtreaming from it, the motion of the earth round the fun may become flower; if the earth increaſes in bulk, the motion of the moon round the earth may be quickened thereby. Aſtronomy, vol. ii. p. 236.

ACCELERATOR, in *Anatomy*, a muſcle in the penis, whoſe office is to expedite the diſcharge of the urine, and the ſemen.

This is more peculiarly called *accelerator urinæ*: ſome make two muſcles of it, and give them the denomination *acceleratores*, or *acceleratorii muſculi*.

It *ariſes* tendinous from the upper and fore-part of the urethra, but ſoon grows fleſhy, paſſes under the os pubis, and circumpaſſes the bulb of the cavernous body of the urethra.—Both ſides of this muſcle meet in a middle line, correſponding to the ſeam in the ſkin over it; and ſometimes unite, the ſpace of two inches; after which it ſeparates two ſeveral elongations, which become thin tendons at their terminations on the cavernous bodies of the penis. Its upper part covering the bulb, when in action, ſqueezes the veins which paſs through it from the glans, in order to the formation of the erection. By the repeated contraction of this upper part, the blood in the bulb is preſſed forwards the glans; and thereby aſſiſts the erection.

The two elongations compreſs the channel of the urethra, and ſo force out the remained feed, or urine; whence the muſcle takes its name.

ACCENDENTES, or ACCENDERES, in *Eccleſiaſtical Writers*, a lower order of miniſters in the church of Rome, whoſe office is to light, trim, and trim the candles, or tapers. Spelman.

The

The *accendentes* are much the same with those otherwise called *acrilythi* and *cerariorii*.

ACCENDONES, or ACCENDERS, in *Roman Antiquity*, a kind of GLADIATORS, whose office was to excite and animate the combatants, during the engagement.

ACCENSI, in *Antiquity*, an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of ushers, serjeants, or tip-staves, among us. They were thus called from *accenso, to send for*; one part of their office being to call assemblies of the people, summon parties to appear before the judges, &c.

ACCENSI also denote a kind of supernumerary soldiers in the Roman armies; whose office was to attend the motions of their principals, and supply the places of those who were killed or disabled by their wounds.

They were thus denominated, *quia accenebantur, or ad ærsum afficiebantur*: Vegetius calls them *supernumerarii legionum*: Cato calls them *ferentarii*, because they furnished those engaged in battle with weapons, drink, &c. Though Nonius suggests another reason of that appellation, viz. because they fought with stones, slings, and weapons, *quæ ferrentur*, such as are thrown, not carried in the hand. They were sometimes also called *velites*, and *velati*, because they fought clothed, but not in armour; sometimes *adventitii* and *subsidiarii*; sometimes *rorarii*. The *accensi*, Livy observes, were placed in the rear of the army, because no great matter was expected from them: they were taken out of the fifth class of citizens. Festus in voc. *Ferentarii*. Salmas. de re Milit. Rom. c. 15.

ACCENSI was also an appellation given to a kind of assistants, appointed by the tribune to assist each centurion and decurion. In which sense, *accensus* is synonymous with *optio*.—In an ancient inscription, given by a Tyree, we meet with ACCENSUS EQUITUM ROMANORUM; an office no where else heard of; that author suspects it for a corruption, and instead thereof reads A CENSIBUS. Ant. Erud. Etrusc. tom. 1. p. 200.

ACCENSION, ACCENDING, in *Physics*, the act of kindling, or setting a body on fire.

The word is formed of the Latin *accendere, to kindle*; a compound of *ad*, to; and *candere, to glow*. Though some grammarians suspect the primitive significations of *accendere*, to have been, *to render famous*.

Accension, on other occasions, is called INFLAMMATION, IGNITION, CONFLAGRATION, &c.

Accension stands opposed to EXTINCTION.

Chemists furnish us with various instances of the *accension* of cold liquors by bare mixture: as of the acid spirits of minerals, and the essential oils of plants.

ACCENT, in its primitive sense, an affection of the voice, which gives each syllable in a word its due pitch, in respect of height or lowness.

The word is originally Latin, *accentus*, a compound of *ad*, to and *cano*, to sing. In this sense, *accent* is synonymous with the Greek προσῳδία, the Latin *tone*, or *tenor*, and the Hebrew מְתֶג *geresh*, *tenor*.

The *accent*, properly, only respects high and low, or acute and grave.—Though the modern grammarians use it also in respect to loud and soft, long and short; but this confounds *accent* with *quantity*.

The difference between the two may be conceived from that which we observe between the beat of a drum, and the sound of a trumpet. The former expresses every thing belonging to quantity and time, and may be heard as long as there is a motion in the sound, though it nothing like accent.

ACCENT is also used in grammar, for a character placed over a syllable, to mark the acuity or gravity of tone to be pronounced in a higher or lower tone: and to regulate the inflections of the voice in reading. It is distinguished from *quantity*, as the former regards the tone of the voice, the latter the length of it.

We reckon three grammatical accents in ordinary use, all borrowed from the Greeks, viz. the *acute accent*, which shews when the tone of the voice is to be raised.

In modern writing it is a little slope or *virgule*, placed over the vowel, a little sloping or inclined in its descent, from right to left, as ´.—It is the ordinary mark either in English or Latin; the French indeed retain it; but only to mark the close or masculine *e*.

The *grave accent*, when the note or tone of the voice is to be depressed, and is figured thus (`).

The *circumflex accent*, which is compounded of both the acute and the grave; it points out a kind of undulation of the voice, and is expressed thus (ˆ or ~).

But if it be true, that the whole system of pronunciation turns on three *accents*, it is no less true, that each of these three admits of several degrees. The acute *accent*, for instance, may be either higher or lower; may be simply acute, or very acute; and the like holds of the grave and circumflex. So that each of the three common *accents* is, as it were, a genus, including divers particular species; though the ancient grammarians have not thought fit to give particular names and figures to all their differences. Vossius de Arte Gram. Accent. Gree. 1725, 12mo.

Words which have no accents are called *anarthra*.

The Hebrews have a grammatical, a rhetorical, and a musical *accent*; though the first and last seem, in effect, to be the same; both being comprised under the general name of *toni accentes*, because they give the proper tone to syllables: as the rhetorical *accents* are said to be *emphases*, inasmuch as they tend to make the pronunciation more sweet and agreeable.

There are four euphonic *accents*, and twenty-five tonic; however, authors are not agreed as to the number; of which some are placed above, and others below the syllables: the Hebrew *accents* serving not only to regulate the risings and fallings of the voice, but also to distinguish the sections, periods, and members of periods, in a discourse; and to answer the same purposes with the points in other languages. These *accents* are divided into *emperors*, *kings*, *dukes*, &c. each bearing a rule answerable to the importance of the distinction it marks.—Their emperor rules over a whole period, and terminates the sense completely; answering to our point.—Their king divers to our colon; and their duke to our comma. The king, however, occasionally becomes a duke, and the duke a king, as the phrases are more or less short.—It must be noted, by the way, that the management and combination of these *accents* differs in Hebrew poetry from what it is in prose.

The use of the tonic, or grammatical *accents*, has been much controverted; some holding that they differ with the sense, while others maintain that they are only intended to regulate the reading, or singing after the manner that the Jews sing, rather than read, the scriptures in their synagogues. The truth seems here to lie between the two opinions. For though we are inclined to think, that the primary intention of these *accents* was to direct the singing; yet the singing seems also to have been regulated according to the sense: so that the *accents* might serve not only to guide the singing, but also to point out the distinctions.—Though it must be confessed, that many of these distinctions are so subtle and inconsiderable; nor can the modern writers, or the editors of old ones, agree in opinion on this subject; some of them making twice as many of these distinctions as others.

The *Hebrew accents*, in effect, have something common with those of the Greeks and Latins; and something peculiar to themselves. What they have in common, is, that they mark the tone; shewing how the voice is to be raised and sunk, on certain syllables. What they have peculiar is, that they do the office of the points in other languages. See ATHNACH, &c.

It is certain the ancient Hebrews were not acquainted with these *accents*; for that at best, they are not *pure divine*.—The opinion which prevails amongst the learned, is, that they were invented about the sixth century, by the Jewish doctors of the school of Tiberias, called the Masclorets.

The learned Hennin affirms them to be of Arabic invention; and to have been adopted and transferred thence into the Hebrew by the Masorets; especially by the celebrated Rabbi Ben Ascher, who flourished in the middle of the sixth century; on occasion of the emperor Justinian's prohibiting the reading of their traditions in their synagogues. He adds, that they were first brought to their degree of perfection by Rabbi Juda Ben David Chiug, a native of Fez, in the eleventh century.—It is indeed credible, the Jews might borrow their points from the Arabs: but how they should have their *accents* from them, is hard to conceive, the Arabic language having no such thing as *accents*, properly so called.

As in the Greek *accents*, now seen both in manuscript and printed books, there has been no less dispute about their antiquity and use, than about those of the Hebrews.—Isaac Vossius, in an express treatise De Accentibus Græcis, endeavours to prove them of modern invention; affirming that they anciently had nothing of this kind, but only a few notes in their poetry, which were invented by Aristophanes the Grammarian, about the time of Ptolemy Philopater; and that these were of musical rather than grammatical use, serving as aids in the singing of their poems; and very different from those introduced afterwards.

This appears from inscriptions as well as manuscripts, some of which, till 170 years before Christ, have either accent, spirit, apostrophus, or iota, subscribed.—He adds, that Aristarchus, a disciple of Aristophanes, improved on his master's art; but that all they both did, was only designed to facilitate youth in the making of verses.—The same Vossius shews from several ancient grammarians, that the manner of writing the Greek *accents* in those days was quite different from those now used in our books.

Hen. Christ. Noldius thinks, that *accents* were the invention of the Greeks, about nine hundred years ago; and that they were used in poetry: that they were intended to ascertain the pronunciation of the Greek, and to keep out the barbarisms which was then breaking in upon them; that the *accents* and *points* of Aristophanes were perfectly agreeable to the genuine Greek pronunciation, and that the modern ones of the Arabs deface it. Wetstein, Greek professor at Basil, in a learned dissertation, endeavours to prove the Greek *accents* of an older standing.—He owns that they were not always formed in the same manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the several parts of Greece.

He brings several reasons *a priori* for the use of *accents*, even in the earliest days; as that then they wrote all in capital letters equidistant from each other, without any distinction either of words, or phrases; so that without *accents* they could scarce be intelligible: and that *accents* were necessary to distinguish ambiguous words, and to point out their proper meaning; and this sentiment he confirms from a dispute on a passage in Homer, mentioned by Aristotle in his Poetics, chap. v. Accordingly, he observes that the Syrians, who have tonic, but no distinctive *accents*, have yet in some certain points, placed either below or above the words, to shew their mood, tense, person, or sense. See farther in his Dissertatio Epistolaris de Accentuum Græcorum Antiquitate & Usu. Basil, 1686.

The use of *accents*, to prevent ambiguities, is most remarkably perceived in some eastern languages, particularly the Siamese and Chinese. The Chinese only reckon four accents; for which the missionaries use the following marks, *ā, á, ă, à*; to which they have added a fifth, thus *a*. They make a kind of modulation, wherein prolonging the duration of the sound of the vowel they vary the tone, raising and falling it by a certain pitch of voice: to that their talking is a sort of music or singing. The same sound *pa*, according to the *accent* affixt to it, signifies *God*, *a vault*, *covetous*, *stupidity*, and *a song*.—If they deviate ever so little from the *accent*, they tax quite a contrary thing than what was intended. Thus, meaning to compliment the person you are talking to with the title Sir, you call him a beast with the same word, only a little varied in the tone. Spizel. de Re Liter. Sinens. p. 106. Bulling. Differt. de Litt. Sinens. p. 308. Le Compte, Nouv. Mem. sur la Chine, tom. i. p. 270.

The Siamese are also obliged to sing rather than talk. Their alphabet begins with six characters, all only equivalent to K, but differently *accented*. For though in the pronunciation the *accents* are naturally on the vowels, yet they have some to diversify such of their consonants as are in other respects the same. De la Loubere de Royaume de Siam, tom. ii. § 8.

As minutely as the *accents* of words have been studied, the *accents* of sentences seem to have been strictly overlooked: yet it may be observed, that all mankind lower the voice at the end of a period, elevate it in interrogations, and the like. See Bacon. de Augmentis Scient. lib. vi. cap. 1. Elem. Crit. vol. ii.

ACCENT is also applied, not very properly, to the characters which mark the quantities of syllables, or the time the voice is to dwell on them.

The spurious *accents* answer to the characters of time in music; as crochets, quavers, &c.—The genuine *accents* rather answer to the musical notes, *fa*, *la*, &c.

Such are the *long accent*, which shews that the voice is to stop on the vowel, and is expressed thus (^); and the *short accent*, which shews that the time of pronunciation ought to be short, and is marked thus (˘).

Some even rank the hyphen, diæresis, and apostrophe, among *accents*.

ACCENT also denotes a certain inflection of voice; or a peculiar tone, and manner of pronunciation, contracted from the country, or province, where a person was bred. In this sense, we say, the Welsh tone or *accent*, the northern *accent*, the Gascoign *accent*, Norman *accent*, &c.

ACCENT is also a tone or modulation of the voice, frequently used as a mark of the intention of the speaker, and giving a good or evil signification to his words.

One may give offence with the softest and most soothing words imaginable, by a proper management of the *accent* and manner of pronouncing them.—The *accent* frequently gives a contrary sense to what the words themselves naturally imported.

ACCENT, in *Musick*, is a modulation of the voice, to express a passion.

Every bar or measure is divided into *accented* and *unaccented* parts.

The *accented* parts are the principal; being those intended chiefly to move and affect; as is no there the spirit of the music depends.

The beginning and middle, or the beginning of the first half of the bar, and of the latter half of it, in common time; and the beginning of the three notes in triple time, are always the *accented* parts of the measures.

In common time, the first and third crotchet of the bar are on the *accented* part of the measure.—In triple time, where the notes always go by three and three, that which is in the middle of every three is always *unaccented*; the first and last *accented*. But the *accent* in the first is to much stronger, that in many cases the last is accounted as if it had no *accent*.

The harmony is always to be full and void of discords in the *accented* parts of the measure. In the *unaccented* parts this is not so absolutely necessary; discords have passing without any great offence to the ear.

ACCENT, in *Poetry*. See RHYME.

ACCEPTANCE, the act of receiving or admitting.

Acceptance, among *Civilians*, is the consurrence of the will, or choice of the donee, which renders the act complete; and without which the donor may revoke his gift at pleasure.

In beneficial matters, the canonists hold, that the *acceptance* should be signed at the same time with the resignation, *nisi ex intervallo*.

ACCEPTANCE, in *Common Law*, denotes a tacit agreement to a preceding act, which might have been defeated and avoided were it not for such *acceptance* had.—If a man and his wife, seised of land in the right of the wife, make a joint lease, or feoffment by deed, reserving rent; the man dying, and the wife receiving the rent; such receipt is deemed an *acceptance*, and shall make the lease good so that the shall be barred from bringing the writ, CUI *in* VITA.

So if a lessee for the term of twenty years, accept a lease of the same land for ten years: by the lessee's *acceptance* of the new lease, the term of twenty years is determined in law. 2 Roll. Abr. 469.

ACCEPTANCE, in *Commerce*, is particularly used in respect of bills of exchange.—To *accept a Bill of exchange*, is to sign or subscribe it; and thereby become principal debtor of the sum contained therein; with an obligation to pay or discharge it at the time prefixed.

The *acceptance* is usually performed by him on whom the BILL is drawn; upon its being presented to him by the person on whose behalf it was drawn, or by some other by his order.

A small matter amounts to an *acceptance*, so that there be a right understanding between both parties; as, "Leave your bill with me, and I will accept it;" or, "call for it to-morrow, and it shall be accepted." This obliges as effectually by the custom of merchants, and according to law, as if the party had actually subscribed, or signed it, which is usually done.

But should a man say, "Leave your bill with me; I will look over my accounts and books between the drawer and me, and call to-morrow, and accordingly the bill shall be accepted." This shall not amount to a complete *acceptance*; for this mention of his books and accounts was really intended to give him an opportunity of examining if there were effects in his hands to answer; without which perhaps he would not accept the same; and so it was ruled by the lord chief justice Hale, at Guildhall, London.

A bill may be accepted for part; because the party, upon whom the same was drawn, had no more effects in his hands; which being usually so, there must be a protest, in case for the whole sum, over and above for the residue; however, after payment of such part there must be a protest for the remainder.

Bills payable at sight are not to be *accepted*, as being to be acquitted at the presenting; or in defect of payment, to be protested.—In bills drawn for a certain number of days after sight, the *acceptance* must be dated; because the time is to be accounted therefrom.—The form of this *acceptance* is, *accepted such a day*; and then the signature.

Bills drawn, payable on a day named, or at USANCE, or double usance, need not be dated; usance being reckoned from the date of the bill itself.—On these it is sufficient to write, *accepted*, and the signature.

If the bearer of a bill be contented with an *acceptance* to pay in twenty days after sight, where, in the usance, only eight days are expected, he runs the risk of the twelve additional days: so that if the acceptor fail, he may immediately against the drawer. And if the bearer accepts himself to receive a less sum than is expressed in part, he is to stand the chance of the rest.

ACCEPTATION, in *Grammar*, the SIGNIFICATION of a word; or the sense wherein it is taken and received.

Thus we say:

Such a word has several *acceptations*. In its first and most natural *acceptation*, it denotes, &c.

ACCEPTILATION, in the *Civil Law*, an acquittance given without receiving any money, or a declaration of the creditor in favour of the debtor, signifying, that he

be is satisfied for his debt, and forgives all farther claim, or demand; though in reality no payment has been made.

ACCEPTOR of a bill of exchange, the person who accepts the bill.

The *acceptor*, who is usually the person on whom the bill is drawn, becomes personal debtor by the acceptance: and is obliged to pay it, though the drawer fail before it becomes due.

ACCESS, in a general sense, signifies the approach of a thing towards another.

In which sense, *access* stands opposed to *recess*.

We sometimes say, the *access* of bodies, the *access* of the moon, the sun, planets, &c. but more frequently, the approach of bodies, the appulse of the moon, the rising of the sun, &c. Geometricians speak of a line called the curve of equal *access*, or approach.

ACCESS, in a more particular sense, denotes entrance, or admission.

We say, such a person has *access* to the prince: the *access* on that side was very difficult, by reason of rocks, &c.

ACCESS, in *Medicine*, denotes a fit, or return of some periodical disease.

We say an *access* of the gout, but especially of an ague, an intermitting fever, an epilepsy, &c. an *access* of madness: sometimes also a preternatural *watch*, a cold *access*, &c. *Access* is frequently confounded with *paroxysm*: but they are different things; an *access* being frequently the beginning or first onset of a disease, a PAROXYSM the height of it.

ACCESSIBLE, something that may be approached, or that access may be had to.

Such a place, a fortress, is *accessible* from the seaward; i. e. the passage to it is practicable. See FORTIFICATION.

ACCESSION, in a general sense, is the act of approaching, or going to a place, person, or thing. It is more particularly used for the act whereby a thing is joined or united to something existing before.

ACCESSION is also used for the act of engaging, and becoming a party, to a treaty before concluded between other powers; on the same footing and conditions as if originally comprehended in the treaty itself: such as

The *accession* of the States General to the treaty of Hanover; of the Czarina to the treaty of Vienna, &c.

ACCESSION, in the language of the Conclave, is a method of electing a pope, by procuring for some candidate two-thirds of the voices, upon which the rest are enrolled by way of *accession*.

ACCESSION, in the Civil Law, denotes a method of acquiring property in certain things, by virtue of their connection with other things, which already belong to us.

Accession is effected divers ways, from whence arise several species of it, *simple* and *mixt*; *natural* and *artificial*; *discrete* and *concrete accession*.

ACCESSORY, or ACCESSARY, something that accedes, or is added to another more considerable thing.

In which sense, the word stands opposed to PRINCIPAL.

ACCESSORY, or ACCESSARY, in *Common Law*, is chiefly used for a person guilty of a felonious offence, not principally, but by participation; as, by advice, command, or concealment.

There are two kinds of *accessories*, *before* the fact, and *after* it.—The first is he who commands, or procures another to commit felony, and is not present himself: for if he be present, he is a principal.

The *second* is he who receives, assists, or comforts any man that has done murder, or felony, whereof he has knowledge. A man may also be *accessory* to an *accessory*, by aiding, receiving, &c. an *accessory* in felony.

An *accessory* in felony shall have judgment of life and member, as well as the principal, who did the felony: but not till the principal be first attainted, and convicted, or outlawed thereon.—Where the *principal* is pardoned without attainder, the *accessory* cannot be arraigned; it being a maxim in law, *that he who is principal, may plead accessory*. But if the principal be pardoned, or have his clergy after attainder, the *accessory* shall be arraigned. 4 Rep. W. 3. M. cap. 4. And by the 1 Anne, cap. 9. it is enacted, that where the principal is convicted of treason, or stands mute, or challenges above twenty of the jury, it shall be lawful to proceed against the *accessory* in the same manner as if the *principal* had been attainted: and notwithstanding such *principal* shall be admitted to his clergy, pardoned, or delivered before attainder. In some cases also if the *principal* cannot be taken, then the *accessory* may be prosecuted for a misdemeanor, and punished by fine, imprisonment, &c. Stat. ibid. See Stat. 5 Anne, cap. 31. In the lowest and highest offences there are no *accessories*, but all are *principals*, as in riots, routs, forcible entries, and other trespasses, which are the lowest offences.—So also in the highest offence, which is, according to our law, high treason, there are no *accessories*. Cok. Littles. 71.

Accessaries, in petty treason, murder, and in felonies of several kinds, are not to have their clergy.—There can be no *accessory* before the fact in manslaughter; because that is sudden and unprepensed.

ACCESSORY by Statute, is such a one as abets, advises, aids, or receives one that commits an offence, which is made felony by statute.

ACCESSORY *nervi*, ACCESSORIUS *Willisii*, or *Par* ACCESSORIUS, in *Anatomy*, a pair of nerves, which, arising from the medulla in the vertebræ of the neck, ascend, and enter the skull, and pass out of it again, with the par vagum, wrapped up in the same common integument, and after quitting them, are distributed into the muscles of the neck, and shoulders. See *Tab. Anat. (Osteol.) fig.* 50. lit. t.

In the ascent towards the head, they receive branches from each of the first five pair of cervical nerves, near their rise from the medulla; and send forth twigs to the muscles of the larynx, gula, &c.—Uniting with a branch of the intercostal, they form the plexus ganglioformis.

ACCESSORY, among *Painters*, an epithet given to such parts of a history-piece, as serve chiefly for ornament, and might have been wholly left out: such as vases, armour, &c.

ACCIDENCE, ACCIDENTIA, a name chiefly used for a little book, containing the first elements, or rudiments of the Latin tongue.

ACCIDENS, in *Philosophy*. See ACCIDENT.

Per ACCIDENS, is frequently used among *Philosophers* to denote what does not follow from the nature of a thing, but from some accidental qualities thereof, in which sense it stands opposed to PER *se*, which denotes the nature and essence of a thing.

Thus fire is said to burn *per se*, as considered as fire, and not *per accidens*; but a piece of iron, though red-hot, only burns *per accidens*, by a quality *accidental* to it, and not considered as iron.

ACCIDENT, ACCIDENS, in *Philosophy*, something additional, or superadded, to a SUBSTANCE; or not essentially belonging thereto, but capable, indifferently, either of being or not being in it, without the destruction thereof. The schoolmen distinguish three kinds of *accidents*; *verbal*, *predicable*, and *predicamental*.

ACCIDENT, *Verbal*, *Accidens verbale*, stands opposed to essence; and in this sense, the words to a thing, though substances themselves, are denominated *accidents* thereof. Thus, the thumbs a man has on, though real substances, yet, as they are not essential, but adventitious or accessory to his person, are *accidents*.

ACCIDENT, *Predicable*, *Accidens prædicabile*, is used in opposition to *proper*.—Such is any common quality; as whiteness, heat, learning, or the like.

Thus a man may be sick or well; and a wall white or black; yet the one be still a man, and the other a wall.

These are called in the schools *predicable accidents*; because usually laid down and explained in the doctrine of predicables.

ACCIDENT, *Predicable*, may either be taken in the ABSTRACT, as whiteness, learning; or in the CONCRETE, white, learned.

If taken in the *abstract*, as is done by Porphyry, the *accident* is defined as above, that which may either be present, or absent, without the destruction of its subject.

If it be taken in the *concrete*; *accident* is usually defined by the schoolmen, to be something capable of being predicated contingently, of many, in respect of quality.—As learning, which may probably be predicated of you, him, &c.

ACCIDENT, *Predicamental*, *Accidens prædicamentale*, is a mode or modification of some creating substance, inhering or depending thereon, so as not to be capable of subsisting without the same.

In this sense, *accident* is opposed to *substance*.—Whence, as substance is defined a thing that subsists in itself, and the *substratum of accidents*; so an *accident* is said to be that *cujus esse est inesse*: and therefore Aristotle who usually calls substances simply ens, entities, beings; commonly calls *accidents*, *entia ens*, entities of entity; requiring some substance wherein to reside, as their subjects of inhesion.

ACCIDENT, then, has an immediate and essential dependence on its substance; both as to its production, its continuation, and its effects: it arises or is deduced from its subject, is preserved or subsisted by it; and can only be affected by what affects, or affects, the subject.

The old schoolmen, however, will not have *accidents* to be mere modes of matter, but entities really distinct from it; and, in some cases, separable from all matter.—But the union of real *accidents*, and qualities, is now exploded. Aristotle and the Peripatetics make nine kinds or classes of *predicamental accidents*: others contract them into a less number.

ACCIDENT, *Absolute*, is a term used in the Romish theology for a predicamental *accident*, which subsists, or may possibly subsist, at least miraculously, and by some supernatural power, without a subject.

Such

Such, they contend, were the *accidents* of the bread and wine in the eucharist, &c. as the colour, flavour, figure, &c. thereof, which remain after the substances they belonged to are changed into other substances of flesh.

The Cartesians, universally, combat the notion of *absolute accidents*; it being their doctrine, that the essence of matter consists in extension; and that *accidents* are only modifications thereof, in no wife distinct from it: an *accident* therefore without a subject must be a contradiction.—And hence Cartesianism is branded as contrary to the Roman catholic faith.

Various expedients have been invented by the Cartesians, to account for transubstantiation, &c. without the hypothesis of *absolute accidents*.—Some hold that the usual impressions are made on the sense by the immediate agency of God; and without any thing remaining of the former nature. Others allege the whole to heterogeneous matters contained in the pores of the bread, &c. which remaining unaltered by the transubstantiation, produce the same sensations as the bread produced.

ACCIDENT, in the popular sense of the word, signifies a contingent effect; or something produced casually, and without any foreknowledge or destination thereof in the agent that produced it.

ACCIDENT, in *Heraldry*, is no additional note, or mark, in a coat-armour, not necessarily forming therein; but capable either of being retained, or omitted, without altering the essence of the armour. Such are ABATEMENTS, DIFFERENCES, and TINCTURE.

ACCIDENT, among *Puritans*, is sometimes used for what is more generally called SYMPTOM.

ACCIDENTS, in *Astrology*, denote the most extraordinary occurrences in the course of a man's life; such are a remarkable influence of good fortune, a signal deliverance, a great sickness, &c.

ACCIDENTAL, something that partakes of the nature of an *accident*; or, what is not essential to the subject, but indifferent.

Thus, whiteness is *accidental* to marble; and heat, to iron.

ACCIDENTAL *Colours*, by Mr. Buffon, are those which depend upon the affections of the eye, in contradistinction to such as belong to the object itself. The impressions made upon the eye by looking fixedly on objects of a particular colour are various, according to the single colour, or assemblage of colours, in the object, and they continue for some time after the eye is withdrawn, and give a false colouring to other objects which are viewed during their continuance. M. Buffon has endeavoured to trace the method in which these *accidental* colours have with those that are natural, in a variety of instances. The subject has likewise been considered by M. de la Hire, and M. Epinus; and M. d'Arcy has contrived a machine for measuring the duration of the above mentioned impressions on the eye, and he inferred, in the result of several trials, that the effect of the action of light on the eye continued about eight thirds of a minute. See Ac. Par. 1743. Dillo, 1765. Nov. Com. Petrop. v. 10. And for an abstract, Dr. Priestley's Hist. & present Discoveries relating to Vision, &c. p. 631.

ACCIDENTAL *Point*, in PERSPECTIVE, is a point in the horizontal line, whose lines parallel to one another, though not perpendicular to the picture, or representation, meet.

ACCIDENTAL *Dignities* and *Impotence*, in *Astrology*, are certain casual dispositions, and affections, of the planets, whereby they are supposed to be either strengthened, or weakened, by their being in such a house of the figure.

ACCIPENSER, or ACIPENSER, in the Linnæan system of *Zoology*, the name of a genus of fish, of the order of *cartilagines*, and class of *amphibia*. This genus comprehends the sturgeon, &c. Its distinguishing characters are, that the mouth is retractile, and without teeth; and the gills have only one hole or aperture on each side.

The species of this genus are three, the STURGEON, the *Acipenser Ruthenus* and the HUSO, or huge-fish.

There have been many disputes, whether the huso or sturgeon be the same fish with the *exocetus*, or not, and what was the difference between the *acipenser* and *huso* of the ancients; but the whole seems to have been this, that the Romans called the sturgeon *acipenser*, when they had it fresh, and caught in their own neighbourhood, but *huso*, when it was brought to them in pickle from the Grecian ports. Rays Ichthyography.

ACCIPESIUS, in *Ichthyology*, a name given by Athenæus and others of the Greek writers, to the sturgeon, called by others *acipenser*. See ACCIPENSER.

ACCIPITER, in *Ichthyology*, a name given by Gesner, and some others, to the fish called by others the *aculeus* and *horrens*. It is a species of the *trigla*, and is distinguished by Artedi, by the name of the *trigla*, with the head a little *aculeated*, and with a singular fin, placed near the pectoral fins.

ACCIPITRES, the *Hawks*, in the Linnæan system of *Zoology*, the name of one whole order of birds; the distinguishing character of which, is, their having a hooked or crooked beak. Of this order there are four genera, the *vultur*, *falco*, *strix*, and *lanius*, and seventy eight species. See VULTURE, OWL, FALCON, &c. See HAWK.

ACCIPITRINA, in *Botany*, a name by which some authors have expressed the hawk-weed, and others the lix-weed or *pilosella hieracium*. Gen. Emac.

ACCISMUS, denotes a feigned refusal of something which a person earnestly desires. The word is Latin, or rather Greek *accismos*; supposed to be formed from *Accis*, the name of a foolish old woman, famous in antiquity for an affection of this kind.

Accismus is sometimes considered as a virtue, sometimes as a vice, which Augustus and Tiberius practised with great success.

Cromwell's refusal of the crown of England may be brought as an instance of an *accismus*. It is used in rhetoric, as a figure of irony.

ACCLAMATION, a confused noise, or shout of joy, by which the public expresses their applause, esteem, or approbation on any thing.

Acclamation, in a more proper sense, denotes a certain *formula* of words, uttered with extraordinary vehemence, and in a peculiar tone, somewhat resembling a song frequent in the ancient assemblies.

Acclamations were usually accompanied with applauses, with which they are sometimes confounded, though they ought to be distinguished; as

Acclamation was given by the voice, applause by the hands; besides, *acclamation* was also bestowed on persons absent, applause only on those present. *Acclamation* was also given by women, whereas applause seems to have been confined to men.

Acclamations are of divers kinds; *civil, judicial, military, nuptial, funereal, synodal, scholastic, theatrical*, &c.

Bishops, and other ecclesiastical officers, were elected by the *acclamations* of the people. We meet with loud *acclamations*, musical and rhythmical *acclamations*, *acclamations* of joy and respect, and even of reproach and contumely. The former, wherein words of happy omen were used, were also called *faustæ* or *bonæ voces*, or good wishes: the latter, *execrationes* or *imprecationes*. *Acclamations* at first practised in the theatre, and pulling hence into the senate, were, in process of time, received into the acts of councils, and the ordinary assemblies of the church. But their principal use has always been at the solemn entries of princes, and heroes; where they are usually attended with good wishes, prayers, vows, &c. Antiquity has handed down to us several forms of *acclamations*; the Hebrews used to cry, Hosanna; the Greeks, Ἄξιος ὁσίως ἄξιος ὁσίως, *worthy, worthy*.—The Romans to their princes, generals, &c. *Dii te nobis servent; vestra salus, nostra gaudia: the Gods preserve you for us; your safety, our joy.*

The *acclamations* of the army were generally *Imperator, et Salve imperator*. Schlamm. de Acclam. Veter. Gentium, 1663. Phil. Lat. Act. tom. 6. p. 12. Petav. de Acclam. & Theol. lib. 3. Exposit. Animad. Lex. Mill. tom. 1. p. 6. Bingham Orig. Eccles. lib. 14. c. 1. vol. 4.

ACCLAMATION is also applied among the *Antiquaries* to certain medals or coins on the reverse of which the people are represented expressing their joy for some considerable event.

In this sense, *acclamation* is distinguished from the vows in that latter, *acclamation* is offered to God; among the vows given to princes, as is practised on other occasions, but were not. Cardinals, princes, victors, and ambassadors, are elected by *acclamation*.

The members thus chosen assume the title *Accadie acclamatæ*, indirectly somewhat inferior to the rest. Giorn. de Letter. d'Ital. tom. 21. p. 437.

ACCLAMATION, in *Rhetoric*, is a figure of speech, thus called by the Latins, by the Greeks ἐπιφώνημα.

ACCLIVITY, the steepness, or slope, of a line [illegible] inclined to the horizon; [illegible] opposite.

The ascent of a hill is an acclivity; the declivity is a descent.

ACCOLA, in general terms, denotes a [illegible] gave its name to the [illegible]

The word is compounded of *ad*, [illegible] *colo*, [illegible] *habito*, &c. [illegible] *accolæ* [illegible] from place the distinguishing character of [illegible] this, that they come from elsewhere: *Accolæ dicuntur qui ex alio nascuntur*, by which they stand opposed to *indigenæ*.—According to the rule:

Ex alio patriam, populum sibi sumit uterque.

ACCOLADE, a ceremony anciently used in the conferring of knighthood.

The word literally denotes an embrace, or hugging; being formed of *ad*, *to*; and *col*, or *collum*, *neck*.

Antiquaries are not agreed, wherein the *accolade* properly consisted

reconciled. The generality suppose it to be the embrace, or kiss, which princes ancientlie gave the new knight, as a token of their affection.—Whence the word *accolade*, q. d. a clapping, or taking round the neck. A very impersonous author will rather have it to be a blow on the chine of the neck, given on the same occasion. Faucher seems to reconcile the two opinions; he supposes it to be the kiss; but withal, imagines the kiss to be intended as a stroke on the cheek. *Est hoc hominis ad se fugandum.*—The ceremony being only an imitation of that practised among the Romans, in the manumission of their slaves, where it is known a blow was given, Skinner. Casseneuve. Orig. Franc. Colomb. Theat. d'Honneur.

As for the *accolade*, or blow, John of Salisbury allures us, it was in use among the ancient Normans: by this it was that William the Conqueror conferred the honour of knighthood on his son Henry.

At first, it was given with the naked fist; thus Lambertus Ardensis, describing the manner in which Baldric, count de Guines, was created knight by Thomas à Becket, says, *eidem comiti in femoris modum clitoris et sinistre sui militis pollice apposito, et manum ictu dire ictus.* But this was afterwards changed into a blow with the flat of the sword, on the shoulder of the knight.

Salmonet, and after him the continuators of Morery, mention an order in England, called knights of the *accolade*; so called from the manner of their creation. The order here meant is that of knights bachelors, or *equites aurati*. But the name, if ever, is now no longer known among us.

ACCOLÉE is sometimes used as synonymous with ACCOLADE.

Accolée is also used in *Heraldry*, in divers senses: when two things are joined together, as two shields divided at the flanks, they are said to be *accolée*.

Accolée is also used in speaking of lions, dogs, and other animals, which have collars, or crowns about their necks; as the lion in the arms of the name of Ogilvy.

English heralds ordinarily say, *collared*, or *gorged* with an open crown, instead of *accolée*.

Others use the term *accolée*, when two keys, bugeons, maces, swords, &c. are ranged, behind the shield. Nisbet's Essay on Armor.

ACCOMMODATION, in *Philosophy*, the application of one thing, by analogy, to another.

To know a thing by *accommodation*, is to know it by the idea of a similar thing referred thereto.

ACCOMMODATION, is also used in *Theology*: thus, a prophecy of scripture is said to be fulfilled properly, as when a thing foretold comes to pass; and improperly, or by way of *accommodation*, when an event happens to any place or people, like to what fell out some time before to another.—This method of explaining scripture by *accommodation*, serves as a key for solving some of the greatest difficulties relating to the prophecies.

The primitive church accommodated multitudes of Jewish, and even heathen ceremonies and practices to Christian purposes; but the Jews had before done the same by the Gentiles: some will even have circumcision, the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only accommodated by Moses to the purposes of Judaism. Baurin's Dissert. Old Test. tom. i. p. 500. Spencer de Leg. Hebr. Dis. I. lib. iii. p. 32. Middleton's Letters from Rome.

ACCOMMODATION, in *Law*, is also used for an amicable agreement or compounding, between two contending parties.—Thus we say, the process is grown so intricate and perplexed, that there is no hope of getting out of it but by an *accommodation*.

These *accommodations* are frequently effected by means of compromise, and arbitration.

ACCOMPANYMENT, something attending or added as a circumstance to another; either by way of ornament, or for the sake of harmony, or the like.

ACCOMPANYMENT, in *Music*, denotes the instruments which accompany a voice to sustain it, as well as to make the music to be more full.

The *accompanyment* is used in recitative, as well as in song; on the stage as well as in the choir, &c. The ancients had likewise their accompanyments on the theatre; they often used different kinds of instruments to accompany the actors, from those which accompanied the actors in the orchestra.

The *accompanyment*, among the moderns, is frequently a different part or melody, from the song it accompanies. It is disputed whether it was so among the ancients.—The organists sometimes apply the word to several pipes which they occasionally touch to accompany the treble; as the flutes, flute, &c.

ACCOMPANYMENTS, in *Heraldry*, are all such things as are applied about the shield by way of ornaments; as the helm, mantlings, supporters, &c.

A thing is also said to be *accompanied*, when there are several bearings, or figures, about some principal one; as a fesse, bend, pale, chevron, or the like.

ACCOMPLICE, one that has a hand in a business; or is privy to the same design or crime with another. See ACCESSORY.

The word is compounded of *ad*, *to*, *cum*, *together*, and *plico*, *to fold*.

By the law of Scotland, the *accomplice* can only be prosecuted after the conviction of the principal offender; unless the accession of the *accomplice* is immediate, in *ipsa actu*, so as in effect to render them *correi*.

By the general rule, the *accomplice* suffers the same punishment with the *principal* offender. Yet if he be remarkably less guilty, justice will not permit equal punishment. The council of Spain, and several other ecclesiastical statutes, expressly prohibit the revealing of *accomplices*.

ACCOMPLISHMENT, the entire execution, atchievement, or fulfilling of something proposed, or undertaken.

ACCOMPLISHMENT, in *Theology*, is principally used in speaking of events foretold by the Jewish prophets, in the Old Testament, and fulfilled under the New.

Dr. Sykes has a particular inquiry into the meaning of those words often by the evangelist: that it might be fulfilled, or accomplished, which was spoke by the prophets; where he shews, that the *implevit*, *fulfilled*, does not necessarily refer to a prediction of a future event, *accomplished*, but is frequently a mere accommodation of words borrowed from some other matter, and accommodated to the present occasion. Grotius suggested the opinion to him.

ACCOMPLISHMENT is more particularly used for the acquirement of some branch of learning, useful art, polite exercise, &c.

ACCOMPT. See ACCOUNT.

ACCORD, in *Music*, is more usually called CONCORD.

The word is formed, according to some, from the Latin *ad*, *to*, and *cor*, the *heart*; but others, with greater probability, derive it from the French *accorder*, a *string*, or *cord*, on account of the agreeable union between the sounds of two strings struck at the same time. Whence also some of the consonants in music come to be called *tetrachord*, *hexachord*, &c. which are a fourth, and a sixth.

ACCORD, in *Law*, is a verbal agreement between two, at the least, to satisfy an offence that the one hath committed against the other; whether it be a trespass, or the like; for which the one agrees to make, and the other to accept, a certain satisfaction.—This, if executed, becomes a good bar in law to any suit to be brought for the same matter.

Accord with satisfaction, is a good plea in personal actions, where damages only are to be recovered; and in all actions which suppose a wrong to be done, where a *capias* and *exigent* lay at the common Law, in trespass and ejectment, detinue, &c. So in an appeal of *Murder*. But in real actions it is not a good plea. 4 Rep. 1. 9. 10. 9 Rep. 77.

ACCOUNT, or ACCOMPT, in *Arithmetic*, a *calculus*, or computation of the number of certain things, or computation of time, &c.

The word is compounded of *ad*, *to*, and *computus*, a *computation*.

There are various ways of *accounting*; as by cumeration, or telling one by one; and by the rules of arithmetic, addition, subtraction, &c.

We *account* time by years, months, &c. The Greeks accounted it by olympiads. The Romans, by indictions, lustres, &c. We account distances by miles, leagues, &c.

ACCOUNT is also used in respect of a COMPANY or society, when two or more persons have received or disbursed money for each other; or when one has been done by their order or COMMISSION.

ACCOUNTS, or ACCOUNTS, is also used collectively, for the several books or registers which merchants keep of their affairs and negociations.

There are divers kinds of *accounts* among merchants, as *personal*, *real*, *imaginary*, *general*, *particular accounts*, &c.

ACCOUNTS, *personal*, are those which discover what each person, or subject, with whom a man has dealings on credit, owes to, or has owing to him.

ACCOUNTS, *real*, are those whereby a dealer discovers what effects are on hand at any time, and what is gained or lost on each.

Every *account* is distinguished into two parts, for which two opposite pages are assigned of one folio or opening; the name of the person with whom a man has *account* being written on the top of each, with the word debtor on the left-hand, and creditor on the right.

ACCOUNT *personal*, is to contain on the debtor side what the person owes me, and the payments I make to him; and on the creditor side, all that I owe to him, and the payments he makes of his debts to me.

ACCOUNT, *real*, must contain on the debtor side the quantity and value of what was upon hand at the beginning

of the *account*, and all afterwards received, with the coſts and charges thereof; and on the credit ſide, the quantity and value of what is diſpoſed of or any way taken out of it, with the returns made by it.

ACCOUNTS, *imaginary*, are then brought in to make a balance between credit and debt, and in caſes where the real and perſonal *accounts* will not fit the articles belonging to them make, as they uſually do, ſuch balance.

The chief of theſe is the *account of profit and loſs*; on the debtor ſide of which are entered all loſſes, and on the creditor ſide all gains. Such alſo is the *ſtock account*, &c.

ACCOUNTS, *ſundry*, when one *account* is balanced by ſundry, i. e. when one debtor or creditor for a ſum, and ſundry *accounts* creditors or debtors for the parts of the ſum; it is entered under the head of to, or by, *ſundry accounts*.

ACCOUNTS, *general*, are thoſe where all the goods of the ſame name are put into one *account*.

ACCOUNTS, *particular*, are thoſe where each ſpecies, or ſubdiviſion of things under the ſame name, have their ſeparate *account*.

ACCOUNT, *open*, is uſed for an account not liquidated or ſettled.

ACCOUNT *in hand*, is a ſund of money, which merchants, or others, place in the common caſh of a bank, to be in readineſs for the payment of bills of exchange, or promiſſory notes, purchaſes, and other debts contracted in the courſe of buſineſs.

ACCOUNT, *current*, amounts to the ſame with an open *account*.

ACCOUNT, *opening an*, with any one, ſignifies the placing him, for the firſt time, in the great book. This is done by writing his name, ſurname, and place of reſidence, in large characters, and afterwards charging him with articles, either of debtor or creditor, as affairs turn up. When an *account* is opened with any perſon in the great book, his name is at the ſame time to be entered in the index or alphabet book, with the page wherein his *account* is to be found.

ACCOUNT, *placing a ſum to*, is to enter down in the great book the ſeveral particulars for which a perſon becomes either debtor or creditor.

ACCOUNT, *examining an*, is the reading it exactly over, pointing the ſeveral articles, and verifying the computation, in order to find whether there be any error, and whether the ſum total, or the balance, be juſt.

ACCOUNT, *caſting up*, or *cloſing an*, is the ſtating and ſettling of it, to find the balance: this is called alſo *balancing* or *ſettling an account*.

Accounts are *cloſed* in the great book, on two occaſions: the firſt, when it is required to terminate an affair entirely, either with debtors or creditors, in order to learn what is due. The ſecond, when it is neceſſary to carry on the *account* to another page of the ſame book, or to a new book, for want of room.

ACCOUNT, *balance of an*, is the ſum by which the debt exceeds the credit, or *vice verſa*, upon ſtating or ſettling of it.

ACCOUNT *of ſales*, is an *account* given by one merchant to another, or by a factor to his principal, of the diſpoſal, charges, commiſſion, and net proceeds of certain merchandize, ſent for the proper, or company, *account* of him, who conſigned the ſame to ſuch factor or vender. When the like *account* is inland or domeſtic, the ſame is tranſmitted in the current money of that country wherein the buſineſs is tranſacted. As from a Blackwell-hall factor to the clothiers in the country, or from the warehouſemen in town, who deal by commiſſion for the country manufacturers, as hop-factors, drugget and duty factors, and the like.

ACCOUNT, *money of*, is an arbitrary ſpecies, contrived for the facilitating, and expediting the taking, and keeping of *accounts*. Such are pounds ſterling in England; livres and ſols in France; rouppes in India; milreis in Portugal.

ACCOUNTS, *books of*, of merchants and tradeſmen, are conſidered as a ſort of private inſtruments, and in the civil law, and law of merchants, are allowed to make a half proof. The reaſon is, that merchants are often under a neceſſity of dealing on truſt without note or writing. Hence the ſuppletory oath of the merchant, with his book of *accounts*, is admitted abroad as a full proof againſt his chapman. But in England this is under ſome limitation. See Stat. 7 Jac. I. cap. 12. which confines this ſpecies of proof to ſuch tranſactions as have happened within one year before the action brought; unleſs between merchant and merchant, in the uſual intercourſe of trade.

ACCOUNT, or ACCOMPT, in a legal ſenſe, is a particular detail or enumeration, delivered to a court, a judge, or other proper officer or perſon, of what a man has received or expended on the behalf of another, whoſe affairs he had the management of.

In the EXCHEQUER, there is a particular office in the exchequer, are entered the ſtates of all the *accounts* concerning the king's revenues; for cuſtoms, excile, ſubſidies, &c.

The great *accounts*, as thoſe of the mint, wardrobe, navy, tunnage, &c. are called *imp. of account*.

All *accounts* which paſs the remembrancer's office are brought to the office of the clerk of the PIPE. See TALLY and AUDITOR.

ACCOUNT, in *Common Law*, denotes a writ or action which lies againſt a perſon, who by his office ought to give an *account*, but refuſes.

A writ or action of *account* properly lies only againſt bailiffs, receivers, and guardians in SOCAGE; though others are alſo brought in as a ſecondary intendment.

By 4 and 5 Anne, actions of *account* may be brought againſt the executors and adminiſtrators of guardians, bailiffs, receivers, &c. and by one joint-tenant, &c. againſt the other, his executors and adminiſtrators, as bailiff, for receiving more than his ſhare: however, actions of *account* are now very ſeldom uſed; the moſt ready and effectual way of ſetting matters of *account* being by bill in a court of equity.

ACCOUNTS, *chamber of*, in the French polity, is a ſovereign court of great antiquity, where the *accounts* relating to the king's revenue are delivered in, and regiſtered. This anſwers pretty nearly to the court of exchequer in England.

There are preſidents of *accounts*, maſters of *accounts*, correctors of *accounts*, &c.

ACCOUNTANT, or ACCOMPTANT, a perſon, or officer, appointed to keep, or make up the *accounts* of a company, office, exam, or the like.

Thus there are *accountants* in the cuſtom-houſe, the excile, &c. See CHANCERY, COUNTING-*Houſe*, BOOK-*Keeping*.

ACCOUTREMENT, an ancient term uſed for an habiliment; or a part of the apparatus and furniture of a ſoldier, knight, or even of a gentleman.

The word is formed from the ancient German, *keiſer*; whence *cuiras*, a name uſed in ſome cathedrals in France, e. g. at Bayeux, for the ſacriſtan, or officer, who has the care of furniſhing, and ſetting out, the altar, in the churches called in German *keiſer*, *weſener*.

ACCRETION, in *Phyſics*, the growth or increaſe of an organical body, by the acceſſion of new parts. Alſo a growing together, as of the fingers to one another.

The word is compounded of *ad*, *to*, and *creſcere*, *to grow*. *Accretion* is of two kinds; the one conſiſting in an external appoſition of new matter.

This is what we otherwiſe call, *intuſſuſception*; and it is thus ſtones, ſhells, &c. are ſuppoſed to grow.

The other is by ſome fluid matter received into proper veſſels, and gradually brought to adhere, or grow to the ſides thereof. This is what we call *intuſſuſception*; and it is thus that plants and animals are nouriſhed.

ACCRETION, in the *Civil Law*, denotes the union or acceſſion of a thing vague or vacant, to another already occupied, or diſpoſed of.

A legacy given to two perſons jointly, *tam re quam verbis*, falls wholly to him that ſurvives the teſtator, by right of *accretion*. ALLUVION is another ſpecies of *accretion*.

ACCROCHE, in *Heraldry*, denotes a thing being hooked into another. Court's Herald.

ACCROCHING, in old *Law* books, the act of encroaching or uſurping on another's right; and particularly the attempt to exerciſe royal power, which was a very vague charge, and led to a multitude of conſtructive treaſons. Theſe are limited and defined by Stat. 25 Edw. III. cap. 2. The word is originally French, *accrocher*, which ſignifies to faſten a thing by a hook.

ACCRUE, or ACCRUE, in *Law*, is underſtood, of a part that accedes to, or follows the property of, another part or perſon.

ACCUBATION, a poſture of the body, between ſitting and lying.

The word is compounded of *ad*, *to*, and *cubo*, *I lie down*. *Accubitores*, or *incubitores*, was the uſual poſture of the Greeks and Romans; whence we find the words particularly uſed for the lying, or rather, as we call it, lying down to meat.

The Greeks introduced this poſture. The Romans, during the frugal ages of the republic, were [illegible] But no luxury got footing, this poſture [illegible] at leaſt by the men; for as to women [illegible] indecency in them to lie down among [illegible] alone is this poſture was got over. But [illegible] lie down, nor ſervants, nor ſoldiers, [illegible] meaner condition; but took their [illegible] poſture left independent.

The Roman manner of diſpoſing themſelves [illegible] this a low round table was placed in the [illegible] or three ſofas, and about this uſually three [illegible] only two beds, or couches; according to the [illegible] whole, it was called *triclinium*, or *triclinium*.

covered with a ſort of bed-cloaths, richer or [illegible] according to the quality of the perſon, and furn[illegible]

quilts and pillows, that the guests might lie the more commodiously. There were ordinarily three persons on each bed; to crowd more was esteemed sordid. In eating they lay down on their left sides, with their heads resting on their pillows, or rather on their elbows. The first lay at the head of the bed, with his feet extended behind the back of the second; the second lay with the back of his head towards the navel of the first, only separated by a pillow, his feet behind the back of the third and so of the third, or fourth. The middle place was esteemed the most honourable. Before they came to table, they changed their cloaths, putting on what they called *synthesin toga*, the dining garment, and pulled off their shoes, to prevent soiling the bed. Pasch. Lex. Ant.

ACCUBITOR, an ancient officer of the emperor of Constantinople; whose business was to lie near the emperor. The *accubitor* was the head of the youths of the bedchamber, and had the cubicularius and procubitor under him.

ACCUMULATION, the act of heaping, or amassing several things together.

The word is originally compounded of *ad*, *to*, and *cumulus*, *heap*.

ACCUMULATION, in a *legal* sense, denotes a concurrence of several titles to the same thing; as, when a person claims lands, a benefice, or the like, in virtue of several titles, or pretensions of different kinds; e. g. by death, by resignation, &c. Or it denotes a concurrence of several circumstances to the proof of one fact: thus, we read of *accumulative* treason; which is, where a fact is not treason in itself, but becomes so by an *accumulation* of circumstances.

The earl of Strafford was condemned of *accumulative* treason; none of the facts alledged against him amounting singly to treason. But his attainder was reversed by 13 & 14 Car. II. cap. 29.

ACCUMULATION, in the ancient *Agriculture*, denotes the operation of covering up the roots of trees, by throwing on them the earth that had been before dug from them; in which sense, *accumulation* stands opposed to ABLAQUATION.

ACCUMULATION *of arms*, *cumulatio armorum*, in *Heraldry*, is what the moderns call QUARTERING of arms. Niffet.

ACCUMULATION *of degrees*, in an *University*, is used for the taking of several degrees together, and with fewer exercises, or nearer to each other, than the ordinary rules allow of.

ACCURSED, something that lies under a curse, or sentence of EXCOMMUNICATION.

The Jewish idiom, *accursed* and crucified were synonymous. Among them, every one was accounted *accursed*, who died on a tree.

This serves to explain the difficult passage in Rom. ix. 3 where the apostle Paul wishes himself *accursed after the manner of Christ*, i. e. crucified, if happily he might by such a death save his countrymen. The preposition *ana* here made use of, is used in the same sense, 2 Tim. i. 3. where it obviously signifies *after the manner of*.

ACCUSATIO, among *Physicians*, is a word of the same import as INDICATIO.

ACCUSATION, Accusatio, in the *Civil Law*, the inventing of a criminal action against any person, either in one's own name, or that of the public.

The word is compounded of *ad*, *to*, and *causari*, *to plead*. By the Roman law, there was no public *accuser*, for public crimes: every private person, whether interested in the crime, or not, might *accuse*, and profecute the *accused* to punishment, or absolution.

But the *accusation* of private crimes was never received but from the mouths of those who were immediately interested in them. Thus none but the husband could accuse his wife of adultery.

Indeed, it was not properly an *accusation*, except in public crimes; in private ones, it was called simply ACTION, or intenting an action, *instituere actionem*, or *actum*.

Cato, who was esteemed the most innocent person of his age, had been *accused* forty-two times, and absolved as often.

When the accused *accuses* the accuser, it is called *recrimination*, which is not admitted till the *accused* has been first purged.

The ancient Roman lawyers distinguished between *pollicitatio*, *delatio*, and *accusatio*: for first, leave was desired to bring a charge against one, which was called *postulare*; then he against whom the charge was laid, was brought before the judge, which was called *deferre*, or *nomina deferre*; lastly, the charge was drawn up, and preferred, which was properly the *accusatio*. Voss. Etym. Lat.

The *accusation* properly commenced, according to Pedianus, when the *reus*, or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the *delatio* made by his opponent. Calv. Lex. Jur. p. 17. By the cruel laws of the INQUISITION, the *accused* is forced to accuse himself of the crime objected to him. There are three ways of entering an information in the tribunal of the inquisition. The first, by way of inquisition, when a private person, applying to the inquisitor, declares he will neither be *denunciator*, nor *accuser*, but that common fame gives out, that such and such a person is a *heretic*: the second, by way of *accusation*, when the informer takes on him the office of *accuser*, which rarely happens; because, in this case, the *accuser* is obliged to prove, and exposes himself to the *ius talionis*, in case his information prove false. The last, and most usual way, is by *denunciation*, that is, by naming those who know the fact.

It has formerly been the custom in some parts of Europe, where the *accusation* was very heavy, either to decide it by combat, or at least make the *accused* purge himself by oath; which, however, was not admitted, excepting a certain number of his neighbours and acquaintance swore together with him.

In the French *Laws*, none but the *procureur general*, or his deputies, can form an *accusation*, except for high treason, and coining, where *accusation* is open to every body. In other crimes, private persons can only act the part of denouncers, and demand reparation for the offence, with damages.

Writers on politics treat of the benefit and the inconveniences of public *accusations*. Various arguments are alledged, both for the encouragement and the discouragement of *accusation* against great men. Nothing, according to Machiavel, tends more to the preservation of a state, than frequent *accusations* of persons trusted with the administration of public affairs. This, accordingly, was strictly observed by the Romans. In the instances of Camillus, accused of corruption by Manlius Capitolinus, *Sec. Accusations*, however, in the judgment of the same author are not more beneficial than calumnies are pernicious; which is also confirmed by the practice of the Romans. Manlius, not being able to make good his charge against Camillus, was cast into prison. Machi. de Repub. l. i. c. 7. p. 35.

ACCUSATIVE, in *Grammar*, the fourth case of nouns that are declined.

Its use may be conceived from this, that all verbs which express actions that pass from the agent, as to *beat*, &c. must have subjects to receive those actions: for, if I beat, I must beat something; so that such verb evidently requires after it a noun, or name, to be the object of the action expressed. Hence, in all languages, which have cases, the nouns have a termination, which they call *accusative*; as *amo Deum*, *I love God*.

In English, we have nothing to distinguish this case from the *nominative*; but as we ordinarily place words in their natural order, it is easily discovered; the *nominative* constantly preceding, and the *accusative* following the verb. Thus, when we say, the prince loves the princess, and the princess loves the prince; the prince is the *nominative* in the first, and the *accusative* in the last; and the princess the *nominative* in the first, and the *accusative* in the second.

ACENTETUM, or Acentra, in *Natural History*, a name given by the ancients to the purest and finest kind of rock crystal. They used the crystal in many ways, sometimes engraving on it, and sometimes forming it into vases and cups, which were held next in value to the *murrhina vasa* of those times. The crystal they obtained from the mines of Cyprus was much esteemed, but often faulty in particular parts, having knots, cracks, and foulnesses, which they called faits, in the midst of the large pieces. Pliny tells us, that when it was used for engraving on, the artist could conceal all those blemishes among the strokes of his work; but when it was to be framed into cups and precious vases, they always chose the *acentetum*, that is, the pure crystal, which had no flaws nor blemishes.

ACEPHALI, or Acephalita, frequently occurs in *Ecclesiastical History*, as the denomination of divers sects: particularly,

1. Of those who in the affair of the council of Ephesus, refused to follow either St. Cyril, or John of Antioch.

2. Of certain Christians of the fifth century, who at first followed Peter Mongus; but afterwards abandoned him, upon his subscribing the council of Chalcedon; being generally of the opinion of Eutyches, that there was only one nature in Christ.

3. Of the adherents of Severus of Antioch; and of all in general who refused to admit the council of Chalcedon.

ACEPHALUS, or Acephalous, something that wants a head.

The word is compounded of the privative *a*, and κεφαλη, *caput*, *head*.

Pliny represents the Blemmyes as a headless, or *cacephalous* nation.

But though the existence of a nation of *acephali* be

warranted, naturalists furnish several instances of individuals born without heads, by some *lusus* or aberration of nature. Wepfer gives a catalogue of such *acephalous* births from Shenckius, Licetus, Paræus, Wolfius, Mauriceau, &c.

Acephalous worms, or what are supposed such, are frequent. The *lumbricus latus*, or joint-worm, was long taken to be *acephalous*: the first who gave it a head was Tulpius, and after him Fehr; the former even makes it *hexapus*, or two-headed.

The levellers in the reign of Henry I. were called *acephali*. This word, in our ancient Law-books, is also used for those poor people who had no proper lord; as holding nothing in fee, either of king, bishop, baron, or other feudal lord.

ACEPHALOUS *cloth*. See CLOTH.

ACEPHALUS is also used in *Poetry*, for a verse which is lame or defective, by wanting a beginning.

Some also give the name acephalus to all verses which begin with a Choit, instead of a long syllable.

ACER, in *Botany*. See MAPLE.

ACERATOS, ἄκερως, from α negative and κερας, or κερατιον, *to mix, unmould, unincrustate*. It is applied sometimes to the humours of the body by Hippocrates. Paulus Ægineta mentions a plaister under this name, but probably means ἀκηρατος. See ACERUTUS.

ACERB, ACERBUS, a compound taste, consisting of sour, with the addition of a degree of roughness, and astringency. Such is the taste of pears, grapes, and most other fruits before they are ripe.

Physicians usually make *acerb* an intermediate flavour between acid, austere, and bitter. All matters which come under this denomination are astringent.

ACERIDES, ἀκηριδες, from α negative, and κηρος, *wax*. Bodies made without wax are thus called.

ACERINA, in *Ichthyology*, a name given by Pliny and other of the old *Naturalists*, to the fish we at this time call the *pinna*, and which is the *pinnophylax* also in England the *wolf*. It is a genuine species of ESOCUS, and is distinguished by Aretius from all the other fish of that genus, by having the back-fin single, and the head cavernous.

ACEROSUS, is an epithet, denoting the brownest and coarsest sort of bread, made of flour not separated from the bran.

ACERRA, in *Antiquity*, a kind of altar, erected near the bed of a person deceased. It was much used among the Romans; and the friends and families daily burnt incense on it, till the time of the burial.

By the laws of the *Twelve Tables*, the erecting of *acerræ* was prohibited.

The *acerra* also signified a little pot, wherein the incense and perfumes were put, to be burnt on the altars of the gods, and before the dead.

The *acerra* appears to have been the same with what was otherwise called *thuribulum*, and *pyxis*: some have also confounded it with the *patera*, in which libations were offered.

We find mention of *acerræ* in the ancient church. The Jews had also their *acerræ*, in our version rendered *censers*; and the Romanists still retain them under the name of *incense pots*.

In Roman writers, we frequently meet with *acerra plena*, a full *acerra*; to understand which it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger quantities, the poor only a few grains: the former poured out *acerræ* full on the altar; the latter took out two or three pits with their fingers. Pitis. Lex. Ant. Bellon de Funeral. l. 3.

ACESCENT, a word used to denote any thing which is turning sour, or *acid*, or which is slightly *acid*. It is only applied properly to denote the first of these two meanings. The second may be better expressed, by either of the words *acidulous*, or *subacid*.

ACETA, ἄκητα, sour-sale diffempers.

ACESTIDES, thus the chimneys of furnaces where brass was made, were called; contrived narrow at top, on purpose to receive the fumes of the melting metals, and collect them, that CADMIA might be produced in greater quantities.

ACESTIS, ἀκεστις, a different sort of CHRYSOCOLLA, made of Cyprian verdigrise, the ooze of children, and wine.

ACESTRIDES, female physicians; midwives were so called among the Greeks.

ACETABULUM, in *Antiquity*, a little vase, or cup, used at table to serve up things proper for sauce, or seasoning: much after the manner of our salts and vinegarets.

Hence Agricola, in his treatise of Roman measures, takes the name to have been formed from *acetum*, *vinegar*; as supposing it principally destined to serve vinegar in.

ACETABULUM also denotes a Roman MEASURE, used both for liquid and dry things, chiefly in medicine.

The *acetabulum* contained a *cyathus*, and a half, as is proved by Agricola, from two verses of Fannius; who, speaking of the *cyathus*, says, it weighs ten drachms; and the *acetabulum*, or *acetabulum*, fifteen, or about one eighth of a pint.

Bis quinque libræ fiabunt drachmæ, si appendere tentes:
Octobolus fiet, si quinque addantur ad illas.

Binet, in his Treatise of Weights and Measures, prefixed to his Translation of Pliny, makes the *acetabulum* of oil weigh two ounces and two scruples; the *acetabulum* of wine, two ounces, two drachms, a grain, and a third of a grain; and the *acetabulum* of honey, three ounces, three drachms, a scruple, and two *siliques*.

ACETABULUM, in *Anatomy*, is used for a deep cavity, in certain bones, appointed for the reception of the large heads of other bones, in order to their articulation. See *Tab. Anat. (Osteol.) fig.* 12. *lit. b.* Thus the cavity of the ischium, or huckle-bone, which receives the head of the thigh bone, is called *acetabulum*, and sometime *cotyle*, or *cavitas*.

The *acetabulum* is lined, and capped round with a cartilage, whose vicular margin is called *supercilium*. In its bottom lies a large mucilaginous gland.

ACETABULUM is also used, by *Anatomists*, in the same sense with COTYLEDON.

It signifies also a glandular substance, found in the placenta of some animals.

ACETABULUM, in *Botany*, the name of a genus of sea-plants, whose seed leaves formed in the shape of a bason, and rising a foot of inverted cone.

ACETARIA. See SALLET.

ACETARY is used for an inner part in the structure of certain fruits; thus called from the fourness of its taste.

The *acetary* of a pear is a globular part, lying within the cavities or chaos, and surrounding the core. It is of the same substance with the parenchyma or pulp, only that the bladders of which it consists are smaller, and rounder than those of the PARENCHYMA: from whence however it seems to be derived. Whence it is sometimes also called, the *inner parenchyma*.

The quince also has an *acetary*, resembling, though less than, that of a pear.

ACETIFICATION is used by some *Chemists* to denote the action or operation whereby vinegar is made.

Acetification is a branch or species of fermentation, arising by exposing vinous liquors in open vessels, and a warm place, which turns them acid.

Acetification chiefly differs from the fermentation whereby wine is made, in this, that the latter is effected by a gentler heat, sufficient only to raise, and rarefy the inflammable parts; whereas, in *acetification*, there is what is sufficient to raise and rarefy the saline parts; which is the precise point wherein *acetification* consists.

ACETOSA, in *Botany*. See SORREL.

ACETOSELLA, in *Botany*. See *Wood* SORREL.

ACETOUS *acetosus*, is the same as VINEGAR.

ACETOUS *fermentation*, is that fermentation by which vinegar is produced.

ACETOUS *ether*, is an ÆTHER made by means of vinegar.

ACETUM, in *Medicine*, &c. the same with vinegar; the properties, uses, and preparations whereof, see under the article VINEGAR.

The word is pure Latin, formed of *acere*, *to be sharp*.

There are several mediciues in the shops, whereof this liquor is the basis; as,

ACETUM *distillatum*, distilled vinegar, chiefly used in preparations for distillation and precipitation.

ACETUM *fortius*, spirit of vinegar, made by drenching copper things with distilled vinegar, then evaporating it till the fumes of the vinegar cannot be fired; the saturation and evaporation to be again repeated, till the menstruum be saturated; which being then distilled, the spirit comes over. Its qualities and uses are much the same with those of the distilled vinegar, only it is more powerful.

ACETUM *scyllinum*, vinegar of squills; that is, vinegar infused in vinegar forty or fifty days: the mixture then pressed out, and the vinegar preserved. It is used by way of embrocation on the head and the pit of the stomach.

After the like manner are made *acetum* [illegible] *per se*, or other; *acetum absinthii*, vinegar of wormwood; *acetum foliorum*, vinegar of [illegible].

The German dispensatories abound with [illegible] gars; chiefly against pestilential [illegible] are not used among us. Our dispensatories [illegible] some of them, as the *acetum theriacale* [illegible] it is never prescribed.

ACETUM *thebaicum*, is made of distilled vinegar, the addition of some alkaline, or volatile [illegible].

ACETUM *philosophorum*, a finer kind of [illegible] dissolving a little butter of antimony in a great deal of

ACETUM *Ecarinum*, in *Chemistry*, a diſtilled vinegar, rectified with the help of verdigriſe. It is made by diſſolving the common verdigriſe in fine diſtilled vinegar, then evaporating the ſolution, and recovering the verdigriſe again in form of cryſtals; and from this, by a proper degree of fire, diſtilling with a recent an acid ſpirit, which is the richeſt acid that can by any art be prepared from vinegar. Boulduc's Chem. p. 148.

ACETUM *Portabile*. See VINEGAR.

ACHAC, in *Ornithology*, the name given by the people of the Philippine iſlands, to a bird common there. It is of the ſize of a common hen; its belly, breaſt, and neck, are of a pale brown, and its back of a duſky reddiſh colour; its wings are extremely beautiful, being principally of a greeniſh blue colour; the tail is white, ſtars and conſtinually in motion; the eyes are black, and the beak is thick and ſtrong, and is of a black colour, and obtuſe figure; the legs are reddiſh, and the claws black; when it makes any noiſe, it ſeems to utter the word *achi, achi*, very often repeated. It lives principally about the cultivated parts of the iſlands, and feeds on rice, and other vegetables, being properly of the partridge kind.

ACHALALACUIL, in *Ornithology*, the name of an American bird, deſcribed by Nieremberg, and remarkable for a chain or ring of ſilvery whiteneſs round its neck. It is of the ſize of a pigeon, its beak is ſharp, and three fingers breadth long, and its head is ornamented with a very long creſt, of a bluiſh black colour. The belly and under-ſide of the wings are white, and the back and outſide of the wings are of the colour of the creſt, of a bluiſh black, and variegated with white ſpots; the tail is partly black and partly blue. It is common about the lakes and rivers of Mexico, and feeds on ſmall fiſh. Ray.

ACHAMELLA, in *Botany*. See ACHILLEA.

ACHANDES, in *Ichthyology*, a name given by ſome to the REMORA.

ACHANE, ACANE, an ancient Perſian corn meaſure, containing 45 Attic *medimni*.

ACHAOVA, in the *Materia Medica* of the ancients, the name of an herb much celebrated in many diſtempers; but we are not aſſured at preſent, what is the plant that it truly belongs to. Some have eſteemed it, what is called in Egypt ochove, an herb nearly reſembling chamomile, but lower, and with broader leaves, approaching to thoſe of feverfew, and of a faint, but not diſagreeable ſmell.

Avicenna ſeems however to have meant a different plant by this name, and probably the herb we call MARUM Syriacum. Ajp.

ACHARISTON, from *a*, *without*, and χαρις, *favour*; under this name Galen deſcribes ſome compoſitions of ſingular efficacy, which cured ſo quickly, that they were undervalued; as the Greek name implies.

ACHAT, in our Law French, ſignifies a contract, or bargain; eſpecially in the way of purchaſe.

Purveyors were by act of parliament 36 Edw. III. ordained to be thenceforward called *achaters*.

ACHATES, *in Natural Hiſtory*, the ſtone properly called AGAT, *lapis ſyrtis*, &c.

ACHE, or ACH, a painful ailment in any part of the body. *Aches* may be either rheumatic, or rheumatic, owing to violent pains of the tile. See HEAD-*Ach*, &c.

ACHE, in ſome old authors, a name given to the plant called *ſmyrnium oluſatrum*, or *pes aſininus*; in Engliſh ALEXANDERS.

ACHEMENIS, an herb mentioned by Pliny; ſuppoſed by the ancients to have the property of exciting terror.

ACHERNER, or ACHARNER, in *Aſtronomy*, a ſtar of the firſt magnitude in the ſouthern extremity of the conſtellation ERIDANUS, but inviſible in our latitude.

ACHERON, a meaſure of corn, ſuppoſed to be the ſame with an quarter or eight buſhels. The monks of Peterborough had an allowance weekly of twelve *acherons de frumento*, and eight *acherons de ſiligine*, and ſix *de pulſe*, and fifteen *acherons de fabis*, &c. Ignotian.

ACHETA, in *Natural Hiſtory*, a name by which the ancients called the largeſt ſpecies of CICADA, the nymphs of which they uſed to eat, and eſteemed an excellent food: the ſmaller kinds, which ſeems to have been our middling ſort (for we have three kinds) they called TETTIGONIA.

ACHIA, a kind of cane which grows in the Eaſt Indies, and is pickled there while green, with ſtrong vinegar and pepper, together with ſome other ſpice and ingredients.

ACHIAR, is a Malayan word, ſignifying all ſorts of fruits and roots pickled with vinegar and ſpice. The Dutch export from Batavia all ſorts of *achiar*. The name is applied to whatever the *achiar* is made of; as *bamboo*, *cane*, &c.

ACHILENUS, or ACHAENUS, in *Natural Hiſtory*, a word uſed by the ancients to expreſs a ſtag or deer, in the ſecond year's age. In the firſt it was called *nebrus*, in the third *dicervus*, and always after that *cervus*.

ACHICOLUM, is uſed to expreſs the *fornix*, *thalus*, or *ſudatorium* of the ancient baths; which was a hot room where they uſed to ſweat. It is alſo called *archibalus*.

ACHILLEA, in the *Materia Medica* of the ancients, a name given to the gum, which we at this time know by that of *ſanguis draconis*, or DRAGON'S-BLOOD.

The ancient Greeks called this *draconthes*; and the uſe of that word for the mineral which we now call cinnabar, was only becauſe of its being of the ſame fine red colour with this gum. Avicenna treating of the *achillea* ſays, it is otherwiſe called *ſanguis draconis*, and deſcribes it as a red gum, univerſally known in his time.

ACHILLEA, in the Linnæan ſyſtem of *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs of plants, the common calyx of which is ovated, and imbricated with oval, acute, connivent ſquamæ; the compound flower is radiated; the hermaphrodite florets are numerous and tubulous; the female florets are ligulated; and the proper hermaphrodite ones funnel-ſhaped; there is no pericarpium, and the ſeed is ſingle, oval, and naked. There are twenty-one ſpecies. See YARROW.

ACHILLEA *Lutea*. See ACHEATUM.

ACHILLEA *Mytulina*. See JACOBEA.

The ancient *Botaniſts* gave the name *achillea* to a plant which is ſaid to be the ſame with our milfoil-ſeam, from Achilles, who having been the diſciple of Chiron, firſt brought it into uſe for the cure of wounds and ulcers.

ACHILLEA *Gallica*, a name given to mountain rag-wort, or corn MARYGOLD.

ACHILLEIS, or ACHILLEID, a celebrated poem of Statius, of the epic kind, wherein he propoſed to deliver the whole life and actions of Achilles.

It only takes in his infancy, the poet being prevented from proceeding by death.

It is a point controverted among the critics, whether the whole life of a hero, e. g. of Achilles, be a proper ſubject of an EPIC poem?

ACHILLES, a name which the ſchools give to the principal argument alledged by each ſect of philoſophers in behalf of their ſyſtem.

In this ſenſe, we ſay, this is his *Achilles*: that is, his maſter-proof; alluding to the ſtrength and impotence of Achilles among the Greeks.

Zeno's argument againſt MOTION, is peculiarly termed *Achilles*.—That philoſopher made a compariſon between the ſwiftneſs of *Achilles*, and the ſlowneſs of a tortoiſe: arguing, that, if the tortoiſe were one mile before *Achilles*, and in the ſame ſpace of time that *Achilles* ran the firſt mile, the tortoiſe ran the ſecond mile, and ſo on; *Achilles* muſt for ever be behind the tortoiſe, yet he would never overtake it. But this ſophiſm is eaſily ſolved, by expreſſing the whole relative diſtance run by the tortoiſe before *Achilles* overtook him, by the following ſeries, $1 + \frac{1}{10} + \frac{1}{100}$, &c. the ſum of which is $1\frac{1}{9}$ of a mile; and the diſtance run by *Achilles* is one mile more: ſo that when *Achilles* had run $1\frac{1}{9}$ of a mile, he would have overtaken the tortoiſe.

ACHILLES, *Tendon of*, CHORDA *Achillis*, in a large TENDON, formed by the union of the tendons of the four extenſor muſcles of the FOOT.

It is ſo called, becauſe the fatal wound, whereby Achilles is ſaid to have been ſlain, was given there.

ACHIOTE, in *Botany*, a name given by ſome authors to the *orucu*, or *orniſtu*, called *orleana*, and *orellana*, by other writers. See next Art.

ACHIOTTE, a red drug from America, uſed in dying, and in the preparation of chocolate.

The word is Braſilian, where it properly ſignifies the tree from whence this matter is procured. Ray writes it *achiote*. *Achaua* is the name with what the French frequently call ROUCOU, and the Dutch *orleane*. It has been commonly eſteemed a kind of *argilla* or earth; but later obſervers find it a flower, or ſeed of a tree, which grows chiefly in very hot countries, as Yucatan, or Campeche, and Guatimala. It is about the ſize of a plum-tree, only more tufted; its branches being longer than the trunk. The fruit is incloſed in a rind like a cheſnut, except that it is of an oval figure. It begins to open croſs-ways from the middle to the top, and ſubdivides into four parts: having, in the middle, a beautiful carnation-coloured flower. The tree has no leaves; but inſtead thereof ſhoots out filaments like thoſe of ſaffron, only bigger and longer. Between theſe grow little ſoft vermilion-coloured grains, about the ſize of pepper-corns; which the Indians, ſeparating from the filaments, bake in cakes of about half a pound each; in which form the drug is brought into Europe.

The poor people uſe *achiotte* inſtead of ſaffron; it is uſed as marygolds are, to give a yellow colour to cheeſe, in Glouceſterſhire, and others mix as an ingredient in chocolate, during the grinding of the cocoa, the quantity of two drams to a pound, to give it a reddiſh colour, &c. though this practice was formerly more frequent than at preſent; the opinion of its being an earth, which

even Mr. Ray fell into, having discredited its use. Some also use it to dye wax of a vermilion colour. Physicians hold it a good cordial, and a preservative against retention of urine. It is made, as we make STARCH.

According to Savary, to procure the *achnite*, they shake out the grains in an earthen vessel, soak and then wash them in several repeated warm waters, till they have discharged all their vermilion colour; after which letting the water stand to settle, the *fecula* at the bottom are taken and formed into little cakes and balls; which, when pure, and not adulterated either with red earth, or fine brick dust, are highly valued. Some also use fire to boil the *achnite*, and give it a farther consistence.

ACHIROPOETOS, a name given by ancient writers to certain miraculous pictures of Christ and the Virgin, supposed to have been made without hands.

The most celebrated of these is the picture of Christ, preserved in the church of St. John Lateran at Rome; said to have been begun by St. Luke, but finished by the ministry of angels.

The word is Greek, and derived from α, *without*, χειρ, *hand*, and ποιεω, *to make*. Du-Cange.

ACHLIS. See MACHLIS.

ACHLYS, in *Medicine*, a darkness or dimness of sight, arising from a small *cicatricula* on the pupil, occasioned by a superficial ulcer on the *uvea*.

The word is Greek, and literally signifies a kind of cloud. In a metaphorical sense, *achlys* also denotes a disorder of the womb; answering to what Latin writers call *suffocatio uteri*.

ACHLYS, in *Mythology*, is applied by some Greek authors to the first Being, who existed before the creation of the world, or chaos, and of the gods.

ACHNE has various significations: sometimes it denotes lint, at other times chaff, or froth of the sea. Hippocrates uses it to denote a white mucilage, observable in the eyes of patients who have fevers; and also a white mucus in the fauces, thrown up from the lungs.

ACHOR, in *Medicine*, the third species or degree of a TINEA, or scald-head.

Achor is a sort of small running ulcer on the face and head, chiefly of children while they suck; by which the skin is broke into a number of little holes, out of which issues a vifcid humour, like *lobur*, whence its name.

Achor differs from the *favus* and TINEA only in the degree of virulence. It is called *favus* when the perforations are large, and the *favus*, when they are like thefe which are made by moths in cloth.

Writers of medical obfervations afford divers anomalous inftances of *achores*, viz. fome are found even in aged people; others on the feet; others refembling the venereal difeafe; others which difappeared upon cutting the hair and returned on its growing anew; others followed by a thickneſs of hearing; others by panics; and others by a *gutta ſerena*. Thefe drying up has ſometimes been followed by a fever, their repulſion forward by an epilepſy.

ACHOR, in *Mythology*, the god of flies to whom, according to Pliny, the inhabitants of Cyrene ſacrificed, in order to obtain deliverance from thefe inſects, and the diſorders occaſioned by them.

ACHRAS, in *Botany*. See SAPOTA.

ACHROMATIC, in *Optics*, a term, ſays M. Des Landes, firſt introduced into his *aſtronomy*, to denote TELESCOPES of a new invention, contrived to remedy *aberrations* in colours. The word is compoſed of the privative α, and χρωμα, *colour*. See ABERRATION and TELESCOPE.

ACHRONICAL, in *Aſtronomy*. See ACRONYCHAL.

ACHTELING, a meaſure for liquids uſed in Germany.

Thirty-two *achtelings* make a *viertel*; four *fellens*, or *fuitres* make an *achtelling*.

ACHTENDEELING, or ACHTELIEN, a meaſure for grain uſed in ſome parts of Holland.

ACHY, a ſpecies of CASSIA that grows in Arabia.

ACHYRANTHES, in *Botany*, a ſpecies of the *pentandria monogynia* claſs: its characters are, that the calyx is five-leaved, it has no corolla, the ſtigma is bifid, and the ſeeds ſingle. There are ten ſpecies.

ACHYRONIA, in *Botany*, a name given by Van Royen, to a genus of plants of the papilionaceous kind, called by Linnæus APALATHUS.

ACHYROPHORUS, in *Botany*, the name of a genus of plants of the ſame character with the HYPOCHÆRIS.

ACIA, a term in the Roman *Surgery*, concerning the meaning of which phyſicians, and commentators, are much divided. Celſus, ſpeaking of the healing of wounds, either by ſuture, or the fibula, ſays, each is beſt effected by means of a ſoft *acia*, not too much twiſted, that it may fit the eaſier on the body.

Boerhaave will have the *acia* to be the *ſcar* of the fibula, or that part which is pinched. In which view *acia mollis* only imported, that it was not ſet ſo as to pinch too much.

ACIOCCA, an herb that grows in Peru, and is ſometimes uſed inſtead of the herb *paraguay*, of which it is ſaid to have all the properties.

ACICULÆ, in *Natural Hiſtory*, ſmall ſpikes, or prickles in form of needles, with which nature has armed ſeveral creatures. See *Tab. of Fiſhes*, N° 2. *Tab. of Teſtaceous and Cruſtaceous Animals*, N° 13. *Tab.* II. of *Quadrupeds*, N° 19.

ACIDS derive their name from the word *acere*, to be *ſharp*; which expreſſes one quality by which they are diſtinguiſhed, viz. their ſour taſte. They form one of the general claſſes, into which ſimple ſalts are divided, and are the moſt ſimple of all ſaline ſubſtances. If they were ſeparated from water, to which they have a ſtrong affinity, and from all other ſubſtances not neceſſary to their ſaline eſſence, they would appear under a concrete or ſolid form; but the contact of the air, which is fouled with watery vapours, is ſufficient to diſſolve them, and therefore they are always in a fluid ſtate. On this account it is not eaſy to aſcertain the quantity of *acid* in *acid* liquors. Homberg made ſeveral experiments to this purpoſe, by combining *acid* liquors with ſalt of tartar, ſo as to form neutral ſalts; imagining that the weight gained by this alkali from its union with *acids*, or the difference between the weight of the ſalt of tartar and the neutral ſalt produced, was equal to the weight of real *acid* contained in the quantity of *acid* liquor employed. But as he did not conſider that the air expelled from ſalt of tartar, during its combination with *acids*, makes a very conſiderable part of the weight of that alkali, the inferences from his experiments are not juſt; and the real quantity of *acid* contained in an *acid* liquor, is ſo much more than the quantity inferred by him, as the whole weight of the alkali air diſengaged from the ſalt of tartar. *Acid* ſalts are all found to be volatile; by which they are diſtinguiſhed from the reſt, which are either fixed, or have an urinous, inſtead of an *acid* taſte.

Some chemical philoſophers have even made it very probable that it is the *acid*, which is the ſaline part, or principle, in all ſalts. They conſider it as a ſubtile penetrating ſubſtance, diffuſed through the ſeveral parts of the globe; which, according to the different matters it happens to be united with, produces different kinds of bodies. Of this ſentiment is Sir Iſaac Newton. 'In decompounding ſulphur, ſays that author, we get an *acid* 'ſalt of the ſame nature with oil of ſulphur *per campanam*; which ſame *acid*, abounding in the bowels of the 'earth, unites ſometimes with earth, and thus makes '*alum*; ſometimes with earth and *bitumen*, and thus 'compounds ſulphur.' In reality, all our native ſalts, though without any mixture from art, are yet found to be real mixtures; and their compoſition and decompoſitions are eaſily made.

Acids poſſeſs ſeveral common properties, beſides the ſharpneſs or ſourneſs of their taſte. They are readily united with water; and from this union, a new compound fluid is formed, whoſe ſpecific gravity differs from the mean gravity of its component parts. They may be likewiſe combined with ſpirits of wine, and form a very volatile ſubſtance, which chemiſts have denominated *æther*. They may alſo be combined with abſorbent earths, with alkaline ſalts, with metallic ſubſtances, with phlogiſton, and with oils; and in the proceſs of uniting with them, diſcharge all or part of the fixable air which they contain. The combination with alkaline ſubſtances occaſions a violent effervescence, and produces neutral ſalts. They diſſolve the aſhes of vegetables, and the ſolid parts of animals. All ſolutions, the metallic ones excepted, deſtroy the acrimony of the diſſolving *acid*, and the menſtruum loſes its diſſolving power.

Acids likewiſe, for the moſt part, agree in changing into red the blue colours of vegetable juices, and in heightening the colour of thoſe that are red. But this property is not common to all *acids*; for the volatile ſulphureous *acid* deſtroys thoſe colours. Nor is it peculiar to *acids*; for *alum*, a neutral ſalt, produces the ſame effect. *Acids* reſiſt fermentation; they are not ſo eaſily frozen as water, and they generate cold, when poured upon ice. M. Homberg explains the actions of *acids* on alkalies, and accounts for the great number of little bubbles, and the heat produced thereby in the following manner. The matter of light, which he ſuppoſes to be the chief principle, ſulphur, and to poſſeſs the whole extenſion of the univerſe, is kept in a perpetual motion by the ſeveral impulſes which the ſun, and fixed ſtars, give it. This motion, happening on ſome occaſions to [illegible] may be retarded again, and augmented by the approach of flame, which this author ſuppoſes to be only matter capable of giving motion to light. Light cannot proceed in its motions without continually ſtriking againſt the ſolid bodies, and paſſing through the porous ones which it meets with.

Suppoſe, now, *acids* to be little, ſolid, pointed bodies, ſwimming at liberty in an aqueous fluid, and kept in continual motion by the repeated impulſes of the matter of light; and alkalies to be ſpongious bodies, whoſe pores

pores have formerly been filled with the points of *acids*, and which still retain the dents or impressions thereof, and are ready to receive the like points again: It is easy to conceive, that if some of these porous alkalies float in the same liquor wherein the solid *acids* float, these latter, being impelled by the matter of light, will enter the cavities of the former; and that they will do it the more readily, if the motion of the impelling light has been accelerated by external heat.

The introduction of *acids* into the pores of alkalies is, to all appearance, effected with great velocity and friction; in as much as it produces so considerable a degree of heat; and as the pores of the alkalies were before filled with an aereal matter, which is now expelled by the points of the *acids*, that air is put in motion, and produces the bubbles, which are so much the more sensible, as the heat accompanying the action is the greater. Homberg's Essai du Sel Principe.

Sir Isaac Newton accounts for the effects of *acids*, by the great principle of attraction. See AFFINITY.

Acids differ considerably from each other with regard to their strength, their resolvent power, and the changes produced in them by the bodies on which they act.

Acids seem, from their universality, to be of the greatest use in the oeconomy of the world. The air, earth, and sea abound with them. It is observed, that the air is most replete with *acid*, when the wind blows from the north and east, and when the weather is serene; a fact which, according to Hoffman, is confirmed by the observations of those who are concerned in nitre works: from whence we may conclude, that the *aerial acid* is instrumental to the production of cold in the air. The analogy between *acids* and *cold*, and between alkalies and heat, is very remarkable. *Heat* and alkalies promote the putrefaction of dead bodies; or, in other words, destroy the cohesion of their parts: on the contrary, *acids* and *cold* preserve them from putrefaction, by preserving the cohesion of their component parts.

Acids are distributed into three general classes, according to the substances from which they are extracted; viz. *animal*, *mineral*, and *vegetable acids*. Nevertheless, it is the opinion of Stahl, and of other eminent chemists, that there is but one primitive *acid*; and that all the other *acids* are only different modifications or combinations of it.

ACID, *aerial*, a name given by Mr. Bergman of Upsal to fixed air, because he found that this species of air had an *acid* quality, by its changing the blue juice of tournesole into red; and the fact was farther verified by Mr. Hey, and Mr. Bewley; the latter of whom has proved, by a series of experiments, that fixed air does not owe its acidity entirely to the nature of the substances from which it is extracted, as Sig. Landriani, and some foreign philosophers, imagine; but that it is an original *acid sui generis*, expelled from the substances with which it is combined by the force of fire, or by the power of a superior *acid*; but Dr. Priestley rather apprehends, that it is a modification of the nitrous *acid*. See AIR, *fixed*.

ACID *of Amber* is supposed by Dr. Monro to be an *acid sui generis*, and extracted from salt of *amber*. Phil. Transf. vol. lxvii. p. i. N° 40.

ACIDS, *animal*, are those which have been lately discovered in certain *animal* substances; as butter, fat, blood, ants, and flies.

M. Homberg first ascertained the existence of a latent *animal acid*, and he has proposed two ways of procuring it. One way is, by concentrating the phlegm which arises first in the common distillation of *animal* substances for their volatile salt and oil. The residuum of this phlegmatic liquor, when it has been redistilled with a gentle heat, till only a small portion is left, will yield an *acid*; which he has sometimes concentrated so far, that it seemed to be as strong as common vinegar.

The other method of collecting this *acid* is, by mixing earthy matters with the animal subject as fish, and urging the distillation after all the alkaline salt and oil have arisen. The *acid* is at length forced out by the great vehemence of fire. Whether this acid be any other than part of the *vegetable acid* derived from plants in the ordinary way of food and nutrition, or of the *acid* of the *marine* salt which *animal* substances possess, must be determined by future experiments and observations. But it is certain that they differ in the same circumstances as the *vegetable acid* do from *mineral acids*.

Dr. Lister has long since observed, that insects which are furnished with stings, as bees, wasps, and hornets, discharge, when irritated, an *acid* juice; but none yield it in a greater quantity as ants. Ants in their *chrysalis*, or nymph state, have no *acid*; but if a stick be thrust into an ant hill, they will discharge a fluid, which has an ant taste and smell; and which will make the blue flowers of succory, borrage, &c. red. And this *acid* obtained, either by distillation, or by throwing the living animals into water, till it is sufficiently impregnated with it, will, with lead, make a peculiar sort of *saccharum saturni*, which on distillation will give back the *acid* in its own form again. M. Margraaf has demonstrated, by some late experiments, that it bears no analogy either to the *marine* or *vitriolic acid*; because it does not precipitate silver, lead, or mercury, from the *nitrous acid*, nor quicksilime from the *marine*. He concludes upon the whole, that this *acid* much resembles that of vinegar, though in some respects it is different.

ACIDS, *Concrete*, are saline solid substances, which have the properties of *acids*; such are crystals of tartar, essential salts of vegetables, the volatile *acid* salt of amber, and of some other bituminous, and the flowers of benjamin.

ACID, *Fluor*, is a new *mineral acid*, so called from the name which the chemists have given to the substance from which it is extracted. This substance is of the same kind with the Derbyshire *spar*. The *acid* is expelled from it by oil of vitriol; and as it was discovered by Mr. Scheele a Swede, it is often distinguished by the name of the Swedish *acid*. Mr. Scheele supposed, that *acid* and water were the constituent parts of the fossil from which it was produced. Mr. Boulanger apprehends, that this new *acid* is only the *acid* of salt combined with an earthy substance. But Dr. Priestley, in the result of his experiments, has proved, that the *fluor acid* is the *acid* of vitriol, charged with so much phlogiston as is necessary to its taking the form of air, and also with much of the earthy matter of the spar. Experiments and Observations on different kinds of Air, vol. ii. p. 188.

ACIDS *Fluor* sometimes denote those *acids*, which are always in a fluid state; such are the volatile, vitriolic, nitrous, marine *acids*, and those which are obtained by distillation from vegetable and animal substances.

ACID, *Marine*, is one of the three *mineral acids*; so called, because it is generally obtained from sea salt; though it may be likewise extracted from fal gem, or fossile salts, and from the salt of saline fountains and pits. This *acid* is stronger than any of those of the *vegetable* and *animal* kingdom; but weaker than the *vitriolic* or the *nitrous*. It is never found pure, but always combined with an alkali, so as to form a neutral salt. As it is more volatile than the other *mineral acids*, it cannot be so easily combined with phlogiston, though many facts sufficiently ascertain the practicability of such a combination. This species of *acid* is supposed by the chemists to be an offspring of the *vitriolic acid*, and to consist of this *acid* combined with an inflammable and a mercurial principle. Becher ascribes its peculiar properties to a principle, which he calls mercurial earth; but Stahl rejects this part of his theory; and expresses a wish, that the existence of the mercurial earth could be as well ascertained as the existence of phlogiston.

The *marine acid* easily dissolves zinc, iron, and copper; it acts with great difficulty on tin, and scarcely acts at all in its liquid state on silver, mercury, lead, or regulus of antimony. It dissolves gold by the help of the *nitrous acid*; and by a modern discovery, gold and platina are rendered soluble in this menstruum, either by previous solution in aqua regia and precipitation from that menstruum, by means of an alkali, or by a previous calcination with tin and other imperfect metals.

Some of the most remarkable phenomena attending the combination of *marine acid* with metallic substances, are the following: it dissolves those substances with less heat and effervescence, and with fewer vapours than *nitrous acid* does. It forms with all the metals, which it dissolves, excepting iron and copper, salts capable of crystallization. The metals with which it contracts the strongest union, are those to which it unites with the greatest difficulty. *Marine acid* volatilizes either wholly or in part, the metals with which it is united; and forms with those metallic substances to which it most firmly adheres, such as mercury, regulus of antimony, silver, and lead, metallic salts, much more corrosive than those formed by the *vitriolic* or *nitrous acids*. Homberg indeed found, that *marine acid* of itself corrodes glass more than any other *acid*.

This *acid* can only be obtained by means of an intermediate substance sufficiently powerful to disengage it from the native fixed *alkali*, which is the basis of common salt. *Vitriolic acid* is the most proper for this purpose.

ACIDS, *Mineral*, are one of the general classes into which *acids* are distributed. They derive their name from the *mineral* substances from which they are procured; and they are subdivided into the *marine*, *nitrous*, and *vitriolic* ACIDS. With respect to their general characters, they are more simple, less volatile, more susceptible of concentration, and stronger than the *acids* obtained from *animals* or *vegetables*.

ACID, *Nitrous*, is the most simined, and the least frequent in the earth, of all the *mineral acids*. It is seldom met with in any combination, but in the neutral salt, from which

which it derives its name. The concentrated *aluminous acid* is weaker and much more volatile than the *vitriolic*. In this state it strongly attracts the moisture of the air, and when mixed with water, occasions a great heat and ebullition. M. Beaumé observes, that while they are mixing, the liquor assumes a blue or deep green colour, though the vapours at the same time retain their original yellowish red. It fulminates, when ignited, on the contact of any inflammable matter; and burns into flame, when mixed with distilled and expressed oils. It is of a yellowish red flame-colour, emits vapours of the same colour, and possesses a peculiar taste and smell. The *nitrous acid* contains phlogiston, and yet takes it with avidity from most other substances. By means of this property, the substances into which it enters, burn without the assistance of common air.

This *acid* is one of the most powerful menstruums in chemistry; not that it is stronger than either the *vitriolic* or *marine*, but on account of the facility, quickness, and activity, with which it dissolves most substances. It corrodes and dissolves all metallic bodies, except gold and platina; and Dr. Brandt has found, that by particular management it can dissolve gold. But its action is most vehement on those metals which contain most inflammable matter, as zinc and iron. This *acid* combined with fixed vegetable alkali forms nitre; with marine or fossil alkali, it forms a neutral salt, which shoots into cubical crystals, hence called *nitrum cubicum*; with volatile alkali, it produces the *nitrous sal ammoniacum*. *Nitrous acid* easily dissolves all calcareous and absorbent earths. It is easily combined with oils, and with *spirits of wine*.

This *acid*, which is sometimes called spirit of nitre, may be procured by mixing two parts of dry and powdered clay with one part of nitre, and distilling the composition in a reverberatory furnace, with a gradual heat. Clay is very proper for decomposing nitre, because it contains a *vitriolic acid*. Martial vitriol is used for producing smoaking spirit of nitre; and pure *vitriolic acid* is made use of in distilling Glauber's smoaking spirit of nitre.

ACID, *Phosphoric*. See PHOSPHORUS.

ACID *of Sugar*. See SUGAR.

ACID, *Vague*, a general term used by some chemists for the *vitriolic acid*.

This mixing with fossil oil, *petroleum*, *oleum terræ*, or the like, constitutes the various sorts of native fossil transparent sulphurs; uniting with iron-metals, it forms cumbar, antimony and other fossils, both solid and fluid; uniting with metals, it forms divers kinds of vitriols; with calcareous earths, different stones; and lastly with *spirituous* which is the matrix of vitriol, calcined in a wood fire, it produces common sulphur. See ACIDS.

ACIDS, *Vegetable*, are those which are procured from vegetable substances. Such as the juices of *sour fruits*, *sour wine*, or vinegar; crystals of tartar; all the essential *acid*, concrete salts, procured by crystallization from the expressed juices of plants; and lastly, all the *acids* obtained from *vegetable* substances in analysing them by distillation. They differ from *mineral acids* in being less simple, less fixed, less subservient of concentration, and weaker.

ACID, *Vitriolic*, in the third species of the *mineral acids*; and was formerly obtained from martial vitriol. This *acid* is copiously diffused through the earth, the waters of the ocean, and the atmosphere, and is supposed by some to be the basis of all the other *acids*. It abounds most in the mineral kingdom, combined with various other bodies. Its specific gravity, when it is highly concentrated, is more than double that of water. M. Hellot obtained some, concentrated to such a degree as to become solid and crystalline. This *acid* being likewise more fixed than water, admits a much greater degree of heat. It very freely imbibes moisture, and acquires hereby a very considerable increase of weight. It dissolves the *æther* of vegetable and calcareous earths; and when combined with the latter forms a matter called *selenites*, resembling salt in its appearance, but differing from it in taste and solubility. It may be likewise combined with alkalies, both vegetable, fixed, and fossile. This *acid* also acts upon all metallic substances by means of their phlogiston, and dissolves them with a moderate effervescence and heat; and by discharging part of the inflammable principle, coalesces them more or less, according to their nature, and the manner of making the solution. This *acid*, when strongly concentrated, will act powerfully on oils; and being distilled together with spirits of wine, yields *æther*. The *vitriolic acid* is more simple and powerful than the *nitrous* and *marine acids*, separates them from the alkalies to which they are united, and substitutes itself in their places. This *acid* may be procured by collecting the vapour of burning sulphur, confined by means of a glass bell, and received into the vapour of water.

ACIDS, *Volatile*, are those which are more *volatile* than other *acids*: such is the *volatile vitriolic*, or sulphureous *acid*, which is only the common *vitriolic* ACID combined with phlogiston. Those who are desirous of farther information concerning the subject of *acids* in general, and the several classes and species of them above enumerated, may consult Neumann's Works, translated by Dr. Lewis, and Macquer's Dictionary of Chemistry, Engl. Transl.

ACIDS, in the *Materia Medica*, denote such medicines as are possessed of an *acid* quality: as vinegar, spirit of vitriol, &c.

ACIDS and *alkalies* have been considered by some chemists as the two *arbitræ* of nature, the great instruments whereby all things were effected; and the causes not only of natural, but preternatural *diseases* and cures. This hypothesis we chiefly owe to Tachenius, a German chemist, and a follower of Helmont's system, who published two books to shew, that all natural things are composed of *alkali* and *acid*. The *acid*, which was generated in the air from the sun, and contained in it the hidden seeds of all things, associated the *alkali* to itself; and from hence, as a passive subject, arose the *ens*, or forms of things. He was followed by Swalve, and his doctrine has been since defended by others, but combated and refuted by Bohnius, Boyle, Bertrand, Pitcairn, Hoffman, &c.

Some have pretended to correct and improve this hypothesis of *acid* and *alkali*, by making *acid* and *oleid* the causes of all diseases, and fluid *alkali* the instrument of all cures. Act. Erud. Lipf. an. 1689.

In reality, though the terms *acid* and *alkali* be new, notions much resembling those already recited may be met with in ancient writers, who frequently ascribe the origin of many diseases to unnatural sour and corrosive juices in the body.

ACIDS, Mr. Boyle observes, not only disturb the body while they continue *acid*, but in many cases create distempers, wherein they shall seem the remedies.

Helmont asserts, that no *acid* can be lodged naturally in any part of the body, except the stomach; that if it extend farther, it becomes unnatural, infects the sweet and balsamic juices, and proves the cause of most diseases.

To correct the redundancy of *acids* in the stomach, all *alkalines*, or urinary salts, both fixed, as of wormwood, tostany, cardous; and volatile, as spirit of sal ammoniac, spirit and salt of hartshorn, scurvy-grass, &c. are recommended. Under corrections also come all fixed, earthy, or metallic concretes, which absorb the *acid*, as iron, saccharum saturni, antimony, and all oils and fat things, which obtund and incrassate the parts of *acids*, as spirits of wine, oil of cloves, &c.

The medicinal qualities of *acids* are much disputed by many physicians. Some alledge that they are hurtful in coughs, and most of them, the juice of lemons excepted, in diseases of the breast. A large dose of such as are very concentrated, taken internally, would prove a very corrosive poison. However, *acids*, properly administered, are excellent cooling and aperitive medicines, fit to quench thirst, and to lessen the acrimony of the bile; these being powerful *antiseptics*, are esteemed good in all putrid and malignant diseases; nor are they less efficacious in inflammatory and feverish cases. However, great care ought to be taken not to administer them in too large quantities as to corrode the bowels, or to coagulate the blood. *Acids* are also commended in the plague, and as *styptics*. Thus vinegar not only serves to stop hæmorrhages, but being sprinkled upon a red-hot tile or iron, corrects the putrefaction of the air.

ACIDITY, ACIDITAS, the quality which constitutes or denominates a body *acid*; or that sensation of sharpness and sourness which one experiences upon the taste.

ACIDULÆ, in *Natural History*, a species of mineral waters, distinguished by a latent acidity in their nature. When they are accompanied with heat, they are called *acidulæ*; but if heat be added to their brisk spirit, they are denominated *thermæ*.

Acidulæ are native waters, impregnated with particles of some acid mineral, as vitriol, alum, nitre, or salt; and as Dr. Seip of Pyrmont first discovered, in 1736, and Dr. Brownrigg of Whitehaven farther evinced, with a considerable quantity of fixed air, formerly known by the name of their *spirits*, or *menstrua*, to which they owe their brisk sparkling quality. Phil. Trans. Abr. [illegible] p. 659. and Phil. Trans. vol. lx. p. 2[illegible] For Dr. Priestley's method of making artificial [illegible] kind, see the article PYRMONT.

The physicians also frequently include chalybeate, aluminous, or ferruginous, waters, under the [illegible] Their virtues depend, in general, on the [illegible] ingredients in their composition. A general [illegible] mineral waters may be made either by [illegible] which will discover both the quantity of solid matter contained in the water, and by subsequent trials, the particular nature of it; or by distillation, whence it may be known, whether the water contains any volatile matter, saline or bituminous; or again, by the mixture of certain liquors.

liquors. The most common for this purpose, are the infusion of galls, syrup of violets, *el. tart. per deliq. tinct. argenti. sal alk. vol. tinct. sulph. vol. spir.* and *aqua fortis*. But for a minute and more accurate investigation, the materials are more numerous, and the *apparatus* more considerable. The *operator* should be provided with scales and weights, an hydrostatic balance, different sorts of glasses and cements, a thermometer, a hand-pump, microscopes, crucibles, &c.

A small quantity of the infusion of *galls* will discovers whether the water be impregnated with iron. If it contains a coarse ochre, the colour struck by the *galls* is very dark; the finer iron produces an inky purple; but the finest, such as the Pyrmont water contains, gives an azure blue. A dram of *syrup of violets*, mixed with a small wine-glass of the mineral water, will produce a green colour, if there be any alkaline salt, or alum, in it; though Dr. Rutty says, that if the spirit be new, alum will turn it red. This green colour is also observed, when a solution of iron is met with; with an acid, the syrup produces a red.

Ol. tart. per deliq. dropped into a small quantity of the water to be examined, discovers earthy matter, by precipitating it in the form of a white cloud: if a whitish cloud rises to the top, and the water be clear underneath, the quantity of earthy matter is very little. This oil precipitates the contents of all hard waters. If it meets with a solution of mercurial particles, it discovers them by producing a yellow colour: and it ferments with acids.

Tinct. argenti, if made with pure *aqua fortis*, is the most delicate addition for discovering sea salt in water, which it joins with, and falls in a milky cloud.

Sal alk. vol. precipitates the contents of hard water, and discovers mercury, or any of its preparations, by turning the liquor whitish, and coagulating part of it. It discovers copper, by producing a blue colour.

Tinct. sulph. vol. discovers lead in water, by turning it into a dusky brown colour. Any readily determines whether the water be hard or soft, by dissolving in it, if hard, the *soap* curdles, but if soft, forms with it an homogeneous mixture, and with a little agitation a froth is raised. *Aqua fortis* turns the water into a green colour, if it contains a solution of copper. After all, Dr. Lewis observes, that he can recollect but two instances, in which simple mixture affords any degree of certainty; blue colour from copper and volatile alkali, and the bluish or purple from iron, and some astringents. See Hoffman de Acidulis, &c. Shaw's Improvements on Mineral Waters, in his Chemical Works, and Neumann's Works, with Dr. Lewis's Additions, p. 252.

ACIDULATED, any thing wherein acid juices have been put, in order to give it a coolness, and brisknefs.

ACIDULOUS denotes a thing that is slightly *acid*; it is synonymous with the word *sub-acid*.

ACIDUM, *æthereum, aluminosum, catholicum, primigenium, sulphureum*, are all different names for SPIRIT of *vitriol*.

ACIDUM *Pingue*, a name first given by M. Meyer, and afterwards adopted by M. Crans, and some other German chemists, to a certain caustic *acid*, which magnesia, limestone, or any calcareous earth, meets with in the fire, and attracts, losing at the same time a considerable portion of water: and by means of which it is *neutralized*, rendered *inactive* and unctuous balsamics, and deprived of the property of effervescing with acids. M. Meyer supposes, that this substance nearly approaches to that of fire and of light; that by the aid of this *acid* lime unites with oil, dissolves sulphur, &c. that it enters very abundantly into the composition of vegetables and animals; that it is this which escapes from charcoal when burning, which increases the weight of metallic *calces*, and in general answers the various purposes in nature, which the English philosophers, Hales, Black, Macbride, Priestley, and others, have ascribed to fixed air. See AIR, *fixed*.

This new doctrine was attacked, and the English system defended, in the year 1769, by M. Jacquin, a professor at Vienna; but before this period it had made a very rapid progress in Germany: it was adopted by many chemists of reputation, and taught publicly in their schools. In 1770, M. Crans, physician to the king of Prussia, published a reply to M. Jacquin's, in which he discovers a very serious attachment to the *acidum pingue* of M. Meyer. See Lavoisier's Essays Physical and Chemical, vol. i.

ACIDUM *Pingue* system. See AETHER, and SPIRIT *Motherof Turpentine*.

ACINACES, in *Antiquity*, a kind of cutlass or scimitar, in use among the Persians.

ACINARIA, in *Botany*, a name given by some to the marsh cranberries, or *vaccinia palustria*.

ACINI, in *Botany*, small grains, or berries, growing in bunches. After the manner of grapes; also the stones or seeds of grapes. The berries of the *elder, privet, ivy*, &c. are called this kind, and so called.

Anatomists have called some glands, of a similar formation, *acini glandulosi*.—See *Tab. Anat. (Sabloch.) fig. 4. lit. bb.*

ACINIFORMIS *Tunica*, the same with the TUNICA UVEA of the eye. It is also called *acinosa tunica*.

ACINODENDRON, in *Botany*, the name given by Burman, in his Thesaurus, to a genus of plants, afterwards called MELASTOMA, belonging, in the Linnean system, to the genus *thymus*, and to the class and order *didynamia gymnospermia*.

ACINOS, stone, or wild BASIL.

ACINUS properly signifies the grape. See ACINI. It is also the name of the STAPHYLOMA.

ACIPENSER, in *Ichthyology*. See ACCIPENSER.

ACITLI, in *Ornithology*, the common Mexican name for the great crested diver, common to Europe and America, and most usually called by authors, the LEBUS *cristatus*, water-hare. Ray.

ACKNOWLEDGMENT. *Money*, a sum, paid in some parts of England, by tenants, on the death of their landlords, as an *acknowledgment* of their new lords.

ACLIDES, in the Roman *Military art*, a kind of missive weapon, having a thong fixed to it, by which, after casting it out of the hand, it might be drawn back again. Servius describes the *aclides* as full of spicula, or cramponets. It was full of barbs, and so would do mischief both where it struck and in the withdrawing. Each warrior seems to have been furnished with two. Vell. Exam. Aquin. Lex. Mil. tom. 1. p. 14. Pitis. Lex. Ant. tom. I. p. 17.

ACLOWA, in *Botany*, the name of a plant common in Guinea, and used by the natives to cure the itch. They rub it on the body, as we do our unguents. Pyrard accounts it a kind of *solanum*, and has named it the *Guinea superficie solatro* with leaves like the gum-tragacanth shrub. Phil. *Trans.* N° 232.

ACME, the height or top of any thing.

The word is Greek, signifies point, and is more especially used to denote the *height* or utmost vehemence, of a distemper.

Accordingly some *inflamma-writers* divide *difeases* into four dates or periods.

1. *Acme*, the beginning, or first attack.—2. *Anabasis*, the growth.—3. *Acme*, the height.—And, 4. *Paracme*, which is the declension of the distemper.

ACMELLA, in *Botany*, a plant which grows in the island of Ceylon, of which there are three species noted by botanists. It is commended in nephritic disorders, but very rarely used. It is also called ACMELLA.

ACNE is a name given to a small pimple, or hard tubercle, on the face.

ACNIDA, in *Botany*, a genus of the *dioecia pentandria* class, in the Linnean system. Its characters are, that it has male and female flowers; the calyx of the former is five-leaved, that of the latter compofed of two leaves; neither have any corolla; the styles are five, and the seed is single, covered by a membranous calyx. There is one species.

ACO, a name given to a fish found in the Mediterranean, called also ACQUA, SARACHUS, and SARACHINUS.

ACOEMETÆ, or ACOEMETI, formed of the privative *a*, and *κοιμαω*, *to sleep*, or *sleep to no*, a name given to certain monks in the ancient church, who flourished, particularly, in the East, and who were thus called because they had divine service performed, without interruption, in their churches.

These monks divided themselves into three bodies, each of which exchanged in their turns, and relieved the others: so that their churches were never silent, night nor day. The STUDITES were also sometimes called *acoemetæ*.

There is a kind of *acoemeta* still subsisting in the Romish church: the religions of the Holy Sacrament coming properly enough under that denomination; because they keep up a perpetual adoration; some or other of them praying before the sacrament, day and night.

ACOLCHICHI, in *Ornithology*, the Mexican name for a bird, described by Nieremberg under the name of the PYRROPHTHALMUS *Indianus*.

ACOLIN, in *Ornithology*, the name of a bird of the partridge kind, common in the Spanish West Indies. It is no larger than a starling; its legs and feet are of a pale greenish colour, and its toes very long. Its beak is yellow, and somewhat long; its head finely tufted; and its breast and belly are white; its sides are spotted with brown; and its back and tail of a dusky yellowish brown; its tail is very short, and both that and the back have some black spots, and some narrow streaks of white. It frequents the sides of lakes, and is supposed to feed on fish, worms, and other insects, which are found about watery places. It is a tolerably well tasted bird.

ACOLUTHI, or ACOLYTHI, compounded of the privative *a*, and *κελευθος, via, way*; as still persisting in their way, or course, in *Antiquity*, a term applied to such persons as were steady and immoveable in their resolutions.

For this reason, the Stoics were called *acolutes*, because nothing could shake or alter their resolves.

Among the *Ecclesiastical Writers*, the term *acolythus*, or *acolythist*, is peculiarly applied to those young people, who, in the primitive times, assisted to the ministry; and, for that purpose, continually attended the bishops: which assiduity occasioned their being distinguished by this appellation.

In the Romish church, *acolythi* were of longer continuance; but their functions were different from those of their first institution. They were such as had only received the first of the four lesser orders, whose business was to light the tapers, carry the candlesticks, the incense-pot, and prepare the wine and water.

At Rome there were three kinds of *acolythi*; viz. *palatini*, who waited on the pope; *stationarii*, who served in churches; and *regionarii*, who, together with the deacons, officiated in other parts of the city.

ACOLUTHI, or *acolythi*, was also a title in the Grecian empire given to the captain or commander of the VARANGI, a body of guards appointed for the security of the emperor's palace.

ACOLYTHIA, in the Greek Church, denotes the office, or order of divine service.

The same name is also given to the prayers, ceremonies, hymns, and the like, whereof the Greek service is composed.

ACON, an instrument used in the ancient exercises, like the *missus*.

ACON gave name to an ancient order of knighthood, who were afterwards united to the knights *Hospitallers*.

ACONCORNA, in *Botany*, a name given by the natives of Guinea to a plant, growing wild with them, and in great esteem for its virtues in the small pox. They give an infusion of it in wine. The leaves of this plant are opake, and as thick as those of the phillerea; they grow in pairs, and stand on short footstalks; they are small at each end, and broad in the middle; and the largest of them are about three inches in length, and an inch and quarter in breadth in the middle. They somewhat resemble those of our bay. They are of a dusky colour on the upper side, and of a pale green underneath.

ACONE, in the *Natural History* of the ancients, the name of a stone used as a whetstone, and for several other purposes; but more usually known among the Romans by the name CUPREUM. It signifies also a mortar for the purpose of levigation.

ACONITE, MONKSHOOD, in *Botany*, a plant famous among the ancients, both in quality of a poison, and a remedy. *Aconitum* is said, by some, to take its name from Aconæ, a city in Bithynia, where it grew in great abundance: though it is also found in other places, particularly the mountains about Trent, &c.

The flower is of the polypetalous anomalous kind, consisting of five irregular leaves, and somewhat resembling a man's head, with a hood or helmet on it. The upper petal seems to perform the office of a hood or helmet; the two lower leaves represent that part of the helmet which receives the lower jaw, and the two wings seem adapted to the upper part of the face, or the temples. From the centre of the flower there arise two pistils, shaped like feet, and reclined into the hollow of the upper petal or hood, as is also the pistil, which finally becomes a fruit, composed of several membranaceous vagine collected into the head, and usually containing angular and wrinkled seeds.

The antient botanists give the name *aconite* to several plants, of different kinds.—One species they call *lycoctonum*, *venefica*, *wolf's-bane*, or *wolfsbane*, *aconitum*, *aconitum*, *dog's-bane*, from its effects: of these they had likewise three divisions; as the *napellus*, thus called a *napo*, because its root resembled the turnep-kind: another called *anthora*, q. d. *anti-thora*, good against disorders caused by the *thora*, another kind of *aconite*.

Dioscorides only makes two kinds of *aconite*; the first the same with the *thelyphonum*, the second the proper *aconite*. In Matthiolus's time appears to have been but one species of *aconite*, which resembled the *thelyphonum* in its virtue and effects, but differed from it in leaf, colour, soil, root, &c. Mr. Tournefort, however, enumerates twenty-one species of *aconite*.

The stalk of *aconite* is held extremely caustic and acrimonious, in virtue whereof they produce mortal convulsions, or inflammations, which end in mortifications. The ancients were so much afraid of these effects, that they were afraid to touch the plants; and hence a thousand superstitious precautions, about the manner of gathering them.—That some are, however, held of service in malignant fevers, by some; and, accordingly, make an ingredient in some orvietans, and other alexipharmic compositions.

The ancients used this plant against the sting of the scorpion, which is said to be deadened by the touch of the *aconite*, and restored to its vigour by that of hellebore.—Theophrastus relates, that there was a way of preparing it, in those days, so as it should only destroy at the end of one or two years.—Arrows dipt in its juice are said to prove mortal, wherever they wound.—The Indians used *aconite*, corrected in cows urine, with good success against fevers.

Some compare the poison of the *aconite* to that of the RAPELLUS. Others term to make it of the same kind with that of the SALAMANDER. Dr. Mead will have it to agree with the CICUTA. It is the root alone that is harmful; for its leaves and fruit are said to be innocent.

The English call this plant WOLF'S*bane*, from the Anglo-Saxon *wulfs-bane*.

ACONITI, *arenæ*, is an appellation given to some of the ancient ATHLETÆ, but differently interpreted. Mercurialis understands it of those who only anointed their bodies with oil, but did not smear themselves over with dust, as was the usual practice. Mr. Burette will have it to signify those who conquered easily without dust, q. d. *arenæ*, *nunquam*, *sine little trouble*.

ACONTON signifies not plaistered, and is a name given to vessels not lined within.

ACONTIAS, a name used by some authors for a sort of COMET, or METEOR, whose head appears round, or oblong, and its tail very long, and slender, resembling a javelin.

It takes its denomination from a serpent thus called, frequent in Calabria and Sicily; where it is also named *jaculator* from *jaculor*, *to dart*, *or throw*, by reason of its flying at passengers like an arrow; in order to which, it winds itself up a tree, to spring thence with the greater violence. For the like reason the Greeks call it *acontias*, of *ακοντιον*, *a dart or arrow*.

It differs from the XEPHIAS, in that it is longer, and more like a dart; and the other is thicker and broader in the middle.

ACONTIAS, in *Zoology*, the name of a species of serpent, called also JACULUM, or the dart-snake, from its manner of vibrating its body in the manner of a dart. Bellonius found one of these in the island of Rhodes, which he describes in this manner: it is about three handbreadth long, and of the thickness of one's little finger. Its colour is a milky grey on the back, variegated with small black spots, like to many eyes; and on the belly it is perfectly white. The neck is wholly black, and from that two milk-white fillets run all the way along the back to the tail: the black spots also are each surrounded with a small circle of white. It is found in Egypt and Lybia, and in the islands of the Mediterranean. It is also called *vipsheras* and *cenchrites*. Ray.

ACONTIUM, in *Ancient Writers*, a kind of Grecian dart, or javelin, somewhat resembling the Roman PILUM.

ACOPA, in *Botany*, a name given by Dioscorides, and some other authors, to the TRIFOLIUM *palustre*, or buck-bean.

ACOPA, in *Medicine*, is also used to denote remedies against the ill consequences proceeding from lassitude, occasioned by too violent labour, exercise, or the like; such as tensions, pains in the bones, &c. These are also proper on many other occasions, some being of a warm, others of a mollifying nature. The name is also applied to the soft strains made use of for tumours, &c.

The word is derived from α privative, and κοπος, *weariness*.

ACOPUS, or ACOPUM, *see* ACOPA.

ACOPOS, a plant mentioned by Pliny, said to be the same with the ANAGYRIS of Dioscorides, which Gerard says is the bean-trefoil; it signifies also LABURNUM.

ACOR signifies *sourness* or *acrimony*.

ACORDINA among Indian tumps.

ACORI, or CALAMUS ODORATUS, in *Natural History*. The true *acori* is very scarce; some, however, is found on the coasts of Africa, particularly from Rio del Re to the river of the Cameroons. This cocoa is part of the merchandize which the Dutch trade for with the Cameroones: that of the kingdom of Benin is also very much esteemed. It grows in form of a tree on a rocky [illegible] also a name for the greater GALANGAL [illegible]

ACORN, in *Natural History* and *Agriculture*, [illegible] fruit or mast of the oak kind.

The *acorn*, according to Dr. Grew, is the [illegible] with this only difference, that besides the [illegible] it has only a leathern or parchment cover, [illegible] shell. And hence it is, that whereas the kernel [illegible] is sweet, that of an *acorn* is of a very rough [illegible] austere parts of the tap, which is not [illegible] off into the shell, being here moulded by the kernel [illegible]

Writers on husbandry give rules concerning seminaries or nurseries of *acorns*, the propagating, sowing, or planting of *acorns*.

For timber, those *acorns* are to be chosen as feed, which are most solid and heavy, not those which are biggest. See SEEDS.

In the Phil. Trans. vol. lviii. N° 11. an. 1768. p. 75. there is a curious and important memoir by John Ellis, esq. containing a method of preserving *acorns* in bee's wax for a whole year, in a state fit for vegetation, whereby other seeds may be preserved in like manner; and such as are valuable may be brought over from the East Indies, to plant for the benefit of the American colonies.

Acorns were the food of the first ages; but when corn was found out, *acorns* were neglected. They are of little use in our days, but to fatten hogs, and other cattle, and poultry. Yet among the Spaniards the *acorn*, *glans Iberica*, is said to have long remained a delicacy, and to have been served up in the nature of a dessert.

In dearths *acorns* have been sometimes dried, ground into meal, and baked into bread.

The inhabitants of Chio held out a long siege, without other food. But they are said to breed head-achs and ventosities, and to be hard of digestion. A decoction of *acorns* is reputed good against dysenteries and colics. A pessary of them is said to be good in immoderate fluxes of the menses.

ACORN, in *Sea-Language*, denotes a little ornamental piece of wood in the shape of a cone, fixed on the top of the spindle on the mast head, above the vane, to keep it from coming off the spindle in a whirlwind, or when the ship leans much upon one side under sail.

ACORUS, a medicinal plant, of the flag kind; frequently confounded by the ancients, and also by the modern speculatists, with the CALAMUS *aromaticus*. It pertains to the class of *hexandria monogynia*, in the Linnæan system. They are distinguished by this, that from the middle of some of the leaves of the latter, there arises a long ish cluster of an infinity of little flowers, the thickness of the little finger, and resembling *mouse-tail*, or long pepper. —The other is the common flag-flower.

It is only the root of the ACORUS that is used in physic; and it is this we usually call *acorus*.—The *calamus aromaticus* is brought from Lithuania and Tartary; it is knotty, reddish without, and white within; as thick as the little finger, and half a foot long.

It is spicy and bitterish; and used in cephalic and stomachic compositions.—It is also an ingredient in the THERIACA *Andromachi*. Its principal use is in obstructions of the menses, spleen, and liver; in the colic, &c.

Some rank *galangals* are a species of *acorus*.

ACORUS *adulterinus*, or *vulgaris*, in the *Materia Medica*, the name of the root of the IRIS *lutea palustris*, or common yellow *water-flag-flower*.

ACOS, in *Medicine*, signifies a remedy.

ACOUSMATICS, from ἀκουω, *to hear*, an appellation given to such among the disciples of Pythagoras, as were still under five years probation.

The *acousmatics* are sometimes also called by Latin writers, *acustici*. The *acusmatici* stood opposed to the *mathematici*, who were those initiated into the secrets of science; and the *acousmatic* philosophy, to the *mathematic*.

Some have denied the appellation of Pythagoreans to be due to the *acousmatics*, because many of these had their learning not immediately from Pythagoras, but from Hippasus, who, according to some, was of Crotona, but according to others, of Metapontum.

ACOUSTICS, ACOUSTICA, the doctrine, or theory of hearing, or of sounds.

The word is formed of the Greek ακουω, *audio*, *to hear*. *Arnobius* is the same with what we otherwise call PHONICS.

ACOUSTICS, ACOUSTICA, or ACOUSTIC *Medicines*, are remedies against the imperfections and disorders of the EAR; or of the sense of HEARING.

ACOUSTIC is particularly applied to *instruments* used by those who are of dull hearing, to supply that defect.

Dr Hooke says, it is by no means impossible to hear the lowest whisper that can be made, to the distance of a furlong; and that he knows a way of hearing any person speak through a thousand three feet thick.

ACOUSTIC *Nerve*. See ADDITORY *Nerve*.

ACOUSTIC *Vessels*. In the ancient theatres there were a kind of earthen vessels, made of brass, shaped, as some have said, in the bell-fashion, which being of all tones within the pitch of the voice, or even of instruments, rendered the sounds more audible, so that the actors could be heard through all parts of the theatres, which were even 400 feet in diameter. Vitruvius.

ACOUSTIC *Duct*, is applied to the external passage of the ear; called also MEATUS *auditorius*.

ACQUEST, or ACQUIST, is understood in a legal sense, of goods, or effects, not descended or held by inheritance; but acquired either by purchase, or donation.

The word is formed of the verb *acquirir*, from *acquirere*, *to acquire*, or *get*.

The French laws make a great difference between *acquests* and hereditary effects. The civil law allows none. See HEIR.

ACQUEST is also popularly used for conquest, or a place acquired by the sword.

ACQUIETANDIS *Pignis*, a writ of justices lying for a surety against the creditor that refuses to acquit him after the debt is paid.

ACQUIETARE, in ancient *Law-Books*, signifies to discharge, or pay the debts of a person deceased; as the heir those of his father, &c.

ACQUISITION, the act of procuring a right or title to the enjoyment, or property of a thing.

ACQUISITION is also sometimes used for an ACQUEST.

ACQUITTAL, a discharge, deliverance, or setting free of a person from the guilt or suspicion of an offence.

Acquittal is of two kinds: in *law*, and in *fact*.—When two are appealed and indicted of felony, one as principal, the other as accessary; the principal being discharged, the accessary is, by consequence, also freed: in which case, as the accessary is *acquitted by law*, so is the principal in *fact*.

ACQUITTAL is also used, where there is a lord MESNE, and tenant, and the tenant holds land of the mesne, and the mesne holds over the lord paramount: here, the mesne ought to acquit the tenant of all services claimed by any other for the same lands; the tenant being to do service to the mesne only, and not to divers lords for one parcel of land.

ACQUITTANCE, or QUITTANCE, a release, or discharge in writing, of a sum of money, or other duty, which ought to be paid, or done.

The verb *acquit*, the participle *acquitted*, and the noun *acquittal*, do all figurly a discharge from an offence objected.—In which sense we meet with *acquitted* by proclamation.

ACRASIA, *acrasia*, is used by some writers in physic, for the excess or predominancy of one quality above another; either in a mixture, or in the constitution of a human body. The word is used by Hippocrates, and other Greek *medicinal* writers, to express excess of any kind, intemperance and imbecility.

ACRAL, an Arabic word, signifying either SATURNALIA or FUROR *uterinus*.

ACRAS, or rather *Achras*, the wild *pear*. See SAPOTA.

ACRATISMA, in *Antiquity*, a breakfast among the old Greeks, consisting of a morsel of bread soaked in pure unmixed wine.

ACRATOMEL. See MELIKRUM.

ACRATOS, from α negative, and κερανυμι, *I mix*, *simple*, unmixed. This is very often used by Hippocrates, and applied to excretions of different sorts, and is always of very bad portage. Thus, in the consumption, he observes, that in all painful disorders of the pleura and lungs, the spittle should appear mixed and yellow; and that it is a dangerous symptom if it be all yellow, without any mixture. And immediately after he tells us, that if the spittle be so unmixed, as to appear black, it is a very bad presage.

ACRE is used in the dominions of the Mogul, in regard to his revenues, for the sum of 100,000 rupees: eight rupees being equal to about one pound sterling.

ACRE, a quantity of land, containing four square ROODS, or 160 square POLES, or PERCHES.

The word perhaps is formed from the Saxon *aecer*, or German *acker*, *field*, of the Latin *ager*. Salmasius derives it from *acra*, used for *acaina*, a land measure among the ancients, containing 10 feet.

By the custom of countries the perch differs in quantity, and of consequence, the acres of land: it is commonly but 16½ feet; but in Staffordshire it is 24 feet. According to the stat. 34 Hen. VIII. concerning the sowing of flax, it is declared, that 160 perches make an *acre*; and the ordinance of *measuring lands*, 35 Edw. I. agrees with this account. The word *acre* formerly meant any open ground or field; as Cattle-*acre*, Weal-*acre*, &c. and not a determined quantity of land.

Also *acre*, or *acre-fight*, is an old sort of duel, fought by single combatants, English and Scotch, between the frontiers of their kingdoms, with sword and lance; and this duelling was also called camp-fight, and the combatants, champions, from the open field, that was the stage of trial.

Acre also by computation is 10 square chains, of 22 yards each, that is, 4840 square yards. And a mile being 1760 yards square, a mile square will be found to contain 640 *acres*.

The Scotch *acre* contains four Scotch roods, and bears proportion

proportion to that of the English by statute, as 100,000 to 78,694, regard being had to the difference between the Scotch and English foot.

The French *acre, arpent*, contains 13 English *acres*, or 342350 square English feet, wherein the English *acre* contains only 43,560.—The Strasburg *acre* is about half an English *acre*.—The Welch *acre* contains commonly two English ones.—The Irish *acre* is equal to one *acre*, two roods, nineteen perches and $\frac{1}{10}$, English.

Houghton gives a table of the number of *acres* to a house in each county of South Britain, which is found to vary in the English counties, from 31 *acres*, the proportion in Middlesex, and 17$\frac{1}{2}$ in Surry, to 40 *acres* in Southampton. In the Welch counties, from 51 *acres*, as it is found in Flintshire, to 193, as in Merionethshire. Houghton.

Dr. Grew attempts to ascertain the number of *acres* in England, which, according to him, amounts to 46 millions and 80,000. Phil. Trans. N° 332, p. 266, seq. or Abr. vol. iv. p. 430.

Sir William Petty reckons but 28 millions; others 29 millions. And by an account of the number of *acres* in each county, supposed to be taken from some old register, the number of *acres* in England amounted only to 30$\frac{1}{2}$ millions. But Dr. Grew shews, that this is too little. The United Provinces are said to contain 4,382,000 *acres*: the province of Holland but one million of *acres*; and was thought formerly to contain 2,400,000 souls. But by the more accurate computations of Mr. Kersseboom, that province does not contain one million of souls. If England were as well peopled in proportion, it would contain 46 millions of inhabitants; that is, perhaps, about seven or eight times as many as it now contains.

By a Statute of 31 Eliz. it is ordained, that if any man erect a new cottage, he shall add four *acres* of land to it. See POLITICAL *Arithmetic* and SURVEYING.

ACRE-*Tax*, a tax laid upon land at so much per *acre*.—In some places this is called *acre-rent*.

Impositions on lands in the Great Level are to be raised by a proportionable *acre-tax*, 20 Car. II. cap. 8.—An *acre-tax* of 3*s.* 6*d.* *per acre*, for draining Hatfield-level. 13 Geo. I. cap. 18.

ACREMP, a term sometimes used in ancient law-books, for ten acres.

ACRIBEIA, a term purely Greek, ἀκρίβεια, literally denoting an exquisite or delicate accuracy; it is sometimes used in our language for want of a word of equal significancy.

ACRID, in *Natural History*, denotes any thing sharp or pungent to the taste.

Ancient *Naturalists* distinguish two kinds of *acrid* tastes: the first proceeding from hot and dry, as that of pepper; the second from hot and moist, as that of garlic.

Acrid, according to Grew, properly belongs to the class of compound tastes. It is not simply sour or pungent; there being bodies not *acrid*, which yet are pungent, e. g. *acuta*; nor is it simply hot, for there are many hot bodies which are not *acrid*, as the roots of celandy, yarrow, and contrayerva.—The characteristic, therefore, of *acrids* consists in pungency joined with heat.

Acrid bodies, by the pungency and tenuity of their parts, incide, digest, heat, open, attenuate, purge, excite appetite, &c. They intimate the skin, when chewed produce saliva, and when inhaled sneezing.

The eating of *acrid* food with their nutritious, is particularly used by the Greeks *Atrophagi*.

Acrid things are hurtful to the head and eyes, and contrary to bilious temperaments; but advantageous to pituitous ones.

Acrids may be divided into classes, according as they yield their acrimony. 1. By distillation. 2. By infusion. 3. Neither by infusion nor distillation.

In leucophlegmatic habits they are powerful expectorants, deobstruents, diuretics, and emmenagogues. Their virtue frequently depends on the trouble which they give to the stomach.

ACRIDOPHAGI, in the ancient *Geography*, a nation, or people, said to have fed on locusts.

The word is compounded of ἀκρὶς, *locust*, and φαγεῖν, *to eat*. The *Acridophagi* are represented as a people of Ethiopia, inhabiting near the deserts. In the spring they made provision of a large kind of locusts, which they salted, and kept for their ordinary food all the year; they lived to forty years of age, then died, as it said, of a sort of winged worms generated in their bodies. See S. Jerom against Jovinian, lib. ii. and on St. John, cap. 4. Isidor. Hisp. lib. xiv. cap. 4. and 29. and Strabo, lib. xvi.—Pliny also speaks of *Acridophagi* in Parthia: and S. Jerom. in Libya.

Though the circumstances of these people be fabulous, yet may the *Acridophagi* be true; and to this day they are said to eat locusts in some parts of the East. This is confirmed by the accounts of the Danish mission, in Niebuhr's Description de l'Arabie, p. 156, &c. seq. And hence St. John the Baptist is said to have lived on locusts, and wild honey, Matth. chap. iii. ver. 4.

Yet is the rendering ἀκρὶς, by locusts, as the English translators have done, much controverted.—Isidor. Pelusiota, in his 123d epistle, speaking of this food of St. John, says, it was not animals, but the tops of herbs; and even charges those who understood the word otherwise with ignorance; but St. Augustine, Beda, Ludolphus, and others, are of a different opinion. Accordingly the Jesuits of Antwerp reject, with contempt the opinion of the Ebionites, who for ἀκρὶς put ἐγκρὶς, a delicious slice, prepared of honey and oil; that of some other innovators, who read ἀκρὰς, or ἀκρὰδας, *fig-trees*; and that of Beza, who reads ἀκρὶδας, *wild pears*.

ACRIFOLIUM signifies any prickly-leaved plant.

ACRIMONY, that quality in things which renders them ACRID to the taste.

Acrimony imports much the same with *asperity*, or sharpness; and expresses a quality in bodies, by which they corrode, destroy, or dissolve mixts.

Salts are only caustic in virtue of their *acrimony*. The *acrimony* of the bile is supposed the cause of divers disorders; and a catarrh is believed to be a defluxion of *acrimonious* humour.

The British water is recommended by Dr. Randolph for tempering the bad effects of *acrimonious* blood. This he mentions as its first and principal virtue. See his Enquiry into the Medicinal Virtues of Bristol Water, 8vo. 1750.

ACRIS signifies a locust, the top of a mountain, and the extremities of fractured bones.

ACRIVIOLA, see NASTURTIUM *Indicum*, for which it is a name.

ACROAMATIC, in a more general sense, denotes a thing sublime, profound, or abstruse. In which sense it stands opposed to *exoteric*.

We by *exoteric* philosophy, *acroamatic* theology, an *acroamatic* method, *acroamatic* interpretation, &c.

There are few sects, or professions, that have not two ways of teaching, if not two sorts of doctrine, an *acroamatic* for adepts and proficients; and an *exoteric* for novices. We find traces of this among the heathen as well as Christian divines, philosophers, and chemists. Hence the ceremonies of initiations, and arbitrations, the discipline of secrecy; and hence also the origin of fables, enigmas, parables, symbols, &c.

ACROAMATIC is sometimes also used in a more general sense for any thing kept secret, or remote from popular use. In which sense Reimman gives the title *Bibliotheca Acroamatica*, to a description of the MSS. of the library of Vienna; abridged from the full commentaries of Lambecius and Nesselius.

ACROAMATICI, a denomination given the disciples, or followers of Aristotle, &c. who were admitted into the secrets of the inner or *acroamatic* philosophy.

ACROATICS, a name given to Aristotle's lectures in the more difficult and nice parts of philosophy; to which none but his disciples and intimate friends were admitted, whereas the *exoterics* were public or open to all: but there are other differences. The *acroatics* were set apart for the higher and more abstruse subjects; the *exoteric* were employed in rhetorical and civil speculations. Again, the *acroatics* were more subtile and exact, evidence and demonstration being here aimed at; the *exoterics* chiefly aimed at the probable and plausible. The former were the subject of the morning exercises in the lyceum, the latter of the evening: and that the former were prohibited, whereas the *acroatics* were kept secret, being either entirely concealed, or if they were published, it was in such obscure terms, that few but his own disciples would be the wiser for them. Hence, when Alexander complained of his preceptor for publishing his *acroatics*, and thus revealing what should have been reserved to his disciples; Aristotle answered, that they were made public and not public, for that none who had not heard them explained by the author, true sure, would understand them. Gell. lib. ii. cap. 25. Plut. in Alex. Stobæe's Hist. Phil.

The word is formed from ἀκροάομαι, *to hear*.

ACROBATICA, or ACROBATICUM, from ἄκρος, *high*, and βαίνω, *I go*, an ancient engine, whereby people were raised aloft, that they might more conveniently shoot them.

The *acrobatica* among the Greeks [illegible] the same with what they call *pensiones* among the Romans. Some authors are divided as to the office of the [illegible]urs, Vitruvius and Barbaro take it to be [illegible] were by it lowly raised by the besiegers, high [illegible] walls, and discover the state of things [illegible]. Rellius rather supposes it a kind of [illegible] or cradle contrived for sailing painters, [illegible] other workmen, to the tops of towers, [illegible] suspect that it might have been used for [illegible] Vitruvius 2. Aquinas.

ACROCHIRISMUS, *ακροχειρισμος*, among the *Ancients*, a kind of gymnastic exercise, wherein the two parties contended only with their hands and fingers, without cloſing, or engaging the other parts of the body.

The word is alſo written *acrochiriſis*, and *acrochiria*: it is originally Greek, formed from *ακρος*, the part employed in this combat, which ſome would needleſly reſtrain to the tips of the fingers: though the etymon does not make this neceſſary.

Some make this a diſtinct exerciſe from wreſtling, and ſuppoſe it to have given the denomination *acrochiriſtæ* to a peculiar ſet of *athletæ* who profeſſed it. Others with more probability conſider it as only a ſpecies, or branch of wreſtling; ſome will have it to have been properly only a prelude to a wreſtling bout, wherewith the *athletæ* began to try each other's ſtrength, and bring their arms into play. This exerciſe made part of the *pancratium*. Pauſanias ſpeaks of a famous *pancratiaſt*, named Soſtratus, who got the ſurname of *Acrochiriſtes*, or *Acrochiriſtes*, from his having overcome all his antagoniſts at the *acrochiriſmus*.—It appears to have been in uſe in the age of Hippocrates, who aſcribes to it a virtue of extenuating the reſt of the body, and making the arms fleſhy.

ACROCHORDON, a painful ſpecies of WART, very preminent and pendulous, having a large head with a ſmall pedicle, or baſe.

Theſe are alſo called *porcine warts*, or *hanging warts*, and ſtand diſtinguiſhed from *ſcaffy warts*, or *myrmecia*. Others deſcribe the *acrochordon*, as a harder, rougher ſort of wart, growing under the cuticle, very callous, and uſually of the ſame colour with the ſkin; ſmall at bottom, and bigger upwards, but rarely exceeding the ſize of a bean.

ACROCOLIA, *ακροκωλια*, from *ακρος*, *extreme*, and *κωλον*, *a limb*. Theſe are the extremities of animals, which are uſed in food, as the feet of calves, ſwine, ſheep, oxen, or lambs; and of the broths of which, jellies are made. They are recommended by Hippocrates as a proper food, where there is a tendency to a dropſy. They are in general recommended as ſtrengtheners for weak people

ACROCORION, in *Botany*, a name uſed by ſome authors for the ſeveral ſpecies of the ſpring crocuſes.

ACROE, in *Botany*, the name given by the natives of Guinea to a kind of ſhrub, which they uſe in wine, as a reſtorative and analeptic. It is of the trifoliate kind, and has ſomewhat of the appearance of the coralloidens, but is not prickly; the middle or end leaf ſtands on a pedicle of an inch long, the other two leaves have no pedicles at all. Phil. Tranſ. N° 232.

ACROMION, ACROMIUM, in *Anatomy*, the upper proceſs of the SCAPULA, or ſhoulder-blade.

The word is derived from *ακρος*, *higheſt*, and *ωμος*, *ſhoulder*, q. d. the extremity of the ſhoulder.

Some have thought the *acromion* of a nature different from other bones; becauſe during infancy, it appears no more than a cartilage, which oſſifies by little and little, and about the age of twenty years becomes hard and firm, like a common bone.

ACROMONOGRAMMATICUM, from *ακρομονος* and *γραμμα*, *letter*, among poets, denotes a kind of poem, or compoſition, wherein each ſubſequent verſe commences with the letter with which the verſe preceding terminates.

ACROMPHALION, from *ακρος*, *extremus*, and *ομφαλος*, the *navel*; the tip of the navel.

ACRON, *ακρον*, in *Medicine*, ſignifies that which is moſt excellent in its kind.

ACRON, in *Botany*, among the *Ancients*, was uſed to ſignify the *capitulum*, *top*, or *flower* of plants of the thiſtle kind.

ACRONYCHAL, ACRONICHUS, in *Aſtronomy*, is applied to the RISING of a ſtar or other point, above the horizon, when the ſun ſets; or its SETTING when the ſun riſes.

The *acronychal* is one of the three poetical riſings and ſettings of the ſtars; and ſtands diſtinguiſhed from COSMICAL and HELIACAL.

Among ancient writers, a ſtar was properly ſaid to be *acronychal*, or to riſe *acronychally*, which roſe in the evening when the ſun was ſet. Greek writers, it is true, uſe the term *ακρονυχιος* indifferently, in ſpeaking either of evening or morning, by reaſon both are conſidered as *ακρα τα νυκτος*, *the extremities of the night*. And hence, among them we find *acronychal* applied to the riſing and ſetting of the ſtars, either in the morning or evening. But the ancients were more diſtinct, and by the *acronychal* riſe rather meant the firſt beginning or approach of night, than the end or period of it; and accordingly among them, the ſtars which roſe in the evening, not thoſe in the morning, were ſaid to riſe *acronychally*.

This word is ſometimes ignorantly ſpelt *achronical*, or *acronichal*, from a miſtaken notion of its being derived from *α*, and *χρονος*, *time*.

ACRONYCHAL is likewiſe an appellation more peculiarly given to the ſuperior planets, Saturn, Jupiter, Mars, when they were come to the meridian of midnight.

ACRONYCTÆ, ſtars riſing in the twilight, about ſun-ſetting.

ACROPATHOS ſignifies literally a diſeaſe at the top or ſuperior part.

ACROPOSTHIA, *ακροποσθια*, or *ακροποσθιον*, from *ακρος*, *extreme*, and *πωσθη*, the prepuce, or ſkin, which covers the glans of the penis, denotes the extremity of the prepuce, that which is cut off in circumciſion.

ACROSPELOS, a name given to the wild-oat graſs, or BROMOS.

ACROSPIRE, in *Natural Hiſtory*, &c. the ſame with PLUMULE.

ACROSPIRED, or ACROSPIRED, is uſed in reſpect of barley; which, in the operation of making MALT, is apt, after coming, or ſprouting, at the lower or root-end, to become *acroſpired*, i. e. to ſprout alſo at the upper or blade-end.

By 6 Geo. I. cap. 21. *Malt-makers* are forbid to wet or water their malt when on the floor, or couch; or to permit it to *acroſpire*.

ACROSTIC, a kind of poetical compoſition, the verſes whereof are diſpoſed in ſuch manner, as that the initial letters make up ſome perſon's name, title, motto, or the like. The word is derived from the Greek *ακρος*, *ſummus*, that which is at one of the extremes; and *στιχος*, *verſus*.

There are alſo *acroſtics*, where the name or title is made up by the initial letters of the middle words, or the laſt of the final ones.—And others which go backwards; beginning with the firſt letter of the laſt verſe, and proceeding upwards. Some refiners in this trifling way, have even gone to PENTACROSTICS; where the name is to be repeated five times.

ACROSTIC is alſo an appellation given by ſome authors to two ancient epigrams in the firſt book of the Anthology; the one in honour of Bacchus, the other of Apollo. Each conſiſts of 25 verſes, the firſt whereof is the propoſition, or argument of the whole, and the other 24 compoſed of four epithets, beginning each with the ſame letter, and thus following in the order of the 24 letters of the Greek alphabet: ſo that the firſt of the 24 comprehends four epithets beginning with *α*; the ſecond as many, with *β*; and ſo of the reſt to *ω*; which makes 96 epithets for each god.

Among *Eccleſiaſtical writers*, *acroſtics* denote the ends of verſes of pſalms, which the people ſang by way of chorus, or reſponſe, to the *præcentor*, or leader of the pſalm. This was called ſinging *acroſtics*, *acroſtichis*, which was a ſpecies of pſalmody uſual in the ancient church.

Acroſtic, in this ſenſe, amounts to the ſame with *hypopſalma*, *anapſalma*, *antelutium*, and *epkymnian*, which are all terms of the ſame ſignification.

Though an *acroſtic* properly ſignifies the beginning of a verſe, yet it is ſometimes alſo uſed for the end and cloſe of it; as by the author of the Conſtitutions, when he orders one to ſing the hymns of David, and the people to ſing after him the *acroſtics*, or ends of the verſes.

It does not, however, denote preciſely the end of the verſe, but ſomething added to the end of a pſalm, or ſomething frequently repeated in the courſe of a pſalm, anſwering to our *gloria patri*.

Some pretend to find *acroſtics* in the Pſalms, particularly in thoſe called ABECEDARIAN Pſalms.

ACROSTICHUM, *forked fern*, in the Linnæan ſyſtem of *Botany*, the name of a genus of capillary plants, belonging to the *cryptogamia filices* claſs, the character of which is, that the fructifications are not diſpoſed in any regular manner on the leaves, as in moſt of the other capillary plants: but they are ſo placed as to form a heap, covering the whole underſide of the leaf: Linnæus enumerates twenty-nine ſpecies.

ACROSTOLIUM, in *Antiquity*, an ornament of the prow, or foreſcaſtle of a ſhip, chiefly of war; ſometimes ſhaped like a buckler, a helmet, or an animal, but more frequently turned circular or ſpiral. The ancients had divers decorations or additional parts to their ſhips, called by a general name *παρασημα*; thoſe on the prow were more particularly called *ακρα*, of which the extreme part alone was denominated *acroſtolium*.

To the *acroſtolia* may be referred the *anſerculus*, mentioned by Bayfius; and all thoſe poliſhed fleel pieces reſembling a duck's neck, uſed by the Venetians at the heads of their gondolas.

The *acroſtolia* were torn from vanquiſhed ſhips, and faſtened to the conqueror's, as a ſignal of victory. We frequently find them repreſented on the reverſes of ancient medals. An *acroſtolium* is alſo ſeen in the famous ſculpture of the *apotheoſis* of Homer.

ACROTELEUTIC, from *ακρος* and *τελος*, *end*, among *Eccleſiaſtical Writers*, denotes the end of a verſe or pſalm; or ſomething added thereto to be ſung by the people.

In which sense *acrostichic* amounts to the same with *acrostic*, *hypopsalma*, *diapsalma*, *epode*, &c.

The *gloria patri* is by some writers called the *acrostichic* to the psalms; because always used to be repeated by the people at the end of each.

Hence the word *acrostichic* is sometimes also used as synonymous with DOXOLOGY.

ACROTERIA, or ACROTERS, in *Architecture*, little pedestals, usually without bases, anciently placed at the middle, and the two extremes, of PEDIMENTS; and serving also to support statues.

The word in its original signifies the [ακρον] extremity of any body; as the tips of a rock, &c.

Those at the extremes ought to be half the height of the TYMPANUM; and that in the middle, according to Vitruvius, should be one eighth part more.

ACROTERIA sometimes also signify figures, whether of *flame*, or *metal*, placed as ornaments, or crownings, on the tops of temples or other buildings.

Sometimes they also denote those sharp PINNACLES, or spiry battlements, which stand in ranges about flat buildings with rails and balusters.

ACROTERIA, among ancient *Physicians*, were used to denote the great extremities of the body, as the head, hands, and feet.

The *acroteria* growing cold in acute distempers, is held a prognostic of death; as indicating a decay of the vital flame, either by reason of a coagulation of the blood, or too great a consumption of it before.

Aristotle also uses *acroteria*, for the tips or extreme parts of the fingers, covered by the nails; sometimes also for the eminences of the bones.

ACROTERIASM, among ancient *Physicians*, the act of cutting off the extreme parts of the body, when putrefied, by a law; i. e. the amputation of any extremity.

ACROTHYMIA, in *Surgery*, the name of a large tumor in the flesh, rising in the shape of a wart, though sometimes depressed and flat, called THYMUS. Heister. See NÆVUS.

ACT, ACTUS, in *Physics*, an effective exercise, or application of some power, or faculty.

In this sense, *act* stands opposed to power, *potentia*, which is only the capacity of *acting*, not the exertion of that capacity.

Though the word *act*, properly and primarily, be only applicable where the power might exist without being drawn forth into *act*; yet the schoolmen extend it further; defining it by the presence of any power or perfection, even though it could not be absent.

In which sense, God himself is held to be a most pure *act*; by reason his perfections are always and necessarily present. And thus, form is called an *act*; inasmuch as the presence hereof completes the power and perfection of matter.—VOLM. fay some, is MATTER reduced into *act*. Even existence is termed an *act*; because, when this is given to a being, nothing farther is wanted. The Greeks sometimes call *act*, ενεργεια, a term denoting an actual possession of perfection, by the Latins usually rendered *perfectibilitas*.

Metaphysicians give various divisions of *act*; viz. into *infinite*, as the *act* of creating; and *finite*, as the *act* of moving.—*Transient*, or those exercised in other beings, as heating; and *immanent*, which remain in their own subject, as thinking.

ACT, in *Logic*, is particularly underflood of an operation of the human mind.

Thus to discern, examine, and judge, are *acts* of the understanding; to affirm and chuse, are *acts* of the will.

There are voluntary *acts*, and spontaneous ones, which seem produced without the privity, or participation of the soul.

ACT, in a *legal* sense, is an instrument, or other matter in writing; of use to declare, or justify the truth of a thing.

In which sense, records, decrees, sentences, reports, certificates, &c. are called *acts*, authentic *acts*, solemn *acts*, &c. See DEED.

ACTS also denote the deliberations and resolutions of an assembly, senate, council, or convocation; taken down by *clerks*, notaries, actuaries, or the like, and entered in a register.

ACTS *of the senate*, *acta senatus*, among the Romans, were minutes of what passed, and was debated in the senate-house.

These were also called *commentarii*, and by a Greek name ὑπομνηματα. They had their origin in the consulship of Julius Cæsar, who ordered them both to be kept and published. The keeping of them was continued under Augustus, but the publication was abrogated. Afterwards all writings, relating to the decrees or sentences of the judges, or what passed and was done before them, or by their authority, in any cause, were all called by the name ACTA. In which sense we read of civil *acts*, criminal *acts*, intervenient *acts*, ACTA *civilia*, *criminalia*, *intervenientia*, &c.

ACTS *of the people*, *acta populi*, among the Romans, were journals or registers of the daily occurrences, as assemblies, trials, executions, buildings, births, marriages, deaths, &c. of illustrious persons, and the like.

These were otherwise called *acta publica*, and *acta diurna*, or simply *acta*.

The *acta* only differed from annals, in that only the greater and more important matters were in the latter, and those of less note in the former. Tacitus Annal.

Their origin is attributed to Julius Cæsar, who first ordered the keeping and making public the acts of the people; some trace them higher, to Servius Tullius, who, to discover the number of persons, born, dead, and alive, ordered that the neat of kin, upon a birth, should put a certain piece of money into the treasury of *Juno Lucina*; upon a death, into that of *Venus Libitina*: the like was also to be done upon assuming the *toga virilis*, &c. Under Marcus Antoninus, this was carried farther; persons were obliged to notify the birth of their children, with their names, and surnames, the day, consul, and whether legitimate, or spurious, to the præfects of the *ærarium Saturni*, to be entered in the public *acts*. Though before this time the births of persons of quality appear to have been thus registered. Suetonius. Pitiſc. Lex.

ACTS, *Public*. The knowledge of public *acts* has been erected into a peculiar science, called the *diplomatic*, of great importance to an hiſtorian, ſtateſman, chronologer, and even critic. The preſervation of them was the firſt occaſion of erecting libraries.

The ſtyle of *acts* is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineneſs, and even whether there be any certain rules at all. F. Germon will have the greater part of the *acts* of former ages to be ſpurious. Fontanini aſſerts, that the number of forged *acts* now extant is very ſmall. It is certain there were ſevere puniſhments inflicted on the forgers and falſifiers of *acts*.

The chief of the Engliſh *acts*, or public records, are publiſhed by Rymer, under the title of *Fœdera*, and continued by Sanderſon: an extract whereof has been given in French by Rapin, and tranſlated into Engliſh, under the title of *Acta Regia*. Great commendations have been given this work, and ſome exceptions made to it: as that there are many ſpurious *acts*, as well as errors in it: ſome have even charged it with falſifications.

The public *acts* of France ſell into the hands of the Engliſh after the battle of Poitiers, and are commonly ſaid to have been carried by them out of the country. But the tradition is not ſupported by any ſufficient teſtimony, and has even been ſhewn by M. Bruſſel to be falſe.

ACTS *of council*. Theſe differed from canons, in that the latter contained only the reſults, or the laws and regulations agreed on, and drawn up in form; whereas the *acts* included the preceding debates, motions, &c.

In the firſt collections of councils, only the bare canons were delivered. Afterwards they began to give the *acts* as well as the canons.

Hence we have two kinds of ſynodical collections: one containing all the *acts*, or tranſactions, relating to matters of faith and doctrine; the other, containing only the canons relating to diſcipline, is called the book of CANONS.

ACTS *of parliament* are particularly denominated *Statutes*.

The *acts* of the Royal Society are called *Tranſactions*; thoſe of the Royal Academy of Sciences at Paris, *Mémoires*; thoſe of the ſcientics at Leipſic, &c. ſimply *acts*, ACTA *eruditorum*, &c.

The edicts and declarations of the council of the Roman emperors, were called conſiſtory *acts*, ACTA *conſiſtorii*.

ACTS, *Clerk of the*, is an officer of the navy. See CLERK.

ACTS are alſo matters of fact tranſmitted to poſterity in certain authentic books, and memoirs.

In which ſenſe we ſay, the ACTS of the *Apoſtles*, ACTS of the *Martyrs*, &c.

ACTS *of the Apoſtles*, a canonical book of the New Teſtament, which contains great part of the lives of St. Peter and St. Paul: commencing at the Aſcenſion of our Saviour, and continued down to St. Paul's arrival at Rome, after his appeal to Cæſar, comprehending in all about thirty years. St. Luke has been generally taken for the author of this book, and his principal deſign in writing it was to obviate the falſe ACTS, and falſe hiſtories, which began to be diſperſed up and down the world. The exact time of his writing it is not known; but it muſt have been at leaſt two years after St. Paul's arrival at Rome, becauſe it informs us that St. Paul dwelt two whole years in his own hired houſe: perhaps he wrote while he remained with St. Paul, during the [illegible] imprisonment.

There are alſo ſpurious ACTS of the Apoſtles, [illegible] in Hebrew by one Abdias; tranſlated into Greek by [illegible] diſciple Eutropius; and thence into Latin, by Julius Africanus,

The book called *Acts* of Pilate, relating to Jesus, is a falſe and ſuppoſititious relation of our Saviour's trial before Pilate; impiouſly framed by the enemies of Chriſtianity; and filled with the groſſeſt blaſphemy.—The emperor Maximin, by a ſolemn edict, ordered it to be ſent into all the provinces of the empire; and injoined the ſchool-maſters to teach and explain it to their ſcholars, and make them learn it by heart.

The piece was written with ſo much careleſſneſs or ignorance, that our Saviour's death was therein referred to the 4th conſulate of Tiberius, that is, to the 7th of his empire; which is eleven years before our Saviour's paſſion, and five before Pilate was made governor of Judea. See Euſebius, lib. ix. cap. 4. and 6. Ruffin, lib. i. cap. 5, &c.

The true and genuine *acts* of Pilate were ſent by him to Tiberius, who reported them to the ſenate; but they were rejected by that aſſembly, becauſe not immediately addreſſed to them: as is teſtified by Tertullian, in his Apol. cap. 5. and Juſtin. Hiſt. lib. ii. cap. 2.

ACT, in the univerſities, a theſis maintained in public by a candidate for a degree; or, to ſhew the capacity and proficiency of a ſtudent in the UNIVERSITY.

The candidates for a degree of bachelor and maſter of arts are to hold philoſophy *acts*; thoſe for bachelor of divinity are to keep divinity *acts*, &c.

At Oxford, the time when the maſters or doctors complete their degrees, is alſo called the ACT; which is held with great ſolemnity: at Cambridge they call it the *commencement*.

ACT *of faith*, AUTO *da fe*, in the Romiſh church, is a ſolemn day held by the INQUISITION, for the puniſhment of hereſies, and the abſolution of the innocent accuſed.

They uſually contrive the *auto* to fall on ſome great feſtival, that the execution may paſs with the more awe and regard: at leaſt it is always on a Sunday.

The *auto da fe* may be called the laſt act of the inquiſitorial tragedy; it is a kind of goal-delivery, appointed as oft as a competent number of priſoners in the inquiſition are convicted of hereſy; either by their own voluntary, or extorted confeſſion; or on the evidence of certain witneſſes. The proceſs is thus: in the morning, they are brought into a great hall, where they have certain habits put on, which they are to wear in the proceſſion. The proceſſion is led up by Dominican friars, after which come the penitents, ſome with ſan benitoes, and ſome without, according to the nature of their crimes; being all in black coats without ſleeves, and bare-footed, with a wax candle in their hands. Theſe are followed by the penitents who have narrowly eſcaped being burnt, who over their black coats have flames painted, with their points turned downwards, *fuego revuelto*. Next come the negative, and relapſed, who are to be burnt, having flames on their habit pointing upwards; after theſe come ſuch as profeſs doctrines contrary to the faith of Rome, who, beſides flames pointing upwards, have their picture painted on their breaſts, with dogs, ſerpents, and devils, all open-mouthed about it. Each priſoner is attended with a familiar of the inquiſition, and thoſe to be burnt have alſo a Jeſuit on each hand, who are continually preaching to them to abjure. After the priſoners, comes a troop of familiars on horſe-back, and after them the inquiſitors, and other officers of the court, on mules; laſt of all, the inquiſitor general on a white horſe, led by two men with black hats and green hat-bands.

A ſcaffold is erected in the Terreiro de Paio, big enough for two or three thouſand people; at one end of which are the priſoners, at the other the *inquiſitors*. After a ſermon made up of encomiums of the inquiſition, and invectives againſt hereſies, a prieſt aſcends a deſk near the middle of the ſcaffold, and having taken the aſſurances of the penitents, reciles the final ſentence of thoſe who are to be put to death; and delivers them to the ſecular arm, earneſtly beſeeching at the ſame time the ſecular power not to touch their blood, or put their lives in danger.

The priſoners being thus in the hands of the civil magiſtrate, are preſently loaded with chains, and carried firſt to the ſecular goal, and from thence in an hour or two brought before the civil judge, who, after aſking in what religion they intend to die, pronounces ſentence, on ſuch as declare they die in the communion of the church of Rome, that they ſhall be firſt ſtrangled, and then burnt to aſhes; on ſuch as die in any other faith, that they be burnt alive.

Both are immediately carried to the Ribera, the place of execution, where there are as many ſtakes ſet up, as there are priſoners to be burnt, with a quantity of dry furze about them. The ſtakes of the profeſſed, that is, ſuch as perſiſt in their hereſy, are about four yards high, having a ſmall board towards the top for the priſoner to be ſeated on. The negative and relapſed, being firſt ſtrangled and burnt, the profeſſed mount their ſtakes by a ladder; and the Jeſuits, after ſeveral repeated exhortations to be reconciled to the church, part with them, telling them they leave them to the devil, who is ſtanding at their elbow to receive their ſouls, and carry them with him into the flames of hell. On this a great ſhout is raiſed, and the cry is, let the dogs *hearts be made*, which is done by thruſting flaming furze, faſtened to long poles, againſt their faces, till their faces are burnt to a coal, which is accompanied with the loudeſt acclamamations of joy. At laſt, fire is ſet to the furze at the bottom of the ſtake, over which the profeſſed are chained ſo high, that the top of the flame ſeldom reaches higher than the ſeat they ſit on, ſo that they rather ſeem roaſted than burnt. There cannot be a more lamentable ſpectacle; the ſufferers continually crying out while they are able, *miſericordia per amor de dios*: yet it is beheld by all ſexes, and ages, with tranſports of joy and ſatisfaction. Geddes's Miſc. Tracts, vol. i. p. 442. Limb. Hiſt. Inq. lib. iv.

ACTS, in *Poetry*, are certain diviſions, or principal parts, in a dramatic poem, contrived to give a reſpite, or breathing-time, both to the actors and ſpectators.

In the interval, between the *acts*, the ſtage remains empty, and without any action viſible to the ſpectators; though it is ſuppoſed all the while there is one paſſing out of ſight. It is not, however, purely for the ſake of the reſpite, that theſe *acts* are obſerved; but to give affairs a greater degree of probability, and render the intrigue more affecting. For the ſpectator who ſees the action prepared that is to paſs in the interval, cannot forbear acting, in his imagination, the part of the abſent actors; by which means, he is the more agreeably ſurpriſed when a new *act* coming upon the ſtage, he ſees the effects of that action, which before he could but gueſs at.

To this it may be added, that authors contrive to have the moſt dry and difficult part of the drama tranſacted between the *acts*, that the ſpectators may have no notion of theſe, excepting what their fancy preſents them with at a diſtance; and that nothing may appear upon the ſtage but what is natural, probable, and entertaining.

The ancient Greek poets were unacquainted with this diviſion of a play into *acts*: though their epiſodes, or choruſes, ſerved almoſt the ſame purpoſe.

It is true, they conſidered their pieces as conſiſting of certain parts or diviſions, which they called *protaſis*, *epitaſis*, *catataſis*, and *cataſtrophe*: but there were no real diviſions or interruptions anſwering to them in the repreſentation.

The Romans firſt introduced *acts* into the drama; and in Horace's time, the five acts were grown into a law, as appears by the verſe,

Neu brevior quinto, neu ſit productior, actus.

This law ſtands unrepealed to this day; though it ſeems to draw its force from the authority of Horace, rather than that of reaſon, or nature.—All plays are held irregular that have either more, or fewer than five acts.

Some indeed have aſſerted, that every juſt action conſiſts of five diſtinct parts: and have undertaken to mark out the preciſe ſtate of the action, which each of the five *acts* ought to bear.

The firſt, they ſay, is to propoſe the matter or argument of the fable, and to ſhew the principal characters.—The ſecond, to bring the affair or buſineſs upon the carpet.—The third, to furniſh obſtacles and difficulties.—The fourth either points a remedy for theſe difficulties, or finds new ones in the attempt.—The fifth puts an end to all by a diſcovery.

Be this as it will, it is certain, on the principles of that great maſter of the drama, Ariſtotle, we may have a juſt and regular play, though only divided into three *acts*.

Theſe *acts* are ſubdivided into SCENES.

ACTÆA, in *Botany*, the name whereby Linnæus diſtinguiſhes the *cimicifugas* of Tournefort. *See* CIMICIFUGA.

The calyx is four-leaved; the fruit is a ſingle oval berry, and the ſeed ſemiorbiculated. There are two ſpecies.

ACTE, the *elder*. *See* ELDER-*tree*.

ACTIAN *Games*, *Ludi* ACTIACI, ſolemn games, inſtituted, or, according to ſome, only reſtored, by Auguſtus, in memory of the victory at Actium.

Strephanus, and ſome others, will have them held every third year; but the more common opinion is that of Strabo, who ſays, they only returned every fifth, and were celebrated in honour of Apollo, ſince ſurnamed *Actius*. By the way it is a groſs overſight in ſome authors, to imagine that Virgil inſinuates them to have been inſtituted by Æneas; from that paſſage Æn. III. v. 280.

Actiaque Iliacis celebramus littora ludis.

It is true, the poet there alludes to the *Actian* games; but he only does it by way of compliment to Auguſtus, to attribute that to the hero from whom he deſcended, which

which was done by the emperor himself, as is observed by Servius.

ACTIAN *Years*, *anni* ACTIACI, were a series of YEARS, commencing from the æra of the battle of Actium; called the æra of Augustus. See EPOCHA.

ACTINE, *actine*, in *Botany*, a name of the herb RUNEAS, or NAPUS.

ACTINIA, in the *History of Insects*, a genus of sea-animals, of the order of the *zoomorthora*, naturally of a cylindric shape, but of variable figure; the *tentacula* are very numerous, and are ranged in several series about the mouth, which is placed at one of the extremities of the body; these are in a continual vibratory motion, and by that means draw small animals into its mouth for food. The whole animal is equally thick in all parts, and is about half an inch long; its tail is divided into three parts, or terminated, as it were, by three points: it is of a pale flesh-colour, except the *tentacula*, which have a beautiful variety of colours. It lodges itself in little cavities of rocks, and of the larger sea-plants, of the stony kind; and is found on the coasts of the American islands, of various species; differing from each other in figure, colour, &c. In the Linnæan system, this is a genus of the *mollusca* order of worms, including five species. See ANEMONIES.

ACTION, in a general sense, denotes the operation of a power. The idea of *action* is so familiar to us, that a definition may as easily obscure as explain it.—Some schoolmen, however, attempt to express its nature by 'a manifestation of the power or energy of a substance; made either within, or without it.'—Thus, say they, when the mind *acts*, what does it more than perceive a vital power exerting itself; as, in reality, the several *actions* of the mind are no other than so many indications of its vitality.

It is a point controverted among the schoolmen, whether or not *action*, thus taken, be a thing distinct both from the agent, and the term, or effects. The *midists* stand for the affirmative, and the *nominalists* assert the negative. These latter observe, that the *action* may be considered two ways, *entitatively* and *connotatively*.

ACTION *entitatively* taken, is what we call a CAUSE, or what may act.

ACTION, *connotatively* considered, is the same cause, only considered as acting, or connoting the effect it produces. Now, say they, a cause may be without any *action*, connotatively taken, i. e. it may be considered as not producing an effect; but it cannot be without it entitatively, for that would be to be without itself. Hence they conclude that the cause differs from the action connotatively, not entitatively taken; and the agent is the cause of the *action*, considered connotatively, not entitatively.

Actions are divided, with respect to their principle, into UNIVOCAL, where the effect is of the same kind with the cause; as the production of man by man; and EQUIVOCAL, where it is different, as the supposed production of frogs by the sun.—And again into VITAL, as nutrition, respiration, the *actions* of the heart, &c. and NOT-VITAL; as beating.

With respect to their subject, *actions* are divided into IMMANENT; which are received within the agent that produced them: as are vital *actions*, cogitation, &c.—And TRANSIENT, which pass into another.

In respect of duration, *actions* are again divided into INSTANTANEOUS, where the whole effect is produced in the same moment; as the creation of light: and SUCCESSIVE, where the effect is produced by degrees; as corruption, fermentation, putrefaction, dissolution, &c. The Cartesians resolve all physical *action* into metaphysical. Bodies according to them, do not act on one another; the *action* all comes immediately from the Deity; the motions of bodies, which seem to be the cause, being only the occasions thereof. See *Occasional* CAUSE.

It is one of the laws of nature, that *action*, and reaction, are always equal, and contrary to each other.

For the *actions of powers*, &c. see POWER, WEIGHT, MOTION, RESISTANCE, and FRICTION.

For the laws of the *action of fluids*, &c. see FLUID and *Specific* GRAVITY.

ACTION, in *Physics*, the *actions* or functions of the body, each part of which has an action peculiar to itself. They are divided by the writers of institutes, into the *vital*, *animal*, and *natural*. The *vital* are such as are essential to the subsistence of the individual; such are the motion of the heart and lungs, the secretion of spirits in the cerebellum, on which the motions of the heart and lungs depend; and the circulation of the blood and fluids in their proper vessels. *Pulsation* and *respiration* are the external signs of life.

The *natural* actions are such as are necessary to the continuance of the animal, but not so immediately, but that it may subsist some time under a suspension of them: as the digestion of the aliment, and its conversion into blood.

Under *animal actions* are comprehended those which constitute the senses of touch, taste, smell, vision, hearing, perception, imagination, memory, judgment, ratiocination, affections of the mind, and voluntary motion; without any, or all of which, it is impossible for an animal to live.

In the year 1752, Dr. White published an ingenious performance, under the title of an Essay on the vital and other voluntary Motions of Animals, 8vo. and in the same year Dr. Simpson also published a book on Vital and Animal Actions, 8vo.

ACTION also, in *Physics* and *Mechanics*, denotes the action of bodies on each other by pressure.

If a body be urged by equal and contrary actions or pressures, it will remain at rest. But if one of these pressures be greater than its opposite, motion will ensue towards the parts least pressed.

It is to be observed, that the *actions* of bodies on each other, in a space that is carried uniformly forward, are the same as if the space were at rest; and any powers or motions that act upon all bodies, so as to produce equal velocities in them in the same, or in parallel right lines, have no effect on the mutual *actions*, or relative motions. Thus the motions of bodies aboard a ship, that is carried steadily and uniformly forward, are performed in the same manner as if the ship was at rest. The motion of the earth round its axis has no effect on the *actions* of bodies and agents at its surface, but so far as it is not uniform and rectilineal. In general the actions of bodies upon each other, depend not upon their *absolute*, but *relative* motion.

ACTION, *Quantity of*, in *Mechanics*, is used for the product of the mass of a body, by its velocity.

When a body is transported from one place to another, the *action* is the greater, in proportion to the mass, and to the velocity or rapidity of the motion. See MOMENTUM.

Mons. de Maupertuis lays it down as a general principle, that, 'whenever any changes happen in nature, the quantity of *action* necessary to produce this change is always 'the least possible.' And this, he says, is a law indicating the highest wisdom.

From this general principle, and the common rule for finding a *maximum* by fluxions, he deduces the known laws of percussion, for hard and elastic bodies, and even the laws of rest, as he calls them; that is the equilibrium, or equipollency of pressures.

This ingenious author seems to think that the laws of motion, thus deduced, afford a stronger proof for the existence of God, or of a first intelligent cause, than the other arguments commonly alleged, and deduced from the order of nature. But we apprehend, that few metaphysicians will be of his opinion. The proof of a God from the order of nature, seems to depend upon two principles: 1. That there is an order in nature. 2. That this order is contingent. For if this order was not contingent, but absolutely necessary, as Spinoza, and other atheists pretend, it seems, that no sufficient reason, from the order of nature, could be assigned for the existence of a first intelligent cause. Now, Mons. de Maupertuis not having established the contingency of this principle of the *maximum* of *action*, his argument seems defective in this respect, not to mention others.

M. Euler has demonstrated, that in the trajectories described by bodies urged by central forces, the velocity multiplied by the element of the curve is always a *minimum*. Mons. Maupertuis looks on this as an application of his principle to the motion of the planets. Mem. de l'Acad. de Berlin, 1746, tom. ii. p. 290.

ACTION, in *Ethics*, or *moral* ACTION, is a voluntary motion, of a creature capable of distinguishing good and evil; whose *effects*, therefore, may be justly imputed to the agent. See MORAL.

A *moral action* may be more fully defined to be whatever a man, considered as endued with the powers of understanding and willing, with respect to the end he ought to aim at, and the rule he is to regard in acting, resolves, thinks, does, or even omits to do; in such a manner as to become accountable for what is thus done or omitted, and the consequences thereof.

The foundation, then, of the morality of *actions*, is, that they are done knowingly and voluntarily.

All moral *actions* may be divided, with respect to the rule, into GOOD and EVIL.

ACTION, in *Oratory*, is an accommodation of the person of the orator to his subject; or, a management of the voice and gesture, suited to the matter spoken, or delivered.

Action makes one of the greatest branches or divisions of rhetoric, as usually taught. The ancients usually call it *pronunciation*.

Action is a collateral or secondary method of expressing our ideas: and is susceptible of a kind of eloquence as well

well as the primary.—It is an address to the external senses; which it endeavours to move, and bring into its party by a well-contented motion and modulation: at the same time that the reason and understanding are attacked by force of argument. Accordingly, Tully very pertinently calls it *sermo corporis, the discourse of the body*; and *corporis eloquentia, the eloquence of the body*.—The Roman mimes and pantomimes, we read, had such a copia in this kind, such a compass even of mute *action*, that voice and language seemed useless to them: they could make themselves understood to people of all nations; and Roscius, the comedian, is particularly famed, as being able to express any sentence by his gestures, as significantly and various as Cicero with all his oratory. Quintilian gives us a system of the rules of *action*; taken not only from the writings of the ancient orators, but from the best examples of the forum.

What we usually attribute to eloquence, was really the effect of the *action* only, as some of the greatest masters in that way have frankly acknowledged.—Demosthenes expressly calls it, 'the beginning, the middle, and the 'end of the orator's office;' and Cicero professes, that 'it is not of so much importance what the orator says, 'as how he says it.'

After all, it is a point that will bear being controverted, whether *action* ought to be practised, and encouraged at all? A thing that has so much command over mankind, it is certain, must be very dangerous; since it is as capable of being turned to our disadvantage as to our advantage. It is putting a weapon in the hands of another, which, if he pleases, he may make use of to subdue and enslave us; and accordingly, history is full of the pernicious uses made of it.—For this reason, eloquence and *action* are generally discouraged in the modern policy; and both the bar, and the pulpit, are brought to a more frigid way of delivery.

Perhaps the foundation of all *action* may be vicious and immoral.—Voice and gesture, we know, will affect brutes; not as they have reason, but as they have passions: so far as these are used in a discourse, therefore, it does not regard an address to all of men, more than it would a herd of quadrupeds: that is, their whole effort is spent, not on the rational faculties, which are out of the question, but on the animal ones, which alone they endeavour to possess and actuate, independently of reason.—Nay, more, our reason, and the judgment itself, are intended to be studied and inclined by them; *action* being only used as an indirect way of coming at the reason, where a direct and immediate one was wanting; i. e. where the judgment cannot be taken by the proper means, argument, it is to be taken indirectly by circuition, and stratagem.

The natural order of things, then, is here inverted; our reason, which should go before, and direct our passions, is dragged after them: instead of coolly considering, and taking cognizance of things; and according to what we perceive therein, raising ourselves to the passions of *grief*, indignation, or the like, we are attacked the other way; the impression is to be carried backwards, by virtue of the natural connection there is between the reason and the passions: and thus the helm, the principle of our actions, is taken out of our own hand, and given to another. See PASSION.

The case is much the same here as in sensation and imagination: the natural and regular way of arriving at the knowledge of objects is by sense: an impression begun there is transmitted to the imagination, where the image is produced, similar to that which first struck on the organ.—But the process is sometimes inverted: in hypochondriac, lunatic, and other delitious cases, the image is first excited in the imagination; and the impression thereof communicated back to the organs of sense: by which means objects are seen, which have no existence.

Upon the whole, *action* does not tend to give the mind any information about the subject that is discussed; nor is it designed to convey any arguments or ideas which the simple use of language would not convey. But is it not that which we should form our judgments upon? And can any thing help us to form a just judgment, beside that which in some way or other enlightens and convinces our understanding? When Cicero made Cæsar tremble, turn pale, and let fall his papers, he did not apprise him of any new guilt which Cæsar did not know of: the effect had no dependence on Cæsar's understanding; nor was it any thing more than might have been produced by the unmeaning sounds of a musical instrument duly applied. However, *action* may be useful in awakening and fixing the attention, provided that it be accompanied with sensible argument and address. See GESTURE.

ACTION, in a *theatrical* sense, is nearly the same with that among orators; with this difference, that the actor adapts his *action* to an assumed character, whereas the orator is supposed, in reality, to feel the passion which his *action* expresses, whether joy, or grief, &c.

ACTION, in *Poetry*, is an event, either real or imaginary, which makes the subject of an epic, or dramatic poem. The *action* of a poem coincides nearly with the fable thereof; it being the usual practice, not to take any real transaction of the history, but to feign or invent one; or at least to alter the historical fact, so as to render it in good measure fictitious.

F. Bossu has two chapters, *Of real actions*, the recitals whereof are fables; and *Of feigned actions*, the recitals whereof are historical.

The critics lay down four qualifications, as necessary to the epic and tragic *action*; the first, UNITY; the second, INTEGRITY; the third, IMPORTANCE; and the fourth, DURATION; to which some add a fifth, viz. CONTINUITY.

This unity is not only to exist in the first draught, or model of the fable; but in the whole epiloditzed *action*.

In order to the integrity of the *action*, it is necessary, according to Aristotle, that it have a beginning, middle, and end.—If the three parts of a whole seem to be generally denoted by the words, *beginning, middle*, and *end*, Bossu interprets them more expressly, thus: the causes and designs of a man's doing an *action* are the beginning; the effects of those causes, and the difficulties met withal in the execution of those designs, are the middle of it; and the unravelling and extricating of those difficulties, is the end of the *action*.

The poet, says Bossu, should to begin his *action*, that, on one hand, nothing should be farther wanting for the understanding of what he afterwards delivers; and, on the other, that what thus begins require after it a necessary consequence. The end is to be conducted after the like manner, only with the two conditions transposed; so that nothing be expected after it, and that what ends the poem be a necessary consequence of something that went before it. Lastly, the beginning is to be joined to the end by a middle, which is the effect of something that went before it, and the cause of what follows.

In the causes of an *action*, one may observe two opposite designs; the first and principal is that of the hero: the second comprehends all the designs of those who oppose the pretensions of the hero. Those oppolite causes do all produce oppolite effects, viz. the endeavours of the hero to accomplish his design, and the endeavours of those who are against it.—As the causes and designs are the beginning of the *action*, so those contrary endeavours are the middle of it, and form a difficulty, plot, or intrigue, which makes the greatest part of the poem: and the solution or clearing up of this difficulty makes the unravelling.

The unravelling of the plot, or intrigue, may happen two ways; either with a discovery, or without.

The several effects which the unravelling produces, and the different states to which it reduces the persons, divide the *action* into so many kinds.—If it change the fortune of the principal person, it is said to be with a peripetia; and the *action* is denominated *implex*, or mixed: if there be no peripetia, but the unravelling be a mere passing from trouble to repose, the *action* is simple.

For the duration of the epic *action*, Aristotle observes, it is not so limited as that of the tragic *action*: the latter is confined to a natural day; but the epopea, according to that critic, has no fixed time.—In effect, tragedy being full of passion, and consequently of violence, which cannot be supposed to last long, requires a shorter time; and the epic poem, being for the habits which proceed more slowly, requires a longer time, either for them to take hold, or to be rooted up; and hence the difference between the epic and dramatic *action*, in point of duration. Bossu says it down as a rule, that the more vehement the manners of the principal personages are, the less time ought the *action* to last: accordingly, the *action* of the Iliad, containing the wrath of Achilles, &c. holds but forty-seven days; whereas that of the Odyssey, where prudence is the reigning quality, lasts eight years and a half, and that of the Æneid, where the prevailing characters of the hero is piety and mildness, nearly seven years. As to the importance of the epic *action*, there are two ways of providing for it; the first, by the dignity and importance of the persons. This way alone Homer makes use of; there being, otherwise, nothing great and important in his models, but what might have happened to ordinary persons.—The second, by the importance of the *action* itself; such as the establishment, or downfall of a religion, or a state; which is Virgil's *action*, and in which he has much the advantage of Homer.

Bossu mentions a third way of making the *action* important, viz. by giving a higher idea of the personages than what the readers conceive of all that is great among men.—This is done by comparing the characters of the poem with those of the present time.

ACTION is also used in *Painting* and *Sculpture*, for the posture of a figure, or the *action* it is supposed to be in; expressed by the disposition of the body, or the passion appearing in the face.

ACTION *of the Mouth*, in the *Manege*, denotes the agitation of a horse's tongue, and mandible, or his champing on the bit; discoverable by a white, ropy foam.—This, with the masters, passes for a sign of health, vigour, and mettle.

ACTION, in the *Military Art*, is an engagement between two armies, or between different bodies of troops belonging to them. This term is likewise used to signify some memorable act done by an officer, or commander of a body of troops.

ACTION, in *Law*, is a right of demanding, and pursuing in a court of judicature, what is any man's due.

Or, *action* is any kind of PROCESS which a person enters for the recovery of his right. See CAUSE.

Actions are divided, by Justinian, into two general kinds; *real*, or those against the thing; and *personal*, or those against the person.—For whoever brings an *action*, either does it against one obnoxious to him, in respect either of contract or of offence; in which case it is *action* against the person, which requires the party to do, or give something: or, he does it against one not obnoxious, yet with whom a controversy is risen touching some matter; as, if Caius hold a field, which Julius claims as his property, and brings his *action* for the same. See the Institut. lib iv. tit. 4. where the principal *actions*, introduced by the Roman law, are summarily explained.

In common law, from the two classes of *real* and *personal actions*, arises a third, called a *mixed action*; which regards both the *person* and the *thing*.

ACTION, *real*, is that whereby the defendant claims title to lands or tenements, rents, or commons, in fee-simple, fee-tail, or for life.

But *real actions*, formerly so numerous and considerable, as writs of right, of entry, &c. with their appendages, as *grand cape*, *petit cape*, receipt, view, aid-prayer, voucher, counter-plea of voucher, counter-plea of warranty, and recovery of value, are now much out of use; by reason of the usual admixture of personal matters therewith, which change them into *mixed actions*.

ACTION, *personal*, is that which one man hath against another, on account of a contract for money or goods; or of an offence done by him, or some other person, for whose fact he is answerable.

ACTION, *mixed*, is that laid indifferently for the *thing* detained, or against the *person* of the detainer; being thus called, because it has a mixed respect, both to the *thing*, and to the *person*.

Others better define it, a suit given by law to recover the thing demanded, and damages for the wrong done.

Such is, assise of *novel disseisin*, which, if the disseisor make a feoffment to another, the disseisee shall have against the disseisor, and the feoffee, or other tenant, to recover not only the land, but damages also. And the like in *action* of waste, *Dower unde nihil*, &c. See ASSISE.

Actions are also divided into CIVIL and PENAL.

ACTION, *civil*, is that which only tends to the recovery of what, by reason of a contract, or other like cause, is a man's due.—As, if a person by *action* seek to recover a sum of money formerly lent, &c.

ACTION, *penal*, aims at some penalty upon the party sued, either corporeal or pecuniary.

Such is the *Actio Legis Aquiliæ*, in the *Civil Law*; and with us, the next friends of a man feloniously slain, or wounded, shall pursue the law against the offender, and bring him to condign punishment.

ACTION is also distinguished, as it lies for the recovery either of the simple value of the thing challenged; or of the double, treble, quadruple, &c.

Thus, a *Decies tantum* lies against embracers; and against jurors that take money for their verdict, of either, or both parties.

To this class also belong all *actions* on a statute that punishes an offence by restitution, or fine, proportionable to the transgression.

Action, again, is divided into *prejudicial*, called also *preparatory*, and *principal*.

ACTION, *prejudicial*, is that which arises from some question, or doubtful point in the *principal* one.

As, if a man sue his younger brother, for land descended from his father; and it be objected, he is a bastard; this point of bastardy must be tried, before the cause can proceed: whence the *action* is termed *prejudicialis, quia prius judicanda*.

ACTION, again, is either *ancestrel*, or *possessory*.—*Ancestrel action*, is that which we have by some right descending from our ancestor.—*Possessory*, sometimes also called *personal action*, is that which hath its beginning in and from ourselves.

ACTION, *upon the Case*, *Actio super causam*, is a general *action*, given for the redress of a wrong done any man without force, and not especially provided for by law.

This, of all *actions*, is now most in use.—Where there arises an occasion of suit, that has neither fit name, nor certain form already prescribed; the clerks of the chancery, anciently, conceived a proper form of *action* for the thing in question: which was called an *action upon the case*, by the civilians, *Actio in factum*.

ACTION *upon the Statute*, *Actio super Statutum*, is a writ of *action*, brought against a man, upon an offence against a STATUTE, whereby an *action* is given that did not lie before.

Thus, where one commits perjury, to the prejudice of another, he who is damaged shall have a writ upon the statute, and a cause accordingly.

ACTION, *popular*, only differs from an *action* upon the statute, in that, where the statute gives the suit or *action* to the party grieved, or otherwise to one single person certain, it is called *action* upon the statute; and where the authority is given by the statute to every one that will sue for, it is an *action popular*.

Action is also divided into *perpetual* and *temporal*.

ACTION, *perpetual*, is that whose force is not determined by any period or term of time.

Of this kind were all civil *actions* among the ancient Romans; viz. such as arose from laws, decrees of the senate, and constitutions of the emperors; whereas *actions* granted by the prætor died within the year.

We have also *perpetual* and *temporary actions* now in England; all being perpetual, which are not expressly limited.

Divers statutes give *actions*, on condition they be pursued within the time prescribed.—Thus, the statute of 1 Edw. VI. gives *action* for three years after the offences committed, and no longer; and the statute of 7 Hen. VIII. cap. 3. does the like for four years: and that of 31 Eliz. cap. 5. for one year and no more.

But, as by the civil law no *actions* were so perpetual, but that by time they might be prescribed against; so, in our law, though *actions* be called *perpetual*, in comparison of those that are expressly limited by statute; yet is there a means to prescribe against real *actions*, after five years, by a fine levied, or a recovery suffered. See PRESCRIPTION.

Again, *actions* are either *local*, as ejectment, waste, &c. which must be brought in the county where the land lies; or *transitory*, such as debt, detinue, &c. which may be brought in any county.

ACTION *of a writ*, is when a person pleads some matter whereby he shews, that the plaintiff had no just cause to have the writ he brought, though it be possible he might have another writ or *action* for the same matter.—Such plea is called, a *plea to the action of the* WRIT.

When by the plea it appears, that the plaintiff has no cause of any *action* for the thing demanded, it is called a *plea to the action*.

ACTION, in affairs of *Commerce*, or ACTION of a COMPANY, is a part or share in the company's stock or CAPITAL, which consists of a number of such *actions*.

Actions in France and Holland amount to the same with *shares*, or *subscriptions*, in England.

Thus, the capital of a company, which has three hundred *actions* of a thousand livres each, consists of three hundred thousand livres. Hence a person is said to have four or six *actions* in such company, if he hath contributed to the capital, and be interested in it for four or six thousand livres.

A proprietor cannot have a deliberate vote in the assemblies of a company, unless he has a certain number of *actions*, fixed by the letters patent of its establishment; nor can he be a director, unless he has a still greater number of *actions*.

ACTION also denotes an obligation or instrument, which the directors of such companies deliver to those who pay money into their stock. See BANK and ACTIONARY.

Actions are always rising and falling, according as the company's credit gains or loses. The smallest whisper of an approaching war or peace, true or false, shall frequently occasion a considerable alteration in it. In the year 1710, the French company of the West, since called the India Company, arrived at such an immense degree of credit, that in six months time its *actions* rose to eighteen hundred *per cent.* a degree of temporary credit which no other company ever attained.

In 1672, the *actions* of the Dutch East India Company were at six hundred and fifty *per cent.* and they were never known to be higher.—But the war with France then coming on, they fell 250 *per cent.* in a few months. After the peace of Nimeguen, they rose again; and in 1718 were 600 *per cent.*

The French have three kinds of *actions*.—*Simple*, which are intitled to a share in all, both the profits and losses of

the company.—*Ventures*, intitled only to a profit of two *per cent.* fare; for which the king is security.—And *interested actions*, which claim the two *per cent.* secured by the king; and are also to share the excess of the dividend with the simple *actions*.

There were several other kinds of *actions* introduced by the brokers, in the busy days of the *Rue Quinquimpoix*; but they have since sunk into oblivion: these were called mother *actions*, daughter, grand-mother, grand-daughter, *actions*, &c.

To *melt* or *liquidate* an *action*, is to sell, or turn it into money, &c.

To *feed* an *action*, is to pay exactly when they become due, the several sums subscribed to the stock of the company, according to the several orders of council, made for the creation of the new *actions*.

ACTIONARY, or ACTIONIST, a term frequent in foreign news-papers: denoting the proprietor of an *action*, or share in a company's stock.

ACTIVE, ACTIVUS, something that communicates motion or action to another.

In this sense, the word stands opposed to *passive*.

Thus we say, an *active* cause, *active* principles, &c.

The quantity of motion in the world, Sir Isaac Newton shews, must be always decreasing, in virtue of the *vis inertiæ*, &c. So that there is a necessity for certain *active* principles to recruit it: such he takes the cause of gravity to be, and the cause of fermentation. Adding, that we see but little motion in the universe, except what is owing to these *active* principles.

ACTIVE *principles*, in *Chemistry*, are those which are supposed to act of themselves, and do not need to be put to action by others.

Salt, sulphur, and mercury, are usually considered by the chemists as *active principles*; and phlegm and earth as passive ones.

M. Homberg, and some late chemists after him, only make one *active principle*, viz. sulphur, or fire; which they take to be the source or principle of all the motion and action of the universe.

The term *active principles*, says Dr. Quincy, has been used to express certain divisions of matter, that are, by some particular modifications, comparatively *active*, in respect of others: such are spirits, oil, and salt, whose parts are better fitted for motion than those of earth and water: but with how much impropriety, will easily appear.

For, in a strict sense, all motion in matter is rather passion; and there is no *active principle*, unless we thus call the known powers of gravitation, attraction, and repulsion, on which the Newtonian philosophy is founded: so that let bodies exist under what modification soever, there can be no alteration made of these universal properties.—Hence, the division of matter into what, for distinction sake, may be called *spirit*, does not give it any properties inconsistent with this general law.

ACTIVE, in *Grammar*, denotes a word having a signification that serves to explain or denote an action.

Thus we say, a verb *active*, a conjugation *active*, &c. or an *active* participle.

ACTIVE *Verbs*, are such as do not only signify doing, or acting, but have also nouns following them, to be the subject of the action or impression.

Thus *to love*, *to teach*, are verbs *active*; because we can say, *to love a thing*, *to teach a man*.

Verbs *neuter* also denote an action, but are distinguished from verbs *active* in that they cannot have a noun following them. Such are *to sleep*, *to go*, &c.

Some grammarians, however, make three kinds of verbs *active*: the *transitive*, where the action passes into a subject different from the agent; *reflected*, where the action returns upon the agent; and *reciprocal*, where the action turns mutually upon two agents who produced it.

ACTIVITY, the power of acting, or the active faculty.

The *activity* of fire exceeds all imagination.—The *activity* of an acid, a poison, &c.—Bodies according to Sir Isaac Newton, derive their *activity* from the principle of ATTRACTION.

ACTIVITY *of a body*, *the sphere of*, is the space which surrounds it, so far as its efficacy or virtue extends to produce any sensible effect.

ACTON *Water*, a purging water of a well in a town near London, noted for the pungency of its salt. Its colour is whitish, its taste is sweetish, with a mixture of the same bitter which is in the EPSOM *water*. Its salt is not quite so soft, and is more calcareous than that of the Epsom water, being more of the nature of the salt of lime: it is however more nitrous than the other. A quantity of it being boiled high, and mixed with a solution of sublimate in pure water, throws down a yellow sediment. It strikes a deep red or purple with the tincture of logwood in brandy, as is usual with nitrous salts. It does not precipitate silver out of the spirit of nitre, as common salt does; a pint and a half of the water yield forty-eight grains of salt. See Allen's History of Purging Waters.

ACTOR, one that acts in the *drama*, one who represents some person or character, upon the theatre.

The drama, in its original, only consisted of a simple chorus, who sung hymns in honour of Bacchus: to that the primitive actors were no more than singing-men. Thespis was the first who took upon him to introduce a person or *actor*, who was to ease the chorus, by reciting the adventures of some of the heroes. Thus came the recitation, or declamation in use.

Æschylus, finding a single person tiresome, thought to entertain the audience more agreeably by the introduction of a second person, who should converse and make dialogue with the first. He likewise dressed his *actors* a little more decently than they had been before, and put on them the BUSKIN.

Sophocles, finding the two persons of Æschylus too few for the variety of incidents, added a third; and here the Greeks stopped; at least, we do not find, in any of their tragedies, above three persons in the same scene: though, in their comedies they took a greater liberty.

The moderns have brought a much greater number of *actors* upon the stage. This heightens the trouble and distress that should reign there, and makes a diversity, in which the spectator is sure to be interested.

Horace speaks of a kind of secondary *actors*, in his time, whose business was to imitate the first; and lessen themselves to become better foils to their principals. The proper business of these subaltern *actors* is unknown to us.

ACTOR, among *Civilians*, the proctor or advocate in civil courts or causes: as *actor ecclesiæ* has been sometimes used for the advocate of the church; *actor dominicus* for the lord's attorney; *actor villæ*, the steward, or head bailiff of a village.

ACTRESS, ACTRIX, a female who *acts*, or does the office of an *actor*.

Actresses, or women actors, were unknown to the ancients, among whom men *always* performed the part of women; and hence one reason for the use of masks among them. Mem. Acad. Inscrip. tom. vii. p. 188.

Actresses are said not to have been introduced on the English stage till after the restoration of king Charles II. who has been charged with contributing to the corruption of our manners, by importing this usage from thence. But this can be but partly true: the queen of James I. acted a part in a pastoral; and Prynn, in his Histriomastix, speaks of women actors in his time as whores; which was one occasion of the severe prosecution brought against him for that book. Whitlock, Mem. 1632. Wood's Athen. Oxon. tom. ii. p. 434.

ACTUAL, something that is real and effective; or that exists truly and absolutely.

In *Philosophy*, we say, *actual* heat, or cold; in opposition to *virtual* or *potential*.

Actual heat, considered actively, is the act of producing heat: passively taken, it is the quality whereby a body is denominated *hot*.—Virtual or potential heat, actively taken, is the power or faculty of producing heat; passively taken, it should be the power or faculty of being heated, or of receiving *actual heat*.

In medicinal language, *actual* is also opposed to *potential*, and is applied to any thing endued with a quality which operates by an immediate power inherent in it. For example: a red-hot iron, or fire, is called an *actual* cautery, in contradistinction from cauteries, which have a power of producing the same effects on animal solids, as *actual* fire; and which are called *potential* cauteries or caustics. Boiling water is *actually* hot, and brandy is *potentially* hot.

Actual sin is that committed knowingly, by a person arrived at years of discretion.

Original sin, in *Theology*, is that which, according to some divines, we contract by descent, as being the children of Adam.

ACTUARIÆ *naves*, in *Antiquity*, a sort of long ships, thus denominated as being particularly contrived for swiftness and expedition: they answer to what the French call *brigantines*.

Cicero, in an epistle to Atticus, calls a ship *decem scalmorum*, of ten banks of rowers, *actuariola*.

ACTUARIUS, or ACTUARIUS, primarily denotes a notary, or officer appointed to write down the acts or proceedings of a court, assembly, or the like.

In the Eastern empire, the *actuarii* were properly officers who kept the military accounts, received the corn from the *susceptores*, or store-keepers, and distributed it to the soldiers. These acted as a kind of brokers with the soldiers; made bargains with them for receiving their pay before it became due: for which there were fixed rates. Aquin. Pitiſc. and Du-Cange.

ACTUARIUS was also a title of dignity, in the court of Constantinople, peculiar to physicians. Du-Cange.

From

From an appellative, the word has become a proper name of a celebrated Greek physician, author of a treatise still extant, on urines. *Fabr. Bibli. Græc.* tom. xii. p. 635.

ACTUARIUS, or ACTUARY, also means the clerk who registered the acts and constitutions of the convocation.

ACTUATE, to bring into act, or put a thing in action. Thus an agent is said, by the schoolmen, to *actuate* a power, when it produces an act in a subject.—And thus the mind may be said to *actuate* the body.

ACTUATIO, *actuation*, signifies the change wrought on a medicine, or any thing else taken into the body, by the vital heat, which is necessary to make it act, and produce its effect.

ACTUS, in the ancient *Agriculture*, the length of one furrow; or as far as a plough goes before it turns. Plin. lib. xviii. cap. 3.

In English it may be rendered by a furlong.—It is also used as a determinate measure, when it contains 120 Roman feet. Virruvius.

ACTUS *minimus*, was 120 feet in length, and 4 in breadth; being equal to the SEXTANS, or sixth part of the JUGERUM, or ACRE.

ACTUS *major*, called also *actus quadratus*, was the square of 120 feet, or 14,400, being the *semis*, or half of the JUGERUM.—This was also denominated *actus*, and *actus*. Varro de Re Rust. lib. i. cap. 10.

ACUANITES, ACUANITÆ, in *Ecclesiastical History*, called more frequently MANICHEES.

They took the name from Acua, a disciple of Thomas, one of the twelve apostles. Bib. Univ. tom. xxiv. p. 330.

ACUBENE, in *Astronomy*, a name given by some to a Star on the southern claw of CANCER.

ACUHYAILI, in *Zoology*, the name of a very large serpent, of a poisonous quality, in America, more usually known by its name of CUCUACCU, or CUPAENDA.

ACUITION, in *Grammar, Prosody, and Medicine*. See ACUTION.

ACULEATE, ACULEATED, something that has ACULEI, or prickles.

Naturalists divide fishes into those with *aculeated*, and non-*aculeated* fishes. Phil. Transf. N° 314.

ACULEATUS *lapis*, in *Lithology*, a name given by some to the PUCHYUS *marinus lapis*, a small prickly West India fish. Willughby. See STICKLE-BACK.

ACULEI, among *Botanists, &c.* denote the prickles or spines of plants of the thorny kind.

The word is Latin, formed *from acus, a needle*.

Among *Zoologists, authors* is also used for the sting of a bee, scorpion, or the like.

The word *aculeus* is also used for certain parts of the ECHINI *marini*. See *Tab. of Fishes, Class* 10.

ACULEI *pinnarum*. See PINNÆ.

ACULEOSA, a name of the CARDUUS *polyacanthos*.

ACULER, in the *Manege*, is used for the motion of a horse, when in working upon volts he does not go far enough forward, at every time or motion, so that his shoulders embrace or take in too little ground, and his croup comes too near the centre of the volt. Horses are naturally inclined to this fault in making demi-volts.

ACUMEN, *acumen*, in the *Ancient Music*, was used to signify a sound produced by the *intension*, or raising of the voice.

Acumen differs from *intension*, as the *effect* from the *cause*. Aristoxen. p. 10, &c. Ed. Methom.

ACUMINA, among the ancients, denoted a kind of military ensign, or surprise, supposed to have been taken from the points or edges of darts, javelins, swords, or other weapons, viz. by examining whether they were bright or foul, sharp or blunted.

ACUPUNCTURE, or ACUPUNCTURATION, a method of curing many diseases, by pricking several parts of the body with a needle, or instrument of that form.

This is practised every day by the Chinese and Japanese and other nations in that part of the world. They perform the operation with a large gold or silver needle, which they strike into the several parts of the body, either with their hand, or with a hammer made on purpose. It is extremely surprising that so severe and desperate an operation should be practised so much by a people otherwise judicious, and that too in the head and breast, as well as in the abdomen, arms, legs, thighs, and many other parts of the body, nay even in the abdomen of women with child, when the foetus is restless.

Surgeons are furnished with *bridges*, wherein all the places in the body proper for the needle are designed by marks. M. Ten Ryne was an eye-witness of the use of this puncture on a soldier, who being afflicted with violent disorders of the stomach, and frequent vomitings at sea, suddenly relieved himself by pricking a thumb's breadth deep into four different places about the region of his EPIGASTRIUM. Ten. Ryn. Diss. de Acupunct. &c. Phil. Transf. N° 188 p. 731, &c.

We sometimes also find mention of an *acupuncture* practised in Europe; but this amounts to no more than the perforating or opening a part, e. g. the cornea, with the point of a needle; which has been done with good success, for the cure of an *hypophthalmia* and *hypopyon*.

It is chiefly used in diseases of the head and lower belly: it is applied to the head in head-achs, lethargies, convulsions, epilepsies, diseases of the eyes, &c. To the abdomen in colics, dysenteries, want of appetite, hysterical disorders, suppers, pains of the belly and joints, obstructions of the liver and spleen, &c.

ACURON, a name given to the ACUS.

ACUS, in *Ichthyology*, the name of a long and slender sea fish, of which there are two species, a larger and a smaller.

The larger is often a cubit long, and not thicker than a finger; its snout is long, tubular, and not fit all the way up, but only open at the end; its eyes are prominent. From the head to the anus it is of an hexagonal figure, and from the anus to the tail it is square. The anus is nearly in the middle of the body, and near it is a long longitudinal fissure for the eggs of the female. In all these respects, it very much resembles the hippocampus. It has two fins at the gills, and another on the back; these are all very small, and the tail in particular, scarce discernible, unless when the fish is alive and in motion. Its tail is a small single fin. It has a hard variegated skin, and has so little flesh about it, that it is not regarded at eatable. It is common in the Mediterranean, and is called by the Venetian fishermen, *bisso*, that is, the viper-fish. Its mouth is of a strange figure, opening onward at the end of the snout. See *Tab.* III. *of Fishes*, N° 25. Rondelet.

ACUS signifies also, with other authors, the *belone* or *pelphis*, called in English the GAR-fish, and by some the STURN-fish. The two distinct kinds understood by this two general term, are distinguished by the names of the authors who first named them; the TOBACCO-pipe fish, or that with the tubular nose, being called the *acus* of Aristotle; and the GAR-fish, or that with the horizontal open mouth, the *acus* of Oppian.

This last is in shape somewhat like the former, being very long and slender, with a round back, and a flat belly. Its nose or snout is very long, pointed and sharp, and its head flat. The back is of a greenish colour, and the sides and belly of a silvery white. The head is of a bluish green, and there is an obscurely purple dotted line which runs all along the back. The under jaw is longer than the upper, and both are thick-set with sharp teeth. It has only one back fin, and its tail is forked. Willughby. See Phil. Transf. vol. lxiii. part i. N° 21. from which it appears, that though the ACUS *maxima squamosa* be a fish that is a stranger to our seas, yet its *exuviæ* are common here. Bellonius has described another species of this fish, which is scaly, and has broader teeth, and is considerably larger than the common one, which either has no scales, or extremely minute ones. Its dotted lines on the back are said by some to be a single row of scales; and the author affirms, that the fish has no other. See LACERTUS.

ACUS is also used by some authors for the ASMODYTES, or *sand-eel*; a small EEL caught in the Indies. Willughby.

ACUS also signifies chaff.

ACUS *pastoris*, a name of the SCANDIX.

ACUS *rapistra*, a name of the GERANIUM *moschatum*.

ACUTE, *sharp*, something that terminates in a point, or edge; disposed either for piercing or cutting.

In this sense the word usually stands opposed to *obtuse*.

ACUTE *angle*, in *Geometry*, is that which is less than a right angle; or which does not *subtend* 90 degrees.

Such is the angle ACB (*Tab. Geometry, fig.* 68.)

ACUTE-*angled triangle*, is that whose three angles are all *acute*; called also an *oxygonous triangle*.

Such is the triangle ACB (*Tab. Geometry, fig.* 68.)

ACUTE-*angular section* of a cone, is used by the ancient *Geometricians* for the ELLIPSIS.

ACUTE-*angled cone*. See CONE.

ACUTE, in *Music*, is understood of a sound, or tone, which is sharp, shrill, or high, in respect of some other.

In which sense the word stands opposed to *grave*; and both these properties of sound depend on the quickness or slowness of the vibrations by which they are produced.

Sounds considered as *acute*, and *grave*, that is, in the relation of gravity and *acuteness*, constitute what we call *tone*, the foundation of all HARMONY.

ACUTE *accent*, in *Grammar*. See ACCENT.

ACUTE *disease*. See DISEASE.

ACUTELLA, in *Botany*, a name used by some to express the common ARGOVES, or KEST-HARROW, a small prickly plant, with red or white flowers and famous for its spreading and tough root. Gor. Emac. Ind. 2.

ACUTIATOR, in writers of the barbarous ages, denotes a person that whets, or grinds cutting instruments: called

called alſo in ancient gloſſaries, *acuter*, *acuarius*, *famiarius*, *cobarius*, &c. Du-Cange.

In the ancient armies there were *acuſtatores*, a kind of ſmiths, retained for whetting or keeping the arms ſharp. Again.

ACUITION, or ACUITION, in a general ſenſe, the ſame with acuating or ſharpening.

ACUITION, in *Grammar*, denotes the pronouncings or marking a ſyllable with an acute ACCENT.

ACUITION, or *acuition*, in *Medicine* and *Chemiſtry*, is uſed for ſharpening or increaſing the force of any medicine.

ACYROLOGIA, denotes an improper acceptation, or expreſſion, wherein a word or phraſe is uſed in ſome unuſual or oblique ſenſe, hardly reducible to the rules of language. The word is compounded of ἀκυρος, *improper*, and λογος, *ſermo*.

Such, e. gr. is the word *ſpera*, ſometimes uſed in Roman writers for *uxor*.

The *acyrologia* bears a near affinity to the *catachreſis*, inſomuch that divers terms and expreſſions, alledged as inſtances of the latter, are by others brought as examples of the former.

AD *hoſtias*, in *Antiquity*, is underſtood of a kind of puniſhment of criminals, condemned to be thrown to wild beaſts. The term was alſo applied to a ſort of gladiators hired to fight with wild beaſts.

Theſe are otherwiſe called *hoſtiarii*. Calv. Lex. Jur. p. 36.

AD *extra*, a term uſed among *School Divines*, in ſpeaking of the external operations of the Godhead.

Acts or operations *ad extra*, are properly thoſe whoſe term or effect is not within the divine eſſence; by which they ſtand oppoſed to operations *ad intra*. Creation, preſervation, regeneration, converſion, renovation, &c. are actions of God *ad extra*.

AD *intra*, among *School Divines*, is underſtood of thoſe acts of the Divine Being, whoſe term and effect is within his own eſſence. In which ſenſe acts or operations *ad intra*, ſtand oppoſed to thoſe *ad extra*.

AD *hominem*, among *Logicians*, is underſtood of a kind of ARGUMENT drawn from the belief or principles of thoſe we argue with, and which of conſequence muſt be concluſive to them, though otherwiſe diſbelieved by us; or, it is where a diſputant quits his own language and ſyſtem, and borrows that of his opponent to convince him, by turning his own prejudices or errors againſt himſelf.

This the ſchoolmen call *argumentum ad hominem*.

AD *libitum*, in ſometimes uſed in *Muſic*, for *je piace*, *at diſcretion*.

AD *ludos*, in *Antiquity*, a Roman ſentence, whereby criminals were condemned to entertain the people, either by fighting with beaſts, or with each other, and thus executing juſtice on themſelves. Kennet. Rom. Ant.

AD *metallia*, in *Antiquity*, the puniſhment of being doomed to work in the mines. Criminals condemned to this, were called *metallici*.

It were to be wiſhed that puniſhments of this kind could be ſubſtituted in lieu of our frequent executions; which are as repugnant to the principles of humanity as to thoſe of ſound policy.

AD *quidditici*, among ſchoolmen, include the relations, analogies, agreements, diſagreements, ſimilitudes, and diſſimilitudes of things.

Ad quiddities are properly thoſe attributes of things, which anſwer to the queſtion, *ad quid? to what?* By which they differ from mere QUIDDITIES, which anſwer to the queſtion, *quid ſit? what is it?* The latter enquire what things are in themſelves; the former what they are, *ad alia*. Herb. De Verit. p. 233.

AD *valorem*, is uſed in ſpeaking of the duties, or cuſtoms, paid for certain commodities, ſome things are rated by the weight, meaſure, tale, or the like; others pay *ad valorem*, according to the value or worth, ſworn to by the owner.

ADAGE, ADAGIUM, a proverb, or popular ſaying.

Eraſmus has made a large and valuable collection of Greek and Roman *adages*, from their poets, orators, philoſophers, &c.

Adage, proverb, and parœmia, are the ſame thing; but they differ from *gnome*, *ſentence*, and *apophthegm*.

ADAGIO, in *Muſic*, one of the words uſed by the Italians to denote a degree or diſtinction of time.

Adagio expreſſes a ſlow time; the ſloweſt of any except grave. Uſed ſubſtantively, it ſignifies a ſlow movement. Sometimes this word is repeated, as *adagio*, *adagio*, to denote a ſtill greater retardation in the time of the muſic.

ADAL, in the ſenſe of Paracelſus, ſignifies that part of plants, in which their medicinal virtue conſiſts; or the pure and active parts of plants, ſeparate from the impure and inert.

ADALIDES, in the Spaniſh policy, are officers of juſtice, for matters touching the military forces.

In the laws of king Alphonſus, the *adalides* are ſpoken of, as officers appointed to guide and direct the marching of the forces in time of war.—Lopez repreſents them as a ſort of judges, who take cognizance of the differences ariſing upon excurſions, the diſtribution of plunder, &c.

ADAMANT, ADAMAS, in *Natural Hiſtory*, &c. an ancient name for a precious ſtone, by us called a DIAMOND. *Adamas* is uſed by ſome ancient *Naturaliſts*, for the ſpume or *ſcoria* of gold; which is caſt away, as not being malleable. This is particularly called ἀχρυσος ἀδαμαντα, and is miſtaken by Pliny for a gem of that name.

ADAMANT is alſo uſed for a ſpecies of iron, denoting the hardeſt, or higheſt tempered part thereof.

This is ſometimes called the *adamantine* part of iron.

Mr. Boyle more particularly gives the denomination *adamas lucidus*, to a diamond in his poſſeſſion, which had the faculty of ſhining in the dark; a property ſince diſcovered in many others, at leaſt when excited by friction. Vide Boyle, Phil. Work. Abr. tom. i. p. 494. Id. tom. iii. p. 155.

ADAMANT is ſometimes alſo uſed for the MAGNET, or load-ſtone.

In which ſenſe Skinner thinks it may be beſt derived from the French *aimant*, which ſignifies the ſame.

ADAMANTII, in *Church Hiſtory*, a name given by ſome Chriſtian hiſtorians to the followers of Origen, ſurnamed *Adamantius*, becauſe of his unwearied pains in reading and writing; or the ſtrength and acuteneſs of his reaſoning, according to ſome; or rather, as Heumon ſays, whoſe name was *Adamantius*: however, Euſebius ſays, this was a common name given to Origen, without aſſigning any reaſon for it. Euſ. lib. vi. cap. 14.

ADAMAS, in *Aſtrology*, a name given to the moon.

ADAMI *pomum*, in *Anatomy*, a protuberance in the fore-part of the throat.

Some fancy it thus called upon a ſtrange conceit, that a piece of the forbidden apple, which Adam eat, ſtuck by the way, and was the occaſion of it.

In reality, it is only the convex part of the firſt cartilage of the *larynx*, called *ſcutiformis*.

The name, Adam's apple, is alſo given to a kind of fruit frequent in Italy, reſembling a lemon, ſaid to be a good remedy againſt the itch.

ADAMIC *earth*, is a name ſome have given to common clay; called alſo *terra ſuica*, *rubella*, and *lutum*. Woodw. Meth. Foſ. p. 4.

The occaſion of the name we ſuppoſe to be, that this is taken for the *adamah*, or ruddy earth, of which the firſt man was formed.

This appellation was likewiſe given to the mud depoſited by ſea-water, which is a ſediment of the moſt ſlimy and unctuous parts contained in it.

ADAMITES, ADAMITÆ, a ſect who took upon them to imitate the nakedneſs of Adam: as if man had been reinſtated in his original innocence.

The critics explain the name Adam, אדם, from whence the term ariſes, variouſly; ſome *by earth*, others by *red*, others by *acquieſcence*.

Prodicus was their author, according to the account given by Theodoret; though according to Tertullian and Clement of Alexandria, the followers of Prodicus were never called by this name. Epiphanius is the firſt writer who ſpeaks of the *Adamites*, and he places them towards the end of the ſecond century.—They were, in reality, a branch ſprung out of the CARPOCRATIANS and BASILIDIANS.

This ſect is ſaid to have ſtarted up afreſh in the fifteenth century, under Picard, their leader; who pretended to re-eſtabliſh the law of nature, which, according to him, conſiſted in two things, viz. community of women, and nakedneſs.—Theſe laſt walked naked in the public places; whereas the former only put off their cloaths in their aſſemblies.

An ingenious writer, viz. Beauſobre, has ſhewn that the *Adamitiſm*, i. e. the nakedneſs of theſe people, is a mere calumny, forged by their adverſaries, the Cataſtines and Papiſts, at the time when the Vaudois firſt appeared in the country.

Jovet and Moreri ſpeak of *Adamites* in England; and indeed the Romaniſts and Reformed mutually reproach each other with having *Adamites* among them.

ADAMITES, in *Church Hiſtory*, a name given by ſome writers to the firſt patriarchs, the ſons or deſcendants of Adam by Seth. In which ſenſe *Adamites* amount to the ſame with *Sethites*, and ſtand diſtinguiſhed from *Cainites*. There are divers traditions concerning the quarrels, wars, &c. between the *Adamites* and the *Cainites*.

ADAMITES, *Præ*. See PRE-ADAMITES.

ADAMITUM and *Adamites*, the hardeſt white ſtones, and ſtones in the bladder. The former, Paracelſus ſays, are a ſpecies of TARTAR.

ADAMAS, *Adam*, this is uſed in an *alchymiſtical* ſenſe, to ſignify the philoſophers ſtone, which they call an animal, and ſay it has carried its invisible *Eve* in its body, ever ſince the moment they were united by the creator.

ADAR, in the Hebrew *Chronology*, the twelfth month of

their ecclesiastical year, and the sixth of their civil year. It contains only nine and twenty days, and answers to our February, and sometimes enters into the month of March, according to the course of the moon. On the seventh and thirteenth days of this month the Jews observe two fasts; the former on account of the death of Moses, and the latter called that of Esther, in commemoration of the affair of Haman. The feast of *purim* is celebrated on the fourteenth day. Esther ix. 17.

ADARCE, in the *Materia Medica* of the ancients, a faltish humour concreting about the stalks of reeds, and other vegetable matter, in form of incrustations.

The ancients speak of *adarce*, as chiefly produced in Cappadocia and Galatia, though we also read of it in Italy; and of a native kind produced in Indian reeds, much as sugar in the cane.

Its colour is like that of the fine powder of the Assian stone, or *sarcophagus*, and its substance all lax and porous, much like the bastard sponge; so that it might be called the bastard sponge of the marshes.

It is a *topic* adapted to rub and scour the skin in a leprosy, sun-burning, tetters, freckles, and such like blemishes, being on the whole of an acrimonious quality. Dr. Plott describes it in his Natural History of Oxfordshire. Tho' some have supposed the incrustations, often seen about our springs, to be the same with the *adarce* of the Greek physicians; this seems a mistake, as these incrustations possess none of the virtues or properties of that substance; it being principally composed of sea-salt, of which those contain no particle, being merely a mixture of earth and spar.

ADARCON, *adarconum*, an ancient coin mentioned in Scripture, usually of gold, derived, as some think, from those gold pieces coined by Darius, called *Darycos*.

Hesius makes the *adarcon* only equal to the Attic *drachma*; but bishop Cumberland, after the scholiasts of Aristophanes and Harpocration, twice as much.

ADARIGES, a name for SAL *ammoniac*.

ADARME, in *Commerce*, a small Spanish weight used through their American provinces, equal to the fifteenth part or an ounce.

Stephanus renders it in English by a dram.

ADARNECH, a name for OXYMEL.

ADARTICULATION, is used, by some physicians, for *ἀρθρωσις*, by others, for *διαρθρωσις*. See ARTHRODIA, and DIARTHROSIS.

ADATAIS, or ADATYS, a muslin or cotton cloth, very fine and clear, of which the piece is ten French ells long, and three quarters broad. This muslin comes from the East Indies, and the finest from Bengal.

ADCHER, in the *Materia Medica*, a name given by Avicenna and Serapion to the SCAMMONY, or camel's hay. This seems to have been, at that time, the common Arabian name of this drug; but Garcias tells us, that in his time the Arabs called it *adher*.

It is to be observed, however, that the Arabians have not confined this word to the SCAMMONY alone, but express by it all the kinds of *resins*. Thus, Avicenna tells us, that the *adcher* is of two kinds, the one bearing no fruit, the other bearing a hard black fruit: this plainly belongs not to the *scammony*, but the common *resin*, of which Dioscorides has, in the same manner, described two kinds, thus differing from one another.

ADCORDABILES *denarii*, in ancient *Law-books*, denote money paid by the vassal to his lord, in the nature of a fine, upon the selling or exchanging of a FEUD.

The word is formed from *accordare*, to *agree*.

ADCRESCENTES, in the Roman *Empire*, the same with ACCENSI.

ADDAC, in *Natural History*, the name by which the Africans call the common ANTELOPE. See GAZELLA.

ADDEPHAGIA, in *Medicine*, a term used by some physicians, to denote a greediness in children, whereby they load themselves with new food, before the old is digested. This is sometimes also written corruptly, *adephagia*.

The word is compounded of *ad*, *much*, and *φαγω*, *I eat*. Some use *addephagia* in a more extensive sense, for voraciousness in general, so as to comprehend the BULIMIA, PICA, and MALACIA.

ADDER, in *Natural History*, a venomous reptile of the serpent kind, more usually called a VIPER.

ADDER is also sometimes confounded with *asp*; thus the deaf *adder*, spoken of in the English Bible, is not properly the *adder*, but the *asp*. Calmet.

The *adder* differs from the snake, in that the former is much shorter for its bigness, especially his tail below the vent; that it is marked on the back with black lines or spots, which the snake wants; that its belly is blackish, and of one colour, whereas the snake's is particoloured, of a pale yellow and blue; that it never grows to the bigness which some snakes attain to; and lastly, that it is *ovoviparous*, whereas the snake is *ovoparous*.

ADDER, *Sea*, the English name of a species of SYNGNATHUS, with a round body, and no pectoral or tail fins.

ADDER, *Water*, in *Zoology*, a name given to the NATRIX.

ADDER-BOLTS. See DRAGON-FLIES.

ADDER-STUNG, is used in respect of cattle when stung with any kind of venomous reptiles; as adders, scorpions, &c. or bit by a hedge-hog, or thrive.

For the cure of such bites, some use an ointment made of dragon's blood, with a little barley-meal, and the whites of eggs.

ADDER'S-TONGUE, in *Botany*, a medicinal plant, so called either from its resembling or its curing the bite of a viper.

It is more commonly called *ophioglossum*.

No part of the fructification of this plant is visible, except the fruit. This is an oblong, double, or distichous capsule, divided by a great number of transverse articulations, into many cells, each of which when mature, opens transversely, and is found to contain a great number of small seeds of a fubovate figure.

Caspar Bauhine describes what he calls three species of this plant.

Tournefort makes eight species of OPHIOGLOSSUM, which are only the varieties of the common European kind, mentioned above.

This is a spring plant, and is only to be found in April and May. It is not uncommon in wet meadows, and is easily distinguished among other spring plants by its spike, or tongue.

It is esteemed one of the best vulnerary herbs this country produces; but it is more in use among the common people than in the shops. They give its juice internally, and use the herb bruised, or an ointment prepared from it, with lard, or May-butter, externally, as the same time. Farriers, &c. prepare an ointment of this herb, called ADDER'S *tongue ointment*, used as a remedy against the bots of venomous beasts. Phil. Transf. vol. xlix. part ii. N° 112.

ADDEVISORY. See HISTORY.

ADDEXTRATORES, or ADDUCTORII, in the court of Rome denote the pope's SQUIRE-bearers.

Some suppose them thus called, on account of their walking at the popes right hand, when he rides to visit the churches.

ADDICE, see ADZE.

ADDICO, see ADDICTIO.

ADDICTI, in *Antiquity*, insolvent persons, or those who being sentenced to pay a debt, but unable to do it, were adjudged to a kind of temporary servitude to the creditor. In this sense, *addicti* were a species of *servi*; from whom, however, they differed in this, that a slave, when discharged, became a *libertus*; whereas an *addictus* became *ingenuus*. Again, a slave could not be discharged without the consent of his master; whereas the *addictus* was discharged of course, when his debt was satisfied. Pitiſc. Lex. Ant. & Calv. Lex Jur.

ADDICTIO, ADJUDICATION, in the Roman law, a transferring, or passing over goods to another; whether by sentence of a court, or in the way of sale to him that bids most for them.

The word stands opposed to *abdictio*, or ABDICATION. It is formed of *addico* one of the stated words used by the Roman judges, when they allowed the delivery of the thing or person to whom judgement had passed.

Hence, goods thus adjudged by the prætor, to the right owner, were called *bona addicta*; and the debtors delivered up, in like manner to their creditors, to work out their debt, were called *servi addicti*.

ADDICTIO *in diem*, denotes the adjudging of a thing to a person for a certain price; unless by such a day the owner or some other person, give more for it.

ADDITAMENT, ADDITAMENTUM, a thing added to another. It signifies the same as EPIBLEMA.

Additaments, in *Physic* and *Chemistry*, are things superadded to the ordinary ingredients of any compolition.

ADDITION, the act of joining one thing to another, or of augmenting a thing, by the accession of others.

ADDITION is also used for the thing added with itself.

ADDITION, in *Arithmetic*, is the first of the four fundamental rules, or operations, of that art.

Addition consists in finding the amount of several numbers, or quantities, several added one to another. Or *addition* is the invention of a number, from two or more homogeneous ones given, which is equal to the given numbers taken jointly, or together.

The number, thus found, is called the *sum*, or aggregate of the numbers given.

The character of *addition* is +, which we usually express by *plus*. Thus 3+4 denotes the sum of 3 and 4; and is read 3 *plus* 4.

The *addition* of simple numbers is easy. Thus it is readily perceived that 7 and 9, or 7+9, make 16; and 31+25 make 56.

In longer or compounded numbers, the business is performed by writing the given numbers in a row downwards; homogeneous under homogeneous, i. e. units under units, tens under tens, &c. and singly collecting the sums of the respective columns.

To do this, we begin at the bottom of the outmost row or column to the right; and if the amount of this column

lumn do not exceed 9, we write it down at the foot of the same column: if it doth exceed 9, the excess is only to be written down, and the rest reserved to be carried to the next row, and added thereto; as being of the same kind or denomination.

Suppose, e. gr. the numbers 1357 and 172 were given to be added: write either of them, v. gr. 172, under the other 1357; so as the units of the one, viz. 2, stand under the units of the other, viz. 7; and the other numbers of the one, under the correspondent ones of the other, viz. the place of tens under tens, as 7 under 5; and that of hundreds, viz. 1, under the place of hundreds of the other,

1357
172
1529

3. Then, beginning, say 2 and 7 make 9; which write underneath; also 7 and 5 make 12; the last of which two numbers, viz. 2, is to be written, and the other one reserved in your mind to be added to the next row, 1 and 3: then say, 1 and 1 make 2, which added to 3 make 5: this write underneath, and there will remain only 1, the first figure of the upper row of numbers, which also must be writ underneath; and thus you have the whole sum, viz. 1529. The same method will extend to any number of sums, which are required to be united in one.

ADDITION *of numbers of different denominations*, for instance, of pounds, shillings, and pence, is performed by adding or summing up each denomination by itself, always beginning with the lowest; and if, after the *addition*, there be enough to make one of the next higher denomination, for instance, pence enough to make one or more shillings, they must be added to the figures of that denomination, that is, to the shillings; only reserving the odd remaining pence to be put down in the place of pence. And the same rule is to be observed in shillings with regard to pounds.

For an instance, 5 pence and 9 pence make 14 pence; now in 14 there is once 12, or a shilling, and two remaining pence; the pence set down, and 1 shilling to be added to the next column, which consists of shillings. Then 1 and 8 and 2 and 5 make 16: the 6 put down, and carry the 1 to the column of tens; 1 and 1 and 1 make three tens of shillings, or 30 shillings: in 30 shillings there is once 20 shillings, or a pound, and 10 over; write 1 in the column of tens of shillings, and carry 1 to the columns of pounds; and continue the *addition* of pounds, according to the former rules.

l.	s.	d.
120	15	9
65	12	5
9	8	0
195	16	2

So, half of an even sum of shillings will be carried to the pounds; and the odd one (where it so happens) set under the tens of the shillings.

ADDITION *of Decimals*, is performed after the same manner as that of whole numbers; as may be seen in the following example:

630.953
51.0807
306.27
987.3037

ADDITION *of Vulgar Fractions*, see under FRACTION.

ADDITION *of Ratios* is used by some authors in the same sense with COMPOSITION of RATIOS, which see.

ADDITION *in Algebra*, or the ADDITION *of Species*, is performed by connecting the quantities to be added, by their proper signs; and also by uniting into one sum, those that can be so united. See QUANTITY, SPECIES, &c. Thus a and b make $a+b$; a and $-b$ make $a-b$; $-a$ and $-b$ make $-a-b$; $7a$ and $9a$ make $7a+9a$; $-a\sqrt{ac}$ and $b\sqrt{ac}$ make $-a\sqrt{ac}+b\sqrt{ac}$, or $b\sqrt{ac}-a\sqrt{ac}$; for the order in which they are written, makes no alteration in their value.

But, particularly, 1. Affirmative quantities of the same species, or kind, are united by adding the prefixed numbers whereby the species are multiplied.

Thus, $7a+9a$ make $16a$. And $11bc+15c$ make $26bc$.

Also $\frac{a}{5}+\frac{a}{5}$ make $\frac{8a}{5}$; and $2\sqrt{ac}+7\sqrt{ac}$ make $9\sqrt{ac}$; $b\sqrt{ab-2x}+7\sqrt{ab-2x}$ make $13\sqrt{ab-2x}$. And in like manner $6\sqrt{3}+7\sqrt{3}$ make $13\sqrt{3}$. Again $a\sqrt{ac}+b\sqrt{ac}$ make $a+b\sqrt{ac}$, by adding together a and b. As numbers multiplying $\sqrt{ac}$. And so $\frac{2a+3\sqrt{3ax-x^2}}{a+x}+\frac{3a\sqrt{3ax-x^2}}{a+x}$ make $\frac{5a+3\sqrt{3ax-x^2}}{a+x}$, since $2a+3a$ and $3a$ make $5a+3a$.

2. Affirmative fractions, which have the same denominator, are added together by adding their numerators.

Thus $\frac{1}{4}+\frac{2}{4}$ make $\frac{3}{4}$, and $\frac{2ax}{b}+\frac{3ax}{b}$ make $\frac{5ax}{b}$; and thus $\frac{8a\sqrt{cx}}{2a+\sqrt{cx}}+\frac{17a\sqrt{cx}}{2a+\sqrt{cx}}$ make $\frac{25a\sqrt{cx}}{2a+\sqrt{cx}}$ and $\frac{aa}{c}+\frac{ba}{c}$ make $\frac{aa+ba}{c}$.

3. Negative quantities are added after the same manner as affirmative. See NEGATIVE.

Thus, -2 and -3 make -5; $-\frac{4ax}{b}$ and $-\frac{11ax}{b}$ make $-\frac{15ax}{b}$; $-a\sqrt{ax}$ and $-b\sqrt{ax}$ make $-a-b\sqrt{ax}$.

When a negative quantity is to be added to an affirmative one, the affirmative must be diminished by the negative one.

Thus, 3 and -2 make 1; $\frac{11ax}{b}$ and $-\frac{4ax}{b}$ make $\frac{7ax}{b}$; $-a\sqrt{ax}$ and $b\sqrt{ax}$ make $b-a\sqrt{ax}$.

And note, that when the negative quantity is greater than the affirmative, the aggregate sum will be negative. Thus, 2 and -3 make -1; $-\frac{11ax}{b}$ and $\frac{4ax}{b}$ make $-\frac{7ax}{b}$; and $2\sqrt{ax}$ and $-7\sqrt{ax}$ make $-5\sqrt{ax}$.

ADDITION *of irrational Quantities*.—If they be of different denominations, reduce them to the same denomination; and if they be then commensurable, add the rational quantities without the vinculum; and to their sum prefix the radical sign.—The rest as in the addition of rationals.

Thus, we shall find $\sqrt{8}+\sqrt{18}=2\sqrt{2}+3\sqrt{2}=5\sqrt{2}=\sqrt{50}$. On the contrary, $\sqrt{7}$ and $\sqrt{5}$ being incommensurable, their sum will be $\sqrt{7}+\sqrt{5}$.

ADDITION, in *Law*, is that name, or title, which is given to a man over and above his proper name, and surname; to shew of what estate, degree, or mystery he is; and of what town, village, or country.

Additions of Estate, or quality, are yeoman, gentleman, esquire, and such like.

Additions of Degree, are those we call names of dignity; as knight, lord, earl, marquis, and duke.

Additions of Mystery, are such as scrivener, painter, mason, and the like. See CHORCHILL.

Additions of Place are, of Thame, of Dale, of Woodstock.—Where a man hath houshold in two places, he shall be said to dwell in both; so that his *addition* in either may suffice. Knave was anciently a regular *addition*.

By stat. 1 Hen. V. cap. 5. it was ordained, that in such suits or actions where process of outlawry lies; such *addition* should be made to the name of the defendant, to shew his estate, mystery, and place where he dwells; and that the writs, not having such *additions*, shall abate, if the defendant take exception thereto; but not by the office of the court.—The reason of this ordinance was, that one man might not be troubled with the outlawry of another; but by reason of the certain *addition*, every person might bear his own burden.

If one be of the degree of a duke, earl, &c. he shall have the *addition* of the most worthy dignity. 2 Inst. 669.

Such titles, however, are not properly *additions*, but names of dignity. The title of knight or baronet, is part of the party's name, and ought to be rightly set; but the titles of esquire, gentleman, or yeoman, &c. being no part of the name, but *additions*, as people please to call them, may be used, or not used, or if varied, it is not material. 1 Lill. 34.

An earl of Ireland is not an *addition* of honour here in England; but such a person must be written by his Christian and surname, with the addition of esquire only; and the sons of English noblemen, although they have given them titles of nobility, in respect to their families, if you sue them, they must be named by their Christian and surnames, with the addition of esquire; as—such-a-one, esquire, commonly called lord A, &c. 2 Inst. 596, 666.

No *addition* is necessary, where process of outlawry doth not lie. 1 Salk 5. If a city be a county of itself wherein are several parishes, *addition* thereof, as *de Londini*, is sufficient; but *addition* of a parish not in a city, must mention the county, or it will not be good. 1 Danv. 237.

ADDITION, in *Music*.—The note or mark of *addition* is a dot placed on the right side of a note, to signify, that the time of the sound of such note, is to be lengthened half as much more, as it would otherwise be.

A note of *addition* amounts to the same with what is by some old English authors called *prick of perfection*.

Thus a semibreve, when marked with a dot, is to be as long as three minims; the minim, with the like dot, to be as long as three crotchets; the crotchet as three quavers, &c. See CHARACTER.

ADDITIONS, in *Heraldry*, denote a kind of bearings, in coats of arms, wherein are placed rewards, or additional marks of honour.

In which sense, *additions* stand opposed to ABATEMENTS, or DIMINUTIONS. See DIFFERENCE.

Additions resemble, but differ from ordinaries. To the

claſs of *additions* belong a bordure, quarter, canton, gyron, pile, flaſquet, hauncheo, voiders, ermine, and an inueſcutcheon gules, called alſo an *eſcutcheon of pretence*. On any of theſe may an *addition* of honour be placed, according to the pleaſure of the prince, or the fancy of the herald; which reward deſcends to none of the family, except the perſon's own direct line. In this manner the arms of a kingdom have been ſometimes given, by way of *addition*, to a private ſubject.

ADDITIONS, in *Diſtilling*, a name given to ſuch things as are added to the waſh, or liquor, while in a ſtate of fermentation, in order to prove the vinoſity of the ſpirit, procure a larger quantity of it, or give it a particular flavour.

All things of whatever kind, thus added in the time of fermentation, are called by thoſe of the buſineſs, who ſpeak moſt intelligently, *additions*; but many confound them with things of a very different nature, under the name of FERMENTS.

The *additions* uſed in the diſtillery, may be reduced to four general heads. 1. *Salts*, 2. *Acids*, 3. *Aromatics*, and 4. *Oils*. A little tartar, nitre, or common ſalt finely powdered, may be added to the liquor while fermenting, eſpecially in the beginning of the operation; or in their ſtead a little of the vegetable, or finer mineral acids, may be dropped in at different times, when found neceſſary. Theſe are of great uſe, eſpecially in the fermenting ſolutions of treacle, honey, and the like ſweet and rich vegetable juices, which either wholly want an acid in themſelves, or have it in too ſmall a proportion, or have been robbed or diveſted of it. The proper acids for this purpoſe are, the juice of Seville oranges, or lemons, or the ſpirit of ſulphur, or Glauber's ſpirit of ſalt, or, what is greatly preferable to all theſe, a particular aqueous ſolution of tartar, a ſucceſſaneum for which may be ramaſinds, or the *lobs* of ſome very acid fruits, or the *mother ſubſtantia vini*. On this foundation ſtands that ingenious practice of uſing a ſuitable proportion of the ſtill bottoms, or the remaining waſh, in the ſubſequent brewing.

After the ſame manner, a very conſiderable quantity of any eſſential vegetable oil, may by proper management be converted into a ſurpriſingly large quantity of inflammable ſpirit; but great care in this caſe muſt be had not to drop it in too faſt, nor too much at a time; this might damp the fermentation; and, indeed, the adding a large quantity of oil at once, in the common way of ſtopping the fermentation at any point required.

The beſt method of all, of introducing the oil, ſo as to avoid all inconvenience, is to reduce it firſt to an eſſentiaccharum, by grinding it in a mortar, with a due quantity of fine ſugar in powder. The oil thus added, with its particles diſunited, and in form of powder, will readily mix with the liquor, and immediately ferment with it.

A large proportion of rectified ſpirit, or of any other ſpirit, may, by prudent management, be alſo introduced into the fermenting liquor; and this will always come back with a large addition to the quantity of ſpirit, that would otherwiſe have riſen from the diſtillation. Shaw.

ADDITIVE, denotes ſomething to be added to another.

Geometricians ſpeak of *additive ratios*; aſtronomers of *additive equations*, &c.

ADDITIVE *ratio* is uſed, by ſome writers, for that whoſe terms are diſpoſed to addition, that is, to compoſition, in oppoſition to *ſubſtractive ratio*, whoſe terms are diſpoſed to ſubtraction, i. e. to diviſion. Phil. Tranſ. N° 257. Suppoſe the line *ac* divided in the points *b* and *c*.

a *b* *c*

the ratio between *ab* and *bc* is *additive*: becauſe the terms *ab* and *bc* compoſe the whole *ac*. But the ratio between *ac* and *bc* is ſubtractive, becauſe *ac* and *bc* differ by the line *ab*.

ADDITIVE *equations*, in *Aſtronomy*, thoſe which are to be added to the ſun's mean ANOMALY, in order to find the true one. V. Hiſt. Acad. Roy. des Scienc. 1720. p. 218.

ADDOUBORS, in *Law*. See REDUBORS.

ADDRESS, in a general ſenſe, is uſed for ſkill and good management, and of late has been adopted from the French, and is uſed in genteel phraſe; and alſo in *Commerce*, as ſynonymous with directions to a perſon or place. The word is formed of the French verb *addreſſer*, *to direct any thing to a perſon*.

ADDRESS, means alſo a diſcourſe preſented to the king, in the name of a conſiderable body of his people; to expreſs or notify their ſentiments of joy, ſatisfaction, or the like, on ſome extraordinary occaſion.

We ſay the words *adreſs*, the common *addreſs*. — *Addreſſes* were firſt ſet on foot under the adminiſtration of Oliver Cromwell. — At Paris, their office of intelligence is called *bureau d'adreſſe*.

ADDUCENT *Muſcles*, or ADDUCTORS, are thoſe which bring forward, cloſe, or draw together, the parts of the body whereto they are annexed.

The word is compounded of *ad*, *to*, and *ducere*, *to draw*, or *bring*.

Adductors, or *adductors*, ſtand oppoſed to *abducent*, or *abductors*.

ADDUCTION, in *Anatomy*, the motion, or action, of the ADDUCENT muſcles. See ADDUCTOR.

ADDUCTOR *oculi*, a muſcle of the eye; ſo called becauſe it inclines its pupil towards the noſe.

It is alſo called *obliquus*; becauſe it directs the eye toward the cup in drinking.

ADDUCTOR *pollicis*, is a muſcle of the thumb which ariſes tendinous, and aſcends obliquely towards a broad termination, at the ſuperior part of the firſt bone of the thumb. — *See Tab. Anat. (Myol.) fig.* I. *n.* 31, *&* *fig.* VII. *n.* 7. — Its office is to bring the thumb near the forefinger.

This muſcle is called by Albinus, and the generality of writers, the *abductor indicis*, and by Winſlow, the *ſemi-interoſſeus indicis*.

ADDUCTOR *pollicis pedis*, called alſo *anitheuar*, is a muſcle of the great toe, which ariſes from the inferior part of the *os cuneiforme tertium*, and is inſerted into the internal part of the *oſſa ſeſſamoidea* of the great toe; which it draws nearer the reſt.

ADDUCTOR *auricis*, is a muſcle of the fore-finger, ariſing from the inſide of the bone of the thumb, and inſerted into the firſt bone of the fore-finger, which it draws towards the thumb.

ADDUCTOR *minimi digiti pedis*; the ſame as TRANSVERSALIS *pedis*.

ADDUCTOR *proſtatæ*, a name given by Santorini to a muſcle, which he alſo calls *levator proſtatæ*; and which Winſlow calls *proſtaticus ſuperior*. Albinus, from its office, has very properly called it *compreſſor proſtatæ*.

ADDUCTOR *brachii* ſerves to draw the arm toward the trunk of the body; though Winſlow finds its office more complicated, and that it acts in concurrence with the flexors and extenſors, in bending and extending the arm.

ADEB, in *Commerce*, the name of a large Egyptian weight uſed principally for rice, and conſiſting of two hundred and ten okes, each of three rotoles, a weight of about two drams leſs than the Engliſh pound. But this is no certain weight: for at Roſetta the *adeb* is only one hundred and fifty okes. Pococke, Egypt.

ADEC ſignifies ſour milk.

ADECTOS, an epithet applied to a medicine that allays the ſenſe of pain, or the uneaſineſs created by ſtimulants.

ADEL-*fiſh*, a name given by ſome nations to the *lavaretus*, or *albula nobilis*.

Theſe are generally treated of by authors as two different kinds of fiſh. But Artedi contends, that they are the ſame ſpecies, and diſtinguiſhes them by the name of the *eregenus*, with the upper jaw flat, and longer than the under; and with fourteen rays in the back-fin.

ADELING. See ATHELING.

ADELPHIANI, in *Church Hiſtory*, a ſect ſo called from their leader *Adelphius*.

They were ſingular in this, that they kept the Sabbath as a faſt.

ADELSCALC, in *Ancient Cuſtoms*, denotes the ſervant of the king.

The word is alſo written *adelſcalche*, and *adelſcalcus*. It is compounded of the German *adel*, or *edle*, *noble*, and *ſcalc*, *ſervant*. Among the Bavarians, *adelſcalci* appear to have been the ſame with royal *thanes* among the Saxons, and theſe called *miniſtri regis* in ancient charters.

ADEMPTION, ADEMPTIO, in the *Civil Law*, the REVOCATION of a grant, donation, or the like.

The *redemption* of a legacy may be either expreſs; as when the teſtator declares in form, that he revokes what he had bequeathed; or *tacit*, as when he only revokes it indirectly or implicitly. See RECISION.

Thus if A by will gives his daughter M 1000*l.* to be firſt paid after his death, before a ſhare out of the dividend of his eſtate; and afterward, on her marriage, an agreement be made for what the ſhould have out of A's eſtate, that it ſhould be only 1200*l.* which ſhould be in full of what was intended thereout; this agreement is an *ademption* of the legacy.

ADEN, a gland. See GLAND.

ADENANTHERA, in *Botany*, the name of a genus of plants belonging to the claſs of *decandria monogynia*, the characters of which are theſe: the perianthium is very ſmall, and is compoſed only of one leaf divided into five ſegments at the edge; the flower conſiſts of five petals, and is of a campanulated form; the petals are pointed and ſeſſile, and they turn inwards, and are hollowed underneath; the ſtamina are ten erect tubulated

filamants,

filaments, a little shorter than the flower; and the antheræ are roundish and incumbent, and bear on their exterior apex a globofe glandule. The germen of the piſtil is oblong and gibbous on the back in the lower part. The ſtyle is tubulated, and of the length of the ſtamina, and the ſtigma is ſimple. The fruit is a long compreſſed pod, in which are ſeveral round ſeeds.

ADENOGRAPHY, that branch of *Anatomy* which deſcribes the glands, and the glandular parts of the body.

The word is compounded of *ἀδὴν*, *gland*, and *γράφω*, *I deſcribe*.

Adenography is the ſame with what ſome others call *adenology*, or the adenological part of *Anatomy*.

ADENOS, a kind of cotton, otherwiſe called marine cotton. It comes from Aleppo by the way of Marſeilles, where it pays 20 *per cent.* duty, according to the TARIFF of the year 1760. Its valuation, by the ſame *tariff*, is of 76 livres 16 ſols.

ADENOSUS *obſtruſio*, in *Medicine*, a crude hard tubercle, difficult of diſcuſſion, and reſembling the appearance of a gland.

ADEPS, among *Phyſicians*, FAT. This is an animal oil, ſecreted from the blood, and contained in the *membrana adipoſa*, or, as Boerhaave calls it, the *membrana celluloſa*; which is not a ſingle membrane, but a *congeries* of a great number of membranous *lamineæ*, joined irregularly to each other at different diſtances, ſo as to form numerous interſtices of different capacities, which communicate with each other. Theſe interſtices have been named *cellulæ*, and the ſubſtance made up of them, the cellulous ſubſtance.

Theſe cellular interſtices are ſo many little bags or ſatchels, filled with an unctuous or oily juice, more or leſs liquid, which is called *fat*; the different conſiſtence of which depends not only on that of the oily ſubſtance, but on the *quæ*, extent, and ſubdiviſion of the cells.

Neumann diviſes *fats*, from their conſiſtence, into three kinds: the firſt, called *pinguedo*, is *ſoft* and thin, and becomes liquid in a very ſmall heat; ſuch as that which we meet with in birds, reptiles, and fiſhes (the very large fiſhes excepted). The ſecond is thick, liquefies leſs readily, and is denominated *axungia*. The third is mere hard and firm; when taken from the animal it is called *adeps*, and when freed from the ſkins, &c. *ſeſum*. The two laſt kinds of *fat* are chiefly found in quadrupeds.

In ſome parts of the body, the fat ſerves for a cuſhion, pillow, or mattreſs; as on the *cornea*, where the *lamineæ* and cells are very numerous. In other parts this membrane has few or no *lamineæ*, and conſequently little or no fat: as on the forehead, elbows, &c.

In the young *fœtus* there is ſcarce any *fat*; but in the older *fœtus*, *fat* begins to appear. When the child is born, and for ſome years after, it hath much *fat* immediately beneath the ſkin; in men, the *fat* is moſt abundantly ſpread on the *glutei* muſcles.

Fats taken freely as food are difficult of digeſtion; relax and weaken the tone of the ſtomach and interſtines, and are ſuppoſed likewiſe to render the juices tenacious, and to increaſe the bile.

The medical virtues of *fats*, as manifeſted by experience, are ſuch as ariſe from their uſe in external applications, for ſoftening and ſuppling, for abating pains and ſpaſms, and for promoting maturation. Thoſe that are principally uſed are the *fat of vipers*, *hog's lard*, and *mutton ſuet*.

ADEPTS, ADEPTI, a denomination given to the proficients in *Alchemy*; particularly to thoſe who pretend to the ſecrets of the philoſopher's ſtone, and the univerſal medicine.

The word is formed from the verb *adipiſci*, *to obtain*.

Ripley, Lully, Parſeellus, Helmont, Hollandus, Sendivogius, &c. are the principal among the *adepts*.

It is a fort of tradition among the *alchemiſts*, that there are always twelve *adepts*; and that their places are immediately ſupplied by others, whenever any of the fraternity die.

The term *adept* is ſometimes more generally applied to thoſe who are proficients in any kind of ſcience.

ADEQUATE, ADEQUATUS, ſomething equal to, or co-extended with, another; and filling the whole meaſure and capacity thereof.

In this ſenſe the word ſtands oppoſed to INADEQUATE.

ADEQUATE, or total, in *Logic*, is applied to the objects of ſciences. The *adequate* object of a ſcience includes the *material* and *formal* object: the *material* object of a ſcience, is that part which is common to it with other ſciences; the formal is that which is peculiar to itſelf.

ADEQUATE *ideas*, or *notions*, in *Metaphyſics*, are ſuch images or conceptions of an object, as perfectly repreſent it, or anſwer to all the parts and properties of it.

M. Leibnitz defines an *adequate notion* to be that, of whoſe ſeveral characters we have diſtinct ideas.—Thus, a circle being defined a figure bounded by a curve line which returns into itſelf, and whoſe points are all equally diſtant from a certain intermediate point therein; our notion of a circle is *adequate*, if we have diſtinct ideas of all theſe circumſtances, viz. a curve returning upon itſelf, a middle point, an equality of diſtance, &c.

All SIMPLE ideas are *adequate* and perfect; and the faculty be what it will, that excites them, repreſents them entire.

The ideas of modes are likewiſe *adequate*, or perfect; except of thoſe modes which occaſionally become ſubſtances; for when we ſpeak of modes ſeparately exiſting, we only conſider them ſeparate from the ſubſtance by way of abſtraction.

All abſtract ideas are alſo *adequate* and perfect; ſince they repreſent all that part of the object which we then conſider.—Thus, the idea of roundneſs is perfect, or *adequate*, becauſe it offers to the mind all that is in roundneſs, in general.

Of the ſame kind are all ideas, of which we know no original, or external object really exiſting out of the mind, by occaſion of which they were excited in us, and of which we think theſe the images. Thus, when a dog is before us, it is the external object without us which raiſes the idea in our mind; but the idea of an animal, in general, has no external object to excite it: it is created by the mind itſelf, and muſt of neceſſity be *adequate* or perfect.

On the contrary, the ideas of all ſubſtances are *inadequate* and imperfect, which are not formed at the pleaſure of the mind, but gathered from certain properties which experience diſcovers in them.

This is evident, becauſe our knowledge of ſubſtance is very defective; and we are only acquainted with ſome of their properties: thus, we know, that ſilver is white, that it is malleable, that it melts, &c. but we do not know what farther properties it may have; and we are wholly ignorant of the inward texture of the particles, whereof it conſiſts.—Our idea of ſilver, therefore, not repreſenting to the mind all the properties of ſilver, is *inadequate* and imperfect.

ADERAIMIN, ſee ALDERAIMIN.

ADES, or HADES, *ᾅδης*, from *a* and *ἰδεῖν*, denotes the inviſible ſtate. In the heathen mythology, it comprehends all thoſe regions that lie beyond the river Styx, viz. Erebus, Tartarus, and Elyſium. See HELL.

ADESSENARII, a name given to thoſe who hold that Jeſus Chriſt is really preſent in the euchariſt; but in a manner different from what the Romaniſts hold. From the Latin verb *adeſſe*, *to be preſent*.

The *Adeſſenarii*, called alſo *Impanatores*, are divided into four different opinions touching the point.—Some hold that the body of Jeſus Chriſt is in the bread; others, that it is about the bread; others, that it is with the bread; and laſtly, others, that it is under the bread. See IMPANATION.

ADFECTED *equation* is that where the unknown quantity is found in two or more different degrees, or powers. E. gr. $x^3 - px^2 + qx = r^3$; where there are three different powers of *x*, viz. x^3, x^2 and x^1. See EQUATION.

ADFILIATION, ADFILIATIO, is uſed to ſignify a Gothic cuſtom: where a perſon remarrying, who has children by a former bed, renders them capable of inheriting equally with the common children of both parties.

This is done by agreement, and is otherwiſe called, by ſome, *adoptio per matrimonium*.

This cuſtom is ſtill retained in Germany, under the name *einkindſchafft*, and *unio prolium*.

But the learned Hemeccius obſerves, that the *unio prolium* is not an ADOPTION. Elem. Jurid. Germ. tom. 1. ſect. 72.

ADHATODA, in *Botany*, the Malabar nut. See JUSTICIA.

Tournefort enumerates four ſpecies of this plant, which by Houſton and Linnæus is called JUSTICIA; but the above name is given to it in the Zeylanic tongue, from its virtue of expelling the dead *fœtus*, which it ſignifies. See *Tab.* VIII. *of Botany, Claſs* 5.

ADHESION, ADHERENCE, in *Phyſics*, the ſtate of two bodies which are joined or faſtened to each other, either by the mutual impreſſion of their own parts; or the compreſſion of external bodies. See COHESION.

The word is compounded of *ad*, *to*, and *hæreo*, *to ſtick*.

Anatomiſts ſometimes obſerve prophyſes, or *adhæſions* of the lungs to the ſide of the thorax, the pleura, and diaphragm, which give occaſion to various diſorders.

We alſo find of *adhæſions* of the *dura mater* to the cranium; of the ſtone to the bladder; though ſome combat this laſt as a chimera; at leaſt the inſtances of it appear to be rare.

We have alſo ſeveral caſes of *adhæſions* of the inteſtines, mentioned in the Philoſophical Tranſactions, Number 481.

The *adhæſions* of two poliſhed planes, and two hemiſpheres,

spheres, are phenomena urged in behalf of the weight and pressure of the ATMOSPHERE.

The argument drawn from the *adhesion* of two polished planes, urged in behalf of the weight and pressure of the atmosphere, might be objected to, as this pressure is not sufficient to produce the effect, and that polished bodies will adhere very strongly, even in an exhausted receiver. However, it is certain, that the air contributes in part to this *adhesion*.

Dr. Desaguliers has given experiments of the *adhesion* of leaden bullets to each other: the cause of which is resolved into the principle of ATTRACTION. Phil. Trans. N° 383.

ADHESION, in *Logic*. The schoolmen distinguish two kinds of *certitude*; the one of *speculation*, which arises from the evidence of the thing; and the other of *adhesion*, or attachment, which does not depend on the evidence, but on the importance of the matter, and the interest we have in its truth.

ADHESION, or ADHERENCE, is also used for the persisting in a former opinion or resolution.—After the free conference between the two houses, concerning the bill for preventing occasional conformity, when the lords retired and it came to the final vote of *adhering*, they were so equally divided, that in three questions put on different heads, the *adhering* was carrying but by one vote in every one, and by a different person each time. The commons therefore *adhered*; and thus the bill was lost.

ADHIL, in *Astronomy*, a star, of the sixth magnitude, upon the garment of ANDROMEDA, under the last star in her foot.

ADHOA, in *Ancient Customs*, denotes what we otherwise call RELIEF.

In which sense we sometimes also find the word written *adoha*, *adhoamentum*, and *adhoamentum*. Du-Cange.

ADJACENT, or ADJOINING, something *situate near*, or aside of another; of *ad*, *to*, and *jacere*, *to lie*.

ADIANTUM, *Maidenhair*, in *Botany*, the name of a genus of plants, the characters of which are these: the flowers are not discovered; the seeds are contained in spherical capsules, placed in the sinuses and complications of the leaves, and surrounded each with an elastic ring, which contracting, bursts the capsule, and scatters abroad the minute seeds: to this it is to be added, that the leaves of the maidenhairs have all one general appearance, by which they are easily distinguished at sight, from the other plants of the same kind. See *Tab.* X. of *Botany Class* 26.

Tournefort enumerates twenty species of this plant.

In the Linnæan system of *Botany*, the general character of the *adiantæ* is, their having the fructifications in form of oval spots, disposed in clusters under the reflected tops of the leaves; and they are classed with the *cryptogamia filices*.

The *adiantum* is esteemed a great pectoral, and gives name to a syrup much in use for that intention. It is also said to be a remover of obstructions, both of the kidneys and the menses, though little used in those intentions. Its essence is by some commended in hypochondriac and hysteric complaints.

ADIANTUM *aureum*, called also *muscus capillaris*, *polytrichum durum medium*, C. B. *polytrichum maius*, *vel primum*, *polytrichum aquifolii rotundum*, &c. in English, *golden maiden-hair*, is of the moss kind. It grows in heathy and boggy ground. It is a good sudorific, and its infusion drunk hot is recommended against pleurisies. Cæsalpinus gives a relation of this plant rising spontaneously out of the ruins of a town burnt down in Germany; as the *erisimum vulgare* did from the ruins of London.

The various species of this plant abound with a neutral saponaceous quality, approaching to nitre; with their mucilage they impart all their virtue to boiling water. The best preparation, therefore, of the plant, is a strong infusion made with boiling water, and sweetened with liquorice-root. The French make a syrup of the *adiantum verum*, and flavour it with orange-flower water; and a syrup is made in America of the *adiantum Canadense*, with maple sugar. Our confectioners prepare a syrup of it, which they sell under the name of *capillaire*. These syrups are esteemed in disorders of the breast: as they allay tickling coughs from defluxion of thin rheum, and assist the expectoration of phlegm.

ADIAPHORISTS, ADIAPHORISTÆ, or ADIAPHORITES, a name given in the fifteenth century to the moderate LUTHERANS, who adhered to the sentiments of Melancthon; and afterwards to those who subscribed the *interim* of Charles V.

The word is compounded of the privative *a*, and *διαφορος* *different*.

ADIAPHOROUS, ADIAPHORUS, is a name given by Mr. Boyle to a kind of spirit distilled from tartar, and some other vegetable bodies; and which is neither acid, vinous, nor urinous; but in many respects different from any other sort of spirit.

ADIAPNEUSTIA, from *a*, *δια*, and *πνεω*, *I breathe*, signifies defective perspiration, from dense pores, &c.

ADIAPTOTOS, the Greek word signifies *firm*; but it is a name given by physicians to a remedy for the colic, which is stone-parsley, henbane-seed, white pepper, &c. made into an electuary.

ADIARRHOEA, from *a*, *δια*, and *ῥεω*, *I flow*, in *Medicine*, signifies a total suppression of all the necessary evacuations.

ADICE, see NETTLE.

ADJECTIVE, in *Grammar*, a kind of noun joined with a substantive, either expressed or implied, to shew its qualities, or accidents.

The word is formed of the Latin *adjicere*, *to add to*; as designed to be added to a substantive, without which it has no precise signification.

Father Buffier defines *adjectives* in a manner somewhat different from other grammarians.—Nouns, according to him, are substantives, when the objects which they represent are considered simply, and in themselves, without any regard to their qualities; on the contrary, they are *adjectives*, when they express the quality of an object. Thus, when I say, simply, *a heart*, the word *heart* is a substantive, because none of its qualities are expressed; but when I say, *a generous heart*, the word *generous* is an *adjective*; because it adds a quality, or attribute, to the heart. *Adjectives*, then, appear to be nothing else but modificatives.

In effect, the end of an *adjective* being only to express the quality of an object; if that quality be the object itself whereof we speak, it becomes a substantive; e. gr. If I say, *this book is good*; *good* here is an adjective: but if I say, *good is always to be chosen*, it is evident *good* is the subject I speak of, and consequently *good*, there, is the substantive.

On the contrary, it often happens in other languages, and sometimes in our own, that a substantive becomes an *adjective*; as, for instance, in these words: *the king, here as he is, remembers he is a man*; where the word *here*, though ordinarily a substantive, is apparently an *adjective*. From this idea of an *adjective*, it appears that many of the nouns, which, in the common grammars, are accounted substantives, are really *adjectives*, and *vice versa*: grammar in this, and a thousand other instances, depending upon custom.

ADJECTIVES, in *Logic*, are divided into four kinds; the *nominal*, the *verbal*, the *numeral*, and the *pro-nominal*. The *nominal* are those which distinguish certain species by some inherent and permanent quality, which arises either from the nature of the thing, or from its form or situation; such as *good*, *black*, *round*, *external*, &c. The *verbal*, are those which denote some accidental or adventitious quality, which appears to be the effect of an action which passes, or has passed, in the thing under consideration; such as *rampant*, *domineering*, *carefling*, *embellished*, &c. *Numeral adjectives* are those which rank any subject in numerical order, as, *first*, *second*, *last*, &c. *Pro-nominal* are those which do not concern either species, action, or arrangement, but are merely indications of individuality; these *adjectives* are either *personal*, as *mine*, *thine*, &c. or they have a vague and indeterminate meaning, such as *some*, *any*, *many*, &c. or lastly, they serve the purpose of mere indication, such as, *this*, *that*, *such*, &c.

Verbal and *nominal adjectives*, are also called CONCRETES. Some distinguish *adjectives* into *physical* and *metaphysical*; the former being used to distinguish physical essences, in consequence of the immediate impressions they make upon us; the latter to denote those which are metaphysical and abstracted, in consequence of some operation of our minds with regard to them.

AD INQUIRENDUM, a judicial writ, commanding inquiry to be made of any thing touching a cause depending in the king's court, for the better execution of justice; as of bastardy, or the like. Reg. Judic.

ADJOINING is particularly used for the associating of a person to another; or appointing him a colleague, or ADJUNCT.

ADJOURNMENT, in *Law*, the putting off a COURT, or meeting; and appointing it to be kept at another time or place.

The word is formed of the Latin *ad*, *to*; and the French *jour*, *day*, q. d. another day.

In which sense, we meet with the phrase *adjournment in eyre*, for an appointment of a day when the justices in eyre intend to sit again.

Adjournments in parliament differ from *prorogations*.

And each house has the privilege of *adjourning* itself.

ADIPOSUS, fat, or fatty. The word is chiefly used in *Anatomy*, as an epithet of certain cells, ducts, membranes, and

and vesicle, *e. g.* MEMBRANA & VASA *adipofa*, CELLULÆ *adipofæ*, DUCTUS *adipofi*, &c. See ADEPS.

ADIPSON, from the privative *a*, and *δίψα*, *thirſt*; a name given by Hippocrates to oxymel; who ſays alſo that the *peiſſana*, by its glutinouſneſs, prevents or cures thirſt. Medicines adminiſtered for allaying thirſt are called by this name.

ADIPSOS, ſignifies the Egyptian palm-tree. Liquorice, and a pill, or catapotium, compoſed by Aſclepiades, and mentioned by Galen.

ADIRATUS, a price or value ſet upon things ſtolen or loſt, as a recompence to the owner.

ADIRIGE, ſingifies *ſal ammoniacum*.

ADIT, in a general ſenſe, denotes the approach to, or entrance of any thing.

The word is originally Latin, *aditus*, formed from *adire*, *to go to*.

In which ſenſe, we meet with *adit* of a houſe, *adit* of a theatre, of the circus, &c.

ADIT *of a* MINE, the hole, or aperture, whereby it is entered and dug, and by which the water and ores are carried away.

Adit of a mine amounts to the ſame with *gallery*, or *drift*, and is diſtinguiſhed from AIR-*ſhaft*. Phil. Tranſ. N° 69.

The *adit* is uſually made on the ſide of a hill, towards the bottom thereof, about 40 5. or 6 feet high, and 8 wide, in form of an arch; ſometimes cut in the rock, and ſometimes ſupported with timber, ſo conducted, as that the ſole or bottom of the *adit* may anſwer to the bottom of the ſhaft, only ſomewhat lower, that the water may have a ſufficient current to paſs away, without the uſe of the pump.

Damps and the impurity of the air are the great impediments againſt driving *adits* above 20 or 30 fathoms, by reaſon of the neceſſity, in this caſe, of letting down air-ſhafts from the day to meet the *adit*, which are often very expenſive, both on account of the great depth of mines, and the hardneſs of the mineral ſtrata to be cut through. The beſt remedy againſt this is that practiſed in the coal-mines near Liege, where they work their *adits* without air-ſhafts: the manner of which is deſcribed by ſir Robert Moray. Vide Phil. Tranſ. N° 5.

Adit of a mine, is ſometimes uſed for the AIR-*ſhaft* itſelf, being a hole driven perpendicularly from the ſurface or the earth into ſome part of a mine, to give entrance to the air.

In this ſenſe we ſometimes find it improperly written *addit*. Phil. Tranſ. N° 200.

To draw off the ſtanding water in winter, in deep mines, they drive up an *adit*, or AIR-*ſhaft*, upon which the air diſengages itſelf from the water, when it begins to run, with ſuch violence, as produces a noiſe equal to the burſting of a cannon, dathes every thing in the way againſt the ſides of the mine, and looſens the very rocks at a diſtance. Ibid. N° 26.

ADIT *in ſhips*, in *Antiquity*, was a ſpace in the upper part, where the ſhip was wideſt, at which people entered, anciently called *apea*.

ADITS *of a theatre*, *aditus theatri*, in *Antiquity*, were doors on the ſtairs, whereby perſons entered from the outer porticos, and deſcended into the ſeats.

ADJUDGING, in *Law*, the act of paſſing a determinate ſentence in behalf of a perſon.

ADJUDICATION, the act of adjudging the property of a thing to a perſon by a legal ſentence, decree, or judgment.

ADJUDICATION is more particularly uſed for the addition, or conſigning a thing ſold by auction, or the like to the higheſt bidder.

ADJUNCT, ADJUNCTUM, in *Philoſophy*, ſomething joined or ſuperadded to a being from without. See ADJUNCTION.

Or, an *adjunct* is an additament or acceſſion to a thing, not eſſentially belonging to it, but only accidental thereto.

There are two kinds of *adjuncts*; the one a ſubſtance (whether ſpirit or body) accidentally ſuperadded to another, as its ſubject.—Such is water in a ſponge, or veſſel, and ſuch is the ſoul in the body.

The ſecond an attribute or mode, accidentally likewiſe ſuperadded to a ſubſtance, whether body or ſpirit.—Such is figure in a body, knowledge in the mind, &c.

Some divide *adjuncts* into *abſolute*; which agree to the whole things, without limitation: thus, paſſions are *abſolute adjuncts*, of a man:—and *limited*, which only agree to their ſubject in reſpect of ſome certain parts thereof: thus, man only thinks, conſidered as to his mind; only grows, as to his body, &c.

In ethics, we uſually reckon ſeven *adjuncts*, popularly, called *circumſtances*; *quis*, *quid*, *ubi*, *quibus auxiliis*, *cur*, *quomodo*, *quando*.

ADJUNCTS, in *Rhetoric* and *Grammar*, are certain words or things added to others; to amplify the diſcourſe, or augment its force.

Such are adjectives, attributes, and epithets, which are added to ſubſtantives, ſubjects, &c. to expreſs their nature, qualities, accidents, &c.

Arguments drawn from *adjuncts*, are ſupplements or enforcements of the proof ariſing from the circumſtances of the fact.

ADJUNCT is alſo uſed in civil concerns, for a COLLEAGUE, or fellow-officer, aſſociated to another, to aſſiſt him in his miniſtry.

ADJUNCT *gods*, or ADJUNCTS *of the gods*, in *Mythology*, among the Romans, were a kind of inferior deities, added as aſſiſtants to the principal ones, to eaſe them in their functions.

Thus, to Mars was adjoined Bellona and Nemeſis; to Neptune, Salacia; to Vulcan, the Cabiri; to the Good Genius, the Lares: to the Evil, the Lemures, &c.

ADJUNCTS, or ADJUNCTS, in the *Royal Academy of Sciences at Paris*, denote a claſs of members, attached to the purſuits of particular ſciences. See ACADEMY.

ADJUNCTION, the act of joining, or adding, of one thing to another.

All *adjunction* implies a ſubordination.—The *adjunct* is for the ſake of a thing it is joined to, not contrary-wiſe; as the cloaths for the man, not the man for the cloaths.—Whatever is part of a thing cannot fail to be an *adjunct* of it.

There are various ſpecies of *adjunction*; viz. by *adheſion*, by *appoſition*, *adjacency*, *incubation*, *incubation*, *impoſition*, *affuſion*, &c.

ADJURA REGIS, is a writ that lies for the king's clerk againſt him who endeavoured to eject him, to the prejudice of the king's title in right of his crown.

ADJURATION, a part of exorciſm, wherein the deviſ is commanded, in the name of God, to depart out of the body of the poſſeſſed, or to declare ſomething.

ADJUTAGE. See AJUTAGE.

ADJUTANT, in the *Military Art*, an officer in the army, whoſe buſineſs is to aid and aſſiſt the major.

Adjutant is the ſame that we otherwiſe call *aid-major*.

In the cavalry, each regiment has an *adjutant*, and in the infantry, each battalion.

The *adjutant* receives the orders every night from the brigade-major, which, after he has carried to the colonel, he delivers out to the ſerjeants. Where detachments are to be made, he gives the number each company muſt furniſh, and aſſigns the hour and place of rendezvous. He alſo places the guards, receives and diſtributes ammunition to the companies, and by the major's orders regulates the price of bread, beer, &c. See *Adjutant-*GENERAL.

ADJUTANT is ſometimes alſo uſed by the French for an *aid de camp*.

The word is formed of the Latin *adjutare*, *to aſſiſt*.

ADJUTANT, among the *Jeſuits*. The general of the Jeſuits had a ſelect number of fathers of that order reſiding with him, under the denomination of *adjutants-general*; who had each their ſeveral province, or country, under their care, as France, England, &c. Their buſineſs was to inform the father-general of the occurrences of ſtate in ſuch countries; to which end, each of them had their correſpondents, delegated *viſitarics*, viſitors, regents, provincials, &c. See JESUITS.

ADJUTORIUM, in *Anatomy*, the *humerus*, or ſhoulder-bone.

It is thus called from *adjutare*, *to help*.

Some authors uſe this word for a medicine intended only as auxiliary, or ſubſervient to another of greater efficacy: in particular, after a due uſe of internals, for an external remedy applied to a part affected, to aſſiſt in, and complete the cure.

ADLE *egg*, that which is not fecundified by the cock's tread.

Adle eggs is the ſame with that which is otherwiſe called a *ſubventaneous* one.

Addle eggs, after incubation, are found to contain a ſhapeleſs, globoſe, aſh-coloured body, not unlike a *mola*. Phil. Tranſ. N° 87.

ADLEGATION, in the *Public Law* of the German empire, a right claimed by the ſtates of the empire of aſſigning plenipotentiaries, in public treaties and negociations, to thoſe of the emperor, for the tranſacting of matters which relate to the empire in general.

In which ſenſe *adlegation*, differs from *legation*, which is the right of ſending ambaſſadors on a perſon's own account.

Several princes and ſtates of the empire enjoy the right of *legation*, who have not that of *adlegation*, and *vice verſa*. The biſhops, for inſtance, have the right of *adlegation* in the treaties which concern the common intereſt, but

but no right of *legation* for their own private affairs. The like had the duke of Mantua.

The emperor allows the princes of Germany the privilege of *legation*, but disputes that of *allegation*. They challenge it as belonging to them *jure regni*, which they enjoy in common with the emperor himself. Lodwig has a discourse on the subject, wherein the controverfy is treated at large.

ADLOCUTION, ADLOCUTIO, in *Antiquity*, is chiefly underſtood of ſpeeches made by Roman generals to their armies, to encourage them before a battle. We frequently find theſe *adlocutions* expreſſed on medals, by the abbreviature ADLOCVT. COH.

The general is ſometimes repreſented as placed on a tribunal; often on a bank or mount of turf, with the cohorts ranged orderly round him, in *manipulis* and *turmis*. The uſual formula in *adlocution* was, *fortis eſſet ac fidus*. Pitiſc. Lex. Ant. tom. i. p. 27. Walk. on Coin. p. i. c. 10.

ADMANUENSES, in *Ancient Law Books*, denote perſons who ſwore by laying their hands on the book. Du-Cange.

The word is compounded of the Latin *ad*, *to*, and *manus*, *hand*.

In which ſenſe, *admanuenſes* amount to the ſame with laymen, and ſtand oppoſed to clerks, who were forbid to ſweat on the book, their word being to be reputed as their oath: whence they were alſo denominated *ſine ſigno*.

ADMEASUREMENT, ADMENSURATIO, in *Law*, a writ which lies for the bringing thoſe to reaſon, or mediocrity, who uſurp more of any thing than their ſhare. This writ lies in two caſes: termed,

ADMEASUREMENT *of dower*, *Admenſuratio dotis*, where the widow of the deceaſed holds more from the heir, or his guardian, on account of her dower, than of right belongs to her. And,

ADMEASUREMENT *of paſture*, *Admenſuratio paſturæ*; this lies between thoſe who have COMMON of paſtures appendant to their freehold, or common by vicinage, in caſe any of them ſurcharge the common with more cattle than they ought.

ADMINICLE, or ADMINICULE, ADMINICULUM, a term uſed in ſome ancient ſtatutes, for aid, help, or ſupport. Stat. 1 Edw. IV. cap. 1.

ADMINICULATOR, in *Eccleſiaſtical Writers*, denotes an ancient officer of the church, whoſe buſineſs was to defend the cauſe of widows, orphans, and others deſtitute of help. The *adminiculator* is the ſame with what is otherwiſe called ADVOCATE of the poor. Du-Cange.

ADMINICULES, among *Antiquaries*, are applied to the attributes, or ornaments wherewith Juno and ſome other figures are repreſented on medals.

ADMINICULUM, in the French *Juriſprudence*, ſignifies the beginning of a proof; an imperfect proof; or a circumſtance or conjecture, tending to form or fortify a proof.

ADMINISTRATION imports the government or direction of affairs; and particularly the exerciſe of diſtributive juſtice.

Indolent princes conſide the *adminiſtration* of public affairs to their miniſters.—Civil wars are uſually raiſed on pretence of *mal-adminiſtration*, or of abuſes committed in the exerciſe of juſtice, &c.

The two criterions of a good *adminiſtration* in England, according to Trenchard, are, the keeping the nation out of foreign broils, and paying off the public debts; the latter of which depends on the former.

ADMINISTRATION, in the Engliſh *Law*, ſignifies the act, or office, of an adminiſtrator, in managing and diſpoſing of a man's goods, or eſtate, that died inteſtate, or without any will; with an intent to give an account thereof. In this caſe, inſtruments, or powers, called letters of *adminiſtration*, are taken out in the prerogative court.

Theſe letters muſt be granted, 1. to the huſband of the wife's goods and chattels; 2. to the wife, of the huſband's goods and chattels; 3. if there is no huſband or wife, to the children, ſons or daughters; 4. if there be no children alive, to the father or mother; 5. then to a brother or ſiſter of the whole blood, or of the half blood, (who for this purpoſe, are of equal degree with the whole blood); 6. and if there are none ſuch, to the next of kin, or neither, unto be couſin; 7. then to a creditor of the deceaſed; 8. and for want of all theſe, to any other perſon, at the diſcretion of the ordinary; or the ordinary may grant to a ſtranger letters of *adminiſtration cum teſtamento annexo*, or gather up the goods of the deceaſed by, or may take them into his own hands to pay the deceaſed's debts, in ſuch order as an executor or adminiſtrator ought to pay them. But it is ſaid he or the ſtranger, who hath letters *ad colligendum*, cannot ſell them, without making themſelves executors of their own wrong, and action lies only againſt the ordinary, &c. Wood's Inſt. 333.

By ſtat. 21 Hen. VIII. widows, and next of kin, are to be appointed adminiſtrator, and a mother is to have *adminiſtration* of goods of a child, before a brother or ſiſter, &c. But an *adminiſtration* may be granted to the father before a widow; and a reſiduary legatee ought to be preferred before the widow in an *adminiſtration cum teſtamento annexo*. 3 Salk. 21.

On granting *adminiſtration*, bonds with ſureties are to be taken for the adminiſtrator, to make and exhibit an inventory of the goods of the deceaſed, to render a juſt account thereof, and to make a diſtribution of the ſurpluſage after debts paid, according to law, &c. Stat. 22 and 23 Car. II. cap. 10. See ADMINISTRATOR, EXECUTOR, INTESTATE, KINDRED.

ADMINISTRATION is ſometimes alſo uſed for the direction of the affairs of a minor, a pupil, a lunatic, or the like.

ADMINISTRATION is alſo uſed in reſpect of eccleſiaſtical functions; as when a perſon has the *adminiſtration* of the ſacraments, &c.—*Adminiſtration* of the euchariſt is [illegible] perſons excommunicate.

[illegible] matters they diſtinguiſh two kinds of *adminiſtration*, *temporal*, which relates to the temporalities of [illegible], *dioceſe*, &c. and *ſpiritual*, to which belong the [illegible] of excommunicating, &c.

ADMINISTRATION, in *Anatomy*, is uſed for the manner of exerciſing the parts of the body, particularly the MUSCLES. In which ſenſe, *adminiſtration* is ſynonymous with *exciſion*, *excerſe*, &c.

Anatomical *adminiſtrations* are not to be learned by oral precept, but require ocular inſpection.—Galen, Harvey, and others, have diſcourſes expreſs under the title of anatomical *adminiſtrations*.

ADMINISTRATION, in *Commerce*, is alſo uſed for a Spaniſh ſtaple at Calao in Peru, a city on the coaſts of the South Sea, where all ſhips, allowed to trade on the coaſt, are obliged to unload their European goods, and pay certain duties.

ADMINISTRATOR, in *Law*, he to whom the ordinary commits the *adminiſtration* of the goods of a perſon deceaſed, in default of an executor.

An action lies for, or againſt an *adminiſtrator*, as for, or againſt an executor; and he ſhall be accountable to the value of the goods of the deceaſed, and no further:—unleſs there be waſte, or other abuſe chargeable on him. If the *adminiſtrator* die, his executors are not *adminiſtrators*; but the court is to grant a new adminiſtration.—If a ſtranger, who is neither *adminiſtrator*, nor executor, take the goods of the deceaſed, and adminiſter, he ſhall be charged, and ſued as an executor, not as an *adminiſtrator*.

The origin of *adminiſtrators* is derived from the civil law. Their eſtabliſhment in England is owing to a ſtatute made in the thirty-firſt year of Edward III. Till then, no office of this kind was known, beſide that of executor: in caſe of a want of which, the ordinary had the diſpoſal of goods of perſons inteſtate, &c.

There are divers ſorts of *adminiſtrators*.

Adminiſtrator durante minore ætate, is where an infant is entitled to adminiſtration of the goods of an inteſtate; in which caſe adminiſtration is granted to another, until he is of the age of twenty-one years. Though where the infant is made executor, ſuch adminiſtration, during his minority, ceaſes at his coming to the age of ſeventeen. 5 Rep. 29. 6 Rep. 27.

Adminiſtrator cum teſtamento annexo, is one to whom adminiſtration, with the will annexed, is granted, upon an executor's refuſal to prove the teſtament, or upon his dying before the probate. 1 Inſt. 113.

Adminiſtrator de bonis non, &c. is one to whom adminiſtration is granted of the goods of a teſtator remaining unadminiſtered, by reaſon of his executors dying inteſtate. 2 Roll. Abr. 907. There is alſo

Adminiſtrator pendente lite; and *durante abſentia extra regnum*.

If a woman have goods thus committed to her charge, or adminiſtration, ſhe is called *adminiſtratrix*; and is accountable, &c. in like manner as an *adminiſtrator*.

ADMINISTRATOR is alſo uſed for the advocate of a church.

ADMINISTRATOR is alſo uſed for a perſon appointed to receive, manage, and diſtribute the revenues of an hoſpital, or religious houſe.

ADMINISTRATOR, is alſo uſed for a prince who enjoys the revenues of a ſecularized biſhoprick.

Yet this title does not hold univerſally: the king of England, as elector of Brunſwick-Lunenburg, for inſtance, is not called *adminiſtrator*, but duke of Bremen and Verden; and the king of Pruſſia is not *adminiſtrator*, but duke of Magdeburg, and prince of Halberſtadt.

ADMINISTRATOR is alſo uſed for the regent or protector

of a kingdom, during the minority of its proper prince, or even a vacancy of the throne.

The pope pretends to the *administration* of the empire, during a vacancy, by censure, or suspension.

ADMINISTRATOR is sometimes used for the president of a province.

ADMINISTRATRIX; see ADMINISTRATOR.

ADMIRAL, ADMIRALIUS, ADMIRALLUS, a great officer, who commands the naval forces of a kingdom or state, and takes cognizance by himself, or officers appointed by him, of all maritime causes.

Authors are divided about the origin and denomination of this important officer, whom we find established, with some variation, in most kingdoms that border on the sea. Du Cange asserts or, that the Sicilians were the first, and the Genoese the next after them, who gave the denomination *admiral* to the commanders of their naval armaments; and that they took it from the Saracen, or Arabic *amir*, a general name for any commanding officer. —The first *admiral* we read of in English history was under Edward I. But the first title of *admiral* of England conferred upon a subject, was given by patent of Rich. II. to the earl of Arundel and Surry in 1385.

ADMIRAL *of England, the lord high*, in some ancient records called *capitaneus marinarum*, is judge, or president, of the court of admiralty.

He takes cognizance, by himself, his lieutenant, or deputies, of all crimes committed on the sea, or the coast thereof; and all the civil and marine transactions relating thereto: as also of what is done in all great ships, riding in any great river, beneath the bridges thereof next the sea.

Anciently, the *admiral* had also jurisdiction in all causes of merchants and mariners; not only on the sea, but in all foreign parts.—We have had no *high admiral* for some years: the office being put in COMMISSION, or under the administration of the lords *commissioners of the admiralty*.

ADMIRAL is also used for the commander in chief of a single fleet, or SQUADRON; and is distinguished by a flag displayed at his main-top-mast-head.

Thus, we say, the *admiral* of the *red*, the *admiral* of the *white*, and *admiral* of the *blue*. See NAVY and SQUADRON.

The term *admiral* is also applied to all flag-officers; in which sense it includes *vice-admirals*, and *rear-admirals*.

ADMIRAL, *Rear*, is the *admiral* of the third, and last squadron of the royal fleet, and carries his flag at the mizen-top-mast-head.

ADMIRAL, *Vice*, is one of the three principal officers of the royal navy; who commands the second squadron, and has his flag set up at the fore-top-mast-head.

ADMIRAL, *Vice*, is also an officer appointed by the *lord high admiral*, in divers parts of the kingdom, with judges and marshals subordinate to him; for the exercising of jurisdiction in maritime affairs, within his respective limits. There are upwards of twenty *vice-admirals*. From their decisions and sentences, appeal lies to the court of *admiralty* in London.

There are also *admirals of the galleys*.

Monstrelet makes mention of an *admiral of the archers*, or cross-bowmen. See ARBALET.

ADMIRAL is likewise the name of the principal vessel of a fleet, on board of which is the *admiral*.

When two ships of war, bearing the same colours, meet in the same port, that which arrived first, has the title and prerogative of *admiral*; and the other, though of greater strength and rate, shall only be accounted *vice-admiral*.—It is pretty much the same with the vessels in the cod and whale fishery. That which arrives first, in any harbour or creek of Newfoundland, takes the title and quality of *admiral*, which it retains during the whole fishing season.—Such ship may secure to herself as much beech, or flakes, or both, as are necessary for the number of boats she shall use, with an overplus of one boat only more than she uses. —The master of the second ship is *vice-admiral*; and the master of the third, *rear-admiral*. See FISHERY.

ADMIRAL'S *Court*, or the *High Court of Admiralty*. See COURT *of* ADMIRALTY.

ADMIRAL, in *Conchology*, the name given by authors to a very beautiful, and very precious shell, of the *cauda* kind. See *Tab. of Shells*, N° 10.

Of these the curious reckon four species. 1. The grand-*admiral*. 2. The *vice-admiral*. 3. The orange-*admiral*. And, 4. The *extra-admiral*.

The first of these is the most esteemed, and a single shell has been sold, in Holland, for five hundred florins. It is of a very elegant and bright white enamel, and is variegated with bands of yellow, representing in some degree the colours of the flags of a man of war at sea; hence it obtained its name. It is of a very curious shape, and formed with particular elegance about the head; the shoulder being exerted. There runs along the centre of the large yellow band in this shell, a fine denticulated line, which is its distinguishing character.

The *vice-admiral* is an elegant shell, but its head is less beautifully wrought than in the *admiral*, and its broad band wants the dentated line, so remarkable in that.

The orange *admiral* has more yellow than either of the others.

The *extra-admiral* has the same bands with these, but they run one into another, and form a more mixed clouding.

ADMIRATION, in *Ethics*; see PASSIONS.

ADMIRATION, in *Grammar*, a note or character, intimating something worthy to be admired, or wondered at.—It is expressed thus (!) See CHARACTER.

ADMISSION, ADMISSIO, in the *Ecclesiastical Law*, an act whereby a bishop, upon examination, *admits* or allows a clerk to be able, or competently qualified for the office; which is done by the formula *admitto te habilem*.

All persons are to have an episcopal ordination before they are admitted to any parsonage or benefice; and if any shall presume to be admitted, not having such ordination, &c. he shall forfeit 100*l*. STAT. 14 Car. II.

No person is to be admitted into a benefice with cure of 30*l*. *per ann.* in the king's books, unless he is a bachelor in divinity at least, or a preacher lawfully allowed by some bishop, &c.

ADMITTENDO *Clericum*, is a writ granted to him who hath removed his right of presentation against the bishop in the common pleas.

ADMITTENDO *in Socium*, is a writ for the association of certain persons to JUSTICES of ASSIZE formerly appointed.

ADMONITION, in *Ecclesiastical Affairs*, a part of discipline much used in the ancient church. It was the first act, or step, towards the punishment, or expulsion of delinquents. In case of private offences, it was performed according to the evangelical rule, privately; in case of public offence, openly before the church. If either of those took effect, for the recovery of the fallen person, all farther proceedings, in the way of censure, ceased: if they did not, recourse was had to EXCOMMUNICATION. Bing. Orig. Eccles. tom. ii. lib. 16. cap. 2. § 6. p. 31. Calv. Inst. lib. iv. cap. 12. § 2.

By the ancient canons, nine monitories or admonitions, at due distance, are required before excommunication.

ADMONITION is also used, in *writers of the barbarous age*, for the CITATION, or summoning a person to appear in a court of justice. See SUMMONS, &c.

ADMONITIO FURTIVA, a military punishment, among the Romans, resembling, in some respects, our whipping or lashing, but performed with a vine-branch. Stehlerman Diss. de Pœn. Mil. Rom. cap. 12.

ADMORTIZATION, among *French writers*, the act of reducing lands to MORTMAIN.

ADNATA, in *Anatomy*, a thick white membrane, investing the ball of the eye; and making the outermost coat thereof: called also *tunica conjunctiva*, or *communis*.

It is the *tunica adnata* that makes what we commonly call the *white* of the EYE; whence it is also called the ALBUGINEA.

The *adnata* springs from the *periosteum*, and grows to the exterior part of the *tunica cornea*, forming in concert the white eye both to the *cuphoræ*, and the adjacent bones, and thus keep it fast in the *orbita*; whence it is also called *conjunctiva*.

To leave room for the visible species to pass through it, a little round aperture is left in the fore-part, called the *sight*, through which the RAIS and PUPILLA appear.

The *adnata* abounds with veins and arteries, which, though ordinarily not visible, are conspicuous in opthalmies, which are properly inflammations of this part. The academists *Naturæ Curiosi* give the history of a dropsy of the *adnata*, and its cure. Ephem. Germ. Dec. 3. An. 3. Obs. 3. p. 4.

ADNATA, or ADNASCENTIA, among *Gardeners*, denote those off-sets, which by a new germination under the earth, proceed from the lily, narcissus, hyacinth, and other flowers, and afterwards grow to true roots. The French call them *cayeux*, *filets*.

ADNATA is also a term used for such things as grow upon animal or vegetable bodies, either inseparably, as hair, wool, horns, &c. or accidentally, as the several epithical plants.

ADNOUN, ADNOMEN, or ADNAME, is used by some *Grammarians* to express what we most usually call an ADJECTIVE.

ADOCTO, *q. d.* to the eighth number; a term used by some ancient philosophers, to denote the highest, or superlative degree; because, in their way of distinguishing qualities, they reckoned no degree above the eighth.

ADOLESCENS signifies the iron bars that support the fire in a grate or furnace.

ADOLESCENCE, ADOLESCENTIA, the state of growing youth; or that period of a person's age commencing from his infancy, and terminating at his full stature or manhood.

The word is formed of the Latin *adolescere*, *to grow*.

The state of *adolescence* lasts so long as the fibres continue to grow, either in magnitude or firmness.

It is commonly computed to be between 15 and 25, or

even 30 years of age; though in different constitutions in this climate very different.—The Romans usually reckoned it from 12 to 25 in boys; and 10 or 12 in girls, &c.—And yet, among their writers, *puberes* and *adolescentes* are frequently used indifferently, for any person under 25 years. The fibres, being arrived at a degree of firmness and tension sufficient to sustain the parts, no longer yield and give way to the efforts of the nutritious matter, to extend them: so that their farther accretion is stopped from the very law of their nutrition.

ADONAI, one of the names of God in Scripture: this word signifies properly *my lords*, in the plural number, as *Adon* signifies *my lord*, in the singular number. The Jews, who either out of respect, or superstition, do not pronounce the name of *Jehovah*, read *Adonai* in the room of it, as often as they meet with *Jehovah* in the Hebrew text. But the ancient Jews were not so nice; there is no law which forbids them to pronounce the name of God. Calmet.

ADONIA, in *Antiquity*, solemn feasts, in honour of Venus, and in memory of her beloved Adonis.

They were begun by the women, who imitated the cries and lamentations of Venus, for the death of her paramour.—When they were weary of lamenting his death, they changed their note, and sung his praise, and made rejoicings, as if he were raised to life again: or rather, according to Meursius, these two offices made two annual feasts, which were held at different times of the year, the one six months after the other; Adonis being supposed to pass half the year with Proserpine, and half with Venus. The *Adonia* were observed with great solemnity by many nations, Greeks, Phœnicians, Lycians, Syrians, Egyptians, &c. To these the prophet Ezekiel is supposed to refer, chap. viii. ver. 14. Bishop Patrick takes their origin from the slaughter of the first-born in the time of Moses. Patrick, Comm. ad loc.

The *Adonia* were otherwise called *Salambo*. The abbé Banier has a memoir on the history of the *adonia*. Mem. Acad. Inscript. tom. iv.

ADONIC, in *Poetry*, denotes a short kind of verse, consisting of a dactyl and a spondee, or a trochee. As *vare mecum*.

It takes its name from Adonis, as having been originally used in the Threnæ, or lamentations for that favourite.

The chief use of the *Adonic* verse is at the end of each strophe of Sapphic verses; or among Asiclepiadic anapæsts in the ancient tragedy. But we meet with *Adonics* by themselves without Sapphics, as alfo Sapphics without *Adonics*. See an instance of *Adonic* verses in Boethius, de Consol. Philof. lib. i. p. 67. Comm. poet. &c.

ADONIDES, in *Botany*, are those writers, who have given histories, or catalogues of the plants cultivated in some particular place. Lemonon.

ADONION, among the *Ancient Botanists*, a species of *fothernwood*, according to Gesnerus, which also to be set in pots, and served as an ornament for gardens.

ADONIS, in *Ichthyology*, the name of a small fish, of the anguilliform kind, of a cylindric shape, and about six inches long: it is of a gold colour, mixt with a greenish hue in some parts, and in others with a reddish. It has, on each side, a white straight line running from the gills to the tail. Its gills are remarkably small, and many have supposed thence that it had none. It is remarkable for sleeping on the surface of the water, and near the shores; and Rondeletius affirms, that he has seen them sleeping upon the dry rocks.

Mr. Ray suspects this fish, which is also called *catostoma*, to be the same with the ERYTHRINUS of Bellonius, or the GOTTORUGINE.

ADONIS *fea*; see PHEASANT'S *eye*.

ADONIS *potio*, an ancient beverage or drink made of wine, mixed with the flour of roasted barley, the same with what was otherwise called CYCEON.

ADONISTS, a sect or party, among *Divines* and *Critics*, who maintain, that the Hebrew points ordinarily annexed to the consonants of the word Jehovah, are not the natural points belonging to that word, nor express the true pronunciation of it, but are the vowel-points belonging to the words *Adonai* and *Elohim*, applied to the consonants of the ineffable name Jehovah; to warn the readers, that instead of the word Jehovah, which the Jews were forbid to pronounce, and the true pronunciation of which had been long unknown to them, they are always to read *Adonai*. They are opposed to *Jehovists*, of whom the principal are Drusius, Capellus, Buxtorf, Alting, and Reland, who has published a collection of their writings on this subject.

ADOPTER, in *Chemistry*, see RECEIVER.

ADOPTIANI, in *Church History*, a sect in the eighth century, whose distinguishing tenet was, that Christ, as to his human nature, was not the proper, or natural, but only the adoptive son of God.

ADOPTION, ADOPTIO, an act by which any one takes another into his family, owns him for his son, and appoints him his heir.

The word is derived from *adoptare*, whence the Latin historians *adoptare*, to make a knight.

The custom of *adopting* was very familiar among the ancient Romans, who had an express formula for it.—They still learnt it from the Greeks, among whom it was called θεσις, *positio*.

As *adoption* was a sort of imitation of nature, intended for the comfort of those who had no children, eunuchs were not allowed to *adopt*; as being under an actual impotency of begetting children.

Neither was it lawful for a young man to *adopt* an elder; because that would have been contrary to the order of nature; but it was even required, that the person who *adopted*, should be eighteen years older than his adoptive son, that there might at least appear a probability of his being the natural father.

The Romans had two forms of *adoption*; the one before the people, the other in an assembly of the people, in the times of the [illegible] commonwealth, and afterwards by a rescript of the [illegible]

In the [illegible] father addressed himself to the [illegible] emancipated his son, resigned [illegible] him, and constituted he should be [illegible] family of the adopter.

The manner of *adoption* was practised, where the [illegible] *adopted* was already free; and this was called *arrogation*.

The person *adopted* changed all his names; assuming the praenomen, name, and surname, of the person who *adopted* him.

Besides the *formalities* prescribed by the Roman law, divers other methods have taken place; which have given denominations to divers species of *adoption*, among the Gothic nations, in different ages. As,

ADOPTION *by arms*, was when a prince made a present of arms to a person, in consideration of his merit and valour.—Thus it was that the king of the Heruli was *adopted* by Theodoric; Athalaric by the emperor Justinian; and Cosroes, prince of the king of Persia, by the emperor Justin.

This method of *adoption*, practised in Germany, was called *barbarous*, by way of opposition to the Roman custom.

The obligation here laid on the *adoptive* son, was to protect and defend the father from injuries, affronts, &c.—And hence the ceremony of dubbing knights took its origin as well as name. Selden, Tit. of Hon. p. 865.

ADOPTION *by baptism*, is that spiritual affinity which is contracted by god-fathers and god-children in the ceremony of baptism.

This kind of *adoption* was introduced into the Greek church, and came afterwards into use among the ancient Franks, as appears by the Capitulars of Charlemagne.

In reality, the god-father was so far considered as *adoptive* father, that his god-children were supposed to be entitled to a share in the inheritance of his estate. Du Cange.

ADOPTION *by hair*, *adoptio per capillum*, or *crines*, was performed by cutting off the hair of a person, and giving it to the *adoptive* father. It was thus that pope John VIII. *adopted* Boson king of Arles; which, perhaps, is the only instance in history of *adoption*, in the order of ecclesiastics; a law that probibits by its nature, not daring to give children to those in whom it would be thought a crime to beget any.

ADOPTION *by matrimony*, is the taking the children of a wife or husband, by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the same footing with those of the present marriage. This is a practice peculiar to the Germans; among whom, it is more particularly known by the name of *sonnenschorr*; among their writers in Latin, by that of *sonnesium*, or *sonnium of stirpes*. But the more accurate writers observe, that this is no *adoption*. See AUTIGNATION.

ADOPTION *by testament*, that performed by appointing a person heir by will, on condition of his assuming the name, arms, &c. of the *adopter*.

Of which kind, we meet with divers instances in the Roman history.

Adoption was allowed among the Greeks to such as had no issue of their own; excepting those who were not *sui juris*, *viz.* *sons under power*, *i. e.* slaves, women, madmen, infants, or persons under twenty years of age; who being incapable of taking wife, or managing their own estates, were not allowed to adopt heirs to them. Foreigners being incapable of inheriting at Athens, if any such were *adopted*, it was necessary first to make them free of the city. The ceremony of *adoption* being over, the *adopted* had his name inrolled in the tribe and ward of his new father; for which entry a peculiar term was allotted, viz. the festival of [illegible]

To prevent ruin and inconsiderate *adoption*, the Lacedæmonians had a law, that *adoption* should be transacted, or at least confirmed, in the presence of their kings. The children *adopted* were invested with all the privileges, and obliged to perform all the duties, of natural children; and being thus provided for in another family, ceased to have any claim of inheritance, or kindred, in the family which they had left, unless they still renounced their *adoption*; which, by the laws of Solon, they were not allowed to do, unless they had first begotten children, to bear the name of the person who had *adopted* them: thus providing against the ruin of families, which would otherwise have been extinguished by the desertion of those who had been *adopted* to preserve them. If the children *adopted* happened to die without children, the inheritance could not be alienated from the family into which they had been *adopted*, but returned to the relations of the *adopter*. It should seem, that by the Athenian law, a person, after having *adopted* another, was not allowed to marry, without permission from the magistrate: in effect, there are instances of persons, who being ill used by their *adoptive* children, petitioned for such leave. However this be, it is certain some men married after they had *adopted* sons in other cases, if they begat legitimate children, their estate were equally shared between the begotten and *adopted*.

Among the Turks, by the law of Mahomet, *adoption* is an impediment of marriage. The ceremony of *adoption* is performed by obliging the person *adopted* to pass through the shirt of the *adopter*. Hence, among that people, to *adopt* is expressed by the phrase, *to draw another through one's shirt*. It is said that something like this has also been observed among the Hebrews; where the prophet Elijah *adopted* Elisha for his son and successor, and communicated to him the gift of prophecy, by letting fall his cloke, or mantle, on him.

But *adoption*, properly so called, does not appear to have been practised among the ancient Jews.

Adoption is now in most countries abolished, though it has been said to subsist in some provinces of France.

ADOPTION is also used, in *Theology*, for a several act of God's free grace; whereby those that are regenerate by faith, are admitted into his household, and instiled to a share in the inheritance of the kingdom of heaven.

ADOPTION is sometimes also used, in speaking of the ancient clergy, who had a custom of taking a maid or widow into their houses, under the denomination of an *adoptive* or spiritual sister, or niece. Du Cange.

ADOPTION is also used in speaking of the admission of persons into certain hospitals, particularly that of Lyons; the administrators whereof have all the power and rights of parents over the children admitted.

ADOPTION is also used for the reception of a new academy into the body of an old one.

In which sense, *adoption* amounts to much the same with *incorporation*.

The French academy of Marseilles was *adopted* by that of Paris; on which account, we find a volume of speeches extant, made by several members of the academy of Marseilles, deputed to return thanks to that of Paris, for the honour.

In a sense, not unlike this, *adoption* is also applied by the Greeks, to the admitting a monk, or brother, into a monastic community; sometimes called spiritual *adoption*.

ADOPTIVE, ADOPTIVUS, or ADOPTITIUS, denotes a person *adopted* by another.

Adoptive children, among the Romans, were on the same footing with natural ones; for which reason, they were either to be instituted *heirs*, or expressly disinherited; otherwise the testament was null.

The emperor Adrian preferred *adoptive* children to natural ones; because we choose the former, but are obliged to take the latter at random.

M. Menage has published a book of elegies, or verses, addressed to him; which he calls *Liber Adoptivus*, an *adoptive book*; and adds it to his other works.—Heinsius, and Furstemburg of Munster, have likewise published *adoptive* books.

ADOPTIVE, in *Ecclesiastical Writers* we find *adoptive* women, or sisters, *adoptivæ famulæ, or sorores*, used for those handmaids of the ancient clergy, otherwise called *subintroductæ*.

ADOPTIVE *arms* are those which a person enjoys by the gift or concession of another; and to which he was not otherwise entitled. They stand contradistinguished from arms of *alliance*.

ADOPTIVE is also used to express a thing borrowed or taken from another. In which sense we sometimes meet with *adoptive time*, by way of opposition to natural time; and *adoptive gods*, by way of contradistinction to domestic ones. The Romans, notwithstanding the number of their domestic, had their *adoptive* gods, taken chiefly from the Egyptians: such were Isis, Osiris, Anubis, Apis, Harpocrates, and Canopus.

ADOPTIVI, in *Church History*. See ADOPTIANI.

ADOR signifies a species of corn called SPELTS and RYE.

ADORATION, the act of rendering divine honours; or of addressing God, or a being, as supposing it a god. See WORSHIP.

The word is compounded of *ad*, *to*, and *os*, *mouth*; and literally signifies to apply the hands to the mouth; *manum ad os admovere*, q. d. *to kiss the hand*; this being, in the eastern countries, one of the great marks of respect and submission.

The ceremony of *adoration* among the ancient Romans was thus: the devotee having his head covered, applied his right hand to his lips, the fore-finger resting on the thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kiss thus given was called *osculum labratum*; for ordinarily they were afraid to touch the images of their gods themselves with their profane lips. Sometimes, however, they would kiss their feet, or even knees, it being held an incivility to touch their mouths; to this the altar pulled at some distance. Others pretend, that they first kissed not the hand, and afterwards drew it back to their lips; but it rather appears, that the contrary order was observed. Satan, however, and Hercules, were *adored* with the head bare; whence the worship of the last was called *infamous perceptions*, and *nuda sacraments*, as departing from the Roman customary method, which was to sacrifice and adore with the face veiled, and the clothes drawn up to the ears, to prevent any interruption in the ceremony, by the sight of unlucky objects.

Sometimes also prostration, or falling on the face, and sometimes kneeling, were practised: sometimes they turned towards the sun, and sometimes to the east.

Other circumstances of *adoration* were the putting crowns, garlands, and the like, on the statues or images *adored*; falling down by them; praying to them, in soft trembling murmurs, to be favourable, *favens nibi*.

The Romans practised *adoration* at sacrifices, and other solemnities, in passing by temples, altars, groves, &c. at the sight of statues, images, or the like, whether of stone or wood, wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in, or out, to pay their respects to.

The Greeks, instead of turning about to the right hand, after the Roman manner, thought it more religious to turn to the left.

In the symbols of Pythagoras, *adoration* is enjoined to be performed in a sitting posture, genuflexion being then unknown.

The Jewish manner of *adoration* was by prostration, bowing and kneeling. Pinchon has a discourse express on the form of the Jewish *adoration*. The Christians adopted the Grecian rather than the Roman method, and *adored* always uncovered. The ordinary posture of the ancient Christians was kneeling, but on Sundays, standing. In this they conformed to the heathens, that a peculiar regard was had to the east, to which point they ordinarily directed their prayers; which occasioned a belief among the heathens, as if they *adored* the sun. Something of this usage is still retained, as appears by the position of our churches. A modern author has discovered an error of the builders in this respect, many of our ancient churches being found to vary several degrees from the true east and west. Plato's Hist. Stuff. chap. iv. § 55. p. 362.

ADORATION is also used for certain extraordinary civil honours, *or respects*, which resemble those paid to the Deity, yet are given to men.

We read of *adorations* paid to kings, princes, emperors, popes, bishops, abbots, &c. *Adorations* paid to the people, to the person. *Adoration* by kneeling, by falling prostrate, kissing feet, hand, garment, &c.

The Persian manner of *adoration*, introduced by Cyrus, was by binding the knee, and falling on the face at the prince's feet, striking the earth with the forehead, and kissing the ground. The ceremony, which the Greeks called *apyrexia*, Conon refused to perform to Artaxerxes, and Callisthenes to Alexander the Great, as reputing it impious and unlawful.

The *adoration* performed to the Roman and Grecian emperors, consisted in bowing, or kneeling at the prince's feet, laying hold of his purple robe, and privately withdrawing the hand, and clapping it to the lips. Some attribute the origin of this practice to Constantius. They were only persons of some rank or dignity that were invited to the honour. Paris kneeling before the emperor to deliver a petition, was also called *adoration*.

It is particularly said of Diocletian, that he had gems fastened to his shoes, that divine honours might be more willingly paid him, by kissing his feet. The like usage was afterwards adopted by the popes, and is observed to this

ADORATION is also used, in the court of Rome, for the ceremony of kissing the pope's feet.

These prelates finding a vehement disposition in the people to fall down before them, and kiss their feet, procured crucifixes to be fastened on their slippers; by which stratagem, the *adoration* intended for the pope's person, is supposed to be transferred to Christ. Divers acts of this *adoration* we find offered even by princes to the pope.

We are told, that in the ancient church the same ceremony was practised to all bishops; people kissed their feet, and saluted them with the phrase *osculor te, I adore thee.*

The practice of *adoration* may be said to be still subsisting in England, in the ceremony of kissing the king's, or queen's hand, and in serving them at table, both being performed kneeling.

ADORATION is also particularly used for the ceremony of *omnigo*, or paying homage to a new elected pope.

Adoration properly is paid only to the pope, when placed on the altar, in which posture the cardinals, conclavists alone, are admitted to kiss his feet. The people are afterwards admitted to do the like at St. Peter's church; the ceremony is described at large by Guicciardin.

ADORATION is also used for a method of electing a pope without scrutiny, or voting.—In the election by *adoration*, the cardinals rush hastily, as if agitated by some fright, and fall impetuously to the *adoration* of some one among them, and proclaim him pope.

In the election by scrutiny, *adoration* is the last thing, as it follows the election; as in the other it is the electa itself, or rather supersedes the election.

ADORATION is more particularly used for kissing one's hand in the presence of another, as a token of reverence.

The Jews *adored* by kissing their hands, and bowing down their heads; whence in their language *kissing* is properly used for *adoration*. Calmet.

ADORATION is also used among Roman writers, for a high species of applause given to persons, who had spoken or performed well in public. The method of expressing it was, by rising, putting both hands to their mouth, and then returning them towards the person intended to be honoured.

ADORATION is of divers kinds and qualities; *supreme* and *subordinate*; *absolute* and *limited*; *direct* and *indirect*; *relative* and *terminal*; *internal* and *external*; *secret* and *open*.

ADORATION, *external*, coincides with what is otherwise called *ritual worship*.

ADORATION, *internal*, coincides with spiritual *adoration*, called also *mental* or *true* in spirit and truth.

ADORATION, *latria*, that performed in public, with stated ceremonies prescribed by authority, in opposition to private, or tacit, or implicit *adoration*.

ADORATION, *supreme*, the highest degree of religious honour or worship rendered to a being, as supposing him the supreme God; in opposition to subordinate worship given to inferior beings.

ADORATION, *absolute*, that rendered immediately to a being in consideration of his own essential perfections, and terminating in himself. This coincides with immediate *adoration*, and stands opposed to relative or mediate *adoration*. Cicarius has an express dissertation on the *adoration* of the Father by the Son.

ADORATION, *relative*, is that worship paid to an object, as belonging to, or representative of another.

In which sense the Romanists profess to adore the cross, not simply or immediately, which they allow would be idolatry, but in respect of Jesus Christ, whom they suppose to be on it. The Jesuits in China carry an image of Christ under their cassocks, and to this refer mentally the public *adorations* they offer to Confucius. Vid. Father Le Comte, &c.

ADORATION, *perpetual*, is a kind of society or association of devout persons, established in Romish countries, who take their turns to pray before the eucharist, regularly relieving each other, so that the service never ceases day nor night.

The members of the perpetual *adoration* answer to the ACOEMETÆ in the eastern church.

We find societies under this denomination in France, Germany, Italy, &c.

ADORATION, *Turkish*, is a term used in the laws of king Canute, for that performed after the heathen manner, who *adored* idols.

The Thracians *adored* the winds, on account of the terrible effects produced by them; the same was adopted by most of the other nations, Persians, Greeks, Romans, &c.

The Englishmen *adored* tortoises, as something peculiarly sacred; several people *adored* weapons, and instruments of war. The Scythians, &c. *adored* swords, the Romans axes, the Arabs flames, the Indians *adored* vipers, the Polygonite and Cataddeite the fetus the latter of which nations is also said to *adore* the cross. The Blanes, a Peruvian people, in the island of Puna, anciently *adored* a huge emerald, of the bigness of an ostrich's egg, by offering to it other emeralds of a less size. All which the priests kept for their own use; the doctrine, as Garcilasso observes, being founded on their avarice.

The Persians chiefly paid their *adoration* to the sun and fire, some say also to rivers, the wind, &c. The motive of *adoring* the sun was the benefits they received from that glorious luminary, which, of all created lubsistances, has double of the best price for such homage; the institution of the fire-worship is usually referred to Zoroaster. The retainers to it are called GUEBRES; by the Persians, Ghebr Arabs, Parsis, Parsees, Parsoth.

Dr. Hyde reduces the Persian fire-worship to a subordinate kind of honour, to service, which he calls *syncdulia*, defending that people from any charge of *latreia*, or idolatry of fire. A late traveller into those parts, Gemelli Carreri, does the same.

The Greeks and Romans also *adored* fire under the name of VESTA. Pliny mentions the method of *adoring* lightnings, which was by popisma, or gentle clappings of the hands.

The Jews have been charged by heathens with *adoring* the vine, the head, &c. By Christians, with *adoring* the [illegible] a charge which one of their rabbies [illegible], has been at the pains to remove.

[illegible] golden calf, into which they fell in [illegible] seems to have been borrowed, like many [illegible] ceremonies, from the Egyptians.

The Egyptians are said to have paid *adoration* to divers animals, plants, fishes, &c. the crocodile, the ibis, onions, &c. But those were only symbolical, or relative acts of homage; they *adored* the sun in a more peculiar manner, under the name of Osiris.

It is disputed, whether the Chinese pay divine or only civil honours to the statues of Confucius, and their ancestors. That people, however, appear to *adore* heaven; whence the inscription in all their temples, and which even the Christians are said to have retained in their churches, *king tien*, i. e. *adora heaven*.

The Indians are said to *adore* the devil. Some charge the same on the Bramins.

ADOREA, in *Roman Antiquity*, a word used in different senses; sometimes for all manner of grain, sometimes for a kind of cakes made of fine flour, and offered in sacrifice; and finally for a dole or distribution of corn, as a reward for some service; whence by metonymy it is put for praise or rewards in general.

ADOS signifies water, in which iron-hot iron has been extinguished.

ADOSCULATION is used, by some *Naturalists*, for a species of copulation or impregnation, by mere external contact between the genital parts of the two sexes, without intromission.

Such is that of plants, by the falling of the *farina fœcundans* on the pistil, or uterus.

Divers kinds of birds and fishes are also impregnated by *adosculation*. Grew Anat. of Plants, chap. v. §9.

ADOSSE'E is used, in *Heraldry*, to denote two figures or bearings, placed back to back.

The arms of the duchy of Bar are two barr *adossées*.

ADOXA, in *Botany*, a name given by Linnæus to the genus of plants, called by other writers MOSCHATELLINA. They are ranked among the *octandria tetragynia*.

ADPERCEPTION, in the Leibnitian style, denotes the act whereby the mind becomes conscious to itself of a perception.

AD PONDUS *Omnium*, to the weight of the whole; an abbreviation among *Physicians*, &c. signifying, that the last prescribed ingredient is to weigh as much as all the others put together.

ADQUISITUS, in some *Ancient Latin Writers of Music*, is used for the note, or chord, which the Greeks called *προσλαμβανόμενος*. See DIAGRAM.

AD QUOD *Damnum*, a writ directed to the sheriff, commanding him to inquire what hurt may befal the king by granting a fair, or market, or any town or place.

The form writ also obtains for an inquiry to be made of what the king, or other person, may suffer, by granting lands in fee-simple to a convent, chapter, or other body politic; by reason such land falls into MORTMAIN.

The writ *Ad quod damnum* is also had for the turning and changing of ancient highways; which may not be done without the king's licence obtained by this writ, or inquisition found that such change will not be detrimental to the public. Vaugh. Rep. 341. Ways turned without this authority are not esteemed highways, so as to oblige the inhabitants of the hundred to make amends for robberies; nor have the subjects an interest therein to justify going there. 3 Cro. 207. If any one change a highway without the authority, he may stop the way at his pleasure. Dav. for the Prince 8 and 9 W. III. case. As for enlarging of highways by order of justices of peace, &c. Where any common way shall be enlarged after a writ of *ad quod damnum* executed, any person

grieved by such enclosure, may complain to the justices at the next quarter sessions; but if no such complaint or appeal be made, then the inquisition and return, recorded by the clerk of the peace, shall be for ever binding. 8 and 9 W. III.

ADRACHNE, in *Botany*, the strawberry-bay. It grows plentifully in the island of Candy, on the hills of Leuce, and in other places among the rocks, more like a shrub than a tree. It flowers and bears fruit twice in the year, as does the arbutus strawberry-tree. It is also called *adracla*, and ANDRACHNE.

ADRACLA, another name for the preceding shrub. See ANDRACHNE.

ADRAGANTH, see TRAGACANTH; the same as gum *dragant*.

ADRAM, a name given to SAL gem.

ADRASTEA, or ADRASTIA, in *Antiquity*, an epithet given to the goddess Nemesis, or Revenge.

It was taken from king Adrastus, who first erected a temple to that deity.

ADRASTIA *certamina*, in *Antiquity*, a kind of Pythian games, instituted by Adrastus king of Argos, in the year of the world 2700, in honour of Apollo, at Sicyon.

These are to be distinguished from the Pythian games celebrated at Delphi.

ADRIANISTS, a branch of *Anabaptists*, the disciples of Adrian Hamstedius, in the sixteenth century, who taught first in Zealand, and afterwards in England.

The *Adrianists*, besides the common dogma of anabaptism, are said to have had some peculiar notions relating to the person of Christ. Theodoret mentions a more ancient sect of this name, who were followers of Simon Magus.

ADRIFT; a vessel broke from her moorings, and driven by the wind or waves, is said to be *adrift*.

ADRIUNE, in *Botany*, a name given by the Arabian writers to the plant known at this time by the name of *cyclamen*, or sow-bread.

ADROBOLON, another name for the Indian BDELLIUM.

ADROGATION, in *Antiquity*, a species of adoption, whereby a person who was capable of choosing for himself, was admitted by another into the relation of a son.

The word is compounded of *ad*, *to*, and *rogare*, *to ask*; on account of a question put in the ceremony of it, whether the adopter would take such a person for his son; and another to the adoptive, whether he consented to become such a person's son?

ADROP, among *Alchemists*, denotes either that precise matter, as lead, out of which the mercury is to be extracted for the philosophers stone; or it denotes the philosophers stone itself, inasmuch as this is also called *saturn* and *plumbum*, or lead, *azar*, *azante*, and *lapis ipse*.

ADROTERON; see ALICA.

ADSAMAR, See URINE.

ADSCRIPTS is used by some *Mathematicians*, for the natural tangent, called also, by Vieta, *prosines*.

ADSIDELA, in *Antiquity*, a table at which the flamens sat, when they offered sacrifice.

ADSIGNIFICATION, among *Schoolmen*, the act of noting or signifying any thing, with the addition of the time when it happened.

ADSTRICTION, among *Physicians*, is used to denote the too great rigidity and closeness of the emunctories of the body; particularly the pores of the skin: also to signify the styptic quality of medicines. See ASTRINGENTS.

AD TERMINUM *qui præterit*, is a writ of entry, which lies where a man, having leased lands or tenements for term of life, or years, is, after the term expired, held from them by the tenant, or other stranger, who enjoys the same, and deforceth the lessor.—The same writ also lies for the lessor's heir.

ADVANCE, in *Commerce*, denotes money paid before goods are delivered, work done, or business performed. To pay a note of hand, or bill by *advance*, is to pay the value before it becomes due, in which case it is usual to allow a discount for the time it is paid advanced.

ADUAR, a kind of ambulatory village, wherein Arab families inhabit, in a sort of tents, moveable on occasion, as forage and provisions suit. Some also write the word *adowar*, and *adouard*. There are reckoned thirty thousand *aduars* in the kingdom of Algiers.

ADVANCE-FOSSE, or DITCH, in *Fortification*, denotes a ditch of water round the *esplanade*, or GLACIS of a place; to prevent its being surprized by the besiegers. See FOSSE.

ADVANCE-GUARD, or VAN-GUARD, in the *Military Art*, is the first line, or division of an army ranged, or marching in battle-array; or that part of it which is next the enemy, or which marches first toward them.

The whole body of an army is divided into *advance-guard*, *arrear-guard*, and *main-body*.

The word is sometimes also applied to a small party of horse, viz. 15, or 20, commanded by a lieutenant, beyond, and in sight of the main-guard.

ADVANCER, among *Hunters*, is one of the starts or branches of a buck's attire, between the back antler and the palm.

ADVENT, ADVENTUS, in the calendar, the time immediately preceding Christmas; anciently employed in pious preparation for the *adventus*, or coming on, of the feast of the Nativity.

Advent includes four Sundays, or weeks; commencing either from the Sunday which falls on St. Andrew's day, or that next before or after it, i. e. from the Sunday which falls between the 27th of November, and the third of December inclusive.—But it is to be noted, this rule has not always obtained.—In the Ambrosian office, there are six weeks marked for *Advent*, and St. Gregory, in his Sacramentary, allows five.

The first week of *Advent*, in our way of reckoning, is that wherein it begins; but it was anciently otherwise; the week NEXT Christmas being reputed the first; and the numeration carried backwards.

Great austerity was practised in the ancient church during this season.—At first they fasted three days a week; but they were afterwards obliged to fast every day; whence the season is frequently called in ancient writers, *Lent*, and *Quadragesimæ S. Martini*.

The courts of justice were at one time all shut.

ADVENT is also one of the times from the beginning whereof, to the end of the octaves of the Epiphany, the solemnizing of MARRIAGE is forbid, without express licence.

ADVENTITIA *cœna*, in *Antiquity*, an entertainment made by the friend of a person who had been travelling, by way of welcome at his return. This was otherwise called *cœna adventoria*. Pitiscus.

ADVENTITIOUS, something accruing or befalling a person, or thing, from without.

Thus, *adventitious* matter is such matter as doth not properly belong to any body, but is casually joined to it.

ADVENTITIOUS, in the *Civil Law*, is applied to such goods as fall to a man, either by mere fortune, or by the liberality of a stranger, or by collateral, not direct succession.

In this sense, the word stands opposed to *profectitious*; by which are signified such goods as descend in a direct line, from father to son.

ADVENTITIOUS *fossils*, are foreign or extraneous ones, found incorporated with others, to which they do not properly belong. Such as sea-shells, &c.

AD VENTREM *inspiciendum*, in *Law*. See VENTRE *inspiciendo*.

ADVENTURE, an extraordinary and surprising enterprize, or accident, either real, or fictitious.

The word is French, and literally denotes an event, or accident.

Novels, romances, &c. are chiefly taken up in relating the *adventures* of cavaliers, lovers, &c.

ADVENTURE, in *Commerce*, a bill of *adventure* is a writing signed by a merchant, attesting that the property of goods shipped, or sent away in his name, belongs to another, the *adventure* or chance whereof the said person is to stand, with a covenant to account to him for the produce of it.

ADVENTURER, see MINE-*adventurer*.

ADVENTURERS is particularly used for an ancient company of merchants and traders, erected for the discovery of lands, territories, trades, &c. unknown.

The society of *adventurers* had its rise in Burgundy, and its first establishment from John duke of Brabant, in 1296; being since known by the name of the *Brotherhood of St. Thomas à Becket*. It was afterwards translated into England, and successively confirmed by Edward III. and IV. Richard III. Henry IV. V. VI. and VII. who gave it the appellation of MERCHANT-*adventurers*; by Henry VIII. and queen Elizabeth, who in 1564 formed it into an English corporation; and by succeeding kings.

By our statutes, *adventurers* making settlements in any part of America belonging to the enemy, may obtain a charter from the king. Stat. 13 Geo. II. c. 4. sect. 13.

ADVERB, ADVERBIUM, in *Grammar*, a particle joined to a verb, adjective, or participle, to explain their manner of acting or suffering; or to mark some circumstance or quality signified by them.

The word is formed from the preposition, *ad*, *to*, and *verbum*, *a verb*; and signifies literally a word joined to a verb, to shew how, when or where, one is, does or suffers; as, the boy paints *neatly*, writes *ill*; the house stands *there*, &c.

Not that the *adverb* is confined purely to the verbs; but because that is its most ordinary use. Whence it becomes so denominated κατ' ἐξοχην. We frequently find it joined to adjectives, and sometimes even to substantives, particularly where those substantives signify an attribute, or quality of the thing spoken of; v. gr. he is *very* sick; he is *truly* king.

An *adverb* is likewise joined sometimes to another *adverb*, to modify its meaning; v. gr. *very devoutly*, &c. Whence

some grammarians choose rather to call *adverbs* modificatives; comprising under this one general term, *adverbs*, conjunctions, prepositions, and even adjectives.

Adverbs are very numerous; but they may be reduced under the general classes of *adverbs* of time, of place, of order, of quantity, of quality, of manner, of interrogation, of affirmation, of denegation, of diminution, of doubting, of exception, and of comparison.

Adverbs are denominated by Mr. Harris attributes of attributes, or attributives of the second order. Hermes, p. 192.

ADVERBIAL, something relating to *adverb*. We say an *adverbial* phrase, *adverbial* expression, &c.

ADVERBIAL *numbers* are sometimes used to denote once, twice, thrice, &c.

ADVERSARIA, among the *Ancients*, was used for a book of accounts, like our journal or day-book.

Hence, ADVERSARIA is sometimes also used among us for a *common place-book*.

Adversaria amounts to the same with *epistlographia*, *excerpta*, or *memoriale*; and stands opposed to *codex*; the former being for occasional matters which were taken down hastily, from which they were afterwards transcribed into the latter, in a fair regular manner, for standing use. Morhof. Polyhist. lib. iii. cap. 1.

ADVERSARIA is also a title given to divers books, containing collections of miscellaneous observations, remarks, &c.

In which sense, *adversaria* amounts to much the same with *variæ lectiones*, *variæ observationes*, *commentarii*, *lectiones antiquæ*, *loci communes*, *genialis dies*, *vespertæ*, *noctes*, *miscellaneæ*, &c.

ADVERSARIA is also used for a commentary on some text or writing.

This was so called, because the notes were written on the *adverse* or opposite page.

ADVERSARY. See ANTAGONIST.

The word is formed of the Latin preposition *adversus*, *against*, and *vertere*, *to turn*.

ADVERSATIVE, in *Grammar*.—A particle *adversative*, is that which expresses some difference, or opposition between what goes before, and what follows.

Thus, in the phrase, *he loves knowledge*, but *has no application*; the word *but* is an *adversative* conjunction: between which and a disjunctive one there is this difference, that the first sense may hold good, without the second opposed to it, which is otherwise in regard to *disjunctive* conjunctions.

Adversatives of this kind may be called *absolute*: beside these, there are several others recited by Harris; such as *adversatives of comparison*, expressed by the words *than* and *as*, which mark not only opposition, but that equality or excess which arises among subjects from their being compared: such likewise are *adversatives adequate*, and *inadequate*, the former of which is expressed by the word *unless*, and the latter by *although*. Hermes, p. 254, &c.

ADVERSATOR, in *Antiquity*, a servant sent to wait his master's returning from supper, and attend him home. The rich had servants in this quality, to apprize them of any danger.

ADVERTISEMENT, an intelligence or information given to persons interested in an affair.

The word is formed from *advertere*, *to consider*.

ADVERTISEMENT in more particularly used for a brief account of articles of private concern, inserted in the daily, or other public papers.

By the statute of 25 Geo. II. cap. 36. and 28 Geo. II. cap. 19. the penalty of 50*l.* is inflicted on persons advertising a reward, with no questions to be asked, for the return of things lost or stolen; and likewise on the printer. See STAMP-*duties*.

ADVICE-*boat*, a small vessel employed to carry expresses or orders with dispatch.

ADULT, ADULTUS, one who is arrived at years of discretion, and entered upon manhood, or the age of ADOLESCENCY; and is old enough to have understanding and discernment.

The word is formed from the verb *adolescere*, *to grow up*. There is a notable difference between the proportions of *infants* and *adults*.—A man, M. Dodart observes, formed like a *fœtus*, would be a monster, and would scarce be acknowledged for one of the species.—The Anabaptists confer the sacrament of baptism upon none but ADULTS. We find many things in authors concerning the diseases, the regimen, the diet, &c. of *adults*.—The Chinese have a peculiar ritual of *adults*.

ADULT is also used in *Civil Law*, for a youth between fourteen and twenty-five years of age.

In which sense *adult* is synonymous with *juvenis*, *adolescens*, or *adolescentes*.

ADULT *places*, a modern author observes, differ from immature ones, in that they contain more oil, and less salt; and the same he judges will hold of men; but this requires farther examination. Terenzoni ap. Giorn. de Lett. Ital. tom. xxix. p. 317, &c.

ADULTERATION, in a general sense, the act of corrupting, or debasing a thing that was pure, by some improper admixture.

The word is Latin, formed of the verb *adulterare*, *to corrupt*, by mingling something foreign to any substance. We have laws against the *adulteration* of coffee, tea, tobacco, snuff, wine, beer, bread, wax, hair-powder, &c. See Stat. 13 W. III. cap. 5.—11 Geo. I. cap. 30.—1 Geo. I. cap. 46.—1 W. and M. cap. 34.—23 El. cap. 8.—10 Ann. cap. 26.—3 Geo. III. cap. 11.

For the method of detecting *adulteration* of liquors, see ESSAY, PROOF, &c.

ADULTERATION *of coin* properly imports the making, or calling of a wrong metal, or with too base or too much alloy.

Adulterations of coins are effected divers ways, as, by forging another stamp, or inscription; by mixing impurer metals with the gold or silver: most properly, by making use of a wrong metal, or an undue alloy, or too great an admixture of the baser metals with gold, or silver. Counterfeiting the stamp, or clipping and lessening the [illegible] are not to properly come under the denomination of

[illegible] rules and methods, both of *adulterating* and [illegible] *adulterated* metals, &c.

Adulterating is somewhat less extensive than *debasing*, which includes diminishing, clipping, &c.

To *adulterate* or debase the current coin, is a capital crime in all nations.—The ancients punished it with great severity: among the Egyptians both hands were cut off; and by the civil law, the offender was thrown to wild beasts. The emperor Tacitus enacted, that counterfeiting the coin should be capital; and under Constantine it was made treason, as it is also among us. The *adulterating* of gems is a curious art, and the methods of detecting it no less useful. Nichols Lapid. p. 18.

ADULTERATION, in *Pharmacy*, denotes a fraudulent corruption of drugs, or medicines, by substituting ingredients of less value, for the sake of greater gain.

This practice the dealers in all the parts of medicine are but too well acquainted with. Pharmaceutical authors give numerous instances of *adulterations*, both in simple and compound medicines.

ADULTERESS, a woman who commits *adultery*. See ADULTERY.

ADULTERINE, in a general sense, denotes any thing which has been adulterated, or that is spurious, or counterfeited; and it is thus applied to a fraudulent balance, to debased and counterfeit coins, to a false key, and to suppositious writings.

ADULTERINE, in the *Civil Law*, is particularly applied to a child issued from an adulterous amour, or commerce.

Adulterine children are more odious than the illegitimate offspring of single persons.—The Roman law even refuses them the title of natural children; as if nature disowned them.

Adulterine children are not easily dispensed with for admission to orders. Those are not deemed *adulterine*, who are begotten of a woman openly married, through ignorance of a former wife being alive.

By a decree of the parliament of Paris, *adulterine* children are declared not legitimated by the subsequent marriage of the parties, even though a papal dispensation be had for such marriage, wherein is a clause of legitimation.

ADULTERINE *marriages*, in St. Augustine's sense, denote second marriages, contracted after a divorce.

ADULTERY, ADULTERIUM, (in *Ancient Law Books* called ADOWETRY) a crime committed by married persons, against the faith pledged to each other in marriage, by having carnal commerce with some other; or even by a person not married, who has the same intercourse with another that is.

Moralists and canonists, and divines, have distinguished several species of *adultery*; as,

ADULTERY, *manifest*, that wherein the parties are caught *in the fact*, or as, some express it, *res in re*.

On such occasions, strangers, or people not interested in the family, have been allowed to accuse, and prosecute women for *adultery*, either if committed during a husband's long absence, or although his connivance.

ADULTERY, *secret* or *feint*, that kept concealed from the knowledge of the world, and only divulged to a confessor, or the like.—In the canon law this is most favourably dealt with; persons were admitted to penance for this, and absolved, who were refused it for the open kind. Du-Cange.

ADULTERY, *presumptive*, that which is only discovered or inferred from certain light, or indications. Such are the parties being found in bed together *nudos cum nudis*.

ADULTERY, *interpretative*, or *reputed*, denotes an act [illegible] though not properly included under the denomination

yet is reputed as equivalent to it, and punished as such. Thus mixed marriages between Christians and Jews, *e. g.* between a Christian man and a Jewish woman, are put by the laws of Arcadius and Honorius, on the footing of *adultery*.

So also second marriages are called by some, as Athenagoras, and St. Ambrose, an honourable or better sort of *adulteries*.

ADULTERY, *improper*, includes other extraordinary cases and species; such are the commerce with a woman only espoused, not actually married; with a married woman, who lives as a common whore; with a married woman, taking her for single; with a putative wife, or concubine, taking her for a real wife; and with a nun, who by her vows is deemed espoused.

ADULTERY, *figurative*, that intended only to represent, or prefigure another fact, or convey some other instruction. This coincides with typical, or allegorical *adultery*, and stands opposed to actual. So the *adultery* of Mars and Venus is turned into an allegory by naturalists, moralists, alchemists, &c.

ADULTERY, *single*, is that where only one of the parties is married, in contradistinction from double *adultery*, which is, where both parties are married.

ADULTERY, *incestuous*, that wherein the parties are related within the third degree of consanguinity.

ADULTERY, *licit*, that not prohibited by any express or known law.

It has been disputed whether *adultery* be *malum in se*, or only *malum prohibitum*, i. e. evil in itself, or only rendered evil, by virtue of positive laws and prohibitions. St. Ambrose and some others have maintained, that *adultery* was not criminal before the Mosaic law. Hobbes de Civ. cap. 6. § 16. Budd. Inst. lib. ii. cap. 4.

It has been controverted, whether *adultery* may be lawfully committed in war, with the enemies wives? The answer is in the negative, and the authorized practice of civilized nations is agreeable to this. It has also been a famous question, whether it be lawful for a woman to commit *adultery* with the consent of her husband, and for the procuring some great good to him? St. Austin apparently allows of it; at least, does not condemn it. De Serm. Dom. in Mont. lib. i. cap. 16. § 49. & De Civ. Dei, lib. xvi. cap. 25.

It has likewise been a dispute, whether it be lawful for one of the parties married to commit *adultery*, with the consent of the other, for the sake of having children? Of which we have instances in Abraham, who, on this account, conversed with Hagar: and likewise among the Greeks and Romans.

Pollman, a German professor, has a dissertation on the husband's right to alienate his wife's body to another's use.

ADULTERY, *illicit*, that which is expressly contrary to some obligatory law: such, according to the generality of casuists, is all *adultery*, proper, improper, single, double, open, and occult; because of a natural baseness or turpitude in the thing, as well as its being a violation of conjugal faith, and injury to our neighbour.

In effect, punishments have been annexed to *adultery* in most ages and nations, though of different degrees of severity. In many it has been capital, in others venial, and attended only with slight pecuniary mulcts. Some of the penalties are serious, and even cruel; others of a jocose and humorous kind.

Among the Egyptians, *adultery* by consent, was punished in the man, by a thousand lashes, given with rods: and in the woman, with the loss of her nose. Nevertheless *adulteries* were not unfrequent among the Egyptians.

The Grecian laws express great indignation against *adultery*. In the earlier times of Athens, the punishment of *adultery* seems to have been arbitrary. In other parts of Greece, *adultery* was severely punished.

In the later times of Greece, it was ordered by Draco, that he who catched an *adulterer* in the fact, might impose on him any arbitrary punishment; and this law was confirmed by Solon. Nevertheless it appears to have been highly impolitic, as it gave full scope to private revenge, instead of leaving the punishment to the state.

It was by the Grecian law farther ordained, that if any one was injuriously confined upon suspicion of *adultery*, he should make his complaint by appeal to the *Thesmothetæ*, which, if they found justifiable, he should be acquitted, and his fetters discharged from their hair; but in case he were found guilty, the judges were to inflict on him what punishment they would, death only excepted; and the offender was obliged to procure friends to be responsible for his future chastity.

There were other remarkable punishments for *adulterers* among the Grecians; such, particularly, as putting out their eyes. And the Locrians observed this custom in later ages, being compelled to the observance of it by Zaleucus, their lawgiver, whose rigour in executing this law is very remarkable; for having caught his son in *adultery*, he resolved to deprive him of his sight, and remained a long time inexorable, notwithstanding the whole city was willing to remit the punishment, and requested him to spare the youth. At length, unable to resist the people's importunity, he mitigated his sentence, and suffered one of his son's eyes, by causing one of his own to be put out; by this glorious act setting a memorable example both of *justice* and of *mercy*.

At Gortyn in Crete, they punished *adultery* after another manner; they were covered with wool, an emblem of the softness and effeminacy of their disposition, and in that dress they were carried through the city to the magistrate's house, who sentenced them to ignominy, whereby they were in a manner deprived of all their privileges, and their share in administering the public business.

The Spartans, indeed, may in one sense be said to have tolerated *adultery*, since they laughed at those who thought the violation of the marriage-bed an unsupportable affront: they allowed other men the liberty of embracing their wives, which freedom they took with others in their turn. Nay even strangers, as well as citizens of Sparta, were allowed the same freedom with their wives. Yet we find that their kings were exempt from this custom, that the royal blood might be preserved untainted, and the government remain in the same lineal descent.

But notwithstanding this liberty, which was founded on mutual consent, they accounted all other *adulteries* the most heinous crime in the world; and while they adhered to their ancient laws, they were wholly strangers to them. See Potter's Arch. lib. iv. cap. 12.

Plutarch tells us, that if any person discovered his sister or daughter, while unmarried, in this crime, he was allowed by Solon's laws, to sell her for a slave. *Adulteresses* were never after permitted to adorn themselves with fine cloaths; and in case they appeared to do so, were liable to have them torn off by any that met them, and likewise be beaten. The same liberty was permitted to any that found them in the temples, which were thought to be polluted by the admission of persons so infamous and detestable. Lastly, their husbands, though willing, were forbidden to cohabit any longer with them, upon pain of *ignominy*, *arrears*; but persons who prostituted women, were adjudged to die.

There are various conjectures concerning the ancient punishment of *adultery* among the Romans.

By a law of Romulus, to which Plutarch makes mention, a man had the liberty of turning away his wife, either for poisoning his children, counterfeiting his private keys, or for *adultery*. Though some maintain that it was made capital, by a law of Romulus, and again by the Twelve Tables. Others, that it was first made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in ancient times was very various, much being left to the discretion of the husband and parents of the *adulterous* wife, who exercised it differently, rather with the silence and countenance of the magistrate, than any formal authority from him. Thus we are told the wife's father was allowed to kill both parties when caught in the fact, provided he did it immediately, killed both together, and, as it were, with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean, or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far, but mutilating, cutting off the ears, noses, &c. were deemed sufficient. The punishment allotted by the *lex Julia* was not, as many have imagined, death; but rather banishment, or deportation, being intermixed fire and water: though Octavius appears, in several instances, to have gone beyond his own law, and to have put *adulterers* to death. But though the Julian law left the accusation of *adultery* open to every body, yet strangers were seldom suffered to prosecute, where the husband made no complaint. But where the husband made a trade of his wife's infamy, or having seen her shame with his own eyes, patiently suffered the affront: in these cases, *adultery* became a crime of public concern; and the Julian law provides a punishment for such husbands as *will* as their wives.

Under Martinus *adulterers* were burnt at a stake. Constantine, it is said by Nonnius and others, first by law made the crime capital. Under Constantius and Constans, *adulterers* were burnt, or sewed in sacks, and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual punishment, or cutting off the nose.

By the civil law, as altered by Justinian, who, at the instance of his wife Theodora, mitigated the severity of the *lex Julia*, *adultery* is punished with whipping, and shutting up in a convent for two years; during which time, if the husband does not condemn to take her back again, she is shaven, and shut up for life.—This is called *authenticating*, as having been established by an authentic.

In France, however, the whipping is omitted, that the husband may be the less averse to the taking her back within the two years.

Under Theodosius women convicted of this crime were punished after a very singular manner, viz. by a public constupration; being locked up in a narrow cell, and forced to admit all the men to their embraces that would offer themselves. This custom was again abolished by the same prince.

It is controverted whether, among the Romans, *adultery* was allowed to be compounded?

By an edict of the emperor Antoninus, the husband was not allowed to bring an action of *adultery* against his wife, unless he himself were innocent; the reason given for it is very natural, *per iniquum enim videtur esse ut judicium vir & uxore exigat, quam ipse non exhibeat.*

By the Jewish law, *adultery* was punished by death in both parties, where they were both married, or only the woman. The Jews had a particular method of trying, or rather purging an *adulteress*, or a woman suspected of the crime, by making her drink the bitter waters of jealousy; which, if she were guilty, made her swell.

Among the Mingrelians, *adultery* is punished with the forfeiture of a hog, which is usually eaten in good friendship between the gallant, the adulteress, and the cuckold. Chardin. Voy. tom. i. p. 47.

In some parts of the Indies, it is said, any man's wife is permitted to prostitute herself to him who will give an elephant for the use of her; and it is reputed no small glory to her, to have been rated so high. Montague's Eff. lib. iii. cap. iv.

Adultery is said to be so frequent in Ceylon, that not a woman but practises it, notwithstanding its being punishable with death. Bibl. Univ. tom. xxiii. p. 237.

Among the Japanese, and divers other nations, *adultery* is only penal in the women. Among the Abyssinians, the crime of the husband is said to be only punished on the innocent wife. In the Marian Islands, on the contrary, the woman is not punishable for *adultery*; but if the man go astray, he pays severely: the wife and her relations waste his lands, turn him out of his house, &c. Among the Chinese there is reason to conclude, that *adultery* is not capital; for it is said that fond parents will make a contract for their daughters future husbands, to allow them the indulgence of a gallant.

In Spain, they punished *adultery* in men by cutting off that part which had been the instrument of the crime.

In Poland, before Christianity was established, they punished *adultery* and fornication in a very particular manner: the criminal they carried to the market-place, and there fastened him by the testicles with a nail; laying a razor within his reach, and leaving him under a necessity, either of doing justice upon himself, or of perishing in that condition.

By the old law of Scotland, notorious or double *adultery* is punished by death; single *adultery* by banishment, fining, &c. though by the opinion of some Scotch lawyers, it may be punished by death.

The Saxons formerly burnt the *adulteress*, and over her ashes erected a gibbet, whereon the *adulterer* was hanged. In this kingdom, likewise, *adultery* by the ancient laws was severely punished. King Edmund the Saxon ordered *adultery* to be punished in the same manner as homicide; and Canute the Dane, ordered that a man who committed *adultery* should be banished, and that the woman should have her nose and ears cut off. In the time of Henry I. it was punished with the loss of eyes and genitals. Lib. Hen. I. cap. 12. Doomsday, tit. Cestre. Civit.

Adultery at present is only punished by fine and penance in the spiritual court; or by an action of common law for damages. Though some of our law-books speak of *adultery* as a thing temporal against the peace. As to the *adulteress*, by our law, she undergoes no temporal punishment whatever, except the loss of her dower; and she does not lose even that, if her husband is weak enough to be reconciled to her, and cohabit with her after the offence committed. 13 Ed. I. cap. 34.

But it is to be observed, that *adulteresses* are such either by the *Canon*, or *Civil law*.

According to the former, a woman is an *adulteress*, who either being herself married converses carnally with another man; or being single herself, converses with a man that is married.

According to the latter, she is not an *adulteress*, if she be not herself in the married state, though she converses with a man that is. The crime, in this case, was more properly called *stuprum* than *adulterium*.

Hence, among the Romans, the word *adultera*, *adulteress*, differed from *pellex*, which denoted a single woman, who cohabited with a married man; and *pellex* differed from *concubina*, which signified her who had only intercourse with an unmarried man. The former was reputed infamous, and the latter innocent.

It is much disputed, whether *adultery* dissolves the bond of matrimony, and be a sufficient cause of divorce, so that the parties may marry again. This was allowed in the ancient church, and is still continued in the Greek, as well as the Lutheran and Calvinist churches. Romanists, however, disallow of it, and the council of Trent even anathematized those who maintain it; though the canon of anathematization was mitigated in deference to the republic of Venice, in some of whose dominions, as Zant, Cephalonia, &c. the contrary usage obtains.

The ecclesiastical courts in England so far agree with the papists, that they only grant a divorce *à mensa & thoro*, in case of *adultery*; so that a complete divorce, to enable the party to marry again, cannot be had without an act of parliament.

By a council of Nantes, marriage was declared dissolved by *adultery*, but the innocent party was not allowed second marriage. In after-times, leave was given to the innocent party alone; and afterwards the same was allowed the criminal party.

ADULTERY is also used in *Ancient Customs*, for the punishment, or fine imposed for that offence, or the privilege of punishing for it.

[illegible] *adulterium* amounts to the same with what the Saxons called *legerwita*.

ADULTERY is sometimes used, in a more extensive sense, for any species of impurity, or crime, against the virtue of chastity; and in this sense divines understand the seventh commandment.

ADULTERY is also used, especially in scripture, for idolatry, or departing from the true God, to the worship of a false one.

ADULTERY is also used, in *Ecclesiastical Writers*, for a person's invading, or intruding into a bishoprick, during the former bishop's life. The reason of the appellation is, that a bishop is supposed to contract a kind of spiritual marriage with his church.

The translation of a bishop from one see to another was also reputed a species of *adultery*; on the supposition of its being a kind of second marriage, which, in those days, was esteemed a degree of *adultery*. This conclusion was founded on that text of St. Paul, *Let a bishop be the husband of one wife*, by a false construction of church for wife, and of bishop for husband. Du-Cange.

ADULTERY is also used, in *Ancient Naturalists*, for the act of ingrafting one plant upon another.

In which sense, Pliny speaks of the *adulteries* of trees, *arborum adulteria*, which he represents as contrary to nature, and a piece of luxury, or needless refinement.

ADULTERY is also used by some fanciful *Astronomers* and *Astrologers*, for an eclipse of the sun, or moon, happening in an unusual, and, as they suppose, irregular manner: as in the case of horizontal eclipses, where, though the sun and moon be diametrically opposite, yet they appear as if both above the horizon at the same time.

ADVOCARIA, in *Middle Age Writers*, a tax paid the lord for his protection; sometimes also called *salvamentum*.

ADVOCATE, ADVOCATUS, among the Romans, a person skilled in their law, and who undertook the defence of causes at the bar.

The word is compounded of *ad*, *to*, and *vocare*, *to call*; q d *I call to my aid or defence*.

The Roman *advocates* answered to one part of the office of a barrister among us, viz. the pleading part: for as to the giving counsel, they never meddled with it; that being the business of the *jurisconsulti*.

The Romans in the first ages of their state, held the profession of an *advocate* in great honour; and the seats of their bar were crouded with senators and consuls; they, whose voices commanded the people, thinking it an honour to be employed in defending them.

They were styled, *comites*, *honorati*, *clarissimi*, and even *patroni*; as if their CLIENTS were not less obliged to them, than freed-men to their masters. See PATRON.

The bar was not at that time venal.—Those who aspired to honours and offices, took this way of gaining an interest in the people, and always pleaded *gratis*.

But no sooner were luxury and corruption brought into the commonwealth, than the bar became a shaare in them.—Then it was that the senators let out their voices for pay, and zeal and eloquence were sold to the highest bidder.—To put a stop to this abuse, the tribune Cincius procured a law to be passed, called from him *Lex Cincia*, whereby the *advocates* were forbid to take any money of their clients.—Feed. Bruneus has published an ample comment upon this law.

It had before this been prohibited the *advocates* to take any presents or gratuities for their pleading.—The emperor Augustus added a penalty to it: notwithstanding which, the *advocates* played their parts so well, that the emperor Claudius thought it an extraordinary circumstance when he obliged them not to take above eight great sesterces, which

which are equivalent to 64 pounds sterling, or upwards, for pleading each cause.

ADVOCATE is ſtill uſed in countries, and courts, where the civil law obtains, for thoſe who plead and defend the cauſes of clients truſted to them.

In Scotland they have a college, *or Faculty of Advocates*, 180 in number, appointed to plead in all actions before the lords of ſeſſion.—They have a dean, treaſurer, clerks, examinators, and a curator of their library.

By the articles of the Union, none are to be named ordinary lords of ſeſſion, except thoſe who have been *advocates*, or principal clerks of ſeſſion for five years, &c.

In France, they have two kinds of *advocates*, viz. pleading *advocates*, *avocats plaidants*; and conſiel *advocates*, *avocats conſultants*.

This diſtinction was formed with a view to the two branches among the Romans, *actuali*, and *juris-conſulti*.—Yet there is this difference, that the function of the *juris-conſulti*, who only gave their advice, was of a different kind from that of the *advocati*; being a ſort of private and perpetual magiſtrature, principally under the firſt emperors; and the *advocati* never became *juriſconſulti*. Whereas, on the other hand, in France, ſince the *advocates* have attained to reputation, and expedience enough at the bar, they quit ſo buſy a province, and become a kind of chamber-counſel.—They have alſo their *advocate* general, and king's *advocat*, *avocat du roy*.

ADVOCATE, *lord*, in Scotland, one of the officers of ſtate, whoſe buſineſs is to give his advice about the enabling and executing of laws; to defend the king's right and intereſt in all publick meetings; to proſecute all capital crimes before the juſticiary; and to concur in all purſuits before ſovereign courts for breaches of the peace; and alſo in all matters wherein the king, or his donator, has intereſt.—He intents no proceſſes of treaſon, except by warrant of privy-council.

The *lord advocate* is ſometimes an ordinary lord of ſeſſion; in which caſe, he only pleads in the king's cauſes; otherwiſe, he is at liberty to plead in all cauſes.

ADVOCATE *of a city*, or *town*, is a magiſtrate eſtabliſhed in ſeveral places of Germany, for the adminiſtration of juſtice in that city, in the emperor's name. See ADVOWEE.

ADVOCATE is more particularly uſed in *Church Hiſtory*, for a perſon appointed to defend the rights and revenues of a church, or religious houſe.

The word *advocatus*, or *advocare*, is ſtill retained, for what we uſually call the *patron*, or him who has the advowion, or right of preſentation, in his own name.

The abbeys and monaſteries had alſo all their *advocati*, or *advocatus*. See ADMINICULATOR.

There are ſeveral other kinds of *advocates*; as,

ADVOCATE, *conſiſtorial*, is an officer of the court of Rome, whoſe buſineſs it is to plead on the oppoſitions made to the PROVISIONS of benefices in that court. There are ten of theſe in number.

ADVOCATES, *elective*, thoſe choſen by the abbot, biſhop, or chapter, a particular licence being had from the king, or prince, for that purpoſe. The elections were originally made in the preſence of the count of the province.

ADVOCATES, *feudal*. Theſe were of the military kind, who, to make them more zealous for the intereſt of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the biſhop or abbot. Theſe were to lead the vaſſals of the church to war, not only in private quarrels of the church itſelf, but in military expeditions for the king's ſervice, in which they were the ſtandard-bearers of their churches.

ADVOCATE, *fiſcal*, *fiſci* ADVOCATUS, was an officer inſtituted by the emperor Adrian, to defend the cauſe and intereſts of the FISCUS, or private treaſury, in the ſeveral tribunals where that might be concerned.

ADVOCATES, *juridical*, in the *Middle Age*, were thoſe who from attending cauſes in the court of the comes, or count of the province, became judges themſelves, and held courts of their vaſſals thrice a year, under the name of the *tria placita generalia*.

In conſideration of this farther ſervice, they had a particular allowance of one third part of all fines, or mulcts, impoſed on defaulters, &c. which was called *tertia bannorum pars*, *tertius denarius*, *tertia pars compoſitionum*, *tertia pars legum*, or *emendarum*, &c.; beſides a proportion of diet for themſelves and ſervants.

ADVOCATES, *matricular*, were the advocates of the mother, or cathedral churches.

ADVOCATES, *military*, thoſe appointed for the defence of the church, rather by arms and authority, than by pleading and eloquence.

Theſe were introduced in the times of confuſion, when every perſon was obliged to maintain their own property by force; biſhops and abbots not being permitted to bear arms, and the ſcholaſtic or gowned *advocates* being equally unacquainted with them, recourſe was had to knights, noblemen, ſoldiers, or even to princes.

ADVOCATES, *nominative*, thoſe appointed by a king, or pope. Sometimes the churches petitioned kings, &c. to appoint them an *advocate*; at other times, this was done of their own accord. By ſome regulations, no perſon was capable of being elected *advocate*, unleſs he had an eſtate in land in the ſame county.

ADVOCATES, *regular*, thoſe duly formed and qualified for the profeſſion, by a proper courſe of ſtudy, the requiſite oath, ſubſcription, licence, &c.

ADVOCATES, *ſubordinate*, thoſe appointed by other ſuperior ones acting under them, and accountable to them.

There were divers reaſons for the creation of theſe ſubordinate *advocates*: as, the ſuperior quality of the principal *advocate*, his being detained in war, or being employed in other affairs: but chiefly, the too great diſtance of ſome of the church lands, and their lying in the dominions of foreign princes.

ADVOCATES, *ſupreme* or *ſovereign*, were thoſe who had the authority in chief, but acted by deputies or ſubordinate *advocates*. Theſe were alſo called principal, greater, and ſometimes general *advocates*. Such in many caſes were kings, &c. when either they had been choſen *advocati*, or became ſuch by being founders, or endowers of churches.—Princes had alſo another title to *advocateſhip*, ſome of them pretending to be *advocati nati* of the churches within their dominions.

ADVOCATIA, in the *Feudal Law*, the procuration of ſome public buſineſs, committed by a ſuperior to his ſubſtitute.

ADVOCATIA is alſo uſed for the patronage and protection of a church, college, monaſtery, and the like.

In which ſenſe it amounts to the ſame with ADVOWSON.

ADVOCATIA is alſo uſed for the protection or defence of the perſons, eſtates, &c.

ADVOCATION, ADVOCATIO, in the *Civil Law*, the act of calling another to our aid, relief, or defence.

ADVOCATION, *letters of*, in the law of Scotland, thoſe granted by the lords of ſeſſion, upon complaint of a perſon ſued before an incompetent judge. By theſe letters, the lords of ſeſſion *advocate*, that is, call that cauſe from the incompetent judge to themſelves.

If, after letters of *advocation* are intimated to that judge, he yet proceeds, his decree will be null, as given *contra mandatum*. Mackenzie, Inſt.

ADVOCATIONE *Decimarum*, a writ which lies for the claim of the fourth part, or upward, of the tithes that belong to any church. Reg. Orig. 29.

ADVOCATURA, in *Writers of the Middle and Barbarous Age*, denotes an inferior kind of juriſdiction, exerciſed by advocates within the diſtricts of their reſpective churches, &c. The word is ſometimes uſed as ſynonymous with ADVOCATIO. Du-Cange.

ADVOWEE, in *ancient Cuſtoms*, and *Law Books*, denotes the advocate of a church, religious houſe, or the like.

The word is otherwiſe written *avowee*, *advouee*, and *avowee*; ſometimes *advour*; being derived from *avower*, *to own*, or *acknowledge*.

There are *advowees* of cathedrals, abbies, monaſteries, &c. Thus Charlemagne had the title of *advowee* of St. Peter's; king Hugh, of St. Riquier; and Bolandus mentions ſome letters of pope Nicholas, by which he conſtituted king Edward the Confeſſor, and his ſucceſſors, *advowees* of the monaſtery at Weſtminſter, and of all the churches in England.

The *advowees* were the guardians, protectors, and adminiſtrators of the temporal concerns of the churches, &c. and under their authority were paſſed all contracts which related to them.

It appears alſo, from the moſt ancient charters, that the donations made to churches were conferred on the perſons of the *advowees*.—They always pleaded the cauſes of the churches in court, and diſtributed juſtice for them, in the places under their juriſdiction.—They alſo commanded the forces furniſhed by their monaſteries, &c. for the war; and even were their champions, and ſometimes maintained duels for them.

This office is ſaid to have been firſt introduced in the fourth century, in the time of Sylveſter; though the Benedictines do not fix its origin before the eighth century.

By degrees, men of the firſt rank were brought into it, as it was found neceſſary, either to defend with arms, or to protect with power and authority. In ſome monaſteries they were only called *conſervators*; but theſe, without name, had all the function of *advowees*.

There were alſo ſometimes ſeveral *ſub-advowees*, or ſub-advocates, in each monaſtery, who aſſiſted inſtead of the *advowees* themſelves; which, however, proved the

ruin of monasteries; those inferior officers running into great abuses.

Hence also, husbands, tutors, and every person in general, who took upon him the defence of another, were denominated *advowees*; or advocates. Hence several cities had their *advowees*; which were established long after the ecclesiastical ones, and doubtless from their example.—Thus, we read in history of the *advowees* of Augsburg, of Arras, &c.

The VIDAMES assumed the quality of *advowees*; and hence it is, that several historians of the eighth century confound the two functions together.

Hence also it is, that several secular lords in Germany bear mitres for their crests, as having anciently been *advowees* of the great churches.

Spelman distinguishes two kinds of ecclesiastical *advowees*.—The one of causes, or processes, *advocati causarum*; the other of territory, or lands, *advocati fuli*.

The former were nominated by the king, and were usually lawyers, who undertook to plead the causes of the monasteries.

The other, which still subsist, and are sometimes called by their primitive name, *advowees*, though more usually PATRONS, were hereditary, as being the founders and endowers of churches, &c. or their heirs.

Women were sometimes *advowees*, *advocatissæ*. And, in effect the canon law mentions some who had this title, and who had the same right of presentation, &c. in their churches, which the *advowees* themselves had.

In a stat. 25 Edw. III. we meet with *advowee paramount*, for the highest patron; that is, the king.

There are also *advowees* of countries and provinces.—In a charter of the year 1187, Berthold duke of Zeringhen, is called *advowee* of Thuringia; and in the Nothia of the Belgic churches, published by Miræus, the count of Louvain is styled count and *advowee* of Brabant.—In the eleventh and twelfth centuries, we also meet with the *advowees* of Alsatia, Suabia, &c.

ADVOWING, or AVOWING, ADVOCARE, in *Law*; see AVOWRY.

ADVOWSON, ADVOCATIO, the quality or office of an *advowee*, or advocate.

ADVOWSON, or ADVOUZEN, in *Common Law*, signifies a right to present to a vacant benefice.

Advowson is so called, because the right of presenting to the church was first gained by such as were founders, benefactors, or maintainers of the church, viz. *rationa fundationis*, as where the ancestor was founder of the church; or *rationa dotationis*, where he endowed the church; or *rationa fundi*, as where he gave the soil whereupon the church was built: and therefore they were called *advocati*. They were also called *patroni*, and thereupon the *advowson* is called *jus patronatus*. 1 Inst. 119. Flets, lib. v. cap. 14.

Though the nomination of fit persons to officiate in every diocese was originally in the bishop, yet they were content to let the founders of churches have the nomination of the persons to the churches so founded, reserving to themselves a right to judge of the fitness of the persons so nominated. Gibs. 2 ed. 756.

Advowsons are of two kinds. 1. *Advowson in gross*, is a right subsisting in itself, belonging to a person, and not adhering to any manor or lands as parcels thereof. 2. *Advowson appendant*, which depends on a manor, as appurtenant to it.—This Kitchen calls an *incident*, which may be separated from its subject.

Advowsons formerly were most of them appendant to manors, and the patrons were parochial patrons: the lordship of the manor, and patronage of the church, were seldom in different hands, until *advowsons* were given to religious houses. But of late times the lordship of the manor, and *advowson* of the church, have been divided.

Advowsons are also *presentative*, *collative*, or *donative*: *presentative*, where the patron presents or offers his clerk to the bishop of the diocese, to be instituted in his church: *collative*, where the benefice is given by the bishop, as original patron thereof, or by means of a right he has acquired by *lapse*: *donative*, as where the king, or other patron does, by a single donation in writing, put the clerk in possession, without *presentation*, *institution*, or *induction*.

Sometimes, anciently, the patron had the sole nomination of the prelate, abbot, or prior; either by investiture (i. e. delivery of a pastoral staff) or by direct presentation to the diocesan; and if a free election was left to the religious, yet a *congé d'elire*, or licence of election, was first to be obtained of the patron, and the person elected was confirmed by him.

If the founder's family became extinct, the patronage of the convent went to the lord of the manor.—Unless the several colleges in the universities be restrained in the number of *advowsons* they may receive; it is argued they will in time acquire such a stock, as to frustrate the design of their foundation (which is the education of youth), by creating too great a succession of fellows; so that there will not be in the colleges a sufficient number of persons of competent age, knowledge, and experience, to instruct and form the minds of the youth.—In some colleges the number of *advowsons* is said to be already two thirds, or more, of the number of fellows.—It is objected, on the other side, that the succession of fellows may be too slow, as well as too quick; whereby persons well qualified may be detained so long in colleges, as not to have strength and activity enough left for the discharge of parochial functions.

Colleges holding more *advowsons* in number than a moiety of the fellows, are not capable of purchasing more. Grants of *advowsons* by papists are void. 9 Geo. II. c. 36. § 5. 11 Geo. II. c. 17. § 5.

Advowsons are temporal inheritances, and lay fees; they may be granted by deed or will, and are assets in the hands of heirs and executors.

Presentations to *advowsons*, for money, or other reward, are void. 13 Eliz. cap. 6. See Burn's Eccl. Law. vol. i.

ADVOWTRY. See ADULTERY.

ADUST, ADUSTUS, among *Physicians*, &c. is applied to such humours, as by long heat become of a hot and fiery nature.

The word is formed of the Latin *adurere*, *to burn*.

Such as choler is supposed to be.—Melancholy is usually considered as black, and *adust* bile.

Blood is said to be *adust*, when by reason of some extraordinary heat, its more subtile parts are all evaporated, leaving the grosser, with all the impurities therein, half terrified.

ADUSTION, among *Physicians*, is used for an inflammation of the parts about the brain, and its membranes, attended with a hollowness of the *sinciput* and eyes, a pale colour, and dryness of the body; in which case the yolk of an egg, with oil of roses, applied by way of cataplasm is recommended, as are the leaves of turnsol, the parings of a gourd, the pulp of a pompion, applied in the same manner with oil of roses.

ADY, in *Natural History*, a name given to the palm-tree of the island of St. Thomas. It is a tall tree with a thick, bare, upright stem, growing single on its root, of a thin light timber, and full of juice. The head of this tree shoots into a vast number of branches, which being cut off, or an incision being made therein, afford a great quantity of sweet juice, which fermenting, supplies the place of wine, among the Indians.

The fruit of this tree is called by the Portuguese *carpeces*, and *carisses*; and by the black natives ABANGA. This fruit is of the size and shape of a lemon, and contains a kernel, which is good to eat. The fruit itself is eat roasted, and the raw kernels are often mixed with mandioc meal. These kernels are supposed very cordial. An oil is also prepared from this fruit, which answers the purpose of oil, or butter, in Europe.

This oil is also used for annointing stiff and contracted parts of the body. Ray.

ADYNAMIA, in *Medicine*, debility, weakness from sickness.

It is formed of the privative *a*, and *δυναμις*, *strength*.

ADYNAMON, among *Ancient Physicians*, a kind of weak factitious wine, prepared from must boiled down with water; to be given to patients, to whom genuine wine might be hurtful.

ADYTUM, a secret or retired place in the Pagan temples, where oracles were given, and into which none but the priests were admitted.

The word originally signifies inaccessible; being compounded of *a. not*, and *δυω*, or *δυνω*, *to enter*.

The *Sanctum Sanctorum* of the temple of Solomon was of the nature of the Pagan *adytum*, none but the high priest being admitted into it, and he but once a year.

ADZE, or ADDICE, a cutting tool, of the axe kind; having its blade made thin, and arching; and its edge at right angles to the handle; chiefly used for taking thin chips off timber or boards, and for paring away certain irregularities which the axe cannot come at.

The *adze* is used by carpenters, but more by coopers, as being convenient for cutting the hollow sides of boards, &c. It is ground from a hole on its inside to its outer edge; so that, when it is blunt, they cannot conveniently grind it, without taking its helve out of the eye.

AE, or Æ, a diphthong, or double vowel, compounded of A and E.

Authors are by no means agreed as to the use of the *æ* in English words.—Some, out of regard to *etymology*, insist on its being retained in all words, particularly technical ones, borrowed from the Greek and Latin; while others, from a consideration that it is no proper diphthong in our language, its sound being no other than that of the simple *e*, contend, that it ought to be entirely disused; and, in fact, the simple *e* has of late been adopted,

adopted, inſtead of the Roman *æ*; as in the word *equator*, &c.

ÆACEA, in *Antiquity*, ſolemn feaſts and combats, celebrated in Ægina, in honour of Æacus, who had been their king, and who, on account of his ſingular juſtice upon earth, was ſuppoſed to have a commiſſion given him, to be a prince or judge, whoſe office it was to preſide over Elyſium, or the region of bliſs.

ÆCHMALOTARCHA, in *Antiquity*, a Greek term, ſignifying the chief, or leader of the Jewiſh captives in Babylonia. The Jews, who refuſed to follow Zorobbabel, and return with him to Jeruſalem, after the Babyloniſh captivity, created an *æchmalotarch* to govern them.—Not that the Jews themſelves called them by this name, as ſome authors have aſſerted; for that people ſpoke Hebrew, or Chaldee, not Greek. But Origen, and others, who wrote in the Greek tongue, rendered the Hebrew name ראשגלות *roſch galuth*, q. d. *chief of the captivity*, by a Greek name of the like import ἀχμαλωταρχος, formed from ἀχμαλωτος, *captive*; of ἀιχμη, *point*, *ſpear*, or *war*; and ἀρχων, *commander*, *chief*.

However, the Jews ſeemed to have had officers of this kind before the return from Babylon; witneſs the hiſtory of Suſannah; the two elders, who condemned her, being ſuppoſed to have been *æchmalotarchæ* that year.—The Jewiſh writers aſſure us, that the *æchmalotarchæ* were only to be choſen out of the tribe of Judah.

The eaſtern Jews had their princes of the captivity, as the weſtern Jews their patriarchs. The Jews are ſtill ſaid to have an *æchmalotarcho* at Babylon, but without the authority of the ancient one. Bainage Hiſt. Jews, and Prideaux's Connection.

ÆDES, in *Antiquity*, a chapel or inferior kind of temple, diſtinguiſhed by this, that it was not conſecrated by the augurs, as thoſe properly called TEMPLES were.

Such was *the ærarium*, or treaſury; called *Ædes Saturni*.

ÆDILE, ÆDILIS, in *Antiquity*, a Roman magiſtrate, veſted with divers functions, chiefly that of ſuperintending the buildings, both public and private; as baths, aqueducts, roads, bridges, cauſeways, &c.

The word is formed of *ædes*, *temple*, or *houſe*; on account of their having the care of temples, houſes, &c.

The *ædiles* at Rome correſpond to what the Greeks called *agoranomi*, and *aſtynomi*; they differed from *œconami* and *arcarii*, who were rather receivers of the revenues; alſo from *legiſlæ*, *curatores* & *patres civitatis*.

To the *ædiles* belonged the inſpection of the weights and meaſures. They fixed the rate of proviſions, and took care the people ſuffered no exactions. The inquiry and cognizance of debauchees, and diſorders in public houſes, likewiſe belonged to them; they were alſo to reviſe comedies; and it belonged to them to treat the people with grand games and ſpectacles, at their own expence. They were likewiſe to attend on the tribunes of the people.

To the *ædiles* alſo belonged the cuſtody of the plebiſcita, and the cenſure and examination of books. They had the power, on certain occaſions, of iſſuing edicts; and, by degrees, they procured to themſelves a conſiderable juriſdiction, the cognizance of various cauſes, &c.—This office ruined numbers, by its expenſiveneſs; ſo that, in Auguſtus's time, even many ſenators declined it, on that account.

All theſe functions, which rendered the *ædiles* ſo conſiderable, belonged at firſt to the *ædiles* of the people, *ædiles plebis*, or *minores*: theſe were only two in number, and were firſt created in the ſame year as the tribunes: for the tribunes, finding themſelves oppreſſed with the multiplicity of affairs, demanded of the ſenate to have officers, with whom they might intruſt matters of leſs importance; and, accordingly, two *ædiles* were created; and hence it was, that the *ædiles* were elected every year, at the ſame aſſembly as the tribunes. But theſe plebeian *ædiles* having refuſed, on a ſignal occaſion, to treat the people with ſhews, as pleading themſelves unable to ſupport the expence thereof; the patricians made an offer to do it, provided they would admit them to the honours of the *edilate*.

On this occaſion, there were two new *ædiles* created, of the number of the patricians, in the year of Rome 388; they were called *ædiles curules*, or *majores*; as having a right to ſit on a CURULE chair, enriched with ivory, when they gave audience; whereas the plebeian *ædiles* only ſat on benches.

Beſides that the *curule ædiles* ſhared all the ordinary functions with the plebeian, their chief employ was, to procure the celebration of the grand Roman games, and to exhibit comedies, ſhews of gladiators, &c. to the people; and they were alſo appointed judges in all cauſes relating to the ſelling or changing of eſtates.

To eaſe theſe four firſt *ædiles*, Cæſar created a new kind, called *ædiles cereales*, as being deputed chiefly to take care of the corn, which was called *donum Cereris*, for the heathens honoured Ceres as the goddeſs who preſided over corn, and attributed to her the invention of agriculture. Theſe *ædiles cereales* were alſo taken out of the order of patricians. In the municipal cities there were *ædiles*, with the ſame authority as at Rome.

We alſo read of an *ædilis alimentarius*, expreſſed in abbreviature by *Ædil. alim.* whoſe buſineſs ſeems to have been to provide diet for thoſe who were maintained at the public charge, though others aſſign him a different office.

In ancient inſcriptions we alſo meet with *ædile* of the camp, *ædilis caſtrorum*.

ÆDILATE, ÆDILATUS, in *Antiquity*, the dignity or magiſtracy of the Roman ÆDILES.

This is otherwiſe called *ædilitas*, *ædility*. In inſcriptions we find it repreſented by the abbreviature ÆD.

ÆDILITIUM *ædilitium*, among the Romans, was that whereby a remedy was given a buyer, in caſe a vicious, or unſound beaſt, or ſlave, was ſold him. It was called *ædilitium*, becauſe the preventing of frauds in ſales and contracts belonged eſpecially to the curule *ædiles*.

ÆDITUUS, in *Antiquity*, the keeper of a ſacred manſion, who had the care of the offerings and ornaments of the deity to whom it was peculiarly devoted.

The word is compounded of *ædes*, and *tueor*, *I defend*; q. d. *a tumbis ædibus*; originally it was written *æditumus*.

The *ædituus* is the ſame with what Scævola calls *Hierophylax*, the Latins ſometimes *ædilis*, and the Greeks νεωκορος; anſwering to the ſexton among us.

The *æditui*, among the Romans, were officers of diſtinction, being the depoſitaries not only of the treaſure, but of the public acts, or records.—The *æditui* had their ſeveral cells, near the temples, the cuſtody of which was committed to them. Struv. Ant. Rom.

The female deities had a woman officer of the ſame kind, under the denomination *æditua*.

ÆDOIA, the ſame as PUDENDA.

ÆGAGROPILA, or ÆGAGROPILUS, in *Natural Hiſtory*, a ball generated in the ſtomach of the *rupicapra*, or *chamois goat*, hard on the outſide, and conſiſting of a ſubſtance like hair. See BALLS, and HAIR-*Balls*.

The word is Greek, from αιγαγρος, the *rupicapra*, or rock-goat; and πιλος, a *ball*. The *ægagropila* is ſometimes called *bezoar Germanicum*, or the German bezoard.

ÆGELETHRON, in *Botany*, is a name uſed by ſome authors for the common *mercurialis*, or Engliſh mercury, an eatable wild herb.

ÆGIAS, in *Ancient Greek Phyſicians*, denotes a white ſpeck on the pupil of the eye, occaſioning a dimneſs of ſight, either ariſing from an excrementitious humour, or from the relicts of the *cicatricula* of an ulcer on the part.

This is the ſame with what others write *ægis* and *ægilia*.

ÆGIDES, a diſorder of the eyes mentioned by Hippocrates. It ſignifies ſmall white cicatrices in the eye, cauſed by an afflux of corroſive humour. See ALBUGO.

ÆGIDION, a name given to a *collyrium* for inflammations and defluctions of the eyes. It is alſo called *ægagropiſpha*.

ÆGILOPS, is a tumor, or rather ulcer, in the great angle of the eye; either with, or without, an inflammation.

The word is compounded of αιξ, *goat*, and ωψ, *eye*; as goats are ſuppoſed extremely liable to this diſtemper. Authors frequently uſe the words *ægilops*, *anchilops*, and *fiſtula lachrymalis*, promiſcuouſly; but the more accurate, after Ægineta, make a difference.—The tumor, before it becomes ulcerous, is properly called *anchilops*; and, after it is got into the lachrymal paſſages, and has rendered the *os lachrymale* carious, *fiſtula lachrymalis*.

If the *ægilops* be accompanied with an inflammation, it is ſuppoſed to take its riſe from the abundance of blood, which a plethoric habit diſcharges on the corner of the eye.—If it be without an inflammation, it is ſuppoſed to proceed from a viſcous pituitous humour, thrown upon this part. The method of cure is the ſame as that of the *ophthalmia*. But before it has reached the lachrymal paſſages, it is managed like other ulcers.

If the *ægilops* be neglected, it burſts, and degenerates in a FISTULA, which eats into the bone.

ÆGILOPS is alſo a name given to a kind of oat, called alſo *tenuis*, and by the Latins *TRITUCA*, the flour of which, mixed with honey, has been reputed a remedy for this diſeaſe.

The *ægilops* ſignifies alſo *avena ſphæritis*, the wild oat, common among corn, called BROMUS; a decoction of the root of which kills worms. See OAT.

The *ægilops* is a genus of the *polygamia monœcia* claſs of plants; the corolla of the hermaphrodite flower conſiſts of a bivalve glume, terminated by a double or triple

triple arista or awn; the seed is single and oblong; the corolla of the male flower is also a bivalve, aristated glume, as in the hermaphrodite flower.

ÆGILOPS is also used for the *holm* OAK, with great acorns; the CERRUS *mas minore glande, quercus calyce echinato, glande majore, arcuato: echinum, aspis montanum, cerrus latinorum.*

At Venice they make cups of the acorns of this tree; which is also used, as we do oak-bark, to dress leather. The cup of this acorn is an inch and half in diameter, and somewhat less in depth. The cups are also used, instead of galls, to dye woollen cloth black.

ÆGINETA, in *Botany*, the name given by Linnæus to a genus of plants, belonging to the class of *didynamia angiospermia*; the characters of which are these; the cup is an oval, inflated, and coloured spatha; it is univalve, and opens longitudinally near the top. The flower consists of one petal. Its base is large, round, and inflated. The tube is short, cylindric, and open; and the mouth is small, but expanded, and turns back at the edge. The stamina are four crooked filaments; two of them are of the length of the flower, and the other two a little shorter. The antheræ are oblong, and stand close to one another at their tops. The germen of the pistil is oval; the style is subulated, and of the length of the stamina; and the stigma is large, round, and bending. The Hortus Malabaricus is the only work in which we have a description of the plant.

ÆGIPAN, in *Antiquity*, a denomination given to Pan, and the Fauns.

The ancients also give the name *ægipans* to a sort of monsters mentioned by Pliny, Solinus, and Pomp. Mela. Salmasius, in his notes on Solinus, takes *ægipan* to have signified the same, in Libya, with *fauni* among the Romans.

Vossius rejects the opinion, and shews, that the *ægipans* had not faces like men, as the sylvans had, but like goats. In effect, the whole upper part of the body resembled that animal, and as to the lower, they painted it with a fish's tail. The monster represented on some medals of Augustus, by antiquaries called *Capricornus*, appears to be the true *ægipan*.

The word is derived from *αιξ, a goat*; Pan being represented with the horns, feet, and legs of that animal.

ÆGIS, in the *Ancient Mythology*, a name given to the shield or buckler of Jupiter and Pallas.

The goat Amalthea, which had suckled Jove, being dead, that god is said to have covered his buckler with the skin thereof; whence the appellation *ægis*, from *αιξ αιγος, she-goat.*

Jupiter, afterwards restoring the beast to life again, covered it with a new skin, and placed it among the stars. As to his buckler, he made a present of it to Minerva; whence that goddess's buckler is also called *ægis.*

Minerva, having killed the Gorgon Medusa, nailed her head in the middle of the *ægis*, which henceforth had the faculty of converting into stone all those who looked thereon; as Medusa herself had done during her life.

Others take the *ægis* not to have been a buckler, but a cuirass, or breast-plate; and it is certain, the *ægis* of Pallas, described by Virgil, *Æn.* lib. viii. ver. 435, must have been a cuirass; since that poet says expressly, that Medusa's head was on the breast of the goddess. But the *ægis* of Jupiter, mentioned a little higher, ver. 354, seems to have been a buckler; the words

Cum sæpe nigrantem
Ægida concuteret dextra,

agreeing very well to a buckler; but not at all to a cuirass, or breast-plate.

Servius makes the same distinction on the two passages of Virgil; for on verse 354, he takes the *ægis* for the buckler of Jupiter, made, as above-mentioned, of the skin of the goat Amalthea: and on verse 435, he describes the *ægis* as the armour which covers the breast; and which, in speaking of men, is called *cuirass* and *ægis*, in speaking of the gods. Many authors have overlooked these distinctions for want of going to the sources.

ÆGLEFINUS, in *Ichthyology*, a name given, by the generality of authors, to the haddock, called by others *the eane*, or ASELLUS *antiquorum*. It is a well known fish, and seems of a middle nature between the cod and the whiting.

ÆGLEUS, in *Botany*, a term of distinction for the white chamæleon-thistle. It is derived from the Greek αιγλεως of Galen; by which word he distinguishes the white chamæleon, which was an efculent and medicinal plant, from the *orobanche*, or *ægyptiaca*, which was what we call the black chamæleon-thistle, and was esteemed poisonous.

ÆGOBOLIUM, in *Antiquity*, the sacrifice of a goat offered to Cybele.

The *ægobolium* was an expiatory sacrifice, which bore a near resemblance to the *taurobolium* and *criobolium*, and seems to have been sometimes joined with them.

ÆGOCEPHALUS, in *Ornithology*, the name by which the generality of authors call the bird, known in England by the name of the GODWIT, or in some places the *fleet-FLOVER*, the *yarwhip*, or *yarwip*. Ray.

ÆGOCERAS, a name given to FENUGREEK, and also to *houcras*, because of its corniculated fruit, the word originally signifying *goat's-horn*.

ÆGOLETHRON, a plant described by Pliny; which appears to be the same with what Tournefort describes under the name of *chamærhododendros pontica maxima mespili folio, flore luteo.* The ancients attribute dangerous qualities to it.

ÆGOMANTIA, in *Antiquity*, a species of divination performed by means of a goat.

ÆGONYCHUS, in *Natural History*, a name mentioned by Pliny, as a synonym of the *helicis mucronum*, or GROMWELL.

It had this name given it, by the Greek writers, from the words *αιγος, the goat's*, or *αιγος ονυξ, the goat's hoof.*

The ancients had another name for this plant, of the same sort or origin, which was *cynoglossum*; by this they expressed its being like the exterior part of the human nails on the fingers. The hardness and scaly nature of the seeds gave the idea of the resemblance of a nail, or hoof.

ÆGOPHTHALMUS, *the goat's eye-stone*, a name given, by some authors, to those pieces of agat, or other semipellucid gems, which have circular spots in them resembling the eyes of that animal in colour, and in their round figure.

ÆGOPODIUM, GOUT-WEED, in *Botany*, a genus of the *pentandria digynia* class of plants; the general corolla whereof is uniform; the single flowers consist each of five oval, concave, and nearly equal petals; the fruit is naked, ovato-oblong, striated, and separated into two parts; the seeds are two, ovato-oblong and striated, convex on one side and plain on the other.

ÆGOPOGON, in *Botany*, a name used by Tragus, and some others, to express the *common* MEADOW-WART, or ULMARIA.

ÆGREFINUS. See ÆGLEFINUS.

ÆGRITUDO *bovina*. See BOVINA *affectio*.

ÆGYPTIACA signifies the PAPYRUS.

ÆGYPTIACUM, in *Medicine*, a name given to divers unguents of the detergent, or corrosive kind.

We meet with a *black*, a *red*, a *white*, a *simple*, a *compound*, and a *magistral Ægyptiacum*.

The simple Ægyptiacum, which is that usually found in our shops, is a composition of verdigrise, vinegar, and honey, boiled to a consistence: the prescription is Mesue's. —It is usually supposed to take its name from its dusky colour, wherein it resembles that of the natives of Ægypt. —It is improperly called an unguent; as there is no oil, or rather fat, in it. Some chuse to call it *mel Ægyptiacum*. It is chiefly used in eating off rotten flesh, and cleansing foul ulcers; particularly venereal ones in the throat, &c. It also destroys those cancerous excrescences apt to grow in children's mouths.

The German dispensaries have another composition called *Ægyptiacum compositum magistrale*, or *Helianum*, wherein treacle, mithridate, camphor, &c. are ingredients.

White *Ægyptiacum* is a composition of lily roots mixed up with aromatics; it is mentioned by Hippocrates, and is the same with what other ancients call *ciconium*. It was used by the ladies of those days to smear over their faces, to preserve their complexions.

Hippocrates also speaks of another unguent under the same name, composed of the flowers of the Egyptian thorn.

Farriers make a red, as well as black kind, of much the same ingredients, only with some differences in the proportions; used especially to soften the hoofs of a horse, when too hard.

ÆGYPTILLA, in *Natural History*, the name of a stone described by the ancients, and said, by some authors, to have the remarkable quality of giving water the colour and taste of wine.

ÆGYPTION, the name of a topic used by the ancients in uterine disorders.

ÆGYPTIUM *pharmacum ad aures*. Actius Tetrab. ii. Serm. 2. cap. 83. speaks of this as excellent for clearing foetid ulcers of the ears, which he says it cures, though the patient were born with them.

ÆHOITULLA, in *Zoology*, the name of an East Indian species of serpent, found frequently in the island of Ceylon; it is a very long and slender snake, sometimes wholly of a fine green, sometimes green and white, and lives principally on trees, and among bushes. Ray.

ÆICHRYSON is a name given to the ACEDIA *major*, called also *aizoides*.

ÆNAUTÆ

ÆINAUTÆ, *in Antiquity*, senators of Miletus, who held their deliberations on board a ship, far from shore, and till matters were resolved upon, never returned to land. The word is Greek, αειναυται; q. d. *semper nautæ, always mariners*. Plut. in Quæst. Rom.

ÆLQUAPPE, in *Ichthyology*, the common name, among the German nations, of a fish of the MUSTELA kind, the viviparous eelpout, called by Schonefeldt *mustela vivipara*, and in some places *aelpute*, *aelmoder*, and *aelmutter*. It is usually of a foot long or more. Its skin is perfectly smooth, and the colour of its back and head a brownish yellow, marked with blotches of black; the colour of the back grows paler on the sides, and on the belly is whitish. It has four gills on a side, and the head is shaped like that of the eel; the back-fin reaches the whole length of the body, terminating near the tail. The belly-fin begins at the anus, and reaches to the extremity of the fish, ending in a fine, slender, and somewhat reddish tail. Besides these, it has two pair of fins, one at the bottom of the gills, which are somewhat broad, and the other very fine and slender under the throat. The young of this species are often found alive, to the number of three hundred in one individual: they are found of two fingers breadth long, and live some time after they are taken out.

ÆIZOON, αειζωον, from αει, *always*, and ζωον, *life*, is a name given to *Sempervivum*, SEDUM, HOUSELEEK.

ÆLUROPO, a name given to a syrup made of the herb *cats foot*, which is a species of GNAPHALIUM.

ÆLURUS, in *Mythology*, the god of the cats; he is represented by the ancient Egyptians, sometimes as a cat, sometimes as a man with a cat's head.

AEM, AM, or AME, a liquid measure used in most parts of Germany; but different in different towns; the *aem* commonly contains 20 verrils, or 80 masses: that of Heidelbergh is equal to 48 masses; and that of Wirtembergh to 160 masses. See AAM.

ÆMOBOLIC M, in *Antiquity*, the blood of a bull, or ram, offered in the sacrifices called, *taurobolia* and *criobolia*.

In which sense the word occurs in ancient inscriptions. Reinesius and Vandale take it for a corruption, and alter it to RHOBOLIUM. M. de Boze defends the *amobolium*.

ÆNEATORES, in *Antiquity*, the musicians in an army; including those who played trumpets, horns, *litui*, *buccinæ*, &c.

The word is formed from *æneus*, on account of the brazen instruments used by them.

ÆNIGMA, a proposition put in obscure, ambiguous, and generally contradictory terms, to puzzle, or exercise the wit, in finding out its meaning; or, an obscure discourse, covering some common and well known thing, under remote and uncommon terms.

The word is formed of αινιττομαι, *obscuré innuere, to hint a thing darkly*; of αινος, *an obscure speech, discourse*.

The Latins sometimes call it *scirpus*, *scipus*, or *scrupus*. The populace with us name it *riddle*; from the Belgic *raedan*, or the Saxon *areathan*, *to interpret*.

Fran. Junius defines an *anigma* to be an obscure parable, or allegory; and makes two kinds: the one *genuine*, rendering the sentence more intricate and knotty, by a multitude of words; the other lesser, consisting of only one or two remote words, or allusions; as in Isaiah, ch. xi. 1. where Jesus Christ is called צמח, *surculus*, *rod*, or *branch*.

Fa. Bouhours, in the memoirs of Trevoux, defines an *anigma*, a discourse, or painting, including some hidden meaning, which is proposed to be guessed.

ÆNIGMATA, *painted*, are representations of the works of nature, or art, concealed under human figures, drawn from history, or fable. Thus Jesus Christ, in the middle of the doctors, represents the Bible, &c.

A *verbal anigma* is a witty, artful, and abstruse description of any thing.

The use of *anigmas* was very great among the Egyptians. Gale thinks, they might borrow their custom from the Hebrews, among whom, it is certain, *anigmas* were not less in use. Witness Samson's riddle, Judg. xiv. 12, 13. *I will now put forth a riddle to you*, חידה. i. e. according to Vatable, an *anigmatical problem*: the LXX. render it, αρρεσιαν. Solomon is said to have been particularly skilful in the solution of *anigmas*. Joseph. Antiq. lib. v. cap. 2. Clemens assures us, that the Egyptians placed *sphinges* before their temples; to intimate that the doctrines of God and religion were *anigmatical*, and obscure. See HIEROGLYPHIC.

Some represent the *anigma* as the same with *gryphus*: but the more exact writers make a distinction; though wherein the difference lies is not agreed on. Some make it consist in this, that the *anigma* properly imports something merry or jocose, and *gryphus* a subject more grave and profound. Others reduce the difference to this, that in the *gryphus* there is something captious, and capable of leading into a snare, which is not found in the *anigma*.

The REBUS is also ranked by some in the number of *anigmas*.

In a general sense, every dark saying, every difficult question, every parable, may pass for an *anigma*. Hence obscure laws are called *anigmata juris*.

The alchemists are great dealers in the anigmatic language, their processes for the philosophers stone being generally wrapped up in riddles; e. gr. *Hoc ex more et fastione circulum, inde quadrangulum, hinc triangulum, sic circulum et habebis lapidem philosophorum*. Barchusen has published an explication of the riddles of chemists, alchemists, physicians, &c.

Among the *anigmas* of chemists, that called the Sibylline *anigma* is famous, of which we had a copy in a MS. of Stephanus Alexandrinus.

Στιβη γραμματ' εχ', τετρασυλλαβος εἰμι, τελευτα
Αι τριες αι πρωται δυ γραμματ' ἐχουσι τελειαι,
Ἡ δευτερη Ν τελευτα, κ. τ. λειπει δε τρια τα πεντε.
Το σωστον δ' ἀριθμει τεσσαρακοντα δυο Κ. ἑπτα.
Και τριες τριες διαδυο και Ρ' τριας. Τωδε δε τοις αριθμοις
Οκτω ἀριστος ἐστι τις σωμ' ἐμοι ἐνθεος.

Thus translated by M. Leibnitz.

Literulis nascor quadrisyllabus ipse reverti:
Syllaba habet binas, nisi quod tenet ultima ternas.
Vocales quatuor, quinis non propria vox est.
Bis septem vicibus numerum centuria totum
Ingreditur, decadisque novem, tum bis tria. Si me
Noveris, bine salvus ad sacra nostra potes.

Stephanus gives a mystical solution of this *anigma*. Moret will have it signify the name Jehovah, which, according to him, comprehends the number 1696, abating one, the number contained in the *anigma*. Brentius maintains that the whole sum amounts to 1711, and that it represents the word φωτογραφος. The generality understand it of the word arsenic, or ΑΡΣΕΝΙΚΟΝ. M. Leibnitz gives a very artful solution of it in this sense, by only supposing the A to stand for a thousand, and I for unity, as we sometimes find them used by grammarians. F. Menestrier has attempted to reduce the composition and resolution of *anigmas* to a kind of art, with fixed rules, and principles, which he calls the philosophy of *anigmatic* images.

ÆNIGMA. The *subject* of an *anigma* should be something easily conceived, and generally known.

ÆSIGMAS, *the form of*, consists in the words, which, whether they be in prose or verse, contain either some description, a question, or a prosopopœia. The last kind are the most pleasing, inasmuch as they give life and action to things, which otherwise have them not. To make an *anigma*, therefore, two things are to be pitched on, which bear some resemblance to each other; as the sun, and a monarch; or a ship, and a house; and on this resemblance is to be raised a superstructure of contrarieties to amuse and perplex. It is easier to find great subjects for *anigmas* in figures than in words, inasmuch as painting attracts the eyes, and excites the attention to discover the sense. The subjects of *anigmas*, in painting, are to be taken either from history or fable; the composition here is a kind of metamorphosis, wherein, e. g. human figures are changed into trees, and rivers into metals. This conversion, however, does not depend merely on caprice; there must be something of suitableness, and even erudition, to authorize it. Thus the battle of Constantine against Maxentius may be taken for the subject of an *anigma*, to represent the game at chess: the sign which appeared in the heavens with the words, *in hoc signo vinces*, may properly enough represent the secret of this game, which consists in saving the king. It is much easier to turn *mythology* into *anigmas*, than *history*. Accordingly several have imagined, that the conquest of the golden fleece was no other than the transmutation of metals; and that the fable of Circe was the art of chemistry in *anigma*.

ÆSIGMAS of pure invention are a kind of *poetry*, and more subtile than those drawn from mythology; since here the matter itself is to be created: instead of adopting some history or received fable, something probable is feigned, the chief action whereof is known, e. g. a shipwreck, a conflagration, an amphitheatre, or the like. It is essential to *anigmas*, that the history or fable, under which they are presented, be known to every body; otherwise it will comprehend two *anigmas* instead of one; the first of the history or fable, the second of the sense it is to be taken in. Another essential rule of the *anigma* is, that it only admits of one sense. Every *anigma* which is susceptive of different interpretations, all equally natural, is so far imperfect.

ÆNIGMATICAL, something that relates to, or partakes of the nature of *anigmas*.

The philosophy of the DRUIDS was altogether *anigmatical*. The ancient sages in general affected an *anigmatical* way

of writing, to conceal their doctrines from the populace. The Romans in Nero's time were obliged to have recourse to the like method, though for different reasons. The *ænigmatical* characters of the Egyptians were a species of HIEROGLYPHICS, consisting of such as bore no natural resemblance to the things they represented. Such was the beetle, used to express the sun; the serpent, to represent the stars.

We read of an *ænigmatical* medal presented by the Huguenots to Henry III. Schott has published an explication of an *ænigmatical* coin of the emperor Augustus, concerning which *antiquaries* have been long divided.

ÆNIGMATOGRAPHER, or ÆNIGMATIST, a maker or explainer of *ænigmas*.

Hardouin, Vander Hardt, &c. are great *ænigmatists*.

ÆNIGMATOGRAPHY, ÆNIGMATOGRAPHIA, the art of making and resolving, or of collecting ÆNIGMAS.

The word is compounded of αἴνιγμα, and γράφειν, *to describe*.

Ænigmatography, otherwise called *ænigmatology*, may be divided into general and particular. The first gives rules concerning the nature, kinds, composition, and use of *ænigmas*; the second considers the *ænigmas* in particular sciences, or languages, Greek, Latin, Hebrew, philological, philosophical, theological, &c.

Nic. Reusner has a treatise, under the title of *Ænigmatographia*.

ÆNITTOLOGIUS, in *Poetry*, a kind of verse, consisting of two *dactyls*, and three *trochæi*. Such is,

Pralia dira placent truci juventæ.

ÆOLIC, or ÆOLIAN, in *Grammar*, denotes one of the five dialects of the Greek tongue.

It was first used in Bœotia; whence it passed into Æolia, and was that which Sappho and Alcæus wrote in.

The *Æolic* dialect generally throws out the aspirate or sharp spirit, and agrees in so many things with the DORIC dialect, that the two are usually confounded together.

The *Æolic digamma* is a name given to the letter F, which the Æolians used to prefix to words beginning with vowels, as ϝοῖνος, *for wine*; also to insert between vowels, as ϝέϝοι, *for ovis*.

ÆOLIC *verse*, *carmen Æolicum*, a kind of measure, consisting first of an *iambic*, or *spondee*, then of two *anapests*, divided by a syllable, and lastly, a syllable common.

This is otherwise called *eulogic*, and, from the chief poets who used it, *Archilochian* and *Pindaric*.

Its type is — ⏑ ⏑ | — ⏑ ⏑ | — ⏑ —

E. gr. *O festiferi conditor orbis.*

ÆOLIPILE, ÆOLIPILA, an hydraulic instrument, consisting of a hollow metalline ball, with a slender neck, or pipe, arising from it. This, being filled with water, and thus exposed to the fire, produces a vehement blast of wind.

This instrument, Des Cartes, and others, have made use of, to account for the natural cause, and generation, of wind.—And hence its name, *Æolipila*, q. d. *pila Æoli*, *Æolus's ball*; or *Aolis ventos*, *the gusts of Æolus*; Æolus being reputed the god of the winds.

Sometimes the neck is made to screw into the ball, which is the most commodious way; because then the cavity may the more readily be filled with water. If there be no screw, it may be filled thus:—Heat the ball red-hot, and throw it into a vessel of water; the water will run in at the small hole, and fill about two thirds of the cavity.

If, after this, the *Æolipile* be laid on, or before the fire, so that the water and vessel become very much heated: the water being rarefied into a kind of momentary air, will be forced out with a very great noise and violence; but it will be by fits, and not with a constant and uniform blast. Great care should be taken that the aperture of the pipe be not stopped, when the instrument is put on the fire, otherwise the *Æolipile* will burst with a vast explosion, and may occasion great mischief.

These phenomena the reader will be easily enabled to solve, from what is shewn under the articles, AIR, WATER, and RAREFACTION.

The air or vapour issuing out of the *Æolipile* is found sensibly hot near the orifice; but, at a farther distance, cold; like what we observe of our own breath: the cause of which is controverted.—The Corpuscularians account for it hence; that the FIRE contained in the rarefied vapour, though sufficient to be felt near the orifice, disengages itself in the progress of the stream, and becomes insensible ere it be arrived at the journey's end.—The mechanical philosophers, on the other hand, hold, that the vapour, at its exit from the ball, is endued with that peculiar species of circular motion which constitutes the quality HEAT; and that the farther it recedes therefrom, the more is this motion destroyed, by the reaction of the contiguous air; till the heat, at length, becomes insensible.

Chauvin suggests some farther uses of the *Æolipile*.—1. He thinks it might be applied, instead of a bellows, to blow the fire, where a very intense heat is required. Dr. Lewis condemns substituting the *Æolipile* instead of a bellows, and says, that upon trial he always found that instead of exciting, it extinguished the fire. Com. Phil. Techn. p. 21.—2. If a trumpet, horn, or other sonorous instrument, were fitted to its neck, it might be made to yield music. 3. If the neck were turned perpendicularly upwards, and prolonged by a tube or hollow cylinder fitted to it, and a hollow ball laid on the orifice of the tube, the ball would be blown up, and kept fluctuating, or playing up and down, as in the stream of a FOUNTAIN. And, 4. It might serve to scent or fumigate a room, if filled with perfumed, instead of common water. An *Æolipile* has been sometimes placed in a chimney, where it can be heated, the vapour of which serves to drive the smoak up the chimney.

Dr. Plott gives an instance where the *Æolipile* is actually used to blow the fire: the lord of the manor of Ellington is bound by his tenure to drive a goose every New-year's day three times round the hall of the lord of Hilton, while Jack of Hilton (a brazen figure having the structure of an *Æolipile*) blows the fire.

In Italy it is said, that the *Æolipile* is commonly made use of to cure smoaky chimnies; for being hung over the fire, the blast arising from it carries up the loitering smoak along with it.

F. Mersennus, and some others, have made use of this machine to measure the gravity and degree of rarefaction of the air. But this method is liable to considerable objections.

Some late authors have discovered a still more extraordinary use, to which the frauds of the heathen priesthood applied the *Æolipile*, viz. the working of sham miracles. Besides Jack of Hilton, which had been an ancient Saxon image, or idol, Mr. Weber shews, that *Pluster*, a celebrated German idol, is also of the *Æolipile* kind: and in virtue thereof, could do noble feats; being filled with a fluid, and thus set on the fire, it would be covered with sweat; and as the heat increased, would at length burst out into flames.

ÆOLUS, in the *Heathen Theology*, the god of the winds, painted with swoln cheeks, like one who with main force endeavoured to blow a blast; also with two wings on his shoulders, and a high-coloured fiery countenance.

ÆOLUS also, in *Mechanics*, denotes a portable machine, not long since invented by Mr. Tidd, for refreshing and changing the air in rooms.

This machine is adapted in its dimensions to supply the place of a square of glass in a sash-window, and is executed in so small a compass, as to project but a little way from the sash, and in so neat a manner, says the inventor, as to be an elegant ornament to the place where it is fixed. It works without the least noise, requires no attendance, and occasions neither trouble nor expence to keep it in order. It throws in only such a quantity of air as is agreeable; and leaves off working, of its own accord, whenever the door or window is opened.

ÆOLUS's *Harp*, an instrument so named, from its producing an agreeable melody, merely by the action of the wind.—It is thus constructed.—Let a box be made of as thin deal as possible, (*Tab.* II. *Miscellany*, *fig.* 18.) of the exact length answering to the width of the window in which it is intended to be placed; five or six inches deep, and seven or eight inches wide. Let there be glued upon it at *aa*, two pieces of wainscot about half an inch high, and a quarter of an inch thick, to serve as bridges for the strings; and within side, at each end, under *bb*, glue two pieces of beech, about an inch square, of length equal to the width of the box, which are to sustain the pegs. Into these fix as many pins, such as are used in a harpsichord, as there are to be strings in the instrument, half at one end, and half at the other, at equal distances. It now remains to string it with small catgut, or blue first fiddle-strings, fixing one end to a small brass pin, as at *cc*, (*fig.* 19.) and twisting the other round the opposite pin at *dd*.

When these strings are tuned unison, and the instrument placed with the strings outward, in the window to which it is fitted, it will, provided the air blows on that window, give a sound like a distant choir, increasing or decreasing, according to the strength of the wind.

The holes in the middle only represent sound-holes; the thinner the top is, the better will the instrument perform. Mr. Thompson, in a note to his celebrated Ode on this instrument, ascribes the invention of it to Mr. Oswald; whereas it was known to Kircher above a hundred years ago; and the method of constructing and using it is described by him in a book intitled, Magia Phonotactica & Phonurgia.

ÆON, AION, *ævum*; literally signifies the duration of a thing.

Some

Some have affixed another IDEA to the word *æon*; in order to which, they have made uſe of the philoſophy of Plato, giving reality to the ideas which that philoſopher had imagined in God: and even perſonifying them, and feigning them diſtinct from God, and to have been produced by him; ſome male, others female. See PLATONISM.

Theſe ideas they call *æons*; of an aſſembly whereof they compoſe their deity, calling it πληρωμα, a Greek word ſignifying *fulneſs*.

Simon Magus is ſaid to have been the firſt inventor of theſe *æons*, which were afterwards brought to perfection by Valentinus; who, refining on thoſe who preceded him in this way, produced a long genealogy of *æons*, to the number of 30. The firſt, and moſt perfect, he particularly denominates Πρωτος, *Proon*, that is, *pre-exiſtent*; beſide other names, the moſt uſual whereof was that of *Bythos*, Βυθος, *depth*.

This *Bythos*, he ſays, continued long alone with ΕΝΝΟΙΑ, *Ennœa*, *Thought*; whom Valentinus alſo called Χαρις, *Grace*, and Σιγη, *Silence*. At length *Bythos*, with *Sige*, produced *Nous*, Νους, *Underſtanding*; and Αληθεια, *Truth*, her ſiſter. *Nous* begat two *æons*; *Logos*, λογος, *Word*; and *Zoe*, Ζωη, *Life*; which begot two others; *Anthropos*, Ανθρωπος, *Man*; and ΕΚΚΛΗΣΙΑ, *Church*. And theſe eight *æons* were the chief of all the reſt.

The *Word* Λογος, and *Life*, Ζωη, begat ten other *æons*; *Man* and the *Church*, begat twelve more; among whom were, the *Paracliete*, *Faith*, *Hope*, *Charity*, the *Perfect*, Τελειος, and *Wiſdom*, Σοφια. And thus were thirty *æons* made up; which, all together, made the *Pleroma*, Πληρωμα, or *ſpiritual and intellectual plenitude*. See GNOSTICS.

Æon alſo ſignifies ſpinal marrow.

Æon likewiſe, in the *Phœnician Theology*, was the firſt created woman.

ÆORA, in the *Medical Writings of the Ancients*, is uſed for geſtation; which ſort of exerciſe was often preſcribed by the phyſicians of thoſe days. Other exerciſes conſiſted principally in the motion of the body; but in the *æora* the limbs were at reſt, while the body was carried about and moved from place to place, in ſuch a manner as the phyſician preſcribed. It had therefore the advantages of exerciſe, without the fatigue of it.

This exerciſe was promoted ſeveral ways: ſometimes the patient was laid in a ſort of hammoc, ſupported by ropes, and moved backward and forward; ſometimes his bed run nimbly on its feet. And beſide theſe, the ſeveral ways of travelling were accounted ſpecies of the *æora*, whether in the liter, in a boat or ſhip, or on even ground in a chariot.

Aſclepiades was the firſt who brought geſtation into practice, which was uſed as a means to recover ſtrength after a fever, &c.

ÆRA, in *Chronology*, a fixed point of time, from whence to begin a computation of the years enſuing.

The word is ſometimes alſo written in ancient authors, *era*. Its origin is conteſted, though it is generally allowed to have had its riſe in Spain. Scaliger ſuppoſes it formed from A. ER. A. the notæ or abbreviatures of the words, *annus erat Auguſti*, occaſioned by the Spaniards beginning their computation from the time their country came under the dominion of Auguſtus, or that of their receiving the Roman calendar. This opinion, however ingenious, is rejected by Scaliger, not only on account that in the ancient abbreviatures *A* never ſtood for *annus*, unleſs when preceded by *V* for *vivus*; and that it ſeems improbable they ſhould put ER for *erat*, and the letter A, without any diſcrimination, both for *annus* and *Auguſtus*. Voſſius nevertheleſs favours the conjecture, and judges it at leaſt as probable, as either that of Iſidore, who derives *æra* from *æs*, the tribute-money, wherewith Auguſtus taxed the world: or that of Scaliger himſelf, who deduces it likewiſe from *æs*, though in a different manner. *Æs*, he obſerves, was uſed among the ancients for an *article*, or *item*, in an account; and hence it came alſo to ſtand for a ſum or number itſelf. From the plural *æra*, came by corruption *ara*, *arum*, in the ſingular; much as *Oſtia*, *Oſtium*, the name of a place, from *Oſtia*, *the mouths of the Tyber*.

ÆRA amounts to the ſame with EPOCHA; though ſome authors make a difference between them; but wherein it conſiſts, they do not agree. A late critic aſſigns this difference, that in ſtrictneſs of ſpeech, *epocha* is that fixed point where an *æra* made uſe of commences. Thus the 26th of February, 747 (abating fifty ſeven days) before the Chriſtian *æra*, may be ſaid to be the *epocha* of the *æra* of Nabonaſſar. Within this *æra* other *epochas* may be noted; as that of the death of Auguſtus, that of the death of Alexander, &c. But theſe cannot properly be called *epochæ* of the *æra* of Nabonaſſar. Bibl. Germ. tom. 5, p. 172. Vallemont makes another diſference, viz. that an *epocha* is a point fixed by chronologers, and an *æra* a like point, only fixed by the popular uſage of a country, or nation. Perhaps it might not be amiſs, if chronologers would keep to this difference; but it is certain moſt of them hitherto uſe the two words promiſcuouſly. The particular *æras* are mentioned under EPOCHA.

ÆRA, *Spaniſh*, otherwiſe called the year of Cæſar, was introduced after the ſecond diviſion of the Roman provinces, between Auguſtus, Anthony, and Lepidus, in the year of Rome 714, the 4676th year of the Julian period, and the 38th year before Chriſt. In the 447th year of this *æra*, the Alani, the Vandals, Suevi, &c. entered Spain. We find frequent mention of it in the Spaniſh affairs; their councils, and other public acts, being all dated according to it. Some ſay it was aboliſhed under Peter IV. king of Arragon, in the year of Chriſt 1358; and the Chriſtian *æra* ſubſtituted in its place. Mariana obſerves, that it ceaſed in the year of Chriſt 1383, under John I. king of Caſtile. The like was afterwards done in Portugal.

If to the year of the Spaniſh *æra* we add the number 4675, the ſum is the Julian year; or if from the ſame year we ſubtract 38, the remainder is the year of the Chriſtian *æra*. Struuchius.

ÆRA, *Chriſtian*. It is generally allowed by chronologers, that the computation of time from the birth of Chriſt was not introduced till the ſixth century, in the reign of Juſtinian, and is commonly aſcribed to Dionyſius Exiguus. This computation then came in uſe in deeds, &c. before which time either the Olympiads, the year of Rome, or that of the reign of the emperors, were uſed for thoſe ends.

ÆRA is alſo uſed, in ſome writers of the barbarous age, for any *year*.

In which ſenſe, we meet with *entering down the æra*, the *eleven hundred and eighth æra*, &c.

ÆRA ſignifies alſo *cuticle* or *darnel*.

ÆRARIUM, the public treaſury of the Roman ſtate.

The temple of Saturn at Rome, being the great treaſury of the ſtate, was firſt called *ærarium*; from *æs*, *æris*, *copper*; that being the only money in uſe before the year of Rome 485, when the ſilver began to be coined.

It was firſt erected under Auguſtus, and maintained by a yearly voluntary contribution; but that proving inſufficient, the twentieth part of all legacies and inheritances, except of ſuch as fell to the next of kin, or to the poor, were conſigned to this treaſury.

For the cuſtody hereof, three of the emperor's life-guard were conſtituted *præfecti ærarii*.

ÆRARIUM differs from *fiſcus*, as the firſt contained the public money, the ſecond that of the prince. Yet the two are ſometimes uſed indiſcriminately for each other. Calv. Lex. Jur.

ÆRARIUM *ſanctius* was an appendage to the former, added on occaſion of the growth of the Roman ſtate, when there was not room enough for lodging all the public monies, and the public acts, which were depoſited with it.

It was called *ſanctius*, becauſe placed in an inner and ſafer part of the temple; or becauſe in it was lodged the *aurum vicefimarium*, or twentieth, which was kept as a fund, or reſerve, for extreme neceſſity of the ſtate. On which account it was alſo called *ærarium vicefimarium*.

ÆRARIUM *Iliſtiæ*, or of *Juno Lucina*, was erected by Servius Tullius, ſixth king of the Romans, and compoſed of money paid in by parents, for the birth of each child. Dion. Hal. lib. iv.

ÆRARIUM *privatum*, or the privy-purſe, contained the money and effects which the prince was maſter of before his acceſſion to the empire. This was under the care of the COMES *rerum privatarum*.—We meet alſo with *ærarium juventutis*, *Veneris*, *libitinæ*, and other leſſer treaſuries, *æraria minora*, in the provinces.

ÆRARIUS, in *Antiquity*, an officer inſtituted by Alexander Severus, for the diſtribution of the money given in largeſſes to the ſoldiery, or people. Piſc. Lex. Ant.

ÆRARIUS was alſo uſed for a perſon whoſe name was ſtruck out by the cenſors from the *album*, or liſt of his century, and was only conſidered as a citizen ſo far as to make him ſubject to pay taxes, *æra*, without being entitled to any privileges, or advantages, from the common-wealth. Liv. dec. iii. lib. 9.

Hence the phraſes, *ærarium facere*, *inter ærarios referre*, *ærarios cenſere*, &c.—Not only plebeians, to whom ſome have reſtrained it, but alſo knights and ſenators were ſubject to this kind of degradation.

The *ærarii* were incapable of making a will, of inheriting, of voting in aſſemblies, of enjoying any poſt of honour or profit; in effect, were only ſubject to the burdens, without the benefits of ſociety; yet they retained their freedom, and were not reduced to the condition of ſlaves. To be made an *ærarius* was a puniſhment inflicted for ſome offence, and required one degree more ſevere than to be expelled a tribe, *tribu movere*.

ÆRARIUS is alſo uſed for a perſon employed in coining or working braſs.

Theſe are ſometimes called *ærarii fuſores*: at other times, *æratius* is diſtinguiſhed from *fuſor*; the former anſwering to what we now call copper-ſmiths, the latter to founders.

ÆRARIUS is alſo applied to a ſoldier, who receives pay.

ÆRATA *aqua*. See ZIMENT-*water*.

ÆREOLUS, anſwering to the Greek χαλκοῦς, was a weight, according to Diodorus and Suidas equal to $\frac{1}{5}$th, and according to others equal to $\frac{1}{8}$th of the OBOLUS, which was 9 $\frac{1}{2}$ grains.

AERIAL, AERIUS, ſomething that conſiſts of, or has relation to air.

The Eſſeni, the moſt refined and rational ſect among the Jews, held that the human ſoul conſiſted of an *aerial* ſubſtance.

And the Roſicrucians, and other viſionaries, fill the atmoſphere with *aerial* inhabitants.

AERIAL *perſpective*, is that which repreſents bodies weakened and diminiſhed, in proportion to their diſtance from the eye.

Aerial perſpective chiefly reſpects the colours of objects, whoſe force and luſtre it takes off more, or leſs, to make them appear as if more, or leſs, remote.

It is founded on this, that the longer the column of air an object is ſeen through, the more feebly do the viſual rays emitted from it affect the eye.

AERIANS, AERIANI, in *Antiquity*, a religious ſect denominated from Aerius, an Armenian prieſt of the fourth century.

The *Aerians* had much the ſame ſentiments, in reſpect of the Trinity, as the Arians; beſide which, they condemned prayers for the dead, ſtated faſts, the celebration of Eaſter, and other rites of the ſame nature; and they held that there is no difference between prieſts and biſhops, but that the prieſthood and epiſcopate are abſolutely one and the ſame order, or dignity: an opinion ſince ſtrenuouſly aſſerted by many modern divines.

Aerius built his doctrine chiefly on ſome paſſages in St. Paul; and, among others, that in the Firſt Epiſtle to Timothy, chap. iv. ver. 14. where that apoſtle exhorts him not to neglect *the gift he had received by the laying on of the hands of the preſbytery*. Here, obſerves Aerius, is no mention of biſhops; but Timothy evidently received his ordination from the preſbyters or prieſts.

Epiphanius zealouſly maintains the ſuperiority of biſhops, againſt the Aerians.—The word *preſbytery*, uſed by St. Paul, he obſerves, includes both biſhops and prieſts; the whole ſenate, or aſſembly, of the eccleſiaſtics of the place.

ÆRICA, or ERICA, in *Natural Hiſtory*, a name given by Gaza, and others, to the common bering.

ÆRIRUSA, the ancient name for the ſky-coloured JASPER.

ÆRITIS is a name given to what is more commonly called ANAGALLIS.

AEROGRAPHY, from ἀηρ, *air*, and γραφω, *I deſcribe*; a deſcription of the air, or atmoſphere, its limits, dimenſions, properties, &c.

This amounts to much the ſame with *aerology*, unleſs we ſuppoſe the latter to enter into the rational, and the former to confine itſelf to a deſcription of the more obvious affections thereof.

AEROLOGY, from ἀηρ, and λογος, *diſcourſe*, the doctrine or ſcience of the air, and its phenomena, its properties, good and bad qualities, &c.

AEROLOGY, called alſo the *aerological*, makes a part of the regimen of health, or the branch of medicine called by ſome *diætetics*, or the NON-NATURALS, which treats of air, its properties and uſe in the animal economy, and its efficacy in preſerving and reſtoring health.

AEROMANCY, AEROMANTIA, an ancient ſpecies of divination, performed by the means of the air, and phenomena happening therein.

The word is compounded of ἀηρ, *air*, and μαντεια, *divination*.

AEROMANCY included the buſineſs of AUGURY, and *auſpices*; the rules of prediction from uncommon winds, ſtorms, ſhowers, and other prodigies.

Modern authors ſpeak of a more rational *aeromancy*, meaning by it, the art of foretelling the changes and variations in the air and weather, winds, ſtorms, and the like.

Moſtof advances conſiderations for reducing *aeromancy* to a certainty, by means of a regular ſeries of meteorological obſervations. But though many ſuch have been inſtituted with great care in many parts, this art has hitherto made a very ſmall progreſs. Of this kind is Huxham's book De Aere.

Barometers, thermometers, hygrometers, and anemometers are of conſiderable uſe in this kind of *aeromancy*.

Mizoldus has publiſhed a body of rules for foretelling ſtorms, &c. drawn partly from vulgar obſervation, and the experience of mariners, partly from aſtrological conſiderations, under the title of AEROMANTIA.

ÆROMELI, a name given to HONEY, and alſo to MANNA. See DYSOMELI.

AEROMETRY, AEROMETRIA, the art of meaſuring the AIR, its powers and properties.

The word is compounded of ἀηρ, *air*, and μετρεω, *to meaſure*.

Aerometry includes the laws of the motion, gravitation, preſſure, elaſticity, rarefaction, condenſation, &c. of the atmoſpherical fluid.

The word *aerometry* is but little uſed: in lieu hereof, we commonly call this branch of philoſophy, PNEUMATICS.

C. Wolfius, profeſſor of mathematics at Hall, having reduced many of the affections of this fluid to geometrical demonſtration, firſt publiſhed Elements of *Aerometry*, at Leipſic, 1709, in High Dutch, and afterwards more largely in Latin.—Thus is the doctrine of the air incorporated into the mathematical ſciences.

AERONAUTICA, from ἀηρ, and ναυτικος, derived from ναυς, *ſhip*; the pretended art of ſailing in a veſſel through the air, or atmoſphere, ſuſtained as a ſhip in the ſea.

AEROPHYLACEA, in *Natural Hiſtory*, denotes ſubterraneous receptacles of air or wind.

The word is compounded of ἀηρ, *air*, and φυλακη, *cuſtodia*, *keeping*.—In which ſenſe *aerophylacea* ſtands contradiſtinguiſhed from *hydrophylacea*, *pyrophylacea*, &c.

Kircher ſpeaks much of *aerophylacea*, or huge caverns, replete with air, diſpoſed under ground, from whence, through numerous occult paſſages, that element is conveyed either to ſubterraneous receptacles of water, which are hereby raiſed into ſprings or rivers, or into the funds of ſubterraneous fire, which are hereby fed and kept alive for the preparation of metals, minerals, and the like.

AEROSIS, among the *Ancient Phyſicians*, denotes the act whereby the blood is attenuated and converted into an *aura*, for the ſupport of the vital ſpirits, and the maintenance of the flame of life.

AEROSTATICA, from ἀηρ, and στατικος, from ιστημι, *ſtatuo*; is uſed by ſome authors for the ſcience called by others AEROMETRY.

AEROSTATICA is properly the doctrine of the weight, preſſure, and balance of the AIR and ATMOSPHERE.

ÆRUGINOUS, ſomething partaking of, or like to, the ruſt of copper.

Authors do not ſeem perfectly agreed about the colour to be expreſſed by this word, ſome expreſſing by it green, others brown.

ÆRUGO denotes RUST, eſpecially that of copper.

Grew will have the TURCOIS-*ſtone* to be only a kind of petrified *æruge*.

Naturaliſts ſpeak of two kinds of *æruge*, one *native*, and the other *factitious*.

ÆRUGO, *nativa*, is only the ſuperficial particles of the metal diſſolved, and intimately mixed with acid ſalts; in which form it is ordinarily found in copper-mines, and other moiſt places.

ÆRUGO, *artificialis*, is what we more vulgarly call VERDIGRISE.

One ſpecies of *natural æruge* is a greeniſh marcaſite, like the drops of iron; it is found in copper-mines, but is of no uſe. There is alſo, on ſome mountains in Moravia, a ſort of green grains like ſand, that is of a graſs green, when uſed in painting. It is called the Hungarian, *mountain*, or *ſea* VERDIGRISE.

ÆRUGO *roſtilis*, is a ruſt formed on copper, by hanging a plate of it over the ſtrongeſt vinegar for ten days, without ſuffering it to touch it.

ÆRUGO *ſalis*, in *Natural Hiſtory*, a name given by Pliny, and ſeveral other ancient authors, to a reddiſh ſlimy matter, ſeparated from the Egyptian ſalt, called NATRUM, in purifying it. We find this matter remain in the filter, on diſſolving and filtering the Egyptian nitre, at this time; it ſeems to be a mixture of a bituminous matter, and a red earth, which had mixed themſelves among the cakes of the ſalt, during the time of their concreting from the water.

ÆRUSCATORES, in *Antiquity*, a kind of ſharping ſtrollers, who got their living by tricks, telling fortunes, and the like, much like modern gypſies. Alſo oppreſſive taxgatherers.

The word is formed from *æruſcari*, *to beg*, *whine*, &c.

The *Galli*, or prieſts of Cybele, were called *æruſcatores magnæ matris*, on account of their begging, or collecting alms in the ſtreets. To which end they had little bells, whereby to draw people's attention to them, much like ſome orders of mendicants abroad.

AERY, or AIRY, in ſpeaking of hawks, eagles, or the like, anſwers to the NEST of other birds.

ÆS, in *Antiquity*, has various ſignifications; but it properly denotes *braſs* or *copper*; and as copper was the firſt metal uſed in comage by the Romans, the word *æs* was

uſed

used in their language to ſignify money in general. It likewiſe denoted a particular coin made of that metal.

Æs cadarium, or *caſt* BRASS, otherwiſe called *æs ſtarium*, or *pot* BRASS, is a ſpecies of *braſs* mentioned by Pliny, which was not capable of being hammered. This is likewiſe a term uſed by the German *mineraliſts*, for a ſubſtance which ſometimes occurs to thoſe who work upon COBALT, and is uſed for making the fine blue colour called SMALT.

Æs candidum, among the *Ancients*, was different from that which we call *white* BRASS; it is a purer and whiter kind of metal, found, it is ſaid, under the veins of ſilver, ſomewhat analogous to Venetian TALC. They had probably a method of making COPPER *white* as well as *yellow*, equal, if not ſuperior, to that now in uſe. The phraſes of *orichalcum album* in Virgil, and of λευκὸν χαλκὸν, among the Greeks, ſtrictly ſignify *white* BRASS.

Æs Corinthium, a precious metallic compoſition, of a much finer colour than common braſs, and for its beauty little inferior to gold. Pliny ſays, that this was an accidental mixture of metals at the ſack and conflagration of Corinth by L. Mummius, 146 years before Chriſt; when the gold, ſilver, and braſs ſtatues, and all metallic ſubſtances, melting and mingling together, formed this maſs. But ſome refiners, who have ſtrictly examined this metal, find no gold in it; a circumſtance which, if true, ſuggeſts one reaſon, among others, for concluding, that this account is fabulous. However, the fable has been interpreted by ſome to ſignify, that the art of making COPPER into BRASS was firſt diſcovered by the Corinthians, who found the CALAMINE ſtone on the plains of Peloponneſus, or at leaſt that they brought this art to perfection.

Æs corusorium is uſed by Pliny to denote BRASS worked into thin plates.

Æs Cyprium was a kind of COPPER produced in the iſland of Cyprus.

Æs flavum, *yellow copper*. All the Roman authors have mentioned the method of making BRASS with *calamine* and *copper*; but their fineſt kind, which they called *oricholcum*, or *aurichalcum*, they diſtinguiſhed from the inferior ſorts, which had only the name of *æs flavum*.

Æs grave denoted money among the Romans, which was paid by weight, and not by tale. In this ſenſe it is uſed by Buddæus and Scaliger.

But others by *æs grave* underſtand large pieces of copper coined, containing, for inſtance, an *as*, or pound of that metal, ſuch as we find current in Sweden. Theſe they aſſert bore the title *æs grave*, till ſuch time as they were reduced to a ſmaller ſtandard.—Gronovius, on the contrary, maintains that the *as*, or pound weight, did not acquire the appellation, *æs grave*, till after their reduction. Phil. Tranſ. N° 19.

Kuſter rejects all theſe opinions, and aſſerts, that the expreſſion is uſed to denote any kind of copper-money, compared with gold or ſilver; which, with regard to the bulk and ſize of the pieces, was much lighter, though of greater value.

But this ſyſtem, however plauſible, is rejected by ſeveral learned men, particularly Periſonius, and Mr. Ward. The former has a diſſertation on the ſubject, wherein the opinion of Gronovius is farther examined and defended.

Æs hepaticon was of a ſilveriſh colour, and probably what the moderns call BRONZE; though ſome confound it with the *æs Corinthium*.

Æs pauperum is a name given to *copper ore*, diveſted of its ſilver, when it contains any.

Æs rude, that unſhaped, or not faſhioned for any particular purpoſe.—Some will have this to be the ſame with *æs grave*.—The money during the firſt ages of Rome was all of this kind.

Others, by *æs rude*, underſtand metal unſtamped; in oppoſition to *æs ſignatum*, that ſtamped, or coined.

Æs uſtum, among *Chemiſts*, is the ſame with what ſome called *æs Veneris*, or ſaffron of Venus; others *æs crematum*.

If good, it is of an iron grey on the outſide, of a reddiſh grey within; and if two pieces are rubbed together, a vermillion red is produced; it muſt alſo be brittle, and glittering when broken.

There are various ways of preparing *æs uſtum*: the moſt frequent is, by expoſing the plates to a reverberatory, or a potter's furnace, ſo long, till they will crumble into a powder. Another is, by heating a long ſlip of copper in a vehement fire, till it ſparkles, then pulling it ſuddenly out, and applying a piece of ſulphur on it; this immediately liquefies the copper, which drops down into a veſſel of cold water, placed to receive it. A third is, by cutting thin plates of copper, which are put into a crucible with ſulphur and ſalt, *ſtratum ſuper ſtratum*, and ſet in a hot charcoal fire, until the ſulphur be conſumed. A fourth is, by ſteeping the metal in a ſolution of ſalt, or ſtrong vinegar; then ſtratifying it with ſulphur, as above. After this, it is put in vinegar impregnated with ſal ammoniac. The like is repeated till the plates are conſumed. The vinegar being diſtilled from it, what remains is *æs uſtum*.

Æs uſtum is very drying and deterſive, and, on that account, mixed with plaſters and unguents, for drying up fiſtulous ulcers, and the imbibing acrimonious humours, or ſanies. It alſo ſerves to eat off dead fleſh; to which end, it is ſaid, they heat it red hot in the furnace nine times, and quench it as often in linſeed oil. It is then called SAFFRON of COPPER. But it is apt to render the bones carious. It is likewiſe uſed for colouring glaſs.

Æs uxorium, in *Antiquity*, a ſum paid, by bachelors, as a penalty for living ſingle to old age.

This tax for not marrying ſeems to have been firſt impoſed in the year of Rome 350, under the cenſorſhip of M. Furius Camillus, and M. Poſthumius.

At the *cenſus*, or review of the people, each perſon was aſked, *Et tu ex anima ſententia uxorem habes liberum quærendorum cauſſâ?* He who had no wife, was thereupon fined after a certain rate, called *æs uxorium*.

Æs; *flos* ÆRIS, called by the Greeks, ἀνθος χαλκου (ſometimes confounded by moderns with *chalcanthum*) is prepared of COPPER melted, and removed into other furnaces, wherein being expoſed to a farther and greater heat, and vehemently agitated by bellows, it depoſits an infinite number of ſmall ſcales like millet grains, which being ſeparated by lotion, make the *flos æris*. The cold water is poured on the copper, as it runs out of the furnace into the receiver.

Æs; *ſquama* ÆRIS properly denotes flakes of that metal ſtruck off by the hammer, in the operations of the forge, &c. Theſe, from the Cyprian copper-works, are called *Heliti*.

Æs; *per Æs & libram* was a *formula* in the Roman law, whereby purchaſes and ſales were ratified.

Originally the phraſe ſeems to have been only uſed in ſpeaking of things ſold by weight, or by the ſcales; but it afterwards was uſed on other occaſions. Hence even in ADOPTIONS, as there was a kind of imaginary purchaſe, the formula thereof expreſſed, that the perſon adopted was bought *per æs & libram*.

ÆSALON, in *Ornithology*, the name of a ſpecies of hawk of the long-winged kind, called, in Engliſh, the MERLIN. It is the ſmalleſt of all the hawk-kind uſed in the diverſion of hawking. It is of about the ſize of the black-bird. Its beak is blue, and its eyes hazel; it has a wreath of whitiſh yellow feathers behind its head; its chin is white, and its back and wings of a duſky blackiſh brown. Its larger wing-feathers are black, with brown ſpots; and its tail long, and variegated with tranſverſe ſtreaks of black and whitiſh brown; its breaſt and belly are of a whitiſh brown, variegated with blackiſh brown ſpots; its legs are long and yellow. It feeds on partridges and other birds. Ray.

ÆSCH, in *Ichthyology*, a name by which ſome have called the grayling, or tumbler, a fiſh of the truttaceous kind, called in Latin THYMALLUS. Willughby.

ÆSCHNA, in *Natural Hiſtory*, the name of a ſpecies of water-fly, of an aſh-colour, with four wings, and a long body, hairy near the tail.

ÆSCHYNOMENE, in *Botany*, a genus of the *diadelphia decandria* claſs of plants, the corolla of which is papilionaceous: the fruit conſiſts of a long compreſſo-plane, articulated, unilocular pod, containing a ſingle kidney-ſhaped ſeed. See SENSITIVE *Plant*.

ÆSCHYNOMENOUS *plants*, among *Botaniſts*, are thoſe popularly called SENSITIVE PLANTS.

ÆSCULAPII *anguis*, in *Zoology*, the name of a harmleſs ſpecies of ſerpent, common in Spain and Italy, called alſo PARRA.

ÆSCULAPIUS, the ancient name for the conſtellation OPHIUCUS.

ÆSCULUS, *horſe-cheſnut*, in *Botany*, a genus of the *heptandria monogynia* claſs. See CHESTNUT.

ÆSNECY, in *Law*, priority of age, among coparceners.

ÆSPING, in *Zoology*, a ſpecies of COLUBER.

ÆSTHPHARA, incineration, or burning of the fleſh, or any other part of the body.

ÆSTIMATIO *Capitis*, in our ancient law-books. See WERE and WERELADE.

King Athelſtan, in a great aſſembly held at Exeter, declared what mulcts were to be paid *pro æſtimatione capitis*, for offence committed againſt ſeveral perſons according to their degrees: the *eſtimation* of the king's head to be 30000 thrymſes; of an archbiſhop, or ſatrapa, or prince, 15000; of a biſhop, or a ſenator, 8000; of a prieſt, or a thane, 2000, &c.

ÆSTIVAL, or ESTIVAL, of or belonging to ſummer.

Thus, we ſay, the *æſtival* SOLSTICE, &c. in oppoſition to *brumal*.

ÆSTIVAL *point* is that whereby the ſun's aſcent above the equator is determined.

ÆSTIVAL *signs* are those extended from the summer solstitial point, i. e. the sun's greatest declination northward, to the intersection of the ecliptic and equinoctial southward, including Cancer, Leo, Virgo.

ÆSTRUS, a name given to particular species of THERIACLE.

ÆSTUARY, ÆSTUARIUM, in *Geography*, an ARM of the SEA, running up a good way into the land.

Such is Bristol channel, many of the firths of Scotland, &c. See BAY.

ÆSTUARY is sometimes also used in pharmacy, for a vapour-bath, *balneum vaporosum*.

ÆSTUARY, in the *Ancient Baths*, was applied to the occult passages, or openings from the *hypocaustum*, or stove, penetrating into the chambers. Pitiſc. Lex. Ant.

ÆSYMNETIC *monarchy*, among *Ancient Writers on Government*, denotes a limited elective monarchy. Arift. Polit. 10. The word is formed from *αισυμναω, regno, I govern.*—An *æſymnetic* ſtate ſtands oppoſed to a barbaric, or hereditary one.

ÆTATE *probanda*, in *Law*, a writ that lay to enquire whether the king's tenant, holding in chief by chivalry, were of full age to receive his lands into his own hands. It was directed to the eſcheator of the county; but is now diſuſed, ſince wards and liveries are taken away by the ſtatute Car. II. Reg. Orig. 294.

ÆTHALE, in *Natural Hiſtory*, a name given by ſome writers to the *cadmia fornacum*, or TUTTY.

It had this name from its being the concreted ſoot, or vapour of the *lapis calaminaris*, and copper, melted together, in the making of braſs.

ÆTHER, in *Phyſiology*, is uſually underſtood of a thin, ſubtile matter, or medium, much finer and rarer than air; which, commencing from the limits of our atmoſphere, poſſeſſes the whole heavenly ſpace.

The word is ſuppoſed to be formed from the verb, *æthuo, to burn, to flame*; ſome of the ancients, particularly Anaxagoras, ſuppoſing it of the nature of fire.

The philoſophers cannot conceive that the largeſt part of the creation ſhould be perfectly void; and therefore fill it with a ſpecies of matter under the denomination of *æther*.—But they vary extremely as to the nature and character of this *æther*.—Some conceive it is a body *ſui generis*, appointed only to fill up the vacuities between the heavenly bodies; and therefore confined to the regions above our atmoſphere.—Others ſuppoſem it of ſo ſubtile and penetrating a nature, as to pervade the air, and other bodies; and poſſeſs the pores and ſpaces even thereof.—Others deny the exiſtence of any ſuch ſpecific matter; and think the air itſelf, by the immenſe tenuity and expanſion it is ſuppoſed capable of, may diffuſe itſelf through the interſtellar ſpaces, and be the only matter found in them.

In effect, *æther* being no object of our ſenſe, but the mere work of imagination, introduced only for the ſake of hypotheſis, or to ſolve ſome phenomenon, real or imaginary, authors take the liberty to modify it how they pleaſe.—Some ſuppoſe it of an elementary nature, like other bodies, and only diſtinguiſhed by its tenuity, and the other affections reſulting from it; which is the philoſophical *æther*.—Others will have it of another ſpecies, and not elementary; but rather a ſort of fifth element, of a pure, more refined, and ſpirituous nature than the ſubſtances about our earth; and void of the common properties of matter, as gravity, &c.—Such is the ancient idea of *æther, or æthereal matter*.

The term *æther*, being thus embarraſſed with a variety of ideas, and arbitrarily applied to ſo many different things, the later philoſophers chooſe to let it alide; and accordingly the Carteſians uſe the term *materia ſubtilis*, which is their *æther*; and Sir Iſaac Newton ſometimes a *ſubtile ſpirit*, as in the cloſe of his Principles; and ſometimes a *ſubtile or æthereal medium*, as in his Optics.

The truth is, there are abundance of conſiderations, which ſeem to evince the exiſtence of ſome matter in the air, much finer than the air itſelf. There is an unknown ſomething, which remains behind, when the air is taken away; as appears from certain effects which we ſee produced *in vacuo*.—Heat, Sir Iſaac Newton obſerves, is communicated through a vacuum, almoſt as readily as through air: but ſuch communication cannot be without ſome interſtitial body, to act as a medium. And ſuch body muſt be ſubtile enough to penetrate the pores of glaſs; and may be very well concluded to penetrate thoſe of all other bodies; and conſequently be diffuſed through all the parts of ſpace, and anſwers to the full character of an *æther*.

The exiſtence of ſuch an æthereal medium being ſettled, that author proceeds to its properties; inferring it to be not only rarer and more fluid than air, but exceedingly more elaſtic and active: in virtue of which properties, he ſhews, that a great part of the phenomena of nature may be produced by it.—To the weight, e. g. of this medium he attributes gravitation, or the weight of all other bodies; and to its elaſticity, the elaſtic force of the air, and of nervous fibres, and the emiſſion, refraction, reflection, and other phenomena of light: as alſo ſenſation, muſcular motion, &c.—In ſhort, this ſame matter ſeems the *primum mobile*, the firſt ſource or ſpring of phyſical action in the modern ſyſtem.

The Carteſian *æther* is ſuppoſed not only to pervade, but adequately to fill all the vacuities of bodies; and thus to make an abſolute *plenum* in the univerſe. See MATERIA *ſubtilis*.

But Sir Iſaac Newton overturns this opinion, from divers conſiderations; by ſhewing that the celeſtial ſpaces are void of all ſenſible reſiſtance: for, hence it follows, that the matter contained in them muſt be immenſely rare, becauſe the reſiſtance of bodies is chiefly as their denſity; ſo that if the heavens were thus adequately filled with a medium or matter, how ſubtle ſoever, they would reſiſt the motion of the planets and comets much more than quickſilver or gold.

Some repreſent the *æther* as 7200 times more rare than air. Others make it more denſe than gold itſelf. See farther concerning the exiſtence of *æther*, Boyl. Philoſ. Works abr. tom. ii. p. 404. Vater, Phyſ. Exper. cap. 2. p. 72, &c. In fluidity, circulation, elaſticity, &c. Vater, ib. 77, ſeq. Verdries, p. 2. cap. 3. ſect. 1, p. 203. Hook, Poſth. Works, p. 171. In being the *primum mobile*, or ſource of all motion, Verdries, p. 6. ſect. 3. p. 307. In influence on the air, Hook, ib. p. 380. Impediment to the moon's motion, Id. ib. p. 191. In being the cauſe of the planetary motions, Gloria. de Letters d'Ital. tom. x. p. 6, ſeq. Of colours and refrangibility, &c. ib. tom. xxii. p. 132. Of ſound, ib. tom. ix. p. 315. and Mem. Acad. Scienc. Ann. 1720, p. 50. Philoſ. Tranſ. N° 102. p. 15.

ÆTHER, in *Chemiſtry*, called alſo *æthereal ſpirits* of Frobenius, *alcaheſted ſpirit of vitriol*, *acidum vitrioli dulcoſum*, by Pott, and *liquor anodynus mineralis*, by Hoffman, is a very ſubtile and penetrating fluid, produced by diſtillation from a mixture of rectified ſpirit of wine and the vitriolic acid. M. Macquer ſuppoſes, that, as ſpirit of wine conſiſts chiefly of an oil, exquiſitely attenuated by fermentation, and intimately combined with water, *æther* is no other than this ſubtilized oil, extricated by the vitriolic acid; which acid, having a ſtrong affinity or attraction to water, abſorbs the watery element of the ſpirit, and thus ſets the oily one at liberty.

Æther is the lighteſt, moſt volatile, and moſt inflammable of all known liquors; it ſwims upon the moſt highly rectified ſpirit of wine, as oil does upon water, and if dropped on a warm hand, it inſtantly exhales, diffuſing a penetrating fragrance, and leaving no moiſture behind. It takes fire on the approach of a candle, and goes off in a flaſh like lightning. As it is the moſt volatile and evaporable of all known liquors, it produces a proportionable degree of cold; inſomuch that M. Beaumé has made the mercury of Reaumur's thermometer ſink to 40 degrees below the freezing point, by applying ſirens ſoaked in *æther* to the ball containing the mercury.

Æther does not eaſily mix with water; *ten* parts of water being neceſſary to diſſolve *one* part of *æther*. It diſcovers a remarkable attraction to gold, though it has no effect on other metals. *Æther*, mixed with a ſolution of gold made in acids, imbibes the gold from the acid, keeps it perfectly diſſolved and ſuſpended, and becomes of a yellow colour. This property renders it of great uſe in extracting gold from other metals, and in aſcertaining the ſmalleſt portions of it in liquids. Thus we may likewiſe very expeditiouſly obtain a tincture of gold, or *aurum potabile*.

Æther has been ſucceſsfully employed in medicine. Dr. Morris recites ſeveral inſtances, in which he has applied it externally as a remedy for headaches, for the toothach, and for rheumatic complaints; and he has likewiſe preſcribed it internally for the hooping-cough, and in hyſterical caſes; and he apprehends, that it may be adminiſtered in large quantities with ſafety, and prove a uſeful medicine in a *typus* or lethargy. He has given the following ſafe, eaſy, and certain proceſs, for preparing it.

Take of rectified ſpirit of wine, three pounds; put it into a two gallon ſtone bottle; and to it by two ounces at a time, allowing the interval of a quarter of an hour between each addition, three pounds and ſix ounces of the ſtrong vitriolic acid; let the mixture digeſt without heat for the ſpace of a night: in the morning, decant it from one veſſel to another three or four times; convey it through a glaſs funnel, and long tube, into a retort, capable of containing three times the quantity; place it in an iron pot, with an inch of ſand at bottom; add more ſand round the retort, to the height of the mixture; ſet it over a quick fire; fave a large receiver to the retort, having a pin-hole in the luting, unleſs the receiver is perforated; continue the fire till an ebullition, accompanied with large bubbles, is obſerved in the mixture;

ture; then remove the fire entirely: the heat of the sand will be sufficient to complete the distillation of the *æther*. The distilled liquor must then be put into a clean retort, with two or three ounces of fixed alkaline salt; about half the liquor should be drawn off, by a very gentle heat, into a large receiver; and this being shaken with an equal quantity of pump water, the pure *æther* will rise immediately to the top. See Med. Obs. and Inq. vol. ii. p. 177.

The nature and use of this substance were very little known to the ancient chemists. Mr. Boyle, and sir Isaac Newton, indeed, were not entirely unacquainted with it; but it first began to excite general attention, in consequence of some experiments of Frobenius, the feigned name of a German chemist, published in the Philosophical Transactions for the year 1730; and it was by him denominated *æther*. See Phil. Trans. abr. vol. viii. p. 744. vol. iv. p. 373, 570.

Æther, though originally obtained from spirit of wine, by means of the vitriolic acid, has since been produced by means of the other acids; and it has been found, that the acid of vinegar is essentially fitter to produce *æther*, than the vitriolic acid. The first discovery of this kind of *æther* was made by the count de Lauraguais.

The marine acid unites with vinous spirits very slowly and with great difficulty. Processes for this purpose have been discovered by the marquis de Courtanvaux, M Beaumé, and M. le Baron de Bormes. The marquis employed the *smoaking spirit of Libavius*; but M. de Bormes made use of *zinc*, as a medium of concentrating the marine acid. M. Navier, in a process communicated to the Academy of Sciences in 1742, shews how to procure *æther* by means of spirit of nitre and spirit of wine, without distillation. He directs to mix them together in a bottle, which is to be exactly closed and left at rest, till the *æther* is formed, and collected like an oil upon the surface of the liquor. Other methods have been since published by M. Rouelle, and M. Beaumé.

See more on this subject in Macquer's Dictionary of Chemistry, under the article ETHER. See *Ætherial* SPIRITS.

ÆTHERIA *Herba*, is a name given to RUNGO.

ÆTHERIAL, ÆTHEREUS, something that belongs to, or partakes of the nature of *æther*.

Thus, we say, the *ætherial* space, *ætherial* regions, &c.—Some of the ancients divided the universe, with respect to the matter contained in it, into *elementary* and *ætherial*. Under *æther*, or the *ætherial* world, was included all that space above the uppermost element, viz. fire. This they supposed to be perfectly homogeneous, incorruptible, unchangeable, &c. See CORRUPTION.

The ancient Platonists and Pythagoreans suppose different bodies united with the human soul, viz. the gross, or material one; a finer aerial one; and, thirdly, the finest of all, which they call *ætherial*, celestial, &c. Cudworth Intell. Syst. c. 4.

The Chaldees placed an *ætherial* world between the *empyreum* and the region of the fixed stars. Beside which, they sometimes also speak of a second *ætherial* world, meaning by it the starry orb; and a third *ætherial* world, by which is meant the planetary region. Stanley Hist. Phil. p. 1046.

ÆTHERIAL *phosphorus*, is a name generally given, by Bernoulli, to that otherwise called mercurial, or barometrical PHOSPHORUS.

ÆTHERIAL *oil*, is a fine, subtle, ESSENTIAL OIL, approaching nearly to the nature of a spirit.

Thus, the pure liquor rising next after the spirit, in the distillation of turpentine, is called the *ætherial oil of turpentine*.

Some chemists distinguish two principles of NITRE; the one a volatile urinous salt, resembling spirit of nitre; the other, an *ætherial oil*, or sulphur, partaking of the nature of spirit of wine.

ÆTHEREAL *Heaven*. See HEAVEN.

ÆTHIOPIAN *crown*, in *Natural History*, the name of a shell-fish, of the genus of the *strombus*, or *lambis globosa*. It is of a brown colour, but differs from the common kinds of this genus, by having the top, or back, dentated, so as to represent a crown.

ÆTHIOPIS, signifies *Ethiopian clary*; a decoction of its roots is commended in pleurisies and rheumatisms.

ÆTHIOPS *mineral*, a preparation of mercury, usually made by grinding equal quantities of crude quicksilver and flower of sulphur, in a stone or iron mortar, till they become incorporated into a black powder.

It is prescribed for the worms, and all crudities and acrimony of the humours: and is reputed infallible against the itch, and other cutaneous diseases.

A new preparation of *æthiops* is given by Cruger a German physician, which is white and fair; and on that account, called *æthiops mineralis sanguine rubi albatum* in opposition to which, he calls the dark, or vulgar kind, *æthiops cum fuerore fuc.*

Authors are not agreed as to the merits of *æthiops mineral*. Cheyne, and many more, commend it highly. Boerhaave, on the contrary, and some others, reject it as useless.

ÆTHIOPS *alkali*, in *Pharmacy*, quicksilver rubbed with a double quantity of crabs-eyes, or of sugar-candy, till it is extinguished. This has been taken by some without any sensible effect; yet a very small quantity of it has raised a high salivation in others. Quicksilver extinguished in prunes, has operated much the same way. It is the same as *mere. alkalizat.*

ÆTHIOPS *antimonialis*, is prepared by fluxing equal parts of antimony and sea-salt, in a crucible, for an hour; the matter is then left to cool, and the *scoria* are obtained by breaking the crucible; equal parts of the regulus thus made, and of mercury rubbed together, till they are incorporated, will give the composition of this name. Different preparations of the same kind have been prescribed, and highly commended by some physicians, in venereal and scrophulous disorders.

ÆTHIOPS *martialis*, is a preparation first introduced into medicine by M. Lemery, junior, and is made in the following manner. Put filings of steel into an unglazed earthen vessel, with water enough to rise four inches above the filings: stir it every day, and supply water as it exhales, so as to keep the filings always covered: and continue to do this till a powder of an inky blackness be produced, which powder is called *martial æthiops*.

ÆTHIOPS *vegetabilis*. The sea-weed, burnt in the open air, and reduced into a black powder, is called *vegetable æthiops*. It is sometimes used to remove scrophulous swellings. See WRACK.

ÆTHOLICES, in *Physic*, derived from *æstus, to inflame*, is a name given to superficial pustules, or boils, in the skin, occasioned by heat.

ÆTHUSA, in *Botany*, lesser hemlock, or *fool's parsley*, a genus of the *pentandria digynia* class. See HEMLOCK.

ÆTHYIA, in *Ornithology*, a name by which the old authors have called one of the web-footed fowls, seeming to be the EUPHEMIA of Crete, or the common ANAS, or ANSER-SILLI.

ÆTIANS, ÆTIANI, in *Church History*, a sect or branch of ARIANS, so called from their leader Aetius, in the fourth century.

The *Aetiani* were of the stricter kind of Arians, who held that the Son and Holy Ghost are in every respect dissimilar to the Father.

Whence also they are called *Anomæi* and *Heteroufiani*; sometimes *pure Arians*.

ÆTIOLOGICAL, something that assigns the cause of an effect or appearance.

ÆTIOLOGY, in *Medicine*, *a rational*, or discourse of the cause of a disease. The word is compounded of *æτια, cause*, and *λογος, discourse*. In this sense we say, the *ætiology* of the small pox, of the *hydrophobia*, of the gout, the dropsy, &c.

ÆTIOLOGY is used for a figure in *Rhetoric*, whereby, in relating an event, we assign also the cause of it. In which sense, *ætiology* differs from *color*, as the former assigns the true cause, the latter only a feigned or specious one.

The sceptics were professed opponents of all *ætiology*, or argumentation from causes.

ÆTITES, or *eagle-stone*, in *Natural History*, a flinty or crustated stone, hollow within, and containing a *nucleus*, which, on shaking, rattles within. It was formerly in repute for several extraordinary *magical*, as well as *medical* powers; such as preventing abortion, discovering thieves, and other ridiculous properties.

The word is formed from *αετος, eagle*; the popular tradition being, that it is found in the eagle's nest, whither it is supposed to be carried while the female sits, to prevent her eggs from being rotten.

The LAPIS *ætites* is found in several parts near TEPHOUX in France; one can scarce dig a few feet, without finding considerable strata or beds, of the coarser or ferruginous kind.—They are originally soft, and of the colour of yellow ochre.

But the finest and most valued of all the eagle-stones, are accidental flakes of one or other of our common PEBBLES. These are so far from being a peculiar species of fossil, though usually accounted such, that they are not determinately of any one species of pebble. That, however, which most usually furnishes them, is the brown coutered pebble, with whitish, bluish, and brown crusts. The plain history of this remarkable fossil is this: the central *nucleus* of many species of pebbles, peculiarly of this, is coarser than the rest of the stone, that is, it is made up of more earth and less crystal; the natural consequence of which must be, that being of a more loose and rare texture, it is in drying more apt to shrink than such masses as are composed of a harder and purer matter. The central *nucleus* in this species is also surrounded with a whitish crust, of a more loose texture, and more subject to shrink in drying than even the *nu-*

cleus itſelf; and being compoſed of more earth and leſs cryſtal, is alſo more friable and ſoft. The outer circles of this ſtone are of a much harder ſubſtance. Whenever the earthy matter in the *nucleus*, and firſt cruſt of this pebble, a little exceeds its juſt proportion, the conſequence will be, that the ſtone will become an *aetites*: for the *nucleus* ſhrinking and contracting itſelf to a ſmall ſize on the evaporation of its fluid matter, muſt ſeparate itſelf from its firſt cruſt, and that alſo ſhrinking, muſt be drawn backward toward the other cruſts; whence the cavity will become larger between that and the *nucleus*, and conſequently, the *nucleus* will rattle in it when the ſtone is ſhaken. The pebble in this ſtate having been afterwards rolled about by waters, the *nucleus* has by rolling broken to pieces all the inner cruſt, and is uſually found in the hollow of the ſtone, buried in a large quantity of a whitiſh powder.

Theſe eagle-ſtones are not uncommon in our gravel-pits, but being by their hollowneſs rendered leſs ſtrong than the ſolid pebbles, we frequently find them broken. Hill.

The *aetites* is alſo known by the names *enteocium*, *echites*, *lapis aquilae*, *ovodialis*, *aquileius*, & *lapis pregnans*; ſome rank it under the claſs of precious ſtones, to which it has no title. Some think it may come properly enough under that of figured ſtones.

ÆTNA ſalt, SAL *Ætnæ*, a name given by ſome authors to the *ſal ammoniac* which is found on the ſurface and ſides of the openings of *Ætna*, and other burning mountains after their eruptions; and ſometimes on the ſurface of the ferruginous matter which they throw out. This ſalt makes a very various appearance in many caſes; it is ſometimes found in large and thick cakes, ſometimes only in form of a thin powder, ſcattered over the ſurface of the earth and ſtones. Some of this ſalt is yellow, ſome white, and ſome greeniſh.

This ſalt is a CONCRETE of nitre, ſulphur, and vitriol, burnt and ſublimed together; Boetii found once a vaſt quantity of this ſalt on mount *Ætna*, and tried many experiments on it; from whence he concluded, that this SALT is ſo far from occaſioning the exploſions of that mountain, as ſome have ſuppoſed, that it does not exiſt in it, but is formed during the burning. Phil. Tranſ. N° 100.

AFDELLES, in *Ichthyology*, a name given by the Cretans to the fiſh called at Rome, *dentellina* and *nigurella*. It is the *julis* of authors, and, according to the Artedian ſyſtem, is a ſpecies of the LABRUS. Artedi diſtinguiſhes it from the others, by the name of the *palmar labrus*, with variegated ſides, and two large teeth in the upper jaw.

AFEA, a weight uſed on the Gold Coaſt of Guinea. It is equal to an ounce, and the half of it is called *eggeba*. Moſt of the Blacks on the gold coaſt give theſe names to thoſe weights.

AFFATOMIA, in *Ancient Law*, a kind of donation made by thruſting a wand into the perſon's boſom, to whom it was made. Du-Cange.

AFFECTIO *lovina*, is a diſeaſe incident to cattle, occaſioned by a little WORM, bred between the fleſh and the ſkin; which works its way over all parts of the body.

AFFECTION, in a proper ſenſe, denotes an ATTRIBUTE, peculiar to ſome ſubject, and ariſing from the very idea or eſſence of it.

The word is formed from *afficere*, *to affect*; the SUBJECT being here ſuppoſed in ſome meaſure *affected*, or acted on, by the thing attributed to it.

In this ſenſe, *affection* is ſynonymous with *property*, or with what the ſchoolmen call *proprium quarto modo*.

Philoſophers are divided as to the doctrine and diviſion of *affections*; according to Ariſtotle, they are either *ſubordinating*, or *ſubordinated*; under the firſt of which comes only *mode*; and under the ſecond, *finiteneſs*, *place*, and *time*. The generality of Peripatetics divide *affections* into *internal*, as motion and finiteneſs; and *external*, as place and time. According to Sperlingius, *affections* are better divided into *ſimple* or *united*, and *disjunct* or *ſeparate*: under the firſt come *quantity*, *quality*, *place*, and *time*; under the ſecond, *motion*, and *reſt*.

Sperlingius then ſeems to reject finiteneſs from the number of *affections*; and Ariſtotle, and the Peripatetics, *quantity* and *quality*: but the difference is not irreconcilable; ſince Sperlingius does not deny body to be finite, nor Ariſtotle, and his followers, that it has *quantum* and *quale*. Only they have not made peculiar heads and titles for theſe.

Affections are alſo diſtinguiſhed into thoſe of *body*, and thoſe of mind.

AFFECTIONS *of body*, are certain modifications of it; occaſioned or induced by motion; in virtue of which, a body comes to be ſo and ſo diſpoſed.

The *affections of body* are ſometimes ſubdivided into *primary* and *ſecondary*.

AFFECTIONS, *primary*, are thoſe which ariſe either from the idea of matter, as quantity and figure; or from that of form, as quality and power; or from both together, as motion, place, and time.

AFFECTIONS, *ſecondary*, or *derivative*, are thoſe which ariſe from ſome of the primary; e. gr. from quantity, as diviſibility, continuity, contiguity, finity, impenetrability, from *figure*, as regularity and irregularity; from *quality*, as health, ſtrength, &c.

AFFECTIONS *of mind*, are what we more uſually call PASSIONS.

AFFECTIONS, *mechanical*. See MECHANICAL *affections*.

AFFECTION, in *Phyſiology*, is ſometimes uſed to expreſs that impreſſion which is made on our minds by ſubjects either within us, or without us; but *affection* more commonly denotes that lively ſenſe of pleaſure, or of averſion, which we feel from certain objects. Thus a picture repreſenting beings ſhocking to nature, is ſaid to *affect* us diſagreeably; and thus the relation of a generous or heroic action is ſaid to *affect* us agreeably.

AFFECTION is more peculiarly uſed, in *Medicine*, for a morbid, or preternatural ſtate of the body, or ſome of its parts. Thus we ſay, an HYPOCHONDRIACAL, an HYSTERICAL *affection*. And in like manner, ſuch a part of the body is *affected*, i. e. indiſpoſed, or ſeized with a DISEASE. The ſick are frequently miſtaken as to the place *affected*, by reaſon of the conſent between the ſeveral parts, which often makes a diſorder in one part to be felt in another.

AFFERORS, AFFERATORES, in *Law*, perſons appointed in court-leets, and other places, upon oath, to ſettle and moderate the FINES of ſuch as have committed faults arbitrarily puniſhable, or which have no expreſs penalty ſet down by ſtatute. See Stat. 25 Edw. III. cap. 7.

The word is formed, according to Cowel, of the French *affier*, to *affirm*; by reaſon thoſe appointed to this office do affirm, upon their oaths, what penalty they think, in conſcience, the offender hath deſerved. Others better derive it from *afferurer*, a word in the cuſtomary of Normandy, rendered by the Latin interpreters, *taxare*, *to ſet the price of a thing*; as *aſſimare*, *indicere*, &c.—Kitchin joins the three words as *ſynonyma*; *affidati*, *averantatores*, *afferores*.

AFFERI, in *Law*. See AVERIA.

AFFETTUOSO, or *Con* AFFETTO, in the *Italian Muſic*, is uſed to denote that kind of muſic, which muſt be performed in a very tender, moving, and affecting manner; and for that reaſon rather ſlow than faſt.

AFFIANCE, in *Law*, the plighting of troth between a man and a woman, upon an agreement of marriage to be had between them.

AFFIDATIO *Dominorum*, ſignifies an oath taken by the lords in parliament: thus called in the Rot. Parl. Hen. VI.

AFFIDATUS, or AFFIDIATUS, in our *Law Books*, denotes a tenant by FEALTY.

Affidati are not properly vaſſals, but *quaſi* vaſſals, or perſons who vow fealty to, and put themſelves under the protection of another.

In this ſenſe they amount to the ſame with what are otherwiſe called *commendati*, and *recommendati*.

AFFIDAVIT, an OATH, in writing, ſworn before ſome perſon who hath authority to take ſuch oath; and made uſe of, and read in court, upon motions; though not allowed upon trials.

In the court of chancery is an *Affidavit-office*, under the direction of a *Maſter of* CHANCERY.

AFFILIATION, AFFILIATIO, in *Middle Age Writers*, the ſame with adoption.

Among the ancient Gauls, *affiliation* was a ſort of adoption only practiſed among the great.—It was performed with military ceremonies: the father preſented a battle-axe to the perſon he was to adopt for his ſon, as an intimation that he was to preſerve the effects he thus called him to ſucceed to, by arms.

AFFINAGE is ſometimes uſed, in *Ancient Law Books*, for the refining of metals.

AFFINITY properly imports a relation contracted between one of two parties married, and the kindred of the other party.

The word is originally Latin, compounded of *ad*, *to*, and *finis*, *boundary*, *limit*; by reaſon, as the lawyer ſays, that one of the families here approaches to the bounds of the other: *Quod duæ cognationes per nuptias copulantur, & altera ad alterius cognationem finem accedit*. Or, as another expreſſes it, *Quod uterinſque cognationis fines in unum locum conferuntur*.

In which ſenſe the word ſtands contradiſtinguiſhed from *conſanguinity*, which is a relation by blood.

In the Moſaical LAW there are ſeveral degrees of *affinity* wherein marriage is expreſly prohibited, which yet ſeem not at all prohibited by the law of nature.

The *Canoniſts* diſtinguiſh three ſpecies of *affinity*.—The *firſt*, that contracted between the huſband and the relations

tions by blood of his wife; and between the wife and the relations by blood of her husband.

The *second*, between the husband and those related to his wife by marriage; and the wife, and those so related to her husband.

The *third*, between the husband and the relations of his wife's relations; and the wife, and the relations of her husband's relations.

By the fourth council of Lateran, held in 1213, it was decreed, that none but the first kind was any real *affinity*; the rest being mere refinements, which ought to be set aside.

The degrees are reckoned after the same manner in *affinity*, as in *consanguinity*; and therefore differently in the *Canon Law* from what they are in the *Civil Law*.

Whatever line or degree of consanguinity the kindred of one of the parties married are in, they are in the same line and degree of *affinity* to the other. And again, in whatever line or degree of *affinity* persons are, in the first kind, they are in the same in the second and third kinds of *affinity*. Hence arise what we may call a direct and collateral, an ascending and descending line of *affinity*.

The Romanists talk of a *spiritual affinity*, contracted by the sacrament of baptism and confirmation. In that church, a god-father may not marry with his god-daughter, without a dispensation.

Affinity does not found any real kinship; it is no more than a kind of fiction, introduced on account of the close relation between husband and wife. It is even said to cease, when the cause of it ceases. Hence a woman who is not capable of being a witness for her husband's brother, during his life-time, is allowed for a witness, when a widow, by reason the *affinity* is dissolved. Yet with regard to the contracting marriage, *affinity* is not dissolved by death, though it be in every thing else.

The degrees and terms of *affinity* are chiefly, father-in-law, i. e. husband's or wife's father, in Latin *socer*; step-father, i. e. mother's husband, *vitricus*; mother-in-law, i. e. husband or wife's mother, *socra*; step-mother, i. e. father's wife, *noverca*; son-in-law, *gener*; daughter-in-law, *nurus*; step-daughter, i. e husband's or wife's daughter by another marriage, *privigna*; step-son, i. e. husband's or wife's son by a former marriage, *privignus*; which two last, considered in relation to each other, are called *comprivigni*; son-in-law, i. e daughter's husband; brother-in-law, i. e husband's brother or sister's husband, *levir*; wife's brother, brother's wife; sister-in-law, i. e. husband or wife's sister. Calv. Lex. Jur.

AFFINITY, in the *Civil Law*, is divided into *civil*, that between free persons; and *servile*, that between slaves.

AFFINITY, *legitimate*, is that contracted by a proper and legal matrimony; or, between slaves, by *contubernium*.

AFFINITY, *illegitimate*, that contracted out of legal marriage.

Affinity may be contracted by an unlawful commerce: thus a person who has impregnated two sisters, is prohibited marrying either of them; thus an *affinity* may commence between husband and wife, by his lying with her sister.

AFFINITY, *true*, is that subsisting while the marriage between the two parties subsists.

AFFINITY, *quasi*, that subsisting either after the dissolution of the marriage, as between a husband, and his wife's daughter, begot by another after her being divorced from him; or before the marriage is solemnized, as that between a father and a daughter, only espoused, or betrothed to his son.

AFFINITY is also used figuratively, for a conformity, or agreement, between one thing and another.

In which sense, the word stands opposed to diversity, variety, opposition, &c.

Bishop Wilkins gives tables, wherein things are classed according to their *affinities*. Vide Real Charact. p. ii. p. 22.

Henckelius has a treatise on the *affinity* between *vegetables* and *minerals*.

AFFINITY, is more particularly used in speaking of the relation or similitude between LANGUAGES, occasioned by their being derived from the same source.

We use also *affinity* of words, sounds, &c.

AFFINITY, in *Chemistry*, is a term which corresponds to *attraction* in the mechanical philosophy, and denotes the tendency which the constituent parts of bodies have to unite, and the power by which they adhere when united. It is sometimes called *elective attraction*, or the *power of combination*.

AFFINITY, *simple*, is either that power of mutual union, which subsists between the integrant and homogeneous parts of the same body, more properly called *attraction of cohesion*; or that which produces the union and adherence of the heterogeneous parts of two different bodies, from which results a new compound body, whose properties are different from those of the two principles whereby it is formed: e. g. two bodies, each by itself very easily fusible in fire, as lead and sulphur, shall form a compound very difficult of fusion: and two which cannot separately be made to melt at all, as pure clay and chalk, can melt with ease when joined together. This is sometimes denominated

AFFINITY *of composition*; though this term is more generally applied to the powers of union, which are discoverable in a *number* of heterogeneous bodies, whose dissimilar parts are blended together. Chemical union, and the properties thence resulting, are exempt from all known mechanism; nor can the united bodies be separated by any mechanical force. But a third body may have a stronger *affinity* to either of the component matters than they have to one another; in which case, on presenting to the compound this third body, the former union is broken, and one of the first bodies coalesces with the third, while the other is detached and separated.

And the result of the combination will be very various, according to the nature and number of the substances employed.

M. Geoffroy, and M. Gellert, have given tables of the different degrees of *affinity*, between most of the bodies employed in *chemistry*, combined in various ways; whereby we may foretel the result of any mixture, what will be the issue of the combat, which will surmount, and which give way to the other.

Some objections to these tables, with illustrations of them, are given in the Mem. Acad. Scienc. for the year 1720, p. 24. and in the Hist. p. 42. and likewise in an appendix to the English edition of Macquer's Chem. Dict. See also the tables, with two additional columns, in that of M. Geoffroy, by Dr. Black.

A TABLE OF THE SOLUTIONS OF BODIES, BY MR. GELLERT.

1. Siliceous Earth	2. Flours	3. Clay	4. Earth Gypseous	5. Earth Calcareous	6. Fixed Alkali	7. Volatile Alkali	8. Acetous Acid	9. Marine Acid	10. Nitrous Acid	11. Vitriolic Acid	12. Aqua Regia	13. These tables, though in many reſpects inaccurate and defective, may be of conſiderable uſe. Each of them conſiſts of a number of columns. At the head of each column is placed the ſubſtance, the *affinities* of which are to be compared with the ſeveral ſubſtances placed below it in the ſame column; and they are diſpoſed in the order of their ſtrongeſt *affinities*.

It is likewiſe to be obſerved, that any ſubſtance in any of theſe columns may be ſeparated from the ſubſtance at the head of that column, by any of the intervening ſubſtances. For a farther explication of the nature and uſe, as well as the defects of theſe tables, conſult the Dictionary above cited.

AFFION, is a name given by the Arabians to opium; and alſo to an electary, in which opium is an ingredient.

AFFIRMATION, *affirmatio*, in *Logic*, a poſitive propoſition, alledging the truth or reality of ſomething.

Affirmation is defined, by the *Logicians*, an act whereby we attribute one idea to another; as ſuppoſing it to belong, or agree thereto.—As when, conceiving perfection to agree to the Deity, we ſay, *God is perfect*.

This, on other occaſions, is called ENUNCIATION, PROPOSITION, COMPOSITION, and JUDGING.

AFFIRMATION, in *Law*, ſignifies the ratifying or confirming a former law, or judgment.

We ſay, to *affirm* a judgment: the houſe of lords, on an appeal, *affirmed* the lord chancellor's decree.

AFFIRMATION is alſo uſed in *Grammar*, by ſome refiners upon that art, for what is uſually called a VERB; becauſe the office of that part of ſpeech is to expreſs what we *affirm* or attribute to any ſubject.

AFFIRMATION is alſo uſed for a ſolemn form of atteſting the truth, allowed to be uſed by the QUAKERS, inſtead of an oath, which they hold abſolutely unlawful to take. See the form of the *affirmation*, &c. under the article QUAKER.

AFFIRMATION is of divers kinds, tacit, by words, by a nod, or geſture, &c.

In a civil law ſenſe, *affirmation* may be divided into *ſimple*, which is that from which no obligation ariſes; and *qualified*, which infers an obligation.

The requiſites of this latter are, that it be, 1. deliberate and free; 2. ſincere; 3. certain and ſpecific; 4. clear and perſpicuous.

AFFIRMATIVE, in *Logic*. See AFFIRMATION.

There are univerſal *affirmative* propoſitions; and ſuch, uſually, are the firſt of SYLLOGISMS.

In *Algebra* we have alſo *affirmative* or poſitive QUANTITIES, which have their appropriated CHARACTERS.

AFFIRMATIVE *ſign*, or character. See CHARACTER.

AFFIRMATIVE, in *Grammar*. Authors diſtinguiſh *affirmative* particles; ſuch is, *yes*.

The term *affirmative* is ſometimes alſo uſed *ſubſtantively*. Thus we ſay, the *affirmative* is the more probable ſide of the queſtion: there were ſo many votes, or voices, for the *affirmative*.

AFFIRMATIVE is particularly applied, in the Roman INQUISITION, to ſuch heretics as own the errors and opinions with which they are charged; and maintain them in their examination with firmneſs and reſolution.

AFFIX, in *Grammar*, a particle added at the cloſe of a word, either to diverſify its form, or alter its ſignification. In which ſenſe, *affix* is the ſame with *ſuffix*; though *affix* is ſometimes, but leſs properly, applied more generally, ſo as to include prefix particles.

The word is Latin, *affixus*, compounded of *ad* and *figo*, *I fix*.

We meet with *affixes* in the Saxon, the German, and other northern languages; but more eſpecially in the Hebrew, and other oriental tongues.

The Hebrew *affixes* are ſingle ſyllables, frequently ſingle letters, ſubjoined to nouns and verbs; and contribute not a little to the brevity of that language.

The oriental languages are much the ſame as to the RADICALS; and differ chiefly from each other as to *affixes* and PREFIXES. Mem. Acad. Inſcrip. tom. ix. p. 334.

AFFLATUS literally denotes a blaſt of wind, breath, or vapour, ſtriking with force againſt another body. It ſometimes affects the body with a diſeaſe, which is a ſpecies of the *eryſipelas*.

The word is formed from *ad* and *flare*, *to blow*.

Naturaliſts ſometimes ſpeak of the *afflatus* of ſerpents.

Tully uſes the word *figuratively*, for a divine INSPIRATION. In which ſenſe, he aſcribes all great and eminent accompliſhments to a divine *afflatus*.

AFFLICTION is not itſelf, in propriety of medical ſpeech, a diſeaſe, but it produces many; for whatever excites envy, anger, or hatred, produces diſeaſes from tenſe fibres; as whatever excites fear, grief, joy, or delight, begets diſeaſes from relaxation.

Many chronical diſeaſes, particularly the *phthiſis*, ſpring *from affliction*. For a very remarkable hiſtory of the effect of *affliction*, ſee Hiſt. de l'Acad. Roy. des Scienc. an. 1732.

AFFLUX, in *Electricity*, is oppoſed to *efflux*; and both terms were uſed by the abbé Nollet, and alſo by Dr. Watſon, previous to the diſcovery of poſitive and negative electrics. They apprehended, that in all electrical operations, there was both an *efflux* of electrical matter to the globe and the conductor, and likewiſe an *efflux* of the ſame matter from them. Dr. Watſon ſoon corrected this miſtaken opinion; but the abbé Nollet was more tenacious; and he was confirmed in his attachment to this favourite theory by obſerving, that bodies not inſulated, plunged in electric atmoſpheres, ſhewed ſigns of electricity; not perceiving, that the electricity of ſuch bodies was in its nature and effects different from, and directly oppoſite to that of the electrified body, in the atmoſphere of which they were involved. See ELECTRICITY.

AFFORAGE, in the French *Coſtoms*, a duty paid to the lord of a diſtrict, for permiſſion to ſell wine, or other liquors, within his ſeignory.

Affurage is alſo uſed for the rate or price of proviſions laid and fixed, by the proveſt, or ſheriff, of Paris.

AFFORCEMENT, *afforciamentum*, in ſome ancient charters, denotes a FORTRESS, or work of FORTIFICATION and DEFENCE.

The word is derived from the barbarous Latin *afforciare*, *to ſtrengthen, confirm*.

AFFORESTING, *afforeſtatio*, the turning ground into FOREST.

In this ſenſe, the word ſtands oppoſed to DISAFFORESTING.

The Conqueror, and his ſucceſſors, continued *afforeſting* the lands of the ſubject, for many reigns; till the grievance became ſo notorious, that the people of all degrees and denominations were brought to ſue for relief; which was at length obtained, and commiſſions were granted to ſurvey and perambulate the foreſt, and ſeparate all the new *afforeſted* lands, and re-convert them to the uſes of their proprietors, under the name and quality of PURLIEU or *pourpris lend*.

AFFRANCHISEMENT. See MANUMISSION.

AFFRAY, in *Law*, is derived from the French word *effroyer*, *to affright*, and it formerly meant no more; as where perſons appeared with armour, or weapons not uſually worn, to the terror of others. Stat. 2 Edw. III. cap. 3. But it now implies a ſkirmiſh or fighting between two or more, and there muſt be a ſtroke given or offered, or a weapon drawn, otherwiſe it is not an affray. 3 Inſt. 158. It is inquirable in the court-leet, and puniſhable by juſtices of peace in their ſeſſions, by fine and impriſonment; and it differs from ASSAULT, in that it is a wrong to the public; whereas aſſault is of a private nature. Lamb. lib. ii. A conſtable, or private perſon, may ſeize offenders where they are aſſembled in a tumultuous manner. 3 Inſt. 158. H. P. C. 135.

AFFREIGHTMENT, or AFFRETAMENT, AFFRETAMENTUM, in *Law*, ſignifies the FREIGHT of a ſhip.

The word is formed from the French *fret*, which expreſſes the ſame thing.

AFFRONTÉ, in *Heraldry*, is underſtood of animals borne in an ESCUTCHEON as facing, or with their heads turned towards each other. This is otherwiſe called *confronté*; and ſtands oppoſed to *adoſſé*.

The word is French, and literally ſignifies the ſame. It is compounded of *ad*, *to*, and *front*, *forehead*.

AFFUAGE, *affuagium*, in *Antient Cuſtoms*, a right of cutting fuel-wood in a foreſt, or the like, for maintaining family fire. De-Cange.

The word is derived from *affuer*, q. d. *affocare*, *to make a fire*, of *ad* and *focus*.

AFFUSION, the act of pouring ſome fluid ſubſtance on another body.

Dr. Grew gives ſeveral experiments of the luctation ariſing from the *affuſion* of divers menſtruums on all ſorts of bodies.

Divines and church hiſtorians ſpeak of BAPTISM *by affuſion*, which amounts to much the ſame with what we now call ſprinkling.

AFLOAT, a ſhip is ſaid to be *afloat*, when ſhe is buoyed up by the water from the ground.

AFOBA, in *Botany*, a name given, by the natives of Guinea, to a kind of plant, of the genus of the *phaſeolus*, or kidney-bean. They uſe it pounded and mixed with oil, to cure the itch, and other cutaneous ſouleſſes. It is more hairy than the common kinds, and its leaves are very ſmall. Phil. Tranſ. N° 232.

AFRA *avis*, in *Natural Hiſtory*. See PINTADO.

AFRICAN *company*. See the article COMPANY.

AFRICANUS *flos*. Gerard mentions four ſpecies of this flower; Miller enumerates and deſcribes thirteen; but they are of no repute in medicine.

AFRICTA denotes a kind of wafers, which the ancients uſed in their ſacrifices. Arnob. lib. vii.

AFSLAGERS, perſons appointed by the burgo-maſters of Amſterdam, to preſide over the public ſales made in that city. They muſt always have a clerk of the ſecretary's office with them, to take an account of the ſale. They correſpond to our BROKERS, or AUCTIONEERS.

AFT, behind, or near the ſtern of the ſhip.

AFTER-BIRTH, among *Midwives*, the coat, or membranes, wherein the FOETUS is incloſed *in utero*.

It is thus called, becauſe it comes away ſome time after the *foetus*; by way of a ſecond birth, or DELIVERY.

Phyſicians uſually call it the SECUNDINE. It alſo includes the *placenta uterina*, popularly called the *womb-cake*.

In brutes it is denominated the HEAM, or *cleaning*. See Collect. Acad. P. E. tom. iii. p. 464.

Authors ſpeak of a ſtrange kind of *after-birth*, of the mole-kind, frequent among Dutch women, where it is called *ſloyger*, q. d. *lieth*, by naturaliſts *mola volutilis*. The ſkeleton of one of theſe is deſcribed and repreſented by Thomas Bartholine, Ephem. Germ. dec. 1. ann. 2. obſ. 160. p. 255.

The *after-births* of ripe children are brought away more eaſily than thoſe of abortions. See Medic. Eſſ. Edinb. vol. ii. p. 212.

AFTER-*math*, among *Huſbandmen*, the after-graſs, or ſecond mowings of graſs; or elſe graſs or ſtubble cut after corn.

AFTER-*noon*, the latter half of the artificial day, or that ſpace between noon and night.

The ancient Romans dedicated their *afternoons* to diverſion, as their forenoons to buſineſs; and their uſual diverſions were the game called *pila*, and other exerciſes of the body, eſpecially walking, or riding. Theſe laſted till the eighth or ninth hour, anſwering to our three o'clock, which was the time for the baths. After bathing, they anointed and perfumed themſelves; and, about the tenth hour, went to *cœna*, *ſupper*, about three hours before ſun-ſet; which done, the day was ended at the public ſpectacles, theatrical, or amphitheatrical ſports; with muſic, ſinging, and the like.

AFTER-*ſails* uſually comprehend all thoſe which are extended on the mizen-maſt, and on the ſtays, between the mizen and main-maſts.

AFTER-*pains*, are pains felt in the loins, the groin, &c. after the birth is brought away.

They ſeem to ariſe from a diſtention of the ligaments of the *uterus* in time of DELIVERY, and are ſeldom dangerous, unleſs aggravated by a detention of the *ichia*.—To prevent them, oil of ſweet-almonds, ſpermaceti, ſyrup of *capillus Veneris*, &c. are uſually preſcribed.

AFTER-*swarms*, in speaking of bees, are secondary or posterior swarms, frequently found to quit the hives within a fortnight after the first.

Butler tells us, that the *after-swarms* differ from the prime, in that the latter are directed by the vulgar, or crowd of bees, whose only rule is the fullness of the hive; whereas the former are appointed by the ruling bees, and indicated by a noise or call, which these make for the space of two or three days, as it were to give warning to the common herd to prepare for a march. Within eight or ten days after the prime swarm is gone, if the princess next in order find a competent number fledged and ready, she begins to tune her treble voice, in a mournful and begging note, as if she prayed the queen-mother to let them go; to which voice, if she vouchsafe a reply, by tuning her base to the other's treble, it marks her consent: in consequence of which, within a day or two after, if the weather allow, the new swarm appears. If the *prime* swarm be broken, the *after* will both call and swarm the sooner, perhaps the next day; in which a third, sometimes a fourth, succeeds in the same season; but all usually within a fortnight after the prime swarm. See SWARM.

AFTO, in *Botany*, a name given by the natives of Guinea to a plant of the *erysimum* kind, which they grind to powder, and take as snuff, to cure the head-ach. Petiver has called this plant the woody and woolly *erysimum*, or hedge-mustard, of the coasts of Guinea. Phil. Trans. N° 232.

AGA, in the language of the Moguls, &c. signifies a great man, lord, or commander.

In this last sense, the term is also used among the Turks: thus, the *aga* of the janizaries is their colonel; and is the only person who is allowed to appear before the grand seignor, without his arms across his breast, in the posture of a slave. The *capi aga* is the captain of the gate of the seraglio.

The title *aga* is also given, by way of courtesy, to several persons of distinction, though not in any office, or command, to entitle them to it; as to the eunuchs of the seraglio.

The chief officers under the KHAN of Tartary are called by this name. And among the Algerines, we read of *agas* chosen from among the *beluk bashis* (the first rank of military officers), and sent to govern in chief the towns and garrisons of that state.

On some occasions, in lieu of *aga*, they say, *agassi*, or *agassi*. Thus the *aga*, or governor of the pages, is called *capi agassi*; and the *aga* or general of the horse, *spahilar agassi*.

AGA *Orientalium*, signifies the Spanish milk-thistle.

AGAI, see AGIO.

AGALACTIA, in *Physic*, signifies a deficiency of milk in a mother, who is therefore called by Hippocrates ἀγάλακτος.

AGALLOCHUM, a medicinal wood imported from the East Indies, usually in small bits, of a very fragrant scent. The word is derived from the verb ἀγαλλομαι, *I boast*, in allusion to the excellency of its odour.

AGALLOCHUM is otherwise called *lignum aloes* and *xylaloe*, q. d. *aloe-wood*, not that it is produced from the common aloe-plant, which yields the inspissated juice of that name. It is the produce of a tree of a very different kind, growing in the East Indies, particularly Sumatra and Cochinchina. Some call it likewise LIGNUM *paradisi*. It yields a concrete oil. See its chemical history in Neumann's Works, p. 420.

It is of a blueish purple colour, marked with veins and spots, very heavy and bitter; when burnt it yields drops of an astringent liquor, and a sweet aromatic fume. It is hot and drying, and esteemed a great strengthener of the nerves in general, but particularly of the head and stomach.

The various names and accounts given of the *agallochum* are so very different, as well as the specimens of it common in our shops, that it does not seem to be properly known amongst us.

AGALMATA, in *Antiquity*, originally denoted the ornaments of temples and statues; but came afterwards to be popularly used for the statues and temples themselves.

AGAPES, or AGAPÆ, in *Church History*, a kind of religious festival, celebrated, in the ancient church, to keep up a harmony and concord among its members.

The word is formed of the Greek ἀγαπη, *love*.

In the primitive days the *agapes* were held without scandal, or offence; but, in after times, the heathens began to tax them with impurity.—This gave occasion to a reformation of the *agapæ*.

The kiss of charity, with which the ceremony used to end, was no longer given between different sexes; and it was expressly forbidden to have any beds, or couches, for the conveniency of those who would be disposed to eat more at their ease. Notwithstanding these precautions, the abuses committed in them became so notorious, that the holding of them (in churches at least) was solemnly condemned, at the council of Carthage, in the year 397.

Some authors imagine the *agapæ* to have been, not a commemoration of our Saviour, but a custom borrowed from the heathens: *Mos vero ille, ut referunt*, says Sedulius, on the XIth chapter of the epistle to the Corinth. *de Gentili adhuc superstitione venisse*. And Faustus, the Manichee, is represented, by St Augustine, as reproaching the Christians with converting the heathen sacrifices into *agapæ*.

AGAPE signifies also an afternoon, or evening's meal.

AGAPETÆ, in *Ecclesiastical History*, a name given to certain virgins and widows, who, in the ancient church, associated themselves with, and attended on, ecclesiastics, out of a motive of piety and charity.

In the primitive days there were women instituted DEACONESSES; who, devoting themselves to the service of the church, took up their abode with the ministers, and assisted them in their functions.

In the fervour of the primitive piety, there was nothing scandalous in these societies; but they afterwards degenerated into libertinism: insomuch, that St. Jerom asks, with indignation, *unde agapetarum pestis in ecclesias introiit?* This gave occasion to councils to suppress them.—St. Athanasius mentions a priest, named Leontius, who, to remove all occasions of suspicion, offered to mutilate himself, to preserve his beloved companion.

AGAPIS *lapis*, in *Natural History*, a name given by ancient writers, to a stone of a dusky yellow, or the colour of a hon's skin; it was held in great esteem in many nations, on account of its supposed virtues, as an anodyne and vulnerary.

AGARENI, or AGARENIANS, a name given by some to the followers of the religion of Mahomet.

The word is derived from Agar, or Hagar, handmaid of Abraham, and mother of Ishmael; and properly denotes the Arabs, called also Ishmaelites, and more lately Saracens.

AGARIC, in *Pharmacy*, a kind of fungous excrescence, growing on the trunks and large branches of several trees; but, chiefly, on the larch-tree, and upon some kinds of oak, when old and decayed. Three fourths of it consist of a resinous subitance, and the remainder is a slimy mucilaginous earthy matter, so tenacious, as scarcely, by any method, to be dissolved by water. It comes forth on the tree in the beginning of the spring, and continues to increase till autumn. The best is easily cut with a knife, friable betwixt the fingers, and has no hard, or gritty, or coloured veins. It has no pedicle, and is internally of a simple uniform structure throughout its whole substance. *Agaric* is an ingredient in the *theriaca Andromachi*, where it is admitted in quality of a cordial; though its cardiac virtue is excepted to as much as its purgative.

Agaric was a purge in much esteem among the ancients, but has deservedly fallen into distrepute of later years, as it occasions unsupportable nausea.

Tournefort enumerates eighteen species of *agaric*. Tournef. Inst. 562. But it is more generally divided into three kinds; the *male*, the *female*, and that called *false*, or *spurious agaric*.

The *male agaric*, otherwise called the common or heavy *agaric*, is of a yellowish colour, and pretty solid. It is commonly used in dying black, and is reckoned among the *not-colouring* drugs, which the dyers of the best woollen cloth and serges are obliged to use in France.

It is called a *not-colouring* drug, because it can produce no colour of itself, without being mixed with other ingredients.

The *female agaric* is the most esteemed, because it is much used in medicine. To be good it ought to be white, large, light, and brittle, so as to be easily pulverised; of a lively and penetrating scent, and of a bitter taste. This was thought efficacious as a dyptic to restrain not only venal, but arterial haemorrhages, without the use of ligatures. Its reputation, however, did not long subsist; and after repeated trial, the surgeons of London were obliged to discontinue it as inefficacious and unsafe. See Neale on the use of *Agaric*.

The *false*, or *bastard agaric*, or *oak agaric*, is that which grows on those trees. It is commonly reddish, and very heavy, and is very little esteemed, which probably occasioned its being called the *false agaric*. The druggists look only upon that which grows upon the *laurel-tree* to be the right sort.

Agaric is brought from different places; the best comes from the Levant; that which comes from Savoy and Dauphiny being less esteemed. Holland also supplies some, but that is reckoned the worst; because it is grated, and whitened at top with chalk. By a chemical solution it passes almost wholly into oil; it yields no volatile salt, but abounds with a sort of flaky earth, and acid phlegm; as to texture, it seems much to resemble COLOCYNTH.

The *agaric* is either *brute*, *cleansed*, or in *trochiscks*.

AGARIC, *brute*, is juſt as it was taken from the tree, without any other preparation than what it has received from nature.

AGARIC, *cleanſed*, is that, which being cleared and purified from all its filth and imperfections, is fit for immediate uſe.

AGARIC in *trochiſcs*, is commonly the female ſort, finely pulveriſed, incorporated with ſome liquid, and made into a maſs, of which cakes of different ſizes and figures are formed, which are dried in the air and ſhade, without coming near the fire.

AGARIC—There is alſo another ſort of *agaric*, which is called *mineral agaric*. This is a kind of ſtone, which is found in the cliffs of rocks, in different parts of Germany. It is very white and light, whence it is called milk of the moon. It is alſo named *marrow of ſtone*, or *lithomagra*; and others called it *ſteomagra*. Some tell us that the calcination of this ſtone is performed by the vapours of the metals within the rocks where it is found. This *agaric* is ſcarcely uſed at all, except in medicine. See LAC *lunæ*.

It is uſed internally againſt hæmorrhages, the ſtrangury, gravel, and eſpecially dyſenteries; externally, to dry and heal old ulcers, ſtop defluxions of the eyes, &c. See the chemical hiſtory of the *agaric* of the larch tree, &c. Neumann's Works, p. 349.

AGARICUS, in the Linnæan ſyſtem of *Botany*, called *tumenta* by Dillenius, the term uſed to expreſs that genus of fungules belonging to the *cryptogamia fungi*, which have no pedicle, but grow to trees, &c. by one ſide, and are therefore called horizontal fungules, and are lamellated underneath: by this laſt character they are diſtinguiſhed from the *boleti* of Linnæus, which are thoſe horizontal fungules which are porous underneath.

AGASYLLIS, in the *Materia Medica*, a name given by ſome of the ancient Greek writers, to gum ammoniac; and by Dioſcorides to the tree which produced that gum. By their deſcriptions of this medicine, it appears not to have been the ſame which we know by this name.

AGAT, in *Natural Hiſtory*, a precious ſtone, partly tranſparent, and partly opake; uſually diverſified with variety of colours, veins, ſpots, &c. and ſometimes exhibiting figures, or appearances of natural objects.

The word is ſometimes alſo written *achat*; by the Greeks and Latins, *achates*, and *achates*; a denomination taken from that of a river in Sicily, on the banks of which it was firſt found.

Agats are compoſed of cryſtal, debaſed by a large quantity of earth, and not formed, either by repeated incruſtations round a central *nucleus*, or made up of plates laid evenly on one another, but are merely the effect of one ſimple concretion, and variegated only by the diſpoſition which the fluid they were formed in gave to their differently coloured veins, or matters.

Theſe are a very numerous genus of foſſils, and ſubject to great variegations in their colours. They are, however, arranged in ſome order, according to the different colours of their ground.

Of thoſe of a *white ground*, there are three ſpecies: 1. The DENDRACHATES, or *Mocca-ſtone*. 2. The dull milky-looking *agat*. 3. The lead-coloured *agats*, called the BIAS-ACHATES, by the ancients.

Of the *agats* with a *reddiſh ground*, there are four ſpecies: 1. An impure one of a fleſh coloured white. 2. The ſecond or the red-grounded *agat*, is that ſpecies of a pure blood-colour, called HÆMACHATES, or the *bloody agat*, by the ancients. 3. The third is the clouded and ſpotted *agat*, of a pale fleſh-colour, called the *cornelian agat*, or SARDACHATES, by the ancients. 4. And the fourth, the red lead coloured one, variegated with yellow, called the *coral agat*, or CORALLO-ACHATES, by the ancients.

Of the *agats* with a *yellowiſh ground*, there are only two known ſpecies: 1. The one of the colour of yellow wax, called *cerachates* by the ancients. 2. The other a very elegant ſtone, of a yellow ground, variegated with white, black, and green; called the *lemina*, and LEONTEBERES, by the ancients.

Laſtly, of the *agats*, with a *greeniſh ground*, there is only one known ſpecies, which was the JASPACHATES of the ancients.

Some have attributed great medicinal and imaginary virtues to the *agat*.

Oriental *agats* are ſaid to be all brought from the river Gambay.

A mine of *agats* was lately diſcovered in Tranſylvania, of divers colours, ſome of a large ſize, weighing ſeveral pounds. *Agats* have been diſtinguiſhed by other names than thoſe before mentioned. Thus we find

AGAT, *vermilion*, that of a deep vermilion-colour.

AGAT, *white ringed*, *achates* PERILEUCOS, diſtinguiſhed by black and white circles. Pliny mentions this under the denomination of *onux-ſtone*.

AGAT, *white*, LEUCACHATES, that altogether white, or at leaſt diverſified with white ſtrokes, being frequently ſemi-tranſparent, and bearing a reſemblance to the white of an egg.

AGAT, *various*, or *tranſparent*, of a thin ſtone-blue colour.

AGAT, *leopardine*, *achates* PARDALIOS, that ſpotted like the ſkin of a leopard. This is otherwiſe called *pandalion*, *pantachates*.

AGAT, *ſapphirine*, that of a ſky-blue colour, tranſparent; ſometimes found with *lapis lazuli*, and called alſo *ſapphiro-achates*.

AGAT, *luminated*, diſtinguiſhed by divers colours, as white, black, yellow, brown, placed over each other, at equal diſtances.

AGATS are alſo divided, with regard to the objects repreſented on them, into

ACAT, *arboreſcent*, DENDRACHATES, and DENDRITIS. This ſeems to be the ſame with what ſome authors call the *achates*, with roſemary in the middle; and others, *achates*, with little branches of black leaves.

AGAT, *horned*, CERACHATES, is ſaid by ſome to be that which, by lines and ſpots, repreſents the figure of a horn.

AGAT, *aphrodiſion*, *achates* APHRODISIUS, is a term given by Veliſchius to an *agat* in his cuſtody, of a fleſh-colour, on one ſide of which appears a half-moon, in great perfection, repreſented by a milky ſemicircle; on the other ſide, the phaſes of Veſper, or the evening ſtar; whence the denomination *aphrodiſius*.

AGAT, *crinid*, repreſenting human hair.

AGAT, *ariſtmetical*, repreſenting the numbers 4191; 191. Scitala, Muſ. 81

AGAT, *aſtronomical*, repreſenting the hemiſphere, with its ſeveral orbs, and the earth in the middle. To which head may be alſo referred an *agat* mentioned by Borrichius, repreſenting the five orbs in great perfection. Act. Hafn. 1677.

AGAT, *Elementary*, conſiſting of four colours; blue, ſuppoſed to expreſs water; white, the air; red, the fire; and brown, the earth.

AGATS, *anthropomorphous*, thoſe wherein the figures of men or women are expreſſed. Such is that mentioned by Kircher, repreſenting a heroine armed: with many others of the *anthropomorphous* kind.

To the claſs of *anthropomorphous agats*, may alſo be referred an *agat* in the library of Franefort, repreſenting the heart, lungs, and part of the veins of man. But the moſt celebrated of this kind, is that of Pyrrhus, repreſenting the nine Muſes with their attributes, and Apollo in the middle playing upon the harp. Plin. lib. xxxvii. cap. 3. Hardouin, Not.

AGATS, *leucophthalmous*, thoſe repreſenting the figures of eyes. Such is that mentioned by Veliſchius, which he calls *emmatia*, or *omphophthalmus*; or thoſe by Cardan and others, repreſenting the eyes of birds, fiſhes, wolves, called *hyophthalmi*; of goats, *aegophthalmi*; of oxen, *boophthalmi*. Among the more curious, we meet with Tiberius *agat*, *achates Tiberianus*, a name given by ſome to the famous *agat* in the treaſury of the French king's chapel, repreſenting the *apotheoſis* of Auguſtus, and the ſeries and portraits of the family of Tiberius and Julia, with divers foreign nations ſubdued in war; concerning which, many different explications and conjectures have been advanced by the learned.

AGAT, *Iſiac*, *achates Iſiacus annularis*, is a curious antique *agate* at Rome, ſo called, as repreſenting the head of Iſis, and being ſet in a ring.

AGATS are alſo divided with regard to the affinities they bear to other ſtones: hence the *jaſpachates*, *ſardachates*, &c. We find alſo *onychates*, between an *onyx* and an *agat*, compoſed net of zones, or bulls, but of plates perſpicuous and aſh-coloured. Grew. Muſ. Reg. Soc. p. iii. p. 289.

AGAT, *orientat ſardonyx*, of an oval figure, and a white colour, in the middle of which appears a body of water, which, upon ſhaking, is perceived to move. This ſpecies is otherwiſe called *oculus, ovum ſolis, oculus paragaunorum, oculus cryſtallinus, aſtites gemmata*, &c. and may be referred to the MYTES kind.

To this kind may alſo be referred the *agat* of Chili, which has cryſtals ſeen in it; and another called *beryllochates*, containing pieces of beryl.

The ANTACHATES is that which in burning yields a ſmell of myrrh. This, though mentioned by Pliny among *agats*, ſeems rather to belong to the head of ambers, or bitumens. Others write it *anochates*; others, *ſaſſachates*.

Authors alſo ſpeak of Roman *agats*, Egyptian *agats*.

The ancients mention a red *agat*, ſpotted with points of gold, found in Candia.

Agat has always been eſteemed for ſeals; as being a ſtone that no wax will ſtick to.

The gold wire drawers burniſh their gold with an *agat*; whence the inſtrument made uſe of on that occaſion, is alſo called an *agat*.

Mr. Boyle takes *agats* to have been formed of ſeparate beds, or ſtrata of fine clay or earth, brought by a petrifying liquor to coagulate into a ſtone. The ſame author obſerves, that the fire will purge away the colours of *agat*. He alſo mentions an *agat* with a movcable ſpot or cloud in it.

See farther concerning the hiſtory of *agats*, Nicolſ. Lapid. cap. 26. p. 133. Grew, Muſ. p. 287. The figures of *agats*, Mercat. Alelloth. p. 375. Their ſtructure, Woodward, Nat. Hiſt. Engl. Foſſ. tom. ii. p. 16. Experiments on them in the burning-glaſs, Giorn. de Letter. d'Ital. tom. viii. The commerce and manufacture of *agats*, Hought. Coll. tom. ii. The counterfeiting of *agats* in glaſs, Neri, Art of Glaſs, lib. ii. cap. 37.

AGATS may be ſtained artificially, by a ſolution of ſilver in ſpirits of nitre, and afterwards expoſing the ſtone, for ſome hours, to the ſun. This operation ſucceeds beſt in whitiſh *agats*. See on this ſubject of ſtaining *agats*, Dr. Lewis's Com. P. Tech. p. 438, & ſeq.

But it is to be obſerved, that no art has hitherto been able to imitate the fineneſs and beauty of the vegetable repreſentations, formed by nature, in ſome *agats*; ſuch as are commonly called DENDRITES. And though art ſhould attain to ſuch a perfect imitation of nature in this caſe, as to deceive the eye, yet might the difference be otherwiſe diſcovered.

For if an *agat* be coloured by art, it will loſe a great part of its colour, by heating it; and this colour may again be reſtored, by adding the ſolution of ſilver in ſpirit of nitre. Again, by putting a little aqua fortis, or ſpirit of nitre, on the ſuſpected *agat*, without expoſing it to the ſun, the artificial colours will diſappear in a night's time; and this colour may again be reſtored, by expoſing the ſtone to the ſun for ſome days. Vide Du Fay, in Mem. Acad. Scienc. 1728.

But Monſ. de la Condamine has ſince obſerved, that even natural *agats*, which, by the fineneſs of the lines repreſented upon them, were beyond all ſuſpicion of art, yet ſuffered a great change in their colours, by the application of aqua fortis. Vide Hiſt. Acad. Scienc. 1733. p. 35, 36. Edit. Amſt.

Agats, and other ſtones, may be ſtained black, by applying to them a ſolution of copper in aqua fortis, and making them red-hot in a crucible. To imitate Mocha ſtones, moiſten the ſmooth ſurface of the *agat* with a ſolution of copper, and on the middle of it ſet an iron nail upright on its head; this abſorbs the acid from the copper, and the copper makes ramifications, which, after the ſtone is carefully waſhed, may be rendered of a black colour, by a red heat. Theſe vegetations are not fixed in the ſtone, which ought therefore to be covered with a plate of cryſtal glaſs.

Becearia obſerves, that the electric ſparks will not be conducted by the ſurface of poliſhed *agat*; and Mr. Boſe has ſhewn that the *agat* was very early known to poſſeſs electrical powers.

AGAT, among *Antiquaries*, denotes a ſtone of this kind, engraven by art.

In which ſenſe, *agats* make a ſpecies of *antique gems*; in the workmanſhip whereof, we find eminent proofs of the greateſt ſkill and dexterity of the ancient ſculptors. Several *agats* of exquiſite beauty are preſerved in the cabinets of the curious. The facts, or hiſtories, repreſented in *antique agats*, with how much addreſs ſoever conducted, are become, at this diſtance of time, many of them obſcure and dubious, and their explication difficult enough; whence divers miſtakes have been committed, and numerous conjectures and diſputes raiſed. Hiſt. Acad. R. Inſcr. tom. i.

AGATHA. *See* ACHATES.

AGATHODÆMON, a beneficent GENIUS, or DÆMON. The word is compounded of ἀγαθὸς, *good*, and δαίμων, *dæmon*.

Among ancient writers, *agathodæmon* is a denomination given to a kind of ſerpents, bred up and revered by the Egyptians, from an opinion of ſome ſanctity reſiding in them.

They are alſo called *dracones*, or *draconculi*, and fabuloufly deſcribed as having wings.—They appear to be the ſame with thoſe otherwiſe called SIRENES. Lamprid. in Heliog. cap. xxviii. Caſaub. Not. in Suet. ed. 2. Bochart. Hiero, p. ii. lib. iii. cap. 14.

AGATY, the name of a Malabar tree, bearing a fruit in taſte and ſhape like the kidney-bean. Ray's Hiſt.

AGAVE, a genus of the *hexandria monogynia* claſs, a name given to the common American aloe. The characters are: the flower has no empalement, is funnel-ſhaped, and of one leaf, which is cut at the brim into ſix equal ſegments; the oblong germen is ſituated below the flower, upon which reſts the ſlender ſtyle, which is extended for a conſiderable length beyond the petals, and is crowned by a three-cornered ſtigma; this is attended by ſix erect ſtamina, of the ſame length, crowned by narrow ſummits; after the flower is paſt, the germen becomes an oblong three-cornered ſeed-veſſel, having three cells, which are filled with flat ſeeds. Miller reckons eight and Linnæus four ſpecies of this plant. The common great American aloe generally riſes upwards of twenty feet, and branches on every ſide in the ſhape of a pyramid. When this plant flowers it makes a beautiful appearance; and if it is protected from the cold in autumn, a ſucceſſion of new flowers will be produced for near three months, in favourable ſeaſons. It has been a common error, that this plant doth not flower till it is a hundred years old; the truth is, that its flowering depends on the growth of the plant; ſo that in hot countries it will flower in a few years; but in colder climates, the growth is ſlower, and the flowering leſs frequent.

AGAUPE, in *Botany*, a name uſed by ſome authors for the common white *water* LILY.

AGE, properly denotes the natural duration of the LIFE of man.

The ordinary *age* of mankind has been occaſionally varied, in ſuch manner as to afford a fine inſtance of the wiſdom of Providence. Dr. Woodward holds, that the ages to which men arrive, are proportioned to the number of their lacteals.

AGE is alſo uſed, in *Chronology*, for a CENTURY; or a ſyſtem, or a period of a hundred years.

In which ſenſe, *age* amounts to much the ſame with *ſeculum*, and differs from *generation*.

AGE is alſo underſtood of a certain ſtate or portion of the ordinary life of man; which is divided into four different *ages*; *viz. infancy, youth, manhood*, and *old age*.

Infancy, or childhood, *puerities*, extends as far as the fourteenth year.

Youth, adoleſcence, or the *age* of puberty, commences at fourteen, and ends at about twenty-five.

Manhood, or the virile *age*, terminates at fifty.

Old age, *ſenectus*, ſucceeds, which is the laſt: though ſome divide this into two; calling it *decrepit age* after ſeventy-five. *See* LONGEVITY.

AGE, in *Horſemanſhip*, makes a conſiderable point of knowledge; the horſe being an animal that remarkably ſhews the progreſs of his years, by correſpondent alterations in his body.

We have characteriſtics from his teeth, hoofs, coat, tail, and eyes.

The firſt year he has his foal's teeth, which are only grinders and gatherers: the ſecond, the four foremoſt change, and appear browner and bigger than the reſt: the third, he changes his teeth next to theſe; leaving no apparent foal's teeth, but two on each ſide above, and two below: the fourth year, the teeth next to theſe are changed, and no foal's teeth are left, but one on each ſide above, and below: at five years, his foremoſt teeth are all changed, and the tuſhes on each ſide are complete: thoſe which come in the places of the laſt foal's teeth, being hollow, and having a little black ſpeck in the midſt; which is called the *mark in a horſe's mouth*: this continues till eight years of *age*.—At ſix years, he puts out new tuſhes; near which appears a little circle of young fleſh, at the bottom of the tuſh; the tuſhes, withal, being white, ſmall, ſhort, and ſharp.—At ſeven years, their teeth are all at their growth, and the mark in the mouth appears very plain.—At eight all his teeth are full, ſmooth, and plain, and the mark ſcarce diſcernible; the tuſhes looking yellowiſh.—At nine, the foremoſt teeth ſhew longer, yellower, and fouler, than before; and the tuſhes become bluntiſh.—At ten, no holes are felt on the inſide of the upper tuſhes; which till then are very ſenſible: add, that the temples begin to be crooked and hollow.—At eleven years his teeth are very long, yellow, black, and foul; but he will cut even, and his teeth ſtand directly oppoſite to one another.—At twelve, the upper teeth hang over the nether.—At thirteen, the tuſhes are worn cloſe to his chops, if he has been much ridden; otherwiſe they will be black, foul, and long.

2. As to the hoof.—If it be ſmooth, moiſt, hollow, and well ſounding, it is a ſign of youth: on the contrary, if rugged, and as it were ſeamed, one ſeam over another, and withal dry, foul, and ruſty, it is a mark of old *age*.

3. For the tail.—Taking him by the ſtern thereof, cloſe at the ſetting on to the buttock, and griping it between the finger and thumb; if a joint be felt to ſtick out more than the reſt, the bigneſs of a nut, the horſe is under ten: but if the joints be all plain, he may be fifteen.

4. The eyes being round, full, and ſtaring, the pits that are over them filled, ſmooth, and even with his temples, and no wrinkles to be ſeen, either under or above, are marks of youth.

5. The ſkin being plucked up in any part betwixt the finger and thumb, and let go again; if it return ſuddenly to

its place, and remain without wrinkles, he may be believed to be young.

6. A dark-coloured horſe, growing griſly above the eye-brows, or under the main; or a whitiſh horſe, growing meanelled, either with white or black, all over; may be infallibly concluded extremely aged.

Laſtly, a horſe being young, the BARS of his mouth are ſoft and ſhallow; otherwiſe they are deep, and feel hard and rough.

AGE, in HUNTING, is an article of conſequence.—Deer, and other beaſts of game, have different denominations, according to their *age*.

The *age* of a hart, &c. is chiefly judged of by the furniture of his head.

The firſt HEAD, called, in fallow deer, *broches*, and, in red deer, *prickets*, does not come till the ſecond year of their *age*: the next year, they bear four or ſix ſmall branches; the fourth year, eight or ten; the fifth, ten or twelve; the ſixth, fourteen or ſixteen; the ſeventh year they bear their heads beamed, branched, and ſumed, as much as ever they will be. The huntſmen have ſeveral other marks, whereby to know an old hart without ſeeing him; as, the ſlot, entries, abatures, foils, fewmets, gate, and fraying poſts.

AGE *of neat cattle*, viz. the *ox*, *cow*, and *bull*, is known by their teeth and horns. At the end of ten months they ſhed their firſt fore-teeth, which are replaced by others, larger, but not ſo white; and in three years all the inciſive teeth are renewed. Theſe teeth are at firſt equal, long, and pretty white; but as the animals advance in years, they wear, become unequal and black. They alſo ſhed their horns at the end of three years; and theſe alſo are replaced by other horns, which, like the ſecond teeth, continue. The growth of theſe horns is not uniform; at firſt, or in the fourth year of the animal's age, two ſmall pointed horns make their appearance, neatly formed, ſmooth, and toward the head terminated by a kind of button. In the following year this button moves from the head, being impelled by a horny cylinder, which lengthening in the ſame manner, is alſo terminated by another button, and ſo on; for theſe horns continue growing as long as the animal lives. Theſe buttons become annular joints, which are eaſily diſtinguiſhed in the horn, and by means of which the age of the animal may be eaſily known; counting three years for the point of the horn, and one for each of the joints. Buffon.

AGE *of ſheep*. Theſe animals in their ſecond year have two broad teeth; in their third year they have four broad teeth before; in their fourth year ſix broad teeth; and in their fifth year eight of the ſame kind; after which their age cannot certainly be known, in this way.—But the age of the ram, and horned ſheep, may be always known by their horns, which ſhew themſelves in the firſt year, and often at the birth, and continue to grow a ring annually to the laſt period of their lives. Ellis and Buffon.

AGE *of goats* is known by the ſame tokens as that of the ſheep.

AGE *of the moon*, in *Aſtronomy*, is underſtood of the number of days elapſed ſince the laſt conjunction, or new moon; called alſo her QUARTER. The method for diſcovering her age, is mentioned under the article MOON.

AGE, in *Chronology* and *Antiquity*, is alſo uſed in ſpeaking of the time paſſed ſince the creation of the world.

The ſeveral ages of the world may be reduced to three grand epochas, viz. the *age* of the law of nature, called by the Jews the *void age*, from Adam to Moſes.—The *age* of the Jewiſh law, from Moſes to Chriſt.—And the *age* of grace, from Chriſt to the preſent year. See INCARNATION and EPOCHA.

The Romans diſtinguiſhed the time that preceded them into three *ages*: the *obſcure* or *uncertain age*, which reached down as low as Ogyges king of Attica; in whoſe reign the deluge happened in Greece.—The *fabulous*, or *heroic age*, which ended at the firſt Olympiad; and the *hiſtorical age*, which commenced at the building of Rome.

Among the poets, the four *ages* of the world are, the *golden*, the *ſilver*, the *brazen*, and the *iron age*. See the Metamorphoſis of Ovid, lib. i. or rather Heſiod, in his poem, Ἔργα καὶ ἡμέραι, *Opera & Dies*, ver. 108, &c. He is the firſt that has deſcribed theſe four *ages*.

The Eaſt Indians alſo reckon four *ages* ſince the beginning.—The firſt, which they repreſent as a ſort of golden *age*, laſted, according to them, 1728000 years: in this the god Brahma was born, and the men were all giants; their manners were innocent: they were exempt from diſeaſes, and lived 400 years.—In the ſecond *age*, which laſted 1296000, their rajas were born: vice now crept into the world; men's lives were fallen to 300 years, and their ſize retrenched proportionally.—Under the third *age*, which laſted 864000 years, vice being more increaſed, men only attained to 200 years.—The laſt *age* is that wherein we now live, of which 4027213 years are already gone; and the life of man ſunk to one fourth of its original duration.

By the Roman law we find different *ages* aſcertained for different purpoſes: as,

AGE, *conſular*, or that wherein a perſon might regularly hold the conſulſhip, was the forty-third year, ſo that he might ſue for it in the forty-ſecond. Where it is to be obſerved, that it was not neceſſary either of thoſe years ſhould be expired, but only begun; beſides, that men of extraordinary merits towards the republic, were in this matter exempt from the ordinary laws. Hence Corvinus was conſul at twenty-three years, Scipio Æmilianus at thirty-ſix, and Pompey at thirty-five: others broke through the laws by violence, as C. Marius the younger, and Octavius Cæſar, who procured themſelves to be made CONSULS, before twenty years of *age*. Macchiav. Diſc. in Liv. lib. i. cap. 60. p. 210.

AGE, *judiciary*, or that wherein a perſon was capable of ſitting as judge, was not always the ſame: for by the *Lex Servilia Glaucia*, none were allowed to be choſen under thirty years of *age*, or above ſixty. By ſome other laws that *age* ſeems to have been limited to thirty-five, but reduced afterwards by Auguſtus to thirty; though Pitiſcus ſuppoſes a miſtake here in the text; and that, inſtead of thirty-five and thirty, it ought to be read twenty-five and twenty. Lex. Ant. tom. i.

AGE, *military*, or that wherein the Romans were obliged to enter themſelves in the army, was at ſeventeen years; at forty-five, they might demand their diſmiſſion. Aquin. Lex. Milit. tom. i.

Among the Lombards, the *age* of entry was between eighteen and nineteen; among the Saxons thirteen.

AGE *for holding offices in the city*, as quæſtor, ædile, tribune of the people, &c. is not determined by the annal-laws of Villius, but appears to have been the twenty-ſeventh year. For it was neceſſary that the perſon who claimed any urban employment, had firſt ſerved ten years without interruption in the army, commencing from the ſeventeenth year. Though ſome think the queſtorſhip might have been held at twenty-five years. Polyb. lib. vi. cap. 17.

AGE, *prætorian*, or that wherein a perſon might ſolicit for the prætorſhip, was at forty; two years earlier than the *age* required for conſul.

AGE, *legitimate*, denotes the age of twenty-five, ſo called, as ſome imagine, becauſe youth were then by law allowed to take the direction of their affairs into their own hands. Briſſ. Select. Aut. ex Jur. Civ. lib. iii. c. 2.

AGE, *diſpenſation of*, *ætatis venia*, is a right which a perſon obtained from the prince, or ſovereign, of ſetting aſide a tutor or curator, and taking the adminiſtration of his affairs into his own hands, before the legitimate *age*. Calv. Lex. Jur.

AGE, *adoptive*, called alſo *plena pubertas*, requires the adoptor to be eighteen years older than the perſon adopted, that there may appear a probability of his being a natural child. Pitiſc. Lex Ant. See ADOPTION.

We likewiſe read of other *ages*; as,

AGE, *rocky* or *ſtony*, in ſome ancient northern monuments, correſponds to the *brazen age* of Heſiod, and the Greeks; being called *rocky*, on account of Noah's Ark, which reſted on mount Ararat.

AGE, *aſhen*, the fourth *age* of the northern poets; ſo called from a Gothic king, Madenis, or Manus, who, on account of his great ſtrength, was ſaid to be made of aſh; or becauſe in his time people began to make uſe of weapons made of that wood. Phil. Tranſ. N° 301.

AGE, *hiſtorical*, that which commenced from the firſt Olympiad, in the year of the world 3228, and ſtill continues. This diviſion, it is to be obſerved, only holds good with regard to the Greeks and Romans, who had no hiſtories earlier than the firſt Olympiad. The Jews, Egyptians, Phœnicians, Chaldees; not to ſay the Indians and Chineſe, who pretend to much earlier monuments, will not be concluded by it. Bibl. Un. tom. i. p. 246.

AGE, *preſent*, among Jewiſh *Writers*, frequently denotes all the ſpace of time before the Meſſiah, in contradiſtinction from *future age*, or *age to come*, the time after the coming of the Meſſiah.

AGE, *middle*, denotes the ſpace of time commencing from Conſtantine, and ending at the taking of Conſtantinople by the Turks, in the fifteenth century.

A late author chooſes rather to date the middle *age* from the diviſion of the empire made by Theodoſius, at the cloſe of the fourth century, and extend it to the time of the emperor Maximilian I. at the beginning of the fifteenth century, when the empire was firſt divided into circles. But this ſeems more accommodated to the ſtate of Germany in particular, than of Europe in general.

The middle is by ſome denominated the barbarous *age*, and the latter part of it, the loweſt *age*. Some divide it into

AGE, *non-academical*, the ſpace or time from the ſixth to the

the ninth century, during which ſchools or academies were loſt in Europe.

AGE, *academical*, from the ninth century, when ſchools were reſtored, and univerſities eſtabliſhed, chiefly by the care of Charlemagne.

AGE, *military*, or *millenary*, *ſeculum militiarum*, or *millenarium*, on *Medals*, denotes the laſt year of a *millennium*, or thouſandth year.

Several medals of the emperor Philip, ſtruck in the thouſandth year from the building of Rome, have this legend.

AGE, *aureus*, on ancient *medals*, denotes the beginning or firſt year of a new *ſeculum*, or century of years.

AGE is alſo uſed among ancient poets for the ſpace of thirty years.

In which ſenſe, *age* amounts to much the ſame with generation. Neſtor is ſaid to have lived three *ages*, at the time when he was ninety.

AGE is differently conſidered by naturaliſts from what it is by lawyers; and even in each of thoſe profeſſions we find various ſyſtems and diviſions of *age*.

AGE *of medals*. See MEDAL.

AGE, in *Law*, is particularly underſtood of a certain ſtate or time in life, wherein a perſon is qualified for certain offices of civil ſociety, which before, for want of years and diſcretion, he was incapable of.

By the common law, there are two principal *ages* in a man: at fourteen, he is at the *age of diſcretion*; at twenty-one years, at *full age*.

With reſpect to a woman, there were anciently ſix *ages* obſerved: at ſeven years, her father might diſtrain the tenants of his manor for aid to marry her: for at thoſe years ſhe may conſent to matrimony.—At nine years old ſhe is dowable; for then, or within half a year after, ſhe is ſaid to be able *promereri dotem, & virum ſuſtinere*.—At twelve years ſhe is able finally to ratify, and confirm her former conſent to matrimony.—At fourteen, ſhe may take her lands into her own hands; and ſhould be out of ward, if ſhe were at this *age* at her anceſtor's death.—At ſixteen, ſhe ſhould be out of ward, though at the death of her anceſtor ſhe was under fourteen: the reaſon is, that then ſhe might take a huſband able to perform knight's ſervice.—At twenty-one years, ſhe may alienate lands and tenements.

As for a man: the *age* of twelve years binds to appearance before the ſheriff and coroner, for enquiry after robberies; 52 Hen. III. 14. at the *age* of fourteen he may chuſe his own guardian, and claim his lands held in ſocage. Though Bracton limits this to fifteen years; with whom Glanville agrees.—At fourteen a man may conſent to marriage, as a woman at twelve.—At that *age*, likewiſe, he may diſpoſe of perſonal eſtate by will, though not of lands until twenty-one: at fourteen alſo perſons may be witneſſes, though in ſome caſes they have been admitted much younger. 2 Hawk. 434. Perſons under fourteen are not in general puniſhable for crimes; but they muſt anſwer for any treſpaſs. 1 Inſt. 247.—At fifteen he ought to be ſworn to the peace, an. 24 Edw. I. ſtat. 3.—At ſeventeen he may be an executor.—At the *age* of twenty-one, a man was obliged to be a knight, if he had twenty pounds land per annum in fee, or for term of life, anno 1 Edw. II. ſtat. 1. But this ſtatute is repealed, 10 Car. I. cap. 20.—The ſame *age* alſo enables him to make contracts and manage his own eſtate; which, till that time, he cannot do with ſecurity of thoſe who deal with him.

The *age* of twenty-four years enabled a man to enter into an order of religion, without conſent of parents, anno 4 Hen. IV. cap. 17. At thirty, he may be a biſhop. Though the *age* of twenty-one is the full *age* of either man or woman, yet they may under that *age* contract for neceſſaries ſuitable to their quality, and it ſhall bind them. If either man or woman do any act before the time preſcribed by law, they may retract it when they come to the proper *age*; but if they do not, they are ſuppoſed to ratify it, and it ſhall be deemed valid. Thus if a man marry before fourteen, or a woman before twelve, they may either agree or diſagree to the marriage, when they attain thoſe reſpective *ages*. But the *age* of marriage has undergone divers modifications: in princes it is allowed earlier than in private perſons; in ſome countries, than in others. In Perſia girls are married at nine, boys only at thirteen; in Holland, males are not allowed to marry without conſent of parents or curators, before twenty-five; girls not before twenty; the Romans choſe to mary their wives young, for the advantage of having them innocent and tractable. Others declaim againſt premature marriages. Some have pretended to limit the other extreme of marriageable *age* to forty-five; but this too will be variable in different conſtitutions. We meet with inſtances of generation from ſixty to one hundred and four, or even one hundred and twenty-one years of *age*. Plott, Nat. Hiſt. Staff. chap. viii. § 3.

Various methods have been in uſe for determining this *age*. One ſect of ancient Roman lawyers, called Caſſiani, fixed it by the ſtate of the body, which Juſtinian, and others after him, ſuppoſe to have been done by ſearch, or inſpection of the genital parts, at leaſt in the male ſex; for as to the female, it is pretended the twelfth year was the only guide, though others alledge that the eruption of the menſes ſerved inſtead of it. The Proculiani, on the contrary, determined the puberty of males, by the expiration of the fourteenth year. Jaſolenus took a middle courſe, and made uſe of both methods.

The *Canon* or *Eccleſiaſtical Law* alſo notes divers *ages*, viz. of baptiſm; of ordination to prieſthood, which is not to be before twenty-four; and to epiſcopacy.

AGE is alſo uſed for the duration of vegetable matters. In which ſenſe, we ſay the *age* of roots, of leaves, of corn, of wine, &c.

Trees after a certain *age* waſte. An oak at a hundred years old ceaſes to grow. The uſual rule for judging of the *age* of wood, is by the number of circles which appear in the ſubſtance of a trunk, or ſtock, cut perpendicularly, each circle being ſuppoſed the growth of a year: though ſome reject this method as precarious, alledging, that a ſimple circle is ſometimes the produce of ſeveral years; beſides that, after a certain *age*, no new circles are formed. Phil. Tranſ. N° 43. Act. Erud. Lipſ. 1713.

AGE is alſo uſed for the duration of things inanimate, and even factitious.

In which ſenſe we ſay, the *age* of a houſe, of a country, a ſtate, a commonwealth, or the like.

AGE *prier, attatem precari*, a petition, or motion made in court, by one in his minority, having an action brought againſt him for lands coming to him by deſcent; requeſting that the action may reſt till he come to full *age*.—This the court, in moſt caſes, ought to grant.—But minors, as purchaſers, ſhall not have it: nor intent of aſſize, dower, or partition; though they may in debt. Hob. 342. D. Alv. 259.

It is otherwiſe in the *Civil Law*; which obliges children in their minority to anſwer to their TUTORS or CURATORS. See PAROL *Demurrer*.

AGED *of the mountain*, is a title or denomination given to the chief or prince of the people called ASSASSINS.

AGEM, in *Botany*, is a name given to the Perſian LILAC.

AGEMA, in the *Ancient Military Art*, a kind of ſoldiery, chiefly in the Macedonian armies.

The word is Greek, and literally denotes vehemence; to expreſs the ſtrength and eagerneſs of this corps.

Some will rather have *agema* to have denoted a certain number of picked men, anſwering to a legion among the Romans, which is authorized by a paſſage in Livy; Arrian, on the contrary, ſpeaks of the *agema*, as a wing of horſe; not but the term is alſo applied to foot.

AGEMOGLANS, or AZAMOGLANS, children of tribute raiſed every third year by the Grand Signior, among the Chriſtians whom he tolerates in his dominions.

The word, in its original, ſignifies a barbarian's child; that is, a child not a Turk.—It is compounded of two Arabic words, 1. ⊐⊐N. *agem*, which among the Turks ſignifies as much as *barbarous* among the Greeks; the former people dividing the world into Arabs or Turks, and *agem*; as the latter into Grecians and *barbarians*. 2. ⊐⊐⊐, *child*.

The commiſſioners appointed for this levy take them by force even out of the houſes of Chriſtians; always claiming one in three, and pitching upon ſuch as ſeem the handſomeſt, and promiſe to be the moſt ſerviceable.

Theſe are immediately conveyed to Gallipoli or Conſtantinople; where they are firſt circumciſed, then inſtructed in the Mahometan faith, taught the Turkiſh language, and the exerciſes of war, till ſuch time as they become of age to bear arms: and out of theſe the order of JANIZARIES is formed.

Such as are not judged proper for the army, they employ in the loweſt and moſt ſervile offices of the ſeraglio; as in the kitchen, ſtables, &c.

The *agemoglans*, only differ from the *ichoglans*, as the former are bred up for the lower, and the latter reſerved for the higher offices of the empire.

AGENDA, in a general ſenſe, denotes things to be done or performed, in conſequence of a man's duty.

The word is Latin, formed from *agere, to do*; and divines ſpeak of the *agenda* of a Chriſtian, meaning the things to be practiſed, by way of contradiſtinction from *credenda*, or the things to be believed; the former imports the articles of obedience, the latter of faith.

AGENDA is alſo uſed for a book containing notes, or memorandums of things neceſſary to be done.

In which ſenſe, *agenda* amounts to much the ſame with table-book, &c. An anonymous French author has publiſhed the *agenda* of a man of the world, containing

maxims or rules, proper for the conduct of life. Tablettes de l'Homme de Cofmop. 1715.

AGENDA is more particularly uſed, among *Eccleſiaſtical Writers*, for the ſervice, or office of the church. We meet with *agenda matutina & veſpertina*, *morning and evening prayers*: *agenda diei*, *the office of the day*, whether feaſt or faſt day; *agenda mortuorum*, called alſo ſimply *agenda*, *the ſervice for the dead*.

AGENDA is alſo applied to certain church-books, compiled by public authority, preſcribing the order and manner to be obſerved by the miniſters and people, in the principal ceremonies and devotions of the church.

In which ſenſe, *agenda* amounts to the ſame with what is otherwiſe called *ritual*, *liturgy*, *aceluthia*, *miſſal*, *formulary*, *directory*, &c.

AGENFRIDA, in *Ancient Cuſtoms*, denotes own lord, or one who has the abſolute property, and dominion of a thing.

The word is alſo written *agenfriga*, and *agenfrit*. It is derived from the Saxon *agen*, *own*, and *frea*, *lord*.

AGENHINE, in our *Old Writers*, ſignifies a gueſt that has lodged at an inn for three nights, after which time he is accounted one of the family; and if he offended the king's peace, his hoſt was anſwerable for him. It is alſo written HUGENINE and HOGENHINE.

AGENT, AGENS, in *Phyſics*, that whereby a thing is done, or effected; or that which has a power whereby it acts on another; or by its action induces ſome change in it. The word *agent* is uſed promiſcuouſly with EFFICIENT; and in contradiſtinction to PATIENT.

The ſchoolmen divide *agents* into *natural* and *free*.

AGENTS, *natural* or *phyſical*, are thoſe immediately determined by the Author of nature, to produce one ſort of effect: with an inability to produce the contrary.

AGENTS, *natural*, again, are ſubdivided into *animated*, which are ſuch as produce effects of the ſame kind and denomination with the *agents* themſelves; and *equivocal*, whoſe effects are of a different kind, &c. from the *agents*.

The ſchoolmen aſcribe the following circumſtances neceſſary to the being of an *agent*; viz. that it be contiguous to the object, diſtinct from it, have a power over it, a ſphere of activity, and a proportion, or rate of acting.

AGENT, *free*, or *voluntary*, is that which may equally do any thing, or its oppoſite; as acting not from any predetermination, but from choice.—Such is the mind ſuppoſed to be; which has a ſpontaneous power of chooſing or refuſing.

It is a celebrated queſtion among *philoſophers* and *divines*, whether man be a free, or a neceſſary *agent*? It may be thus ſtated; man is a neceſſary *agent*, if all his actions are ſo determined by the cauſe preceding each action, that no one poſſible action could poſſibly not have come to paſs, or have been otherwiſe than it was; nor one future action can poſſibly not come to paſs, or be otherwiſe than it ſhall be. On the contrary, man is a free *agent*, if he be able at any time, in certain circumſtances, to do different things; or, in other words, if he is not ever unavoidably determined in every point of time, by the circumſtances he is in, to do that one thing he does, and not poſſibly to do any other.

Which of theſe two definitions agrees to man, is a queſtion of fact to be determined by what we experience in ourſelves, with regard to the operations of our own minds. See LIBERTY, NECESSITY, and WILL.

The term *agent* evidently implies a power of ſelf-determination; and the epithet *neceſſary*, applied to *agent*, forms a ſolecism both in ſenſe and language. Price's Review, &c. p. 315. &c.

AGENT is more particularly uſed for the miniſter of a prince, or ſtate, at another court.

In which ſenſe, *agents* are commonly reputed a ſpecies of public miniſters, or AMBASSADORS; but they differ eſſentially, as *agents* are not inveſted with any repreſentative character, although intruſted with the affairs and intereſts of their princes. See ENVOY.

AGENT is alſo uſed for a perſon entruſted with the management of affairs, either of a corporation, or a private perſon.—In which ſenſe, the word coincides with *deputy*, *procurator*, *ſyndic*, *factor*, &c.

Among the officers in the EXCHEQUER, there are four *agents* for taxes.

AGENTS *of bank and exchange* are public officers, eſtabliſhed in the trading cities of France, to negociate matters between merchants, relating to bills of exchange, and the buying and ſelling of goods. The ſame with thoſe who, among us, are called EXCHANGE-BROKERS.

AGENTS *of the victualling office*, are officers under the commiſſioners, appointed to buy, and contract for proviſions, &c. Some of theſe are ſettled in the ports, where they have much the ſame office and authority as the commiſſioners at London.

AGENT-*victualler* is uſed in the ſame ſenſe.

AGENT is more particularly uſed in *Medicine*, for a being which has motion within itſelf.

In which ſenſe it ſtands oppoſed to patient, which receives motion from another; thus medicines are conſidered as *agents*, or as acting on the body, by way of contradiſtinction from aliments, which are ſuppoſed rather to be acted on, than to act.

AGENT *and patient*, in *Common Law*, is where a perſon does, or gives, ſomething to himſelf; ſo that he is at the ſame time both the doer or giver, and the receiver or party it is done to.—Such is a woman, when ſhe endows herſelf part of her huſband's inheritance.

AGENT, in *Chemiſtry*, is ſometimes attributed to menſtrua, or ſuch bodies as in mixture have the greateſt ſhare of activity and motion.

That internal *agent* in man, whereby all the vital motions neceſſary to the preſervation and reſtoration of the body are managed, is by ſome called *nature*; by others *archæus*, *calidum innatum*, animal ſoul, vital ſpirit; or principle, &c.

AGENT is ſometimes alſo uſed in *Chemiſtry*, for what we more uſually call *inſtrument*.

In which ſenſe, fire, water, air, earth, and menſtrua, are chemical *agents*.

AGENTES *in rebus*, one of the ranks of officers, in the court of the Conſtantinopolitan emperors, whoſe buſineſs was to collect and convey the corn both for the army and houſhold; carry letters and meſſages from court to all parts of the empire; reguiate couriers, and their vehicles; to make frequent journeys and expeditions through the provinces; inſpect any motions, diſturbances, machinations tending that way, and give early notice thereof to the emperor. Aquin. Lex. Mil. tom. i. Piaſc. Lex. Ant. tom. i. Calv. Lex. Jur.

The *agentes in rebus*, are by ſome made ſynonymous with our poſt-maſters, but their function was of great extent. They correſpond to what the Greeks call *ἀγγαροι*, and the Latins, *veredarii*.

There were divers orders or degrees of *agentes in rebus*, as, *tribuni*, *primiceriæ*, *ſenatores*, *ducenarii*, *biarchæ*, *circitores*, *equites*, *ternes*, &c. through all which they roſe *gradatim*. Their chief was denominated *princeps*, which was a poſt of great dignity, being reckoned on a level with that of proconſul.

The *princeps agentium in rebus*, reſided at Conſtantinople: others of them were ſettled in every part of the empire. They are alſo ſaid to have ſerved as interpreters.

AGEOMETRIA, a defect in point of GEOMETRY, or a deviation from the ſtrict principles and concluſions of that ſcience.

This is otherwiſe called *ageometreſia*.

Some have complained of the *ageometria* of the Scriptures in reſpect of the proportions of the *brazen* SEA, ARK, &c.

AGER *veſtigalis perpetui*, in *Roman Antiquity*, that whoſe property was granted to private perſons on the reſerve of a certain rent, or tribute.

AGER *veſtigalis publicus*, that whoſe property was reſerved to the public, and being let out to farm, the rents or profits accrued to the public treaſury.

AGER is alſo uſed for a certain portion or meaſure of land, anciently allowed in the diviſion of grounds to each citizen.

In the early days of the Roman ſtate, the *ager* was only two *jugera*, amounting to $1\frac{1}{4}$ Engliſh acre. After the expulſion of the kings, ſeven *jugera* were allowed a plebeian.—Under the conſulate of C. Licinius Stolo, in the year of Rome 376, a law was made to limit eſtates to 500 *jugera*, or 330 Engliſh acres. Under Julius Cæſar another AGRARIAN law was publiſhed, by which thoſe who enlarged their pittance of land, were to pay 50 *aurei* to the public.

AGER is alſo uſed, in *Middle Age Writers*, for what we now call an ACRE.

AGER *mineralium*, among *Chemiſts*, denotes the element of WATER; conſidered as the field, or ſoil, wherein MINERAL bodies have their firſt root, and from whence they ſhoot their branches upon the earth.

AGER *naturæ*, ſignifies the womb.

AGERATUM, in *Botany*, the name of a genus of plants, of the *ſyngeneſia polygamia æqualis* claſs; the characters of which are theſe: the flower is monopetalous, of the perſonated kind, and tubular in its lower part, and in the upper divided into two lips, the upper of which is bifid, and the lower divided into three ſegments; the piſtil ariſes from the cup, and finally becomes an oblong membranaceous fruit, divided into two cells, which contain a number of very fine ſeeds affixed to a placenta. There are three ſpecies.

AGERATUM, in the *Materia Medica*, an officinal plant, popularly called *maudlin*.

The word is compounded of the privative *a*, and *γηρας*, *old age*, on account of its flowers, which do not eaſily wither or grow old.

Ageratum

Ageratum bears a near resemblance to the costmary, from which it only differs, in that its flowers are formed into loose umbels; there are divers species of it. The officinal is called *ageratum foliis serratis*, C. B. or *ageratum luteum*, the ACHILLEA *ageratum* of Linnæus, and is the same with the *eupatorium mesues*, so called on account of its virtue, in diseases and obstructions of the liver.

Ageratum is of an astringent quality, and as such recommended by Riverius, and others, against incontinence of urine: Gesner has also discovered a bulk purgative power in its roots. But it is rarely prescribed in the present practice.

AGERATUS *lapis*, in the *Materia Medica of the Ancients*, the name of a stone mentioned by Galen and other writers; and said to be of the nature of the Phrygian stone, but more astringent: and as that was used in dying, this was in dressing of leather. We have no account of its external appearance, but probably it contained vitriol, and perhaps alum.

The great use of vitriol or copperas in the management of leather, is well known; and the stones which contain it, or pyrites, are every where common. The method used also in the preparation of the *Phrygian lapis*, which was the wetting and slightly calcining it, must be very proper to make the vitriol contained in this appear and exert itself in the working with it. This stone is used by shoemakers to polish women's shoes.

AGERIUM. See AGITAMENT.

AGES, signifies the palm, or hollow of the hand.

AGGADA, in *Jewish Antiquity*, an ingenious tale, or story, of which kind there are many in the Talmud.

There are several books extant among the Jews under this title. R. San Israel Ben Juda has published *Novellæ Aggadarum*, or new explanations of the stories and relations in the TALMUD, discovering the hidden meanings thereof.

AGGER, in *Ancient Latin Writers*, denotes the middle part of a military road, raised into a ridge, with a gentle slope on either side, to make a drain for the water, and keep the way dry.

AGGER is also used for the whole road, or military way.

Where high-ways were to be made in low grounds, as between two hills, the Romans used to raise them above the adjacent land, so as to make them of a level with the hills. These banks they called *aggeres*. Bergier mentions several in the *Gallia Belgica*, which were thus raised, ten, fifteen, or twenty feet above ground, and five or six leagues long.

They are sometimes also called *aggeres calcati*, and now generally known by the name *chaussées*, or CAUSEWAYS.

AGGER also denotes a work of fortification, used both for the defence and the attack of towns, camps, &c.

In which sense *agger* is the same with what was otherwise called *vallum*, and in later times *aggestum*, and among the modern, *lines*; sometimes *ravaliers*, *terrasses*, &c.

The *agger* was usually a bank, or elevation of earth, or other matter, bound and supported with timbers; having sometimes turrets on the top, wherein the workmen, engineers, and soldiery, were placed. It was also accompanied with a ditch, which served as its chief defence.

The usual materials, of which it was made, were earth, boughs, fascines, stakes, and even trunks of trees, ropes, &c, variously crossed, and interwoven somewhat in the figure of stars; whence they were called *stellati ages*. Where these were wanting, stones, bricks, tiles, supplied the office: on some occasions, arms, utensils, pack-saddles, were thrown in to fill up. What is more, we read of *aggers* formed of the carcasses of the slain; sometimes of dead bones mixed with lime; and even with the heads of slaughtered citizens. For want of due binding, or solid materials, *aggers* have sometimes tumbled down, with infinite mischief to the men.

The besiegers used to carry on a work of this kind nearer and nearer towards the place, till, at length, they even reached the wall. The methods taken, on the other side to defeat them, were by fire, especially if the *agger* were of wood; by sapping and undermining, if of earth; and in some cases by erecting a counter *agger*.

The height of the *agger* was frequently equal to that of the wall of the place. Cæsar tells us of one he made, which was thirty feet high, and three hundred and thirty feet broad. Besides the use of *aggers* before towns, the generals used to fortify their camps with such works; for want of this precaution divers armies have been surprised and ruined.

There are vast *aggers* made in towns, and places on the sea-side, fortified with towers, castles, &c. Those made by Cæsar and Pompey at Brundusium, are famous. Sometimes *aggers* were even built across arms of the sea, lakes, and morasses; as was done by Alexander before Tyre, and by M. Antony and Cassius.

The wall of Severus, in the north of England, may be considered as a grand *agger*, to which belong several lesser ones. Besides the principal *agger*, or *vallum*, on the brink of the ditch, Mr Horsley describes another *agger* on the south side of the former, about five paces distant from it, which he calls the south *agger*; and another larger *agger* on the north side of the ditch, called the north *agger*. This latter he conjectures to have served as a military way; the former, probably, was made for an inner defence, in case the enemy should beat them from any part of the principal *vallum*, or to protect the soldiers against any sudden attack from the provincial Britons.

AGGER *Tarquinii*, *Tarquin's agger*, was a famous fence built by Tarquinius Superbus, on the east side of Rome, to stop the incursions of the Latins, and other enemies, whereby the city might be infested.

AGGER is also used for the earth dug out of a trench, and thrown upon the bank of it.

In which sense, the chevalier Folard thinks the word to be understood, when used in the plural number, since we can hardly suppose they would raise a number of cavaliers, or terraces.

AGGER is also used for a bank, or wall, erected against the sea or some great river, to confine or keep it within bounds.

In which sense, *agger* amounts to the same with what the ancients called *tumulus* and *moles*; the Dutch, *dyke*; we, *dam*, *sea-wall*.

AGGER also denotes a heap of earth, raised over the graves of the ancients.

In which sense, it amounts to the same with *tumulus*; and is sometimes also called *aggestum*.

AGGLESTONE, otherwise called *stone-Borrow*, and vulgarly the *Devil's Night Cap*, is a remarkable monument of antiquity situated in the N. E. extremity of the isle of Purbeck. Its dimensions are 60 feet in circumference at the bottom, in the middle 80, and at or near the top 90; and it is computed to contain 407 tons of stone. The name seems to have been derived from the Saxon *hag*, or *hæg*, *hay*, and, *stan*, *stone*, which expresses its ancient use; as it was probably a rock-idol in the British age.

AGGLUTINANTS, AGGLUTINANTIA, in *Medicine*, a species of strengthening medicine, whose office and effect are to adhere to the solid parts of the body, and thus recruit, and supply the place of what is worn off, and wasted, in the animal actions.

Agglutinants are most of them of the glutinous kind, or such as easily form themselves into jellies, and gummy consistencies; whence the name *agglutinant*, which is formed of *ad*, *to*, and *gluten*, *glue*.

For the operation and use of *agglutinants*, see STRENGTHENERS.

The principal simples which come under this class, found in the shops, are isinglass, olibanum, gum Arabic, dragon's blood, cassia, sago, vermicelli, pulse, comfrey, plantain, &c.

AGGLUTINATIO *Pilorum*, a healing or reducing the hairs of the eye-lids, that grow inwards, to their natural order and situation. This may be done by mastic applied with a probe, which bends the hairs back into their proper order. Bitumen, the slime of a snail taken off with a needle, the juice of hawks weed, the liquor of agglutinants, or ammoniac, produce the same effect.

AGGLUTINATION, literally, denotes the act of joining or cementing two bodies together, by means of a proper *gluten*, or GLUE. See CEMENT.

In *Medicine*, the term is peculiarly used for the apposition or adherence of a new substance; or the giving a greater consistence to the animal fluids; to fit them the more for nourishment.

Some assign a difference between *agglutination* and *assimilation*; in that species of leprosy called *lepra*, there is an adhesion, or *agglutination* of the nutriment, but no *assimilation*. In the anasarcous dropsy, on the contrary, there is an *apposition*, without any *agglutination*: i. e. there is an afflux of new matter, or nourishment, but this is so thin and watery, that it wants the due stiffness and tenacity to make it bind.

Some will have *agglutination* to be effected by a *ferment*: others assert, that by reason of the glutinous quality of the chyle, a mere contact suffices to make it adhere to the parts.

AGGLUTINATION is used by some astronomers to denote the meeting of two or more stars in the same part of the ZODIAC.

AGGLUTINATION is more peculiarly understood of the seeming coalition of several stars, so as to form a NEBULOUS star.

AGGRAVATION, the act of augmenting a CRIME, or the PUNISHMENT thereof.

The word is compounded of *ad*, *to*; and *gravis*, *heavy*. *Aggravation*, in the Romish *Canon Law*, is particularly used

used for an *ecclesiastical* censure, threatening an EXCOMMUNICATION, after three admonitions used in vain.
From *aggravation* they proceed to *re-aggravation*; which is the last EXCOMMUNICATION.

AGGREGATÆ *glandulæ*; the small glands in the cellular, which is next to the villous coat of the intestines, are so called. But as these glands are not visible in an uninjected gut, many anatomists suspect them to be only little bits of separated wax.

AGGREGATE, the sum, or result of several things *aggregated* or added together.
The word is formed of *ad, to*; and *grex, gregis, a flock*. Natural bodies are *aggregates*, or assemblages of particles, or corpuscles, bound together by the principle of attraction. Bodies politic are likewise said to be *aggregate*; such as mayor and commonalty, dean and chapter, &c. in contradistinction to corporations *sole*; such as the king, a bishop, &c.

AGGREGATE, in general, signifies a body resulting from the union of others which are smaller, the whole sum of which combined is called the *aggregate*. It is particularly used by some modern *chemists* and *naturalists*, for a numerous collection of atoms, or minutest corpuscles, whether homogeneous or heterogeneous, joined together by contiguity, without regard to the quality of such atoms. In which sense, *aggregate* differs from MIXT, as the former supposes no particular situation or position, of the corpuscles, other than what arises from their proportion, and the relation they bear to the ambient bodies, among which the coalition is formed.
Aggregate also differs from *mixt*, as the latter is formed immediately out of the principles of matter, so firmly united, as that it is very difficult, if not impossible, to separate them. *Aggregate* again differs from *compound*, as the latter is formed out of *mixts*, and is easily dissolvable.
Aggregates, then, are the ultimate compounds, or the last effects of composition; they resolve into compounds as their next ingredients, these into mixts, and mixts into simples, or principles; though in strictness, *aggregates* may resolve also into mixts, and mixts into simples, inasmuch as they consist of heterogeneous parts.
This doctrine and distinction of *aggregates*, *mixts*, and *compounds*, is the foundation of the *chemical theory* of Becher and Stahl; the last of whom has traced it with great exactness. Hence has arisen a new doctrine of earths, metals, &c. which has since been illustrated and extended by the best modern chemists.

AGGREGATE, in *Botany*, is a term used to express those flowers, which are composed of parts or florets, so united by means either of the receptacle or calyx, that no one of them can be taken away without destroying the form of the whole. They are opposed to simple flowers, which have no such common part, and are usually divided into seven kinds, viz. the *aggregate*, properly so called, whose receptacle is dilated, and whose florets are supported by foot-stalks; such are the blue daisy, thrift, or sea-pink, &c. the *compound*; the *umbellate*; the *synopic*; the *amentaceous*; the *glumose*, and the *spadiceous*.

AGGREGATE *fund*. See FUND.

AGGREGATION, AGGREGATIO, in *Physics*, a species of UNION, whereby several things, which have no natural dependence, or connection with one another, are collected together, so as in some sense to constitute one. Thus, a heap of sand, or a mass of ruins, are bodies by *aggregation*.

AGGREGATION, in *Chemistry*. See AGGREGATE.

AGGREGATION is also used *figuratively*, for ASSOCIATION. We say, to be of a company, or community, by *aggregation*.—An *aggregation* of several doctors to the faculty of laws.—In Italy, *aggregations* are frequently made of houses, or families; by virtue whereof, they all bear the same name and arms.

AGGRESSOR, in *Law*, he, of two contending parties, who makes the assault or attack; or who began the quarrel, encounter, or difference.
In criminal matters, it is always first enquired who was the *aggressor*.

AGIADES, a kind of Turkish soldiery, employed in fortifying of camps, smoothing of roads, and the like offices. Du-Cange.

AGIAHALID, the name of an Egyptian tree, called also *lycis*, and *lycium*; it resembles the wild pear.

AGIASMA, from ἁγιάζω, *holy*, among *Ancient Writers*, is sometimes used for the whole church, sometimes for the more sacred part or *bema*, wherein mass was said. Du-Cange.

AGILD, or AGILDE, in our *Ancient Customs*, a person so vile, that whoever killed him was to pay no mulct for his death.
The word comes from the privative *a*, and the Saxon *gildan, to pay*.

AGILENSZ, in *Botany*, a name used, by some, for the common hazel.

AGILITY, AGILITAS, a light, and active habitude, or disposition of the members and parts, designed for motion.
Some define *agility*, the art or habit of directing our strength, i. e. of intending, or remitting it to advantage.
The improving of *agility* was one of the chief objects of the institutions of games and exercises. The *athletæ* made particular profession of the science of cultivating and improving *agility*.

AGILLARIUS, in *Ancient Law-books*, a heyward, or keeper of a herd of cattle in a common field.
The *agillarius*, or *heyward of a town*, or *village*, was to supervise the greater cattle, or common herd of beasts, and keep them within their due bounds; and was otherwise called *bubulcus*, q. d. *cow herd*, (whence the reproachful term *coward*)—If he were a cottager, or other servile tenant, he was exempted from the customary services, as being presumed to be always attending on his herd, as a shepherd on his flock, who had therefore the like privilege.
The *agillarius of the lord of a manor*, or a *religious house*, was an officer appointed to take care of the tillage and harvest-work, to pay the labourers, and see there were no incroachments made, or trespasses committed: the same in effect with what has been otherwise called *fieldman*, and *tilling-man*; and among us BAILIFF.

AGIO, in *Commerce*, an italian word signifying *aid*, is a term used, chiefly in Holland, and at Venice, for the difference between the value of bank money, and current money.
So that if a merchant who sells his merchandise, stipulated to be paid either 100 livres bank money, or 105 cash, or current money, in such case the *agio* is said to be 5 *per cent*.
The bank *agio* varies in almost every place. At Amsterdam it is usually from 3 to 5 *per cent*.; at Rome, near 25 *per* 1500; at Venice 20 *per cent*. fixed; at Genoa from 15 to 16 *per cent*.
AGIO is also used for the profit arising from discounting a note, bill, or the like.
AGIO is also used, though with some impropriety, for the rate of exchange of a sum negociated, whether to profit or loss. It is sometimes called AGAI.
AGIO *of assurance* is used, by some, for what we more usually call *police of* ASSURANCE.

AGIOSYMANDRUM, a wooden instrument used by the Greek and other churches, under the dominion of the Turks, to call together assemblies of the people.
The word is compounded of ἁγιος, *holy*, and σημαινω, *I signify*.
The *agiosymandrum* was introduced in the place of bells, which the Turks prohibited their Christian subjects the use of, lest they should make them subservient to sedition.

AGIS, a name for the THIGH. See FEMUR.

AGIST, in *Law*, signifies to take in and feed the cattle of strangers in the king's forest, and to gather up the money due for the same. Chart. de Foresta, 9 H. III. cap. 9.
The officers appointed for this purpose are called *agistors*, or *gistakers*, and are made by the king's letters patent: there are four of them in every forest, wherein the king hath any pannage. Manw. For. Laws, 8vo.
The time for this is fifteen days before Michaelmas, and as many after, when the running of the cattle cannot prejudice the game.

AGISTMENT, supposed to be formed of the French *gîte, a bed*, or lying place: though Kennet excepts to this etymon, and chooses rather to derive it from *ager*, the field, or feeding place for cattle; imagining *agistment* to have originally been the same with *agrarium, agerium*, or *agretum*, the profit of feeding cattle on such a piece of ground.
AGISTMENT, *agistamentum*, is where other men's cattle are taken into any ground, at a certain rate per week. It is so called, because the cattle are suffered *agistare*, that is, to be *levant* and *couchant* there; and many great farms are employed to this purpose. 2. Inst. 643. Our graziers call cattle, which they thus take in to keep, *gisements*; and to *rise*, or *joice*, the ground, is when the occupier thereof feeds it not with his own flock, but takes in the cattle of others, to *agist* or pasture it. *Agistment* is likewise the profit of such feeding in a ground or field; and extends to the depasturing of barren cattle of the owner, for which tythes shall be paid to the parson.
AGISTMENT is also used metaphorically for a charge, or burden, on any thing.
In this sense we meet with *terra ad custodiam maris agistata*, i. e. *charged with a tribute to keep out the sea*.—So *terræ agistatæ*, are lands whose owners are bound to keep up the sea-banks.
AGISTMENT, the duty and levy for repairing the banks and walls in Romney-marsh was particularly called *agistamentum*;

Stamentum; and the act of laying such a proportion of this duty on the several estates was called *agistatio*. Spelman.

AGISTOR, or AGISTATOR, see AGIST and AGISTMENT.

AGITATION, AGITATIO, properly signifies *shaking*; or reciprocal MOTION of a body.

The *prophets*, *quakers*, Pythian priestesses, &c. were subject to violent *agitations* of body. See INSPIRATION.

Among physiologists, the term is sometimes appropriated to that species of earthquake, called *tremor*, or *aritatio*.

Among the philosophers, it is chiefly used for an intestine commotion of the parts of any natural body.

Thus, fire is said to *agitate* the minute particles of bodies.—Fermentation, and effervescence, are attended with a brisk *agitation* of the particles.

Heat is supposed by some, to consist in the *agitation* of the parts of the hot body; and sound is produced by a tremulous *agitation*, excited first in the sonorous body, and communicated thence to the ambient air.

AGITATION is likewise used for a violent hurry or perturbation of spirits, occasioned by some predominant passion.

AGITATION is also used, in *Medicine*, for a species of exercise, popularly called *swinging*: and, in general, for any exercise which shakes the body.

Bartholine mentions fits of the tooth-ach, deafness, &c. removed by vehement *agitations* of the body; and they have been found of especial use for preventing and dissolving concretions.

Dr. Sydenham attributes the great benefits of riding to *agitation*, which is very efficacious in removing obstructions of the *viscera*. See ÆGRA.

Sanguification is in great measure effected by the *agitation* of the parts of the blood and chyle, in their continual circulation. DIGESTION itself is only supposed by some to be an insensible kind of *agitation*.

AGITATION *of beasts in the forest*, anciently signified the DRIFT of beasts in the forest.

AGITATIVE, something having power to agitate or shake another.

AGITATIVE *force of a pendulum*, is that which produces motion in it.

The *agitative force* of the pendulum arises from three things? 1. The power of gravity. 2. The weight fastened at the end of the rod. 3. The distance of that weight from the point of suspension; or, which amounts to the same thing, the length of the rod, or *pendulum*. Hist. Acad. Scien. 1714.

AGITATOR, in *Antiquity*, a *charioteer*; or he who drove or directed a chariot, or horses in a race.

In which sense, *agitator* amounts to the same with what the Romans called *auriga*, and we a coachman, driver, &c.

AGITATOR was more particularly used for him who drove in the public *circus* games in the *circus*.

The *agitators* were distinguished, by their habits, into *russati*, *albati*, *prasini*, and *veneti*, which gave rise and denomination to so many factions. Besides which, they had other marks, or ensigns of their family, corresponding to what we call arms.

The conquerors, besides the ordinary rewards, *bravia*, as crowns, &c. had statues erected to them in the circus; on the bases whereof, their titles, atchievements, &c. were inscribed; several of which are still found among ancient inscriptions, drawn in the following formulæ: *Vicit ſpigs, ſeptyigs, bigis, trigis, tot annis, ubique principia, duobus entraſſigis*, &c.

It has been disputed, whether the *agitators* were on the footing of mimes and pantomimes, and by law held infamous? Brisson. Select. ex Jur. Civ. Ant. lib. i. c. 10.

AGITATORS, *militarium*, *agitatores militarii*, were those who drove in the forum at Constantinople, a place adorned with statues, &c. after the manner of the circus at Rome, having a *milium*, or *miliarium*, in the middle.

AGITATORS, in our English affairs, were certain officers, created by the army in 1647, to take care of its interests. Cromwell leagued himself with the *agitators*, whom he found to have greater interest than the council of war.—The *agitators* undertook to make proposals relating to the reformation of religion, and the state.

AGLAIA, the name of the youngest of the three Graces, espoused to Vulcan.

AGLAOPHOTIS, in *Botany*, a name used, by some, for PIONY.

AGLECTS, AGLETS, or AGLEEDS, among *Florists*, the APICES, or pendants hanging on the tip-ends of CHIVES, or STAMINA; as in tulips, roses, spike-grass, &c.

AGLIA, among *Ancient Physicians*, a whitish cicatrix, or spot in the eye, formed by a congestion of humours.

AGLIBOLUS. The Palmyrenes worshipped the sun under this title.

AGLITHES, used by Hippocrates for a clove of garlick.

AGME, in *Surgery*, signifies a fracture.

AGMEN, in *Antiquity*, properly denotes a Roman army in march.

In which sense, it stands contradistinguished *from acies*, which denoted the army in battle array; though, on some occasions, we find the two words used indifferently for each other.

The Roman armies, in their marches, were divided into *primum agmen*, answering to our van-guard; *medium agmen*, our main-battle; and *poſtremum agmen*, the rear-guard.

The order of their march was thus: after the first signal with the trumpets, &c. the tents were taken down, and the baggage packed up; at the second signal the baggage was to be loaden on the horses and carriages; and at the third signal, they were to begin their march. First came the *extraordinarii*; then the auxiliaries of the first wing, with their baggage; these were followed by the legions. The cavalry marched either on each side, or behind.

AGMEN *pilatum*, that disposed in a narrow oblong form, or column; being withal close and compact; thus called, as resembling the figure of a *pila*, or *pier*. Vegetius compares it to that of a broach, or spit. This form was chiefly used in marching without their baggage, through bad ways and close countries.

AGMEN *quadratum*, that ranged somewhat in a square form; being the method ordinarily observed in the Roman armies. This was also called *agmen grave*, by the Greeks χαραγματος τρόπος. The three lines, or columns, in which the army usually marched, were considerably more in length, or breadth, than in depth: but as the baggage marched somewhat in the same order, the whole approached to the figure of a square.

AGMEN is also used for any number of persons, or even animals, moving or advancing in some regular order.

AGNACAT, *Scaligeri pyri* species. In a country of America, beyond the Terra de Labrador, toward the isthmus of Darien, there is a tree of the figure and size of a pear-tree, always covered with leaves, and of an extraordinary greenness and lustre. It bears a fruit also like a pear, but green even when it is ripe; the pulp is of the same colour, sweet, fat, and tastes like butter. It is a powerful promoter of venereal vigour. Ray's Hist.

AGNANTHUS, in *Botany*, the name given by Vaillant to a genus of plants, called afterwards CORNUTIA, by Plumier and Linnæus. It is of no medical use.

The word is formed of αγνος, *chaſte*, and ανθος, *a flower*.

AGNATI, in the *Roman Law*, the male descendants from the same father.

AGNATION, in the *Civil Law*, the kinship, or relation, between the descendants of the same father, being males, and issued only from males.

The word is formed from *ad*, *to*, and *naſci*, *to be born*. *Agnation* differs from *cognation*, as the latter is an universal name, under which the whole family, and even the *agnati* themselves, are contained; and *agnation*, a particular branch of *cognation*, which only includes the descendants in the male line. Again, *agnation* is properly only a civil name, as that of *gens*, or family; *cognation*, a natural name, or derived from blood.

By the law of the *Twelve Tables*, males and females succeed one another, according to the order of proximity, and without any regard to the sex: but the laws were afterwards changed in this respect, by the *Lex Voconia*; and women were excluded from the privileges of *agnation*, excepting such as were within the degree of consanguinity; i. e. excepting the sisters of him who died abintestate; and it was hence that the difference between *agnati* and *cognati* first took its rise.

But this difference was again abolished by Justinian (Inſt. 3. 10.) and the females were reinstated in the right of *agnation*; and all the descendants on the father's side, whether males or females, were appointed to succeed each other indiscriminately, according to the order of proximity.

Hence, *cognation* came to take in all the relations of the mother as well as father; and *agnation* to be restrained to those of the father alone.

Adoptive children enjoy the privileges of *agnation*; which was called *civil* in their respect, in opposition to the other, which was *natural*.

AGNEL, an ancient French gold coin, first struck under the reign of St. Louis, worth about twelve sols, six deniers. The *agnel* is also called sometimes *mouton d' or*, and *agnel d' or*. The denomination is supposed to have arisen from the figure of a lamb, or sheep, struck on one side.

AGNELET, an ancient French silver coin, first struck under Philip le Bel, worth about twenty sols.

AGNIFER is an appellation applied, by some *Ecclesiastical Writers*, to John the Baptist, and used in the same sense with *præcurſor*, or *forerunner*.

AGNIS; see INDICUM.

AGNINA *membrana*, the same as the AMNIOS.

AGNINA *lactuca*; see LACTUCA.

AGNOETÆ, in *Church History*, a sect of ancient heretics,

who maintained that Chriſt, conſidered as to his human nature, was ignorant of certain things, and particularly of the time of the day of judgment.

The word is formed of *ayvoεω*, *ignore*, *to be ignorant of*. Eulogius, patriarch of Alexandria, aſcribes this doctrine to certain ſolitaries in the neighbourhood of Jeruſalem, who, in defence hereof, alledged divers texts of the New Teſtament, and, among others, this of St. Mark, chap. xiii. ver. 32. *Of that day and hour knoweth no man; no not the angels who are in heaven, neither the Son, but the Father only.*

There ſeem to have been two kinds of *agnoetæ*, though they are uſually confounded.

AGNOIA, a word uſed by *Phyſicians*, when a perſon in a fever does not know his acquaintance. When a rigor accompanies this ſymptom, Hippocrates ſays it is dangerous.

AGNOMEN, in *Antiquity*, an epithet given to a perſon, either by way of praiſe, or diſpraiſe, or from ſome remarkable event, which became, as it were, an additional name, but peculiar to the perſon, and not deſcendible to his iſſue. Thus, one of the Scipios was named *Africanus*, and the other *Aſiaticus*, from the brave atchievements which the one performed in Africa, and the other in Aſia.

The *agnomen* was the third in order of the three Roman names.—Thus in Marcus Tullius Cicero, Marcus is the *prænomen*, Tullius the *nomen*, and Cicero the *agnomen*. Others think the *agnomen* to have been the fourth or honorary name, ſuperadded on account of ſome extraordinary action or virtue. Some imagine *agnomen* and *cognomen* to have been the ſame, as they generally are, except in caſes of ADOPTION.

It was a cuſtom among the Romans, for a perſon, when *adopted* into another family, to lay aſide all his other names, and only retain his family name, to which he added the *prænomen*, *nomen*, and *cognomen* of the adopter. Thus P. Cornelius Scipio, being adopted by Q. Cæcilius Metellus, laid aſide his *prænomen* PUBLIUS, and *nomen* CORNELIUS, and was called Q. Cæcilius Metellus Scipio.

AGNOS, in *Ichthyology*, a name given by Athenæus, and many other of the Greek writers, to that fiſh called *callyonymus*, or *uranoſcopus*. It is a ſpecies of the *trachinus*, and is diſtinguiſhed, by Artedi, from the reſt of that genus, by the name of the *trachinus*, with a great number of beards growing from the lower jaw.

AGNUS *Caſtus*, the *chaſte tree*, in *Botany*. Its characters are theſe: the empalement of the flower is cylindrical, and indented in five parts: the flower has one ringent petal, the brim plain, and divided into two lips, which are trifid, and the middle ſegment broadeſt in both. It has four hair-like ſtamina, two of them ſhorter than the other, terminated by moveable ſummits; and a roundiſh germen ſupporting a ſlender ſtyle, crowned by two awl-ſhaped ſpreading ſtigmas. The germen turns to a globular berry with four cells, each containing one oval ſeed. This plant was famous among the ancients as a ſpecific for the preſervation of chaſtity, and the preventing of all venereal deſires, poſſutions, &c.

The Greeks call it *ἀγνος*, *chaſte*; to which has ſince been added the reduplicative *caſtus*, v. d. *chaſte chaſte*.

The Athenian ladies, who made profeſſion of chaſtity, lay upon leaves of *agnus caſtus*, during the feaſt of Ceres. See CERRALIA.

This ſhrub is alſo called *agnon*, *vitex*, ſometimes *elæagnon*, *ſalix amerina*, *ſycon*, *lygus*.

There are divers ſpecies of it. Pliny mentions two, the *greater*, called alſo the *white* kind, and the *leſſer*, or *black*. Miller ſpeaks of four; only one of which, called VITEX *foliis anguſtioribus, canabis modo diſpoſitis*, is pretty common in Engliſh gardens; the reſt are rare. Its ſeed is round, about the bigneſs of pepper, and having a pungent aromatic taſte; whence the French ſometimes call it *wild pepper*. This ſeed is ſaid to be more effectual than rue, in hardneſs of the liver or ſpleen; it is of the ſize of a pepper-corn. It grows in waſte grounds, about the banks of rivers, and contains a great deal of ſalt and oil, but little phlegm. The oil of it is inſipid, and of a ſaffron colour, and is eaſily obtained by expreſſion. It is a native of Italy. The *agnus caſtus* is a ſpecies of VITEX in the Linnæan ſyſtem.

AGNUS *Dei*, in the *Romiſh Church*, denotes a cake of wax, ſtamped with the figure of a lamb, ſupporting the banner of the croſs, conſecrated in due form by the pope, to be diſtributed in preſents among the people, and ſuppoſed to have great virtues annexed to it.

The name literally ſignifies *Lamb of God*; this being ſuppoſed an image, or repreſentation of the Lamb of God, who took away the ſins of the world.

They cover it up with a piece of ſtuff, cut in form of a heart, and carry it very devoutly in their proceſſions.—The Romiſh prieſts, and religious, derive conſiderable pecuniary advantage from ſelling theſe *Agnus Dei*'s to ſome, and preſenting them to others. The pope provides a regular ſupply, by conſecrating once in ſeven years; they are diſtributed by the maſter of the wardrobe; and received by the cardinals, and other prelates, with great reverence, in their caps and mitres.—This ceremony they pretend to derive from an ancient cuſtom of the church, wherein part of the paſchal taper, conſecrated on Holy Thurſday, was diſtributed among the people, to perfume their houſes, fields, &c. in order to drive away devils, and to preſerve them from ſtorms and tempeſts. Other imaginary virtues are likewiſe attributed to them. See concerning the origin of *Agnus Dei's*, Jour. des Scav. tom. xxxi. p. 252. Mem. de Trev. ann. 1722 p. 2010. Their virtues, Act. Erud. Lipſ. Supp. tom. iv. p. 224. Their myſtic meanings, Du Pin, Bibl. Eccleſ. tom. xviii. p. 68. The order of conſecrating them, Magri, Notiz. de Vocab. Eccleſ. in voc.

Some authors alſo ſpeak of a kind of metalline *Agnus Dei's*, hung to chapelets, or pater-noſters.

The *Agnus Dei* is ſaid to have been firſt brought into the miſſal, by pope Sergius I.

The *Agnus Dei* is forbidden to be brought into England, under pain of incurring a *præmunire*. 13 Eliz. cap. 2.

AGNUS *Dei* is alſo a name popularly given to that part of the maſs, wherein the prieſt, ſtriking his breaſt three times, rehearſes, with a loud voice, a prayer beginning with the words *Agnus Dei*.

AGNUS *Scythicus*, in *Natural Hiſtory*, a kind of *zoophyte*, or plant-animal, ſaid to grow in Tartary, reſembling the figure and ſtructure of a lamb. See ZOOPHYTON.

The *Scythian lamb* is alſo called *agnus vegetabilis*, *agnus Tartaricus*, and by the people of the country, *boranetz*, *boranetz*, or *boranetz*.

The uſual account given of this extraordinary production is, that the Tartars ſow in their ground a ſeed reſembling that of melon, but leſs oblong; from whence ariſes a plant called by them *boranetz*, i. e. *lamb*, growing all moſt to the height of three feet, and having feet, hoofs, ears, and the whole head, excepting horns, reſembling that animal. In lieu of horns it has a peculiar ſort of hair, not unlike horns; it is covered with a fine thin ſkin, which being pulled off, is worn by the natives as a cover for the head. The pulp within reſembles that of the *gammarus*; and when wounded, a liquor ouzes out like blood. It lives as long as there is graſs and herbage around it; but when theſe are conſumed, it waſtes and dies. They add, that wolves are fond of it, while no other beaſts will feed on it.

Deuſingius ſeems to have been the firſt who ſuſpected this account to be fabulous; and Kempfer, when in the country, made diligent inquiry concerning it, but could hear of nothing like it.

As to the plants ſhewn under this denomination, in ſome repoſitories of rarities, they appear to be originally the roots, or ſtalks, of certain vegetables, probably of the capillary kind, covered with a woolly moſs, which naturally bearing reſemblance to the figure of a lamb, have been helped out and brought near to it by art, and the addition of new parts.

Sir Hans Sloane, and Breynius, give us the figures and deſcriptions of ſuch *boromerzes* in their collections. It is from theſe plants that the Indian moſs is gathered, famous for its uſe in ſtaunching blood. Breynius and Libavius have written expreſly on the *Agnus Scythicus*. Phil. Tranſ. N° 390, and N° 287.

AGOGA, in *Natural Hiſtory*, a ditch or drain for carrying off the water from a mine.

The word ſeems derived from *ἀγω*, *ductus*, of *ἀγω*, *duco*, *I draw*.

AGOGE, *ἀγωγη*, in the *Ancient Muſic*, a ſpecies of modulation, wherein the ſounds or notes proceed by continuous degrees of the ſcale, both riſing and falling. As when we ſing, re, mi, fa, ſol, la: la, ſol, fa, mi, re. *Agoge* anſwers to what the Latins call *ductus*, and the Italians *conducimento*, and *di grado*: it ſtands contradiſtinguiſhed from *ploce*, *petteia*, &c.

Agoge makes the firſt part of the *melopœia*, or art of modulating.

There are three ſpecies or caſes of this modulation; firſt when the ſounds follow each other from grave to acute, i. e. riſing as in ſinging, B C D E. This the Latins call *ductus rectus*, and the Italians *conducimento retto*.

The ſecond, when they go from acute to grave, i. e falling, as in the notes E D C B, called by the ancients *ductus reverſus*, and by the modern Italians *conducimento rivertante*.

The third, when they riſe by ſtats and fall by ſharps, as in D, E, F *ſharp*, G, or, *vice verſa*, as in G, F *natural*, E *flat*, D. This the ancients call *ductus circumvertens*, and the Italians *conducimento circonvertente*. Euclid Introd. Harm. p. 22. Ariſtid. Quintil. de Melop. lib. i. Mem. Acad. Inſcr. tom. vii. Malcom on Muſ. chap. xiv. ſect. 4.

AGOMPHIASIS, or GOMPHIASIS, a diſtemper of the teeth. It conſiſts in their being looſe in their ſockets.

AGON, in *Antiquity*, a diſpute or conteſt for the maſtery, either of ſome exerciſe of the body, or of the mind.

There were *agones* on certain days, in moſt of the ancient feaſts, and other ceremonies in honour of the gods, or heroes.

There were alſo *agones* eſtabliſhed expreſly, and not attached to any other ſolemnity.—Such was the *agon gymnicus*, at Athens; the *agon Nemæus*, inſtituted by the Argians in the 33d Olympiad; the *agon olympius*, inſtituted by Hercules, 430 years before the firſt Olympiad; the *agon Adrianalis*, inſtituted at Athens, by the emperor Adrian, called Παναθήναια, Παναθήναια, and Ὀλύμπια Ἀδριανεῖα.

The Romans had alſo *agones* inſtituted after the example of the Greeks: the emperor Aurelian eſtabliſhed the *agon ſolis*, *agon of the ſun*; and Dioclefian, the *agon capitolinus*, which was held every fourth year, after the manner of the Olympic games.—Hence the years, inſtead of *luſtro*, are ſometimes numbered by *agones*. The *agon ſeculaticus*, inſtituted at Puzzuoli by the emperor Antoninus Pius, and held every fifth year, was a ſacred combat, and the victors at it were called *hieronicæ*: they were to be received into the city, through a breach in the wall, made on purpoſe. The *agon muſicus* was that wherein either poets, or muſicians, diſputed for the prize; ſuch was that dedicated by Ptolemy to Apollo and the Muſes, with rewards aſſigned to the writers who gained the victory. Of this kind were alſo found in the Pythian, Nemæan, and Iſthmian games; alſo in the Olympic games, after Nero's time, who firſt introduced a muſical *agon* here; others were founded by the emperor Domitian, and others at Rome, Naples, Alba, &c. The *agon Neronianus* was a quinquennial combat, called alſo *Neronian*, from the name of its inſtitutor, who here bore away the prize for playing on the harp, *citharo*.

AGON is alſo uſed for a place near the Tyber, otherwiſe called *circus Flaminens*, wherein curule games and combats were celebrated.

AGON is alſo uſed by *Phyſicians*, for the ſtruggle of death.

AGON was alſo a miniſter of ſacrifice, whoſe buſineſs was to ſtrike the victim. The name is ſuppoſed to have been derived hence, that ſtanding ready to give the ſtroke, he aſked *agon*, or *agone? ſhall I ſtrike?*

The *agon* was alſo called *popa*, *cultrarius*, and *victimarius*.

AGONALES, in *Antiquity*, an epithet given to the SALII, conſecrated by Numa Pompilius to the god Mars, ſurnamed *Gradivus*.

They were alſo called *Quirinales*, from the *Mons Quirinalis*, where they officiated. Roſinus calls them *Agonenſes Salii*.

AGONALIA, in *Antiquity*, feaſts celebrated by the Romans, in honour of Janus; or, as ſome would have it, in honour of the god *Agonius*, whom the Romans uſed to invoke upon their undertaking any buſineſs of importance. They appear to have been held thrice in the year, viz. on the fifth of the ides of January, on the twelfth of the calends of June, and the third of the ides of December. Struv. Ant. Rom. c. 8.

AGONE. See HENBANE.

AGONISMA, in *Antiquity*, the palm or prize given the victor in a game or combat.

AGONISTARCHA, in *Antiquity*, ſeems to have been much the ſame with *agonotheta*; though ſome ſuggeſt a difference, making it the office of the former to preſide at, and direct the private exerciſes of the *athletæ*, which they went through by way of practice, before they made their appearance on the public theatres or amphitheatres.

AGONISTIC, *agoniſtica*, the ſcience of what relates to the combats, or *agones* of the ancients.

In which ſenſe, *agoniſtic* amounts to much the ſame with *athletic*, and makes a branch of *gymnaſtic*.

AGONISTIC, ἀγωνιστικὸν, is alſo uſed among *Ancient Phyſicians*, for cold ſpring-water.

The reaſon of the denomination is taken from the plentiful uſe of that element in the ſtate of an acute eryſipelaceous fever, wherein water was ſuppoſed to combat and ſtruggle with the febrile heat.

AGONISTICI, in *Antiquity*, a name given by Donatus to thoſe of his ſect, whom he ſent into the neighbouring places, fairs, markets, &c. to preach his doctrine; for which reaſon they were alſo called *circumitores*, *circelliones*, *cotropitæ*, *coropitæ*, and, at Rome, *montenſes*.

They were called *agoniſtici*, from *agon*, *combat*; becauſe they were ſent, as it were, to fight, and ſubdue the people to their opinion.

AGONIUM, in *Roman Antiquity*, was uſed for the day whereon the *rex ſacrorum* ſacrificed a victim. The ſame name was alſo given to the place wherein the games were anciently celebrated.

AGONOTHETA, AGONOTHETES, in *Antiquity*, a magiſtrate choſen among the Greeks, to preſide, and have the ſuperintendency of the ſacred games, or combats; to defray the expences thereof, and to adjudge the prizes to the conquerors.

The word is compounded of *agon*, *combat*, and θετης, *he who diſpoſes*.

Among the Romans, the like officer was denominated *deſignator*, and *munerarius*.

Middle-age writers uſually confound *agoniſtæ*, the combatants at the games, with the *agonotheta*, or preſidents of them.

The *agonotheta* had the immediate charge of the manner of life, diſcipline, and morals of the *athletæ*. They examined, and admitted, or expelled them the ſociety, or order. During the combats, the *agonotheta* were cloathed in purple, and rode in a triumphal manner through the circus, holding in their hands an ivory ſceptre, with an eagle on it.

Van Dale has an expreſs diſſertation on the *agonotheta*.

The name *agonotheta* is ſtill retained in ſchools and academies, for him who defrays the charge of the prizes diſtributed. The founders of prizes are perpetual *agonotheta*.

AGONOS, in *Phyſic*, a Greek word ſignifying *barren*. Hippocrates applies it to women who have no children, though they might have them, if the impediment were removed.

AGONUS, in *Ichthyology*, a name uſed by the generality of authors, for the fifth called by ſome *ſarachus*, by others *chalcis*, and by others *ſardella*.

It is in many particulars very like the *alauſa*, or ſhad, called the mother of herrings, but ſmaller, never arriving at more than a foot in length; and is always lean and lank in ſpring, and fat in autumn. But the diſtinctions between it and the *alauſa*, if real, are ſo very ſmall, that Mr. Ray, and many of the moſt accurate naturaliſts, have ſuſpected it the ſame fiſh, only in a different ſtate.

AGONY, AGONIA, denotes the extremity of pain, or a diſeaſe; when nature makes her laſt effort, or ſtruggle, to throw off the evil that oppreſſes her.

The word is formed from the Greek ἀγων, *certamen*, *combat*; this being a kind of ſtrife between life and death.

Much of the terror of death conſiſts in the pangs and convulſions wherewith the *agony* ſeems attended; though we have reaſon to believe, that the pain in ſuch caſes is ordinarily not extremely acute; a courſe of pain and ſickneſs having uſually ſtupified, and indiſpoſed the nerves for any quick ſenſations. However, various means have been thought of for mitigating the *agony* of death. Lord Bacon conſiders this as part of the province of a phyſician, and that not only when ſuch a mitigation may tend to a recovery, but alſo when there being no farther hopes of a recovery, it can only tend to make the paſſage out of life more calm and eaſy. Accordingly, he ranks *euthanaſia*, or the art of dying eaſily, among the *deſiderata* of ſcience; and does not even ſeem to diſapprove of the courſe Epicurus took for that end. De Augm. Sc. lib. iv. c. 4.

Opium has been applied for this purpoſe, with the applauſe of ſome, but the condemnation of more.

Baglivi promiſed a treatiſe expreſs, De Medicina Agonizantium, or the method of treating thoſe in the agonies of death. But perhaps one of the beſt recipes for this end, is that of Mr. Patin, viz. *abſtinence from all medicines*.

AGONYCLITÆ, or AGONYCLITES, in *Antiquity*, a ſect, in the ſeventh century, whoſe diſtinguiſhing principle it was, never to kneel, but to deliver all their prayers ſtanding. See GENUFLEXION.

The word is compounded of the private particle α, γόνυ, *knee*, and κλίνω, *to bend*.

AGORÆUS, in *Antiquity*, an appellation given to thoſe deities, who had ſtatues in the public markets, or *fora*.

The word is formed of ἀγορὰ, *market*.

AGORANOMUS, in *Antiquity*, a magiſtrate of Athens, eſtabliſhed for the maintenance of good order and policy in the markets, ſettling the prices of proviſions, excepting corn, and deciding diſputes relating to buying and ſelling, inſpecting the weights, meaſures, and the like.

The word is compounded of ἀγορὰ, *market*; and νομος, *law*.

The *agoranomus* among the Greeks was much the ſame with the *curule* ÆDILE among the Romans.

Ariſtotle diſtinguiſhes two kinds of magiſtrates, the *agoranomi*, who had the ſuperintendence of the markets; and the *aſtynomi*, who inſpected the buildings of the (ἀστυ) *cities*.

The *agoranomi*, at Athens, were ten in number, five belonging to the city, and as many to the Piræus; though others make them fifteen in all, of whom they aſſign ten to the city. To theſe a certain toll or tribute was paid, by all who brought any thing to ſell in the market.

AGOSTUS, in *Anatomy*, ſignifies the part of the arm from the fingers to the elbow; alſo the palm or hollow of the hand.

AGRA, a kind of ſweet-ſcented wood, found in the iſland of Hainan, on the coaſt of China.

AGRA-*Caramba*, is another sweet-scented wood, which also comes from the island of Hainan.

AGRARIÆ *flotiones*, in the *Ancient Military Art*, corps of guards posted in the fields, and in the open air.

AGRARIÆ *naves* was used for vessels placed to keep watch, or guard.

AGRARIAN, in a general sense, something relating to fields or lands.

The word is originally Latin, *agrarius*, formed of *ager*, *a field*.

AGRARIAN, in the Roman *Jurisprudence*, a denomination given to such laws as relate to the partition or distribution of lands.

There are fifteen or twenty *agrarian* laws; whereof the principal are, the *Lex Cassia*, in the year of Rome 268; the *Lex Licinia*, in 337; the *Lex Flaminia*, in 525; two Sempronian laws, in the year 620; the *Lex Apuleia*, in the year 653; the *Lex Barbia*; the *Lex Cornelia*, in 673; the *Lex Servilia*, in 690; the *Lex Flavia*; the *Lex Julia*, in the year 691; the *Lex Ælia Licinia*; the *Lex Livia*; the *Lex Mœnia*; the *Lex Roscia*, made after the taking of Carthage; the *Lex Flavia*, and the *Lex Titia*.

By the laws of Licinius, no Roman was allowed to occupy more than seven *jugera* of land; and by a similar law of Romulus, every Roman was limited to two *jugera*.

AGRARIAN *Law*, *Lex* AGRARIA, absolutely, and by way of eminence, so called, was a celebrated law, published by Spurius Cassius, about the year 268, for an equal division of the conquered lands among all the citizens, and for limiting the quantity of ground possessed by each person to a certain number of acres.—Those other two in the Digest, the one published by Cæsar, and the other by Nerva, only relate to the limits or boundaries of grounds; and have no relation to that of Spurius Cassius.

The Roman lands were of divers kinds, some conquered from the enemies, and not yet brought to the public account: others brought indeed to the public, but clandestinely usurped by private great men: lastly, others purchased with the public money, in order to be divided. *Agrarian* laws, either for dividing lands taken from the enemy or the public lands, or those purchased with the public money, were easily passed without disturbance; but those whereby private rich men were to be ousted of their lands, and the common people put in possession of what had been held by the nobility, were never attempted without great disturbances.

Several have pleaded for the necessity of *agrarian* laws among us. William Spigge, or, as some say, Fr. Osborne, has written expressly on this subject. See also the Supplement to Dr. Price's Observations on Reversionary Payments, &c. p. 381.

But the author who seems to have entered deepest into the nature and use of *agrarian* laws, is Harrington; he shews that the balance of property in a state cannot be fixed but by laws, and the laws whereby such a provision is made are *agrarian* laws. Now these are necessary to the stability of government, because governments will, according to the diverse balance of property, be of diverse or contrary natures, that is, monarchical, or popular. Thus monarchy requires of the standard of property, that it be vast or great; and of *agrarian* laws, that they hinder recess or diminution, at least in so much as is thereby entailed upon honour. But popular government requires, that the standard be moderate, and that its *agrarian* laws prevent accumulation.

This author thinks, that in a territory not exceeding England in revenue, if the balance be in more hands than three hundred, it is declining from monarchy; and if it be in fewer than five thousand hands, it is swerving from a commonwealth.

The same writer defines an equal *agrarian*, a perpetual law establishing and preserving the balance of dominion by such a distribution that no one man, or number of men, within the compass of the few or aristocracy, can come to overpower the whole people, by their possessions in lands.

He also observes, that the people of Rome, by striving for an *agrarian*, drove to save their liberty: and that commonwealth, through want of such a law, or the non-observance of it, came to ruin.

To the Grecian cities, the defect of an *agrarian* was supplied by *ostracism*.

In Venice, the council of ten, and the officers of pomp, restrain those who might be too powerful; and these two orders in a commonwealth, where the gentry have but small estates in land, are as much as needs be in lieu of an *agrarian*.

Some German republics have no more to supply the place of this law, than that estates descending are divided among the children.—And the same law would establish an *agrarian* in England.

Agrarian laws may be framed different ways, as by intailing the lands upon certain families, without power of alienation in any case, as in Israel and Lacedæmon: or, except with leave of the magistrate, as in Spain. But this, by making some families too secure, as those in possession, and others too despairing, as those not in possession, may make the whole people less industrious.

Therefore Harrington prefers a law regulating estates, so that no man shall have above two thousand pounds a year in land; and that the estates of those who exceed this proportion shall be divided in descending to their children, till the greater share do not exceed 2000*l. per annum*. This is the rule he lays down for his commonwealth of Oceana, by which he means his scheme for the government of England.

By this law, Harrington intended that the property of land in England, should never fall into fewer hands than 5000; as he computes the rents of this country to be ten millions. But if these rents, as is probable, amount now to twenty millions, it would follow that, by our author's rule, the land could never be in less than 10000 hands, which, according to his system, must effectually secure the liberties of the people.

It would exceed the limits of our design, to enter into the full detail of all the reasonings of this ingenious author, on the subject of *agrarian* laws; we therefore refer to his works. See also GOVERNMENT, PROPERTY, &c.

AGRARIUM. See AGISTMENT.

AGREDULA, is a name given to a species of the FROG.

AGREEMENT, AGREAMENTUM, in *Law*, a joining, or putting together, of two or more minds in any thing done or to be done.

Of this there may be three sorts.—The first an *agreement executed* at the beginning, mentioned in the statute of 25 Edw. III. cap. 3. which says, "That the goods "bought by forestallers, being thereof attainted, shall be "forfeited to the king; if the buyer thereof have made "*gree* with the seller:" where the word *gree*, otherwise called *agreement executed*, signifies payment for the things, or satisfaction.

The second is, an *agreement after an act*, that is, where one does an act, and another *agrees* or assents thereto, afterwards.—The third is, an *agreement executory*, which is, when both parties at one time are *agreed* that such a thing shall be done in time to come. It is called executory, because the thing is to be done afterwards.

Agreements are to be in writing, by stat. 29 Car. II. cap. 3. of *frauds* and *perjuries*.

AGRESSES, or AGRESSES, in *Heraldry*, the same as PELLETS.

AGRESTA, in *Medicine*, an unripe grape; otherwise called *omphax* and *vva acerba*, by the French *verjus*.

Agrestæ are held cooling, detersive, and astringent; they temper the acrimony of the bile, and cheer the heart. Eaten plentifully, they have been found to destroy worms.

AGRESTA is sometimes also applied to the juice of this fruit, more properly called *omphacium*.

AGRIA, a name given to HOLLY; and also to a malignant pustule, of which there are two sorts. The one is small, with a roughness, redness, and slight corrosion of the skin; it is of a round figure, its centre is smooth, and it spreads slowly. It is cured by rubbing it with fasting spittle. The other sort ulcerates with a violent redness and corrosion, so as to make the hair fall off; it is of an unequal form, and turns leprous. It is cured by poultices of PELLITORY *of the wall*.

AGRIÆ, in *Natural History*, an order of quadrupeds, which have no teeth, but have a very long cylindric tongue. Of this order there are only two known genera, the *myrmecophaga* and the *manis*.

AGRIAMPELOS, the *wild* VINE; and according to Gerard, the *black* BRIONY.

The word is formed of *ἄγριος*, *wild*, and *ἀμπελος*, *a vine*.

AGRICULTURE, the art of tilling or cultivating the earth, in order to render it fertile, and make it bear plants, trees, fruits, &c.

The word is formed of the Latin *ager*, *field*, and *cultura*, *tilling*, of *colere*, *to till*.

The principal and most general operations in *agriculture* are manuring, ploughing, fallowing, sowing, harrowing; as also, reaping and mowing. See the articles MANURE, PLOUGHING, SEMINATION, &c.

To the operations of *agriculture* do also belong the management of the productions of particular countries; as hops, hemp, vines, tobacco, saffron, liquorice, woad, &c.

To the same art belong, planting, transplanting, pruning, engrafting; the culture of forests, timber, copses, &c. See ENGRAFTING, PLANTING, PRUNING, TIMBER, TREE, &c.

Even gardening, or horticulture itself, is only a branch of *agriculture*. See GARDEN.

Agriculture, in its most extensive sense, besides tillage,

comprehends feeding and the management of cattle, and the rural ſports, hunting, fiſhing, &c. Some even include under it the buſineſs of mines, coal-pits, and other ſubterraneous matter.

Among the ancients, *agriculture* is frequently called *georgica*.

This art has been cultivated by many of the greateſt men among the ancients, and has been treated of by their moſt celebrated authors. The hiſtory of its riſe and progreſs may be eaſily traced from the firſt period of time; and it has been more or leſs the ſubject of attention in every age and nation of the world. The ancient patriarchs, though principally devoted to a paſtoral life, were not altogether ignorant of this art; and their deſcendants, as ſoon as they were ſettled in Paleſtine, conſidered it as a very honourable employment. From them it was tranſmitted to the Chaldeans and Egyptians, to the Phœnicians and Carthaginians; and it was in ſuch repute among the latter, that Mago, their famous general, wrote twenty-eight books on the ſubject, which were afterwards tranſlated into Latin by an expreſs decree of the Roman ſenate; and Servius obſerves, that theſe were adopted as a model by Virgil, when he wrote his Georgics. It has been ſaid, that *agriculture* was firſt introduced among the Europeans by Ceres, queen of Sicily, in memory whereof ſhe was placed among the principal divinities: a fable, which imports, that Sicily, famed for its fertility in corn, was the ſcene of conſiderable improvements. The firſt Greek writer on *agriculture* was Heſiod; and he was ſucceeded by Democritus of Abdera, Xenophon, Ariſtotle, Theophraſtus, and many others. It is well known, that this art was in very high reputation among the Romans; and that it was cultivated by their emperors, dictators, and conſuls. The firſt Latin treatiſe on the ſubject of *agriculture* was compoſed by M Cato, the cenſor; Varro likewiſe is the author of a very elaborate work on the ſame ſubject; Columella, in the reign of the emperor Claudius, wrote twelve books on huſbandry; and in the reign of Conſtantine IV. a new work, as ſome ſay, collected by himſelf from the beſt writers, was publiſhed under the title of Geoponics, with a view of reviving this art, which was now in a very declining ſtate.

In England, the firſt perſon who diſtinguiſhed himſelf by his attention to the practical part of huſbandry was Fitzherbert, who publiſhed two treatiſes on this ſubject: one intitled the Book of Huſbandry, in 1534; and the ſecond, called the Book of Surveying and Improvements, in 1539.

In 1600, the French made conſiderable efforts to revive huſbandry, and ſeveral large works appeared for this purpoſe. It was likewiſe induſtriouſly cultivated about the ſame period by the Flemings, who, portioning out their lands in ſmall tenements, and diſcovering ſeveral new ſorts of manure, brought the ſoil hereby to a proper degree of cleanlineſs, health, and ſweetneſs; ſo that they were able to raiſe the more delicate graſſes; ſuch as LUCERN, SAINTFOIN, &c.

The moſt conſiderable Engliſh writers, previous to the Reſtoration, were Sir Hugh Plate, who made many very important diſcoveries with reſpect to the nature and qualities of manure; Gab. Plattes, and S. Hartlib; and ſince that period, Evelyn, Nourſe, Mortimer, Bradley, Lawrence, Tull, Ellis, and Miller; not to mention many more among our contemporaries. The attention generally given to this art both at home and abroad, and the numerous ſocieties eſtabliſhed for encouraging improvements in the theory and practice of it, both in Europe and America, promiſe a degree of perfection, of which none in former ages could have had any conception.

In France, there are no leſs than thirteen ſocieties eſtabliſhed by royal ſanction, beſide many ſubordinate aſſociations, for promoting *agriculture*. It is likewiſe publicly taught in the Sweediſh, Daniſh, and German univerſities. The ſpirit and example of Linnæus and his diſciples have very much conduced to the progreſs of this important and uſeful art; and the emulation of improving has ſpread through moſt of the nations of Europe. In England, the Royal Society, and the Society of Arts, &c. in particular, have been ſignally uſeful in this reſpect; and the other aſſociations, which are now eſtabliſhed in many parts of the country, co-operate with them in forwarding their laudable deſign.

Among the Japaneſe, *agriculture* is in great repute; and among the Chineſe, it is diſtinguiſhed and encouraged by the court beyond all other ſciences. The emperor of China yearly, at the beginning of ſpring, goes to plough in perſon, attended by all the princes and grandees of the empire. The ceremony is performed with great ſolemnity; and is accompanied with a ſacrifice, which the emperor, as high prieſt, offers to Chang-Ti, to enſure a plentiful crop in favour of his people.

The reader will find a conciſe abſtract of the principal improvements in the various branches of *agriculture*, diſpoſed, in the courſe of this work, under their proper heads.

AGRIELÆA, the *wild* OLIVE.

AGRIFOLIUM, in *Botany*, the HOLLY-*tree*.

AGRIGINTINE *ſalt*, in *Natural Hiſtory*, a kind of eatable ſalt, famous among the ancients for its not crackling in the fire as common ſalt does. It might probably owe this quality to the fineneſs of the powder, in form of which it was generally uſed.

AGRIMONOIDES, in *Botany*, a ſpecies of AGRIMONY.

This plant flowers in April, and comes to perfection in May; and grows in ſome mountainous parts of Italy; it is ſometimes called PIMPINELLA *ſolis agrimoniæ*.

AGRIMONY, AGRIMONIA, in *Botany*, the name of a genus of plants, belonging to the claſs of *dodecandria digynia*; the characters of which are theſe; the flower is of the roſaceous kind, conſiſting of five petals, which are arranged in a circular form, indented at their extremity, and ſtand upon a cup, which finally becomes an oblong echinated fruit, containing two oblong ſeeds. In the centre ariſes a double ſtyle, reſting on the germen, attended by twelve ſtamina.

Miller reckons five ſpecies, viz. 1. The common *agrimony*. 2. The white *agrimony*. 3. The ſweet ſcented *agrimony*. 4. The eaſtern *agrimony*, with narrow pinnated leaves, which are ſharply ſerrated, and a thick root. 5. Three-leaved *agrimony*, with ſmooth fruit. Tournefort enumerates only the three firſt ſpecies; Linnæus includes the firſt, third, and fourth, under one ſpecies.

The firſt ſpecies of this genus is frequent in dry paſtures, by the ſide of hedges, and in woods, and flowers in June. The dried leaves make a very pleaſant infuſion, in the manner of tea; and are eſteemed a very proper medicine in obſtructions of the liver and ſpleen. It is celebrated in the jaundice, and in cachectic caſes; and is given in coughs and catarrhs, and in ſuppreſſions alſo of the menſes.

It uſed to be a very common ingredient in the baths of the ancients, prepared with the decoctions of detergent and emollient herbs.

Agrimony is otherwiſe called *eupatorium vulgare*, or *Græcorum*.

From Mr. Geoffroy's analyſis of *agrimony*, it appears, that this plant contains very little ſalt of the ammoniacal kind, ſince no concrete urinous ſalt is got from it, but the acid ſalt wherewith it abounds, joined with earths, forms a concrete reſembling tartar, or ſalt of coral combined with a large proportion of ſulphur.

Agrimony has a ſaline taſte, ſubaſtringent and acid; its juice turns the tincture of heliotropium to a faint red, ſo that its aſtringent and aperitive virtues ſeem both owing to the ſame auſtere ſalt. For though theſe effects ſeem contrary to one another, yet they often flow from one and the ſame principle, the ſtrengthening of the weak and lax fibres of the ſolid parts. Experience ſhews, ſays Geoffroy, that *agrimony* has the virtue, ſuppoſed to ariſe from its compoſition; for it is aſtringent, detergent, reſolvent, vulnerary, and aperient.

The country people uſe the common or eſſential *agrimony* bruiſed, or its juice, in contuſions, and freſh wounds. Emuller ſays, it reſolves ſwellings and inflammations of the *ſcrotum*; yet it is rarely found in ſhop-compoſitions, though frequently preſcribed by the ſurgeons, in diſcutient and vulnerary fomentations.

AGRIMONY, *ſweet-ſmelling*, *agrimonia odorata*, is by ſome preferred, for medicinal purpoſes, to the former, as being more grateful to infuſe for pectoral decoctions. It may be infuſed in water, or in whey; and is efficacious in diſeaſes from a lax habit.

AGRIMONY, *hemp*, *eupatorium*, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs of plants. Its characters are theſe; it has a compound flower compoſed of hermaphrodite florets, included in one common ſcaly empalement, whoſe ſcales are narrow, erect, and unequal; and the florets have each five ſhort ſtamina. In the bottom is ſituated a ſmall germen, which becomes an oblong ſeed, crowned with down, ſitting in the empalement. There are ſeveral ſpecies.

The common *hemp agrimony* is recommended as an hepatic and vulnerary, and has been alſo uſed in catarrhs; but is at preſent very little known in the ſhops.

AGRIMONY, *water-hemp*, *bidens*, in *Botany*, belongs to the ſame claſs with the former. Its characters are theſe: it has a compound flower, the middle or diſk compoſed of hermaphrodite florets; theſe have five ſtamina, with an oblong germen. The female flowers which compoſe the border are naked, and are all ſucceeded by a ſingle angular obtuſe ſeed, having two or more briſtles or teeth. It grows in wet places, and flowers in Auguſt. Several ſpecies of this plant are common weeds; but there are five ſpecies cultivated in the gardens of the curious.

This herb is accounted hepatic and vulnerary.

AGRIOCARDAMUM; see CARDAMINE.

AGRIOCASTANUM, the fame as EARTH-NUT, popularly call *pig-nut*, and *arnut*.

AGRIOCINARA, in *Botany*, a name uſed by ſome authors for that ſpecies of wild ARTICHOAK, the root of which is uſed inſtead of the *coſtus nigra*.

AGRIOCOCCIMELA, or *prunus ſylveſtris*. See PLUM-*tree*.

AGRIOMELA, a name for the *crab* APPLE.

AGRIOMELANZANION, in the *Botanical Writings of the Ancients*, a word that has perplexed many of the later writers. The Arabian writers, Avicenna and Serapion, uſed the word *hedengian* for the fruit of the *pomum amoris*, a kind of eſculent nightſhade, or *ſolanum*, called by the old Greek writers, as Theophraſtus, &c. *ſtrychnos*, and only diſtinguiſhed from the other *ſtrychni*, or nightſhades, by its being deſcribed as wholeſome, not poiſonous. From this Arabic word *hedengian*, the Italians formed their word *melenzana*, and the late Greek writers their *melanzanion*, which they uſed as the name of the ſame fruit. This, when the plant was cultivated in gardens, was probably larger and fairer than when it grew wild; but, in this latter ſtate, was not leſs uſed, but was diſtinguiſhed by the term *agrionmelanzanion*. If the Greeks, who uſe this word, or the *melanzanion*, would have appropriated them to the *pomum amoris*, and diſtinguiſhed theſe from the other nightſhades, they would have done ſervice to the world.

AGRION ſignifies the PEUCEDANUM, called alſo *agriophyllon*.

AGRIOPHAGI, in *Antiquity*, a name given to thoſe who fed on wild beaſts.

The word is compounded of ἄγριος, *wild* and φαγω, *I eat*.

AGRIORIGANUM, in *Botany*, wild *marjoram*.

AGRIOSELINUM, in *Botany*, ſignifies *wild* PARSLEY.

AGRIPALMA, in *Botany*, a name given to MOTHERWORT.

AGRIPPA, a name applied, among the ancients, to children born in an unuſual or irregular manner; particularly ſuch as come with the feet foremoſt, inſtead of the head.

They were called *agrippæ*, according to Pliny, on account of their being (*ægre partu*) *born with difficulty*. Salmaſius derives it from the Greek ἀγρὸς, *venari*, and ἵππος, *equus*, q. d. *a hunter of horſes*.

Daventer has a particular chapter of *agrippæ*, or infants coming with their feet foremoſt, which, according to him, is one of the moſt convenient and ſafe ways for a mature birth.

Agrippa gives the denomination to an unguent. deſcribed in the *Antidotarium Nicolai*, and in ſeveral other diſpenſatories, ſuppoſed, by ſome, to have been invented by Agrippa king of Judæa, but, as others ſuſpect, by Julius Agrippa, a Roman phyſician.

AGRIPPINIANS, in *Church Hiſtory*, the followers of Agrippinus biſhop of Carthage, in the third century, who firſt introduced and defended the practice of *rebaptization*. Aſſud. Lex. Ant. Eccl. p. 465.

AGRIUM, in the *Materia Medica of the Ancients*, a name given to an impure ſort of *natrum*. The purer ſort of this ſalt they call *ſcimyologa*, and the coarſer and dirtier kind *agrium*. The former of theſe they had from Media, the latter from Thrace.

AGROM, a diſeaſe frequent in Bengal, and other parts of the Indies, wherein the tongue chaps and cleaves in ſeveral places, being alſo extremely rough, and ſometimes covered with white ſpots. The Indians are very fearful of this diſeaſe, which they attribute to extreme heat of the ſtomach.

Their remedy is, to chew the black-ſeeded baſilica, drink ſome chalybeated liquor, or the juice of large mint.

AGROSTEMA, in *Botany*, the name given by Linnæus to a genus of plants of the *decandria pentagynia* claſs, uſually confounded by other authors among the ſpecies of LYCHNIS.

The characters of the genus are theſe: the *perianthium* conſiſts of one leaf, which forms an oblong tube, of a coriaceous texture, and ribbed with ten *ſtriæ*; the limb of this, which is of the ſame length with the flower, is divided into five ſegments, which are ſlender and permanent; the flower conſiſts of five petals, the ungues of which are as long as the tube of the cup; the limb is obtuſe and expanded; and the ſtaminæ are ten ſubulated filaments affixed to the ungues of the flower; the *antheræ* are ſimple; the germen of the piſtil is oval; the ſtyles are capillary, and five in number; they are erect, and of the length of the ſtamina; the ſtigmata are ſimple; the fruit is an oblong capſule covered by the cup, and contains only one cell, in which are a number of ſpotted kidney-ſhaped ſeeds, in a looſe and free receptacle.

AGROSTIS, in the Linnæan ſyſtem of *Botany*, the name of a diſtinct genus of plants, of the *triandria digynia* claſs; the diſtinguiſhing characteriſtics of which are theſe: the calyx is a pointed bivalve glume, containing only one flower: the flower is made of two pointed valves, ſhorter than the calyx, and has one of the valves larger than the other, and terminated by a beard or awn; the ſtamina are three capillary filaments longer than the flower; the *antheræ* are ſplit at their ends; the germen of the piſtil is roundiſh; the ſtyles are two, reflex and hairy; and the ſtigmata are of a like ſtructure; the flower cloſely ſhuts in the ſeed, and does not open to let it fall out; the ſeed is ſingle, roundiſh, and pointed at each end.

Agroſtis is commonly uſed for the ſpecies of graſs called *quick-graſs*, or *couch-graſs*.

This plant is ſaid to diſſolve ſtones, eſpecially bilious ones, and hence to cure oxen and ſheep that feed upon it.

AGROSTOGRAPHIA, in *Phyſiology*, the *hiſtory* or deſcription of *gramens*, or plants of the graſſy kind.

The word is compounded of ἀγρωστις, *graſs*, and γραφω, *deſcription*.

AGROSTOGRAPHIA is alſo the title of a learned and laborious work of John Scheuchzer, containing an exact deſcription of about four hundred ſpecies of graſs; particularly dogs-tooth, *ſpergula*, *cyperoides*, ruſhes, &c. all diſpoſed in a new method; yet the *hiſtory* is far from being complete.

A-GROUND expreſſes the ſituation of a ſhip, whoſe bottom, or any part of it, reſts upon the ground.

AGRYPNIA, ἀγρυπνια, a privation of ſleep; otherwiſe called WATCHING, *waking*, *vigilia*, *pervigilium*, &c. In the Greek church, it is uſed for the vigil of any of the greater feaſt days, obſerved by the monks and clergy. Du-Cange.

AGUAGUIN, in *Botany*, the name of a ſhrub among the Africans, who eſteem it greatly as a balſamic and vulnerary. The leaves of this ſhrub reſemble thoſe of our common lilac; they grow alternately, and ſtand upon foot-ſtalks of half an inch long; and when held up to the light, they ſhew a fine texture of the ſmaller veins. Philoſ. Tranſ. N° 232.

AGUAPECACA, in *Ornithology*, the name of a Braſilian bird of the moor-hen kind. It is of the ſize of a pigeon, very long-legged, and has a beak like that of the gallinaceous kind. Its back, and the upper part of its wings, are brown, and in each wing they have a ſharp horn, or prickle, ſerving for their defence. Marcgrave.

AGUARA-QUIYA, in *Botany*, a Braſil plant, thought to be the *ſolanum vulgare*, or common night-ſhade, by Ray.

AGUARA-PONDA, in *Botany*, a plant otherwiſe called *viola ſpicata Braſiliana*. It grows to the height of a foot and a half, or more, with a ſmooth, round, green, and jointed ſtalk. At each joint come forth four, five, or more, narrow, ſerrated, pointed, green, and unequal leaves. The top of the ſtalk bears an ear a foot long, ſmooth, and covered with flowers of a fine violet azure, or the colour of our *viola martia*, conſiſting of five roundiſh leaves. The whole flower is not unlike the *viola martia*, and has ſomewhat of its ſmell. The root is ſtraight, of a moderate thickneſs, and ſhoots out into abundance of leſſer ones, and theſe again into fibrements.

There is another kind, diſtinguiſhed by the wideneſs of its ear of flowers, which repreſents a helmet of a green colour. It is marked with cubic pits, from whence proceed azure flowers. Ray.

AGUE, a periodical diſeaſe, of the fever kind, conſiſting in a cold ſhivering fit, ſucceeded by a hot one; and going off in a diaphoreſis, or ſweating.

If the coldneſs and ſhivering be inconſiderable, and only the hot fit felt, the diſeaſe is called an *intermitting fever*.

According to the periods or times of the returns of the fit, the diſeaſe is either a QUOTIDIAN, TERTIAN, or QUARTAN *ague*, or fever.

The cauſe of *agues* ſeems to be, an obſtructed perſpiration, or whatever, by overloading the juices, retards their motion, or occaſions a *lentor* in the blood.—The *cauſa proxima* ſeems to be a corruption of the humours of the body.—The ſymptoms are, heavineſs, and reaching; a weak, ſlow pulſe; coldneſs and ſhivering felt firſt in the joints, thence creeping over the whole body; pain in the loins, and an involuntary motion of the under jaw.

A vernal *ague* is eaſily cured; but an autumnal one is more obſtinate, eſpecially in aged and cachectical perſons; and, particularly, if complicated with a dropſy, peripneumony, &c.

When an *ague* proves fatal, it is uſually in the cold fit, through the oppreſſion of the ſpirits.

The cure is uſually begun with an emetic of *ipecacuanha*, an hour before the acceſs, and completed with the *cortex Peruvianus*, adminiſtered in the interval between two fits; and continued, at times, to prevent a relapſe.

We meet with divers other methods of curing *agues*, beſides that by the *cortex*; as by means of tea, which, taken an hour before the acceſs, is ſaid to remove the obſtruction,

tion, and correct the acidity; by *sal volatile*, which acts by attenuating the blood: in the island of Tino, by an infusion of flowers of little centaury. See Phil. Trans. N° 145.

Etmuller gives divers instances of *agues* cured by putting the patient in a fit of passion. Others have been effected by a fright, a fit of drunkenness, &c. 'Do we not often see *agues* cured by amulets and *periaptas*?' I myself, says Mr. Boyle, was cured of a violent quotidian by applying to my wrists a paste made of bay-salt, new hops, and blue currants, which has also relieved many others both of quotidians and tertians.' Phil. Works abr. tom. i. p. 80.

Lord Bacon says, 'It is often tried, that juices of stock-gillyflowers, rose-campion, garlick, and other things, applied to the wrists, and renewed, have cured long *agues*.' He likewise recommends in the heats of *agues*, to hold eggs of alabaster, and balls of crystal, in the hands.

Sir John Pringle accounts for them, by means of the principle of putrefaction. The heat of the body, he observes, varies little; and therefore the corruption produced in any of the humours must happen in a determinate time. If we suppose, that in the paroxysm, the more corrupted particles of the blood do not all pass off through the skin with the sweat, but that some part of them is discharged with the bile; their particles coming into the intestines, and being from thence taken up by the lacteals, and carried into the blood, may there act as a new ferment, and occasion a return of the fit. Thus the corruption of the bile may be the cause of the first fit, as well as of those that follow. He farther adds, that though all moist countries are subject to *agues* of some kind or other; yet if the moisture is pure, and the summers are not close and hot, they will mostly be regular tertian *agues*, and admit an easy cure. But if the moisture arises from long stagnating water, in which plants, fishes, and insects, die and rot, then the damps, being of a putrid nature, occasion not only more frequent, but more dangerous fevers, which more commonly appear in the form of quotidians, and double tertians, than that of single ones. Accordingly they are found to vary with the season, on which the degree of putrefaction in a great measure depends.

Though the bark be the most effectual remedy in this distemper, yet it has been known to cause worse disorders.

AGUE-*cake*, the popular name for a hard tumor on the left side of the belly, lower than the false ribs, said to be the effect of intermitting fevers.

AGUE-*tree* is a name given by some to SASSAFRAS, on account of its febrifuge virtue.

AGUGLIA, *see* OBELISK.

AGUGLIA is also the name given by the Italian fishermen to the ACUS of Oppian, called in English the GAR-FISH.

AGUILLANEUF, or AGUILLANEUS, a form of rejoicing used among the ancient Franks on the first day of the year.

The word is compounded of the French *à*, *to*, *gui*, *mistletoe*, and *l'an neuf*, i. e. *the new year*.

Its origin is traced from a druid ceremony: the priests used to go yearly in December, which with them was reputed a sacred month, to gather mistleto off the oak in great solemnity. The prophets marched in the front, singing hymns in honour of their deities; after these came a herald with a *caduceus* in his hand; these were followed by three druids a-breast, bearing the things necessary for sacrifice. Last of all came the chief, or arch-druid, accompanied with the train of people.

The chief druid climbing the oak, cut off the mistleto with a golden sickle, and the other druids received it in a white cloth. On the first day of the year it was distributed among the people, after having blessed and consecrated it by crying *au gui l'an neuf*, to proclaim the new year.

This cry is still continued in Picardy, with the addition of *planton*, *plantin*, to wish a plentiful year. In Burgundy, and some other parts, the children use the same word to beg a new year's gift.

Of later times the name *aguillaneuf* was also given to a sort of begging, practised in some dioceses, for church tapers, on a new year's day, by a troop of young people of both sexes, having a chief, &c. It was attended with divers ridiculous ceremonies, as dancing in the church, &c. which occasioned the synods to suppress it.

AGUILLES, or AUGUILLES, cotton cloth, manufactured at Aleppo.

AGUL, in *Botany*, a small shrub very prickly. Its leaves are longish, and resemble those of the knot-grass. It abounds with flowers of a reddish colour. These are succeeded by red husks. Its root is long, and of a purple colour.

This plant is otherwise called *alhagi mauroram*, by Rauwolf: it grows in Arabia, Persia, and Mesopotamia.

Manna is found on its leaves, as large as the grains of coriander, of the same taste and smell as ours, but it melts if the sun shines upon it. The leaves of this plant are purgative. Lemery.

AGURAH, in *Jewish Antiquity*, the twentieth part of an ancient silver SHEKEL.

The *agurah* is the same with what is otherwise called *gerah*, and *obolus*. The Septuagint translation renders it κέρας.

AGUSADURA, in *Ancient Customs*, a fee due from vassals to their lord, for sharpening their ploughing tackle.

Anciently the tenants in some manors were not allowed to have their rural implements sharpened by any but whom the lord appointed; for which an acknowledgment was to be paid, called *agusadura*, in some places *agusage*, which some take to be the same with what was otherwise called *reithege*, from the ancient French *reile*, a *plough-share*. Du-Cange.

AGUTI, in *Zoology*, the name of an American animal, much resembling the Guinea pig, as we call it, having the characters of the rat-kind, with the voice and hair of the hog.

The hairs are very hard, thick, and glossy, and are of a mixt colour, of a reddish and brown, with more or less black; those on the belly, however, are yellowish; its head and whiskers are like those of the rabbit-kind, but that the nose is sharper, and the upper chop longer than the under one, as in the hog-kind; the upper lip is split as in the hare, and the legs are naked, or have at the utmost only a few scattering hairs on them; the fore-feet have four toes, and the hinder ones six, and these are much longer than the fore-legs; its tail is very short, and its eyes prominent; its voice altogether resembles the grunting of a hog. It is a very voracious animal, devouring its food with extreme eagerness, and using its fore-feet for hands in the manner of the squirrel. It runs very swiftly, and is very expert at digging, so that it soon buries itself in the earth. When provoked, it raises all the hair of its back upright, and strikes the earth with its hinder feet. Ray.

AGUYI TREVA *Insulæ Mariguanæ*, in *Botany*, a plant mentioned by De Laet. It has the leaves of the orange-tree, only thinner, a dewy flower, a large fruit, with a greenish rind, which contains kernels like those of the pomegranate, thin, sweet, and not ill-tasted.

AGUYIGUEPA *ubi Brosimum*, in *Medicine*, the name given by many authors to the arrow-root, or *sagittaria alexipharmica* of the West Indies.

AGYEI, in *Antiquity*, a kind of obelisks consecrated to Apollo, and placed in the vestibules of houses, for their security.

The *agyei* were no other than huge stones, or perhaps sometimes timber, having either a circular or square basis, and terminating in a point at the top, sacred to Apollo, or, as some say, to Bacchus, as protector of the high-ways. Others will have them to have been erected to both those deities. Suidas & Pitiscus.

AGYNIANI, in *Church History*, a sect who condemned all use of flesh, and marriage, as not instituted by God, but introduced at the instigation of the devil.

The word is compounded of the private *a*, and γυνη, *woman*. They are sometimes also called *agynenses* and *agynii*; and are said to have appeared about the year 604.

AGYRTÆ, in *Antiquity*, a kind of strolling impostors running about the country, to pick up money by telling fortunes at rich men's doors, pretending to cure diseases, by charms, sacrifices, and other religious mysteries; also to expiate the crimes of their deceased ancestors, by virtue of certain odours and fumigations; to torment their enemies, by the use of magical verses, and the like. The word is formed of the verb αγυρω, *I congregate*; alluding to the practice of quacks, who gather a crowd about them. See ÆRUSCATORES.

AHALOTH, in the *Materia Medica*, a name used by some writers for the *lignum aloes*, or *aloes-wood*. It is the Hebrew name.

AHANIGER, in *Ichthyology*, a name given by Albertus, and others, to the fish called by authors ACUS *vulgaris*, and by us the GAR-FISH. The shape of this fish, which is very long and slender, has caused it to be confounded with the *syngnathus*, or tobacco-pipe fish, called also *acus*; but they differ extremely when examined; that being a true species of the *syngnathus*, and this of the ESOX or pike.

A-HEAD, refers to any object that lies immediately before a ship, or towards that point of the compass to which her stem is directed.

AHUCYATLI, in *Zoology*, the name of an American serpent, approaching to the nature of the hæmorrhous and rattle-snake, but larger than the former, and wanting the rattle of the latter; it is as fatal in the effect of its poison as any known species of serpent. Ray.

AHIUS,

AHIUS, see SALT-*fleur*.

AHMELLA, in *Botany*, is a species of *bidens*, or water-hemp agrimony. Its flowers are large, and resemble those of the marygold; they grow in large numbers on the tops of the stalk, and of the large branches, and are succeeded by oblong seeds, which have the same sort of points at one end with those of our common *bidens*, and all the other plants of that genus. The stalks are square, and the leaves stand in pairs, and are in shape like those of the common nettle. We have one species of it very common in all parts of England, about watry places; and easily known by its seeds, in autumn, sticking to the cloaths and stockings of people who go near the plant; by means of the three points at the end, which are sharp and bearded. It would be worth while to try whether these seeds possess virtues worthy notice in physic for at present they are neglected.

This plant, and the others of the same genus, are called by the name *beaux*, from the teeth or prickles at the ends of the seeds; but the word should be *bidens*, for these are three of them. Phil. Trans. N° 23.

AHOUAI, in *Botany*, the name of a genus of plants, called by Linnæus CRESSA.

The species of *ahouai*, mentioned by Mr. Tournefort, are these: 1. The *ahouai* of Theves, or the apple-leaved poisonous *ahouai*. And, 2. The narrow-leaved *ahouai*. By incision into the bark a milky liquor is produced, that smells like garlick.

AHULL denotes the situation of a ship, when all her sails are furled, on account of the violence of a storm, and when having lashed her helm to the lee side, the lies nearly with her side to the wind and sea, her head being somewhat inclined to the direction of the wind.

AIAIA, in *Ornithology*, the name of a Brasilian bird, of the *platea*, or spoonbill-kind, called by the Portuguese *colhereiro*. It is exactly of the same shape, and much of the same size with the European spoonbill, and its beak is in the very same manner broad at the end. It is of a pale, but very bright and shining flesh-colour, on the back and wings; the other parts of its body are perfectly white: it is common about the shores of rivers, and is held in very well tasted. Maregrave.

AJAX, in *Antiquity*, a furious kind of dance, in use among the Grecians; intended to represent the madness of that hero, after his defeat by Ulysses, to which the Greeks had given the preference in his contest for Achilles's arms.

Lucian in his treatise of dancing, speaks of dancing the *Ajax*. There was also an annual feast called *Aiantia*, *Aiantea* consecrated to that prince, and observed with great solemnity in the island of Salamis, as well as in Attica; where, in memory of the valour of Ajax, a bier was exposed, set out with a complete set of armour. Potter, Archæol.

AICHMATOTARCHA, see ÆCHMALOTARCHA.

AID, or AYDE, AUXILIUM, literally denotes the help, succour, or assistance, which any person lends another, when too weak to do, or avoid, something.

The word is French; formed, according to M. Menage, from the Italian *ajutare*, and that from the Latin *adjutare*, *to help*, or *assist*.

AID, or AYDE, in *Law*, is when a petition is made in court, for the calling in of help from another person interested in the matter in question; who, it is probable, may not only strengthen the party's cause who thus prays *his aid*, but also prevent a prejudice arising to his own right. This is called *aid prayer*; but this course of proceeding is now much disused.

A city, or corporation, holding a fee-farm of the king, may pray in *aid* of him, if any thing be demanded of them relating thereto.

The *aid prier* is sometimes also used in the king's behalf, to prevent any proceedings against him till his counsel be called, and heard what they have to say for avoiding the king's prejudice, or loss. Jenk. Cent. 64. Terms de Ley. 35. Stat. 4 Edw. I. and 14 Edw. III.

AID *de camp*, an officer in the army, whose business is to attend the general officers, and receive and carry their orders, as occasion requires.

When the king is in the field, he usually appoints young volunteers of quality to carry his orders, who are called the king's *aids de camp*.

AID *major*, or *adjutant*, is an officer, whose business is to ease the MAJOR of part of his duty; and to perform it all in his absence.

Some majors have several *aid majors*. Each troop of guards has but one major, who has two *aid majors* under him, or more, according as the business requires.

Every regiment of foot has as many *aid majors* as it contains battalions. When the battalion is drawn up, the *aid major's* post is on the left, beyond all the captains, and behind the lieutenant-colonel.

AID, AUXILIUM, in our *Ancient Customs*, denotes a subsidy or sum of money due to the lord, from his tenants, on certain occasions.

It differed from a *tax*, which is imposed at any time when wanted; whereas the *aid* could only be levied where it was customary, and where the particular occasion fell out.

Such was the *aid de relief*, due from the tenants in fee, upon the death of the lord next above, to his heir, towards the charge of a relief of the fee of the superior lord.

Such also was the *aid chevel*, or *capitale aid*, due by vassals, to the chief lord, or the king, of whom they held *in* CAPITE. Of this there are three kinds.

The first, of chivalry; or, as they call it, *pour faire fitz chevalier*, towards making his eldest son a knight, when arrived at the age of fifteen years: the second of marriage, or *pour file marier*, towards marrying his eldest daughter. Both these, with all charges incident thereto, are taken away by stat. 12 Car. II. c. 24. TYDDE, Survey, &c. Some will have them to have been first established in England by William the Conqueror, and afterwards transferred to Normandy; but the more common opinion is, that the Conqueror brought them with him. The third was of a ransom, due when the lord was taken prisoner by the enemy.

In some provinces there was a fourth kind of *aid*, due whenever the lord should undertake an expedition to the Holy Land.

We also read of *aids* paid the lord, when he was disposed to purchase any new land, or tenement. These were only granted once in his life. Also *aids* for the repairing, and fortifying of castles, seats, &c.

Aids were at first imposed by the lord, or king, at what rate he pleased, but by the statute of 3 Edw. I. a restraint was laid on common persons being lords, and they were tied down to a fixed proportion; and by a subsequent statute, the same rate was extended even to the king.

By the stat. 34 Edw. I. it is ordained that the king shall levy no *aid* or tax, without his parliament.

Aids seem to have been first established with a view to the clients and freedmen of ancient Rome, who made presents to their patron towards his daughter's fortune, as also on his birth day, and on other solemn occasions. Accordingly, Boutellier tells us, that in his time, these *aids* depended on the courtesy and good will of the vassals; for which reason they were called, *droits de complaisance*.

The bishops also received *aids* from their ecclesiastics, called *synodals*, and *procurations*. They were to be paid at the time of their consecration; or when they had a king to entertain; or when called by the pope to his court, or to a council; as also when they went to receive the *pallium*.

Add, that the archdeacons also exacted *aids* from the clergy of their jurisdiction. See PROCURATION.

Aids of feudal *aids* are still levied in Germany, &c. under the title of *collecta*.

AIDS are also used in matters of polity, for any extraordinary taxes, or impositions, occasionally levied by the king and parliament, upon the subjects, to support the charges of the government, when the ordinary revenue is deficient.

AID, *royal*, is a name frequently given to the land-tax.

AID, in *Theology*, the *aids* or assistances of divine favour, which are offered to man, have been the subject of much dispute betwixt Jansenists and Jesuits; for the composing whereof, a celebrated congregation was erected at Rome, under the title of congregation of *aids*, *congregatio de auxiliis*.

Some divines, after St. Augustine, distinguish two kinds of *aids*, viz. *sine quo*, and *quæ*.

Auxilium sine quo, that which the mind is at liberty either to use or refuse; such is supposed to have been the *aid* ministered to man in the state of innocency, while his mind and will were sound and upright.

Auxilium quo amounts to what is otherwise called efficacious grace, which surmounts and subdues the will: such, according to the Calvinists and Jansenists, is supposed to be the *aid* ministered by grace, in the present fallen state of human nature.

AIDS, in the *Manege*, are helps, or assistances, which some call cherishings, by which the horseman contributes towards the motion, or action, required of the horse; by a discreet use of the bridle, cavesson, spur, poinson, rod, calf of the leg, and voice; and also by a just and well-timed motion of the body.

Such a horse knows his *aids*, answers his *aids*, takes his *aids* with vigour, &c. The *aids* are made use of, to avoid the necessity of corrections. The same *aids*, given in a different manner, become corrections.

The *aids* used to make a horse go in ayre, are very different from those required in going upon the ground. Newcastle.

The inner heel, inner leg, and inner rein, are called *inner*

aids. The outer heel, outer leg, &c. are *outer aids*, See Berenger's Art of Horſemanſhip, vol. ii. p. 92, &c.

AIDS, in the *French Law*, denote a duty paid on all goods ſold and tranſported either out of, or into the kingdom. In this ſenſe, *aids* anſwer to what the Latins call *veſtigalia*, *a vehendis mercibus*, and are paid by all kinds of perſons, privileged or non-privileged; by which they diſſer from *tailles*, *taxes*, which are only paid by the peaſants, being a ſort of capitation, anſwering to what the Latins call *tributum*. The farm of the *aids* was formerly diſtinct from, but now united to, that of the *gabelles*, and other impoſts.

AIDS, *court of*, in France, is a ſovereign court, erected for the cognizance of matters relating to the taxes. Appeals come to this from the court of elections, where matters relating to the *taille* are firſt heard. The *court of aids* of a province is ſometimes ſeparated from the parliament of the province, and fixed in another city, as at Montpelier, Montauban, &c. There are twelve courts of *aids*, of which the principal is that at Paris.

AIEREBA, in *Ichthyology*, the name of a fiſh of the *paſſinacha marina* kind, but differing from all the others, in that the form of its body is regularly round, or oval, and its head placed far within the verge of its thin part. It is common in the weſtern ocean; but it is not much eſteemed for the table, being more looſe and flabby in its fleſh than the other kinds. Marcgrave.

AIGEIROS, a name ſometimes given to *black* POPLAR.

AIGHENDALE, a liquid meaſure in Lancaſhire, containing ſeven quarts.

AIGITHALUS, *aiγiθaλος*, in *Ornithology*, a name by which ſome of the old authors call the PARUS, or TITMOUSE.

AIGLETTE, in *Heraldry*. See EAGLET.

AIGRETTA, in *Ornithology*, a name uſed by ſome authors, as the name of a diſtinct ſpecies of heron, but ſeeming to be no other than a ſynonym of the GARZA *ſtavata*, or ARDEA *alba minor*, the ſmall white heron.

AIGUE *marine*, in *Natural Hiſtory*. See AQUA *Marina*.

AIGUISCE', AIGUISSE', or EGUISCE', in *Heraldry*, a term applied to a CROSS, when its four ends are ſharpened, but ſo as to terminate in obtuſe angles.

The croſs *aiguiſé* differs from the *croſs* FITCHE'E, in that the latter goes tapering by degrees to a ſharp point; whereas only the ends of the former are tapered.

AILE, or AIREL, in *Law*, a writ which lies where the grand-father, or great grand-father, called *beſaile*, was ſeiſed of lands or tenements in fee-ſimple, on the day he died; and a ſtranger abates or enters the ſame day, and diſpoſſeſſeth the heir or grand-child. See ABATEMENT.

The word is formed of the French *aieul*, *aval*, *grand-father*.

AILERONS, in *Natural Hiſtory*, petty-wings, a French term expreſſing two ſmall ſhelly ſubſtances, reſembling parts of wings, or young and juſt growing wings, and found in the two-winged flies, ſituated at the root of the larger wings. Reaumur.

The word is a diminutive of the French *aile*, *wing*.

AILES *vitrées*, in *Natural Hiſtory*, a French term uſed to expreſs the wings of a ſeries of inſects, which ſeem of a middle nature, between the fly and the butterfly kind, and are therefore called PAPILION *mouches* by theſe writers. The wings of theſe inſects are in part covered with duſt, or ſcales, and in part free from it, and tranſparent. In theſe free parts they look glaſſy; whence their name, ſignifying *glaſſy wings*.

AIPIMIXIRA, in *Ichthyology*, the name of an American fiſh, more uſually known by the name of PUDIANO. It is a ſmall fiſh, of the ſhape of a pearch, with a purple back, and yellow ſides and belly. Marcgrave.

AIR, AER, in *Phyſics*, a thin, fluid, elaſtic, tranſparent, ponderous, compreſſible, and dilatable body; ſurrounding the terraqueous globe to a conſiderable height.

Air was conſidered by ſome of the ancients as an *element*; but then, by *element*, they underſtood a different thing from what we do. See ELEMENTS.

It is certain, that *air*, taken in the popular ſenſe, is far from the ſimplicity of an *elementary* ſubſtance; though ſome of its properties and uſes in a ſtate of combination with various ſubſtances, from which it has been extricated by modern analyſis, may entitle it to this appellation. Hence *air* may be diſtinguiſhed into *proper* or *elementary*, and *vulgar* or *heterogeneous*.

AIR, *elementary*, or AIR *properly ſo called*, is a certain ſubtile, homogeneous, elaſtic matter; the baſis, or fundamental ingredient of the atmoſpherical *air*, and that which gives it the denomination.

In this ſenſe, it likewiſe enters into the compoſition of moſt, or perhaps all bodies, exiſting in them under a ſolid form, deprived of its elaſticity and moſt of its diſtinguiſhing properties, and ſerving as their cement, and the univerſal bond of nature; but capable, by certain proceſſes, of being diſengaged from them, recovering its elaſticity, and reſembling the *air* of our atmoſphere. See Hales's Vegetable Statics, chap. vi.

The peculiar nature of this *aerial* matter we know but little of; what authors have advanced concerning it being chiefly conjectural. We have no way of altogether ſeparating it from the other matters with which in its pureſt ſtate it is more or leſs combined, and conſequently no way of aſcertaining, with ſatisfactory evidence, its peculiar properties, abſtractedly from thoſe other bodies.

Dr. Hooke, and ſome others, maintain, that it is the ſame with the *æther*, or that fine, fluid, active matter diffuſed through the whole expanſe of the celeſtial regions which coincides with Sir I. Newton's *ſubtile medium*, or ſpirit. In this view it is ſuppoſed to be a body *ſui generis* ingenerable, incorruptible, immutable, preſent in all places, in all bodies.

Others, conſidering only its property of elaſticity, which they account its eſſential and conſtituent character, ſuppoſe it to be mechanically producible; and to be no other than the matter of other bodies ſo modified and altered, as to become permanently elaſtic. Sir Iſaac Newton obſerves that the particles of denſe, compact, and fixed ſubſtances, cohering by a ſtrong attractive force, are not ſeparable without a vehement heat, or perhaps not without fermentation; and ſuch bodies being at length rarefied by ſuch heat or fermentation, become true *permanent air*; and diſtinguiſhable from vapour, which is only *apparent* or *tranſient air*, as is evident from the experiment with the *antliple*. Optics, Qu. 31. p. 371. 372. ed. 3. See AIR, *atmoſpherical* and *fixed*.

AIR, *vulgar*, or *heterogeneous*, is a coalition of corpuſcles of various kinds, which together conſtitute one fluid maſs, wherein we live and move, and which we are continually receiving and expelling by reſpiration. The whole aſſemblage of this makes what we call the *atmoſphere*; where this *air*, or *atmoſphere*, terminates, there *æther* is ſuppoſed to commence; which is diſtinguiſhed from *air*, by its not making any ſenſible retraction of the rays of light, as *air* does.

Air, in this popular and extenſive meaning of the term, is acknowleged by Mr. Boyle to be the moſt heterogeneous body in the univerſe: Boerhaave ſhews it to be an univerſal chaos, or *colluvies*, of all kinds of created bodies. Beſide the matter of light or fire, which continually flows into it from the heavenly bodies, and probably the magnetic effluvia of the earth; whatever fire can volatiliſe is found in the air.

Hence, for inſtance, 1. The whole foſſil kingdom muſt neceſſarily be found in it: for all of that tribe, as ſalts, ſulphurs, ſtones, metals, &c. are convertible into fume, and thus capable of being rendered part of the *air*. Gold itſelf, the moſt fixed of all natural bodies, is found to adhere cloſe to the ſulphur in mines; and thus to be raiſed along with it. Mr. Boyle obſerves, that beſide the ſaline *effluvia* of the common ſort, ſuch as the nitrous vitriolic, marine, &c. there may be many compound kinds of ſalts in the *air*, which we have not on earth aſſiſting from different ſaline ſpirits, fortuitouſly meeting and mixing together. Thus, the glaſs windows of ancient buildings are ſometimes obſerved to be corroded, as if they had been worm-eaten; though none of the ſimple ſalts above mentioned have the faculty of corroding glaſs.

Sulphurs too muſt make a conſiderable ingredient of the *air*, on account of thoſe many volcanos, grottos, caverns, and other ſpiracles chiefly affording that mineral, diſperſed through the globe.

2. All the parts of the animal kingdom muſt alſo be in the *air*; for beſide the copious *effluvia* continually emitted from their bodies, by the vital heat, in the ordinary proceſs of perſpiration; by means of which an animal, in the courſe of its duration, impregnates the *air* with many times the quantity of its own body; we find that any animal when dead, being expoſed to the *air*, is in a certain time wholly incorporated with it.

3. As to vegetables, none of that claſs can be ſuppoſed wanting; ſince we know that all vegetables, by putrefaction, become volatile.

The aſſociations, ſeparations, attritions, diſſolutions, and other operations of one ſort of matter upon another, may likewiſe be conſidered as ſources of numerous other neutral, or anonymous bodies, unknown to us.

Air, in this general ſenſe, is one of the moſt conſiderable and univerſal agents in all nature; being concerned in the preſervation of life, and the production of moſt of the phenomena relating to our world. Its properties and effects, including a great part of the reſearches and diſcoveries of the modern philoſophers, have in a conſiderable degree been reduced to preciſe laws and demonſtrations; in which form they make a very extenſive

and important branch of the mixed mathematics, called PNEUMATICS.

AIR, *mechanical properties and effects of.* The moſt conſiderable of theſe are its *fluidity*, *weight*, and *elaſticity*.

I. *Fluidity.* That the *air* is a *fluid*, is evident from the eaſy paſſage it affords to bodies through it; as in the propagation of ſmells, and other *effluvia*, and the eaſy conveyance it affords to ſounds: for theſe, and ſimilar effects, prove it to be a body, whoſe parts give way to any force impreſſed, and, in yielding, are eaſily moved among themſelves; which is the definition of a *fluid*. Beſides, it is certain, that no degree of cold has ever yet been produced, natural or artificial, ſtrong enough to deprive it of its *fluidity*.

They who, with the Carteſians, make *fluidity* to conſiſt in a perpetual inteſtine motion of the parts, find that *air* anſwers alſo to that character: thus, in a darkened room, where the ſpecies of external objects are brought in by a ſingle ray, they appear in a continual fluctuation; and thus even the more accurate *thermometers* are obſerved never to remain a moment at reſt.

The cauſe of this *fluidity* of *air* is attributed by ſome later philoſophers to the fire intermixed with it; without which, they imagine, the atmoſphere would harden into a ſolid, impenetrable maſs. And hence, the greater the degree of fire, the more fluid, moveable, and pervious, is the *air*: and thus, as the degree of fire is continually varying, according to the circumſtances and poſition of the heavenly bodies, the *air* is kept in a continual reciprocation. See Buffon's Hiſt. Nat. Suppl. vol. i. Hence, in a great meaſure, it is ſaid, that on the tops of the higher mountains, the ſenſes of ſmelling, hearing, &c. are found very feeble. The increaſed rarity of the *air* at a conſiderable height may account for this effect; but the above hypotheſis is contradicted by the more ſenſible experience of cold: the *air* near the ſurface of the earth deriving greater heat from the *reflected* than from the direct rays of the ſun. See Mountains.

II. *Weight* or *gravity.* Galileo firſt diſcovered that *air* had weight, Dial. I. but the preſſure of the atmoſphere was obſerved by his diſciple Torricelli; and the variations of it depending on different heights, by M. Paſcal. That the *air* is heavy, follows from its being a body; weight being an eſſential property of matter. But we have many arguments to the ſame purpoſe from ſenſe, and experiment: thus, the hand, applied on the orifice of a veſſel empty of *air*, ſoon feels the load of the incumbent atmoſphere. Thus, glaſs veſſels, exhauſted of their *air*, are eaſily cruſhed to pieces by the weight of the *air* without. So, two ſmall hollow ſegments of a ſphere, four inches in diameter, exactly fitting each other, being emptied of *air*, are preſſed together with a force equal to 188 pounds, by the weight of the ambient *air*; and that they are kept together by the preſſure of the *air* is evident, by ſuſpending them in an exhauſted receiver, where they will ſeparate of themſelves. Farther, if a tube, cloſe at one end, be filled with mercury, and the other end immerged in a baſon of the ſame fluid, and thus erected, the mercury in the tube will be ſuſpended at the height of about thirty inches above the ſurface of that in the baſon. The reaſon of which ſuſpenſion is, that the mercury in the tube cannot fall lower, without falling that in the baſon; which being preſſed down by the weight of the incumbent atmoſphere, cannot give way, unleſs the weight of the mercury in the tube exceeds that of the *air* out of it. That this is the caſe, is evident; becauſe, if the whole *apparatus* be included in the receiver of an *air*-pump, the mercury will fall in proportion as the *air* is exhauſted; and on gradually letting in the *air* again, the mercury re-aſcends to its former height. This makes what is uſually called the *Torricellian experiment*.

To ſay no more, we can actually weigh *air*; for a veſſel, full even of common *air*, is found, by a very nice balance, to weigh more than when the *air* is exhauſted; a quart of *air* weighing about 17 grains; and the effect is proportionably more ſenſible, if the ſame veſſel be weighed full of condenſed *air* in a receiver void of *air*.

The weight of *air* is continually varying, according to the different degree of heat and cold, and the concurrence of other cauſes. Ricciolus eſtimates its weight to that of water, to be as 1 to 1000: Merſennus, as 1 to 1300, or 1 to 1356: Lana, as 1 to 640; Galileo only makes it as 1 to 400. Mr. Boyle, by a more accurate experiment, found it about London, as 1 to 938; and thinks, all things conſidered, the proportion of 1 to 1000 may be taken as a *medium*; for there is no fixing any preciſe *ratio*, ſince not only the *air*, but the water itſelf, is continually varying. Add, that experiments made in different places neceſſarily vary, on account of the different heights of the places, the ſeaſons of making the experiments, and the different denſities of *air* correſponding to theſe circumſtances. It muſt be added, however, that by experiments made ſince, before the Royal Society, the proportion of *air* to water was, firſt, found as 1 to 840; then, as 1 to 852; and a third time, as 1 to 860. Phil. Tranſ. N° 181. And laſtly, by a very ſimple and accurate experiment of Mr. Haukſbee, the proportion was ſettled, as 1 to 885. Phyſ. Mechan. Paper. But theſe experiments being all made in the ſummer months, when the barometer was 29½ inches high; Dr. Jurin thinks that at a *medium* between heat and cold, when the barometer is 30 inches high, the proportion between the two fluids may be taken as 1 to 870; which agrees with the obſervation of the honourable Mr. Cavendiſh, the thermometer being at 50°, and the barometer at 29½ inches. Phil. Tranſ. vol. lvi. p. 152.

Air, then, being heavy and fluid, the laws of its gravitation, or preſſure, may be inferred to be the ſame as in other fluids; and conſequently its preſſure muſt be as its perpendicular altitude. This is alſo confirmed by experiment. For removing the *Torricellian tube* to a more elevated place, where the incumbent column of *air* is ſhorter, a proportionably ſhorter column of mercury is ſuſtained. On this principle depend the ſtructure and uſe of the BAROMETER.

From hence alſo, it follows, that the *air*, like all other fluids, muſt preſs equally every way. This is confirmed by obſerving, that ſoft bodies ſuſtain this preſſure without any change of figure, and brittle bodies, without breaking; though the preſſure upon them be equal to that of a column of mercury thirty inches high, or a column of water of thirty-two feet. It is obvious, that no other cauſe can preſerve ſuch bodies unchanged, but the equable preſſure on all ſides, which reſiſts as much as it is reſiſted. And hence, upon removing or diminiſhing the preſſure on one ſide only, the effect of the preſſure is ſoon perceived on the other. For the quantity and effect of this preſſure of the atmoſphere on the human body, and on the ſurface of the earth, ſee ATMOSPHERE.

From the *gravity* of the *air*, conſidered in connection with its fluidity, ſeveral of its uſes and effects are deducible.

1. By means of its *weight*, &c. it cloſely inveſts the earth, with all the bodies upon it; and conſtringes and binds them down with a force amounting, according to the computation of M. Paſcal, to 2732 pounds weight upon every ſquare foot, or upwards of 15 pounds upon every inch ſquare. Hence it prevents, e. g. the arterial veſſels of plants and animals from being too much diſtended by the impetus of the circulating juices, or by the elaſtic force of the *air* ſo plentifully contained in the blood. Thus, we ſee, in the operation of cupping, that, upon a diminution of the preſſure of the *air*, the parts of the body grow tumid: which neceſſarily alters the manner of the circulation through the capillaries, &c.

The ſame cauſe hinders the juices from oozing and eſcaping through the pores of their containing veſſels: this is experienced by ſuch as travel up high mountains, who, in proportion as they aſcend, find themſelves more and more relaxed; and at length become ſubject to a ſpitting of blood, and other hemorrhages: becauſe the *air* doth not ſufficiently conſtringe the veſſels of the lungs. Similar effects are obſerved in animals that are incloſed under the receiver of the *air*-pump, who, as the *air* is taken from them, pant, ſwell, vomit, and diſcharge their urine and excrements. See VACUUM.

2. The *weight* of the *air* promotes the mixture of contiguous fluid bodies. Hence many ſolids, as oils and ſalts, which readily and ſpontaneouſly mix in *air*, remain, on the removal of it, in a ſtate of ſeparation.

3. This *gravity* of *air* does in ſome caſes determine the action of one body upon another.

And, 4. to the ſame principle are chiefly owing our winds, which are only *air* put in motion by ſome alteration in its *equilibrium*.

III. *Elaſticity*—or a power of yielding to an impreſſion by contracting its dimenſions: and, upon removing or diminiſhing the impreſſive cauſe, of returning to its former ſpace or figure. This *elaſtic* force has been long accounted the diſtinguiſhing property of *air*, the other properties hitherto enumerated being common to it with other fluids: though, from late experiments, it appears more than probable, that the capacity of being compreſſed and expanded is not peculiar to *air*. See WATER and COMPRESSION.

This property of *air* was firſt aſcertained by ſome experiments of lord Bacon, who, upon this principle, conſtructed his *nitrum calendare*, the firſt thermometer. Bacon. Nov. Organ. lib. ii. aph. 13.

Of this power we have numerous proofs. Thus, a blown bladder being ſqueezed in the hand, we find the included *air* ſenſibly reſiſt; ſo that upon ceaſing to compreſs, the cavities or impreſſions, made in its ſurface, are readily expanded again, and filled up.

On this property of *elaſticity*, the ſtructure and office of the *air*-pump depend.

Every particle of *air* always exerts this *niſus*, or endeavour to expand, and thus ſtrives againſt an equal endeavour of the ambient particles; whoſe reſiſtance, happening by no means to be weakened, it immediately diffuſes into an immenſe extent. Hence it is, that thin glaſs bubbles, or bladders, filled with *air*, and exactly cloſed, being included in the exhauſted receiver of an *air*-pump, burſt, by the force of the included *air*. So a bladder quite flaccid, containing only the ſmalleſt quantity of *air*, ſwells in the receiver, and appears quite full. The ſame effect is alſo found, by carrying the flaccid bladder to the top of a high mountain.

It has been queſtioned among philoſophers, whether this *elaſtic* power of the *air* is capable of being deſtroyed or diminiſhed. Mr. Boyle made ſeveral experiments, with a view to diſcover, how long *air*, brought to the greateſt degree of expanſion to which he could reduce it in his *air*-pump, would retain its ſpring; and could never obſerve any ſenſible diminution. Defaguliers found that *air*, after having been incloſed for half a year in a wind-gun, had loſt none of its *elaſticity*; and Roberval, after preſerving it in the ſame manner for ſixteen years, obſerved, that its expanſive projectile force was the ſame, as if it had been recently condenſed. Nevertheleſs, Mr. Haukſbee concludes, from a later experiment, that the ſpring of the *air* may be ſo diſturbed by a violent preſſure, as to require ſome time to return to its natural tone. Dr. Hales inferred, from a number of experiments, that the *elaſticity* of the *air* is capable of being impaired and diminiſhed by a variety of cauſes. See AIR, *fixed*.

The weight or preſſure of the *air*, it is obvious, has no dependence on its *elaſticity*; but would be the ſame, whether the *air* had ſuch a property or not. But the *air*, being *elaſtic*, is neceſſarily affected by the preſſure, which reduces it into ſuch a ſpace, as that the *elaſticity* which re-acts againſt the compreſſing weight, is equal to that weight.

In effect, the *law* of this *elaſticity* is, that it increaſes as the denſity of the *air* increaſes; and the denſity increaſes, as the force increaſes by which it is preſſed. Now, there muſt neceſſarily be a balance between the action and re-action; i. e. the *gravity* of the *air*, which tends to compreſs it, and the *elaſticity* of the *air*, which endeavours to expand it, muſt be equal.

Hence, the *elaſticity* increaſing, or diminiſhing, univerſally, as the denſity increaſes, or diminiſhes, i. e. as the diſtance between the particles diminiſhes, or increaſes, it is no matter whether the *air* be compreſſed, and retained in ſuch ſpace, by the weight of the atmoſphere, or by any other means; it muſt endeavour, in either caſe, to expand with the ſame force. And hence, if *air* near the earth be pent up in a veſſel, ſo as to cut off all communication with the external *air*, the preſſure of the incloſed *air* will be equal to the weight of the *atmoſphere*. Accordingly, we find *mercury* ſuſtained to the ſame height, by the *elaſtic* force of *air* incloſed in a glaſs veſſel, as by the whole *atmoſpherical* preſſure.

On the ſame principle *air* may be artificially condenſed; and hence the ſtructure of the WIND-*gun*.

The utmoſt limits to which *air*, of the denſity which it poſſeſſes at the ſurface of the earth, is capable of being compreſſed, have not been aſcertained. Mr. Boyle made it thirteen times more denſe; Dr. Halley ſays that he has ſeen it compreſſed ſo as to be ſo times denſer than in its natural ſtate, which is farther confirmed by M. Papin, and M. Huygens; Dr. Hales, by means of a preſs, condenſed it 38 times; and by forcing water in an iron ball or globe, into 1551 times leſs ſpace than in naturally occupies.

However Dr. Halley has aſſerted, in the Philoſophical Tranſactions, Abr. vol. ii. p. 17. that from the experiments made at London, and by the Academy del Cimento at Florence, it might be ſafely concluded, that no force whatever is able to reduce *air* into 800 times leſs ſpace than that which it naturally poſſeſſes on the ſurface of our earth. In anſwer to which, M. Amontons, in the Memoirs of the French Academy, maintains, that there is no aſſixing any bounds to its condenſation; that greater and greater weights will ſtill reduce it into leſs and leſs compaſs; that it is only *elaſtic* in virtue of the fire which it contains; and that as it is impoſſible ever abſolutely to drive all the fire out of it, it is impoſſible ever to make the utmoſt condenſation.

The dilatation of the *air*, by virtue of its *elaſtic* force, is found to be very ſurpriſing; and yet Dr. Wallis ſuggeſts, that we are far from knowing the utmoſt of which it is capable. In ſeveral experiments made by Mr. Boyle, it dilated firſt into 9 times its former ſpace; then into 31 times; then into 60; then into 150. Afterwards, it was brought to dilate into 8000 times its ſpace; then into 10000, and even at laſt into 13679 times its ſpace; and this altogether by its own expanſive force, without the help of fire.

On this depend the ſtructure and uſe of the MANOMETER. Hence, it appears, that the air we breathe near the ſurface of the earth is compreſſed by its own weight into at leaſt the 13679th part of the ſpace it would poſſeſs *in vacuo*. But if the ſame *air* be condenſed by art, the ſpace it will take up when moſt dilated, to that it poſſeſſes when condenſed, will be, according to the ſame author's experiments, as 550000 to 1.

We thence ſee how wild and erroneous the obſervation of Ariſtotle was, that *air*, rendered ten times rarer than before, changes its nature, and becomes fire.

M. Amontons, and others, we have already obſerved, attribute the rarefaction of the *air* wholly to the fire contained in it; and therefore, by increaſing the degree of heat, the degree of rarefaction may be carried ſtill farther than its ſpontaneous dilatation. Air is expanded $\frac{1}{3}$ of its bulk by boiling water. Hiſt. Acad. Sc. 1699.

Dr. Hales found that the *air* in a retort, when the bottom of the veſſel was juſt beginning to be red-hot, was expanded through twice its former ſpace, and in a white, or almoſt melting heat, it occupied thrice its former ſpace; but Mr. Robins found, that *air* was expanded by the heat of iron, juſt beginning to be white, to four times its former bulk.

On this principle depend the ſtructure and office of the THERMOMETER.

M. Amontons firſt diſcovered that *air* will expand, in proportion to its denſity, with the ſame degree of heat. On this foundation, the ingenious author has a diſcourſe, to prove 'that the ſpring and weight of the *air*, 'with a moderate degree of warmth, may enable it to 'produce even earthquakes, and other of the moſt ve'hement commotions of nature.'

According to the experiments of this author, and M. de la Hire, a column of *air* on the ſurface of the earth, 36 fathoms high, is equal in weight to three lines depth of mercury; and it is found, that equal quantities of *air* poſſeſs ſpaces reciprocally proportional to the weights with which they are preſſed: the weight of the *air*, therefore, which would fill the whole ſpace poſſeſſed by the terreſtrial globe, would be equal to a ſylinder of mercury, whoſe baſe is equal to the ſurface of the earth, and its height containing as many times three lines, as the atmoſpherical ſpace contains orbs equal in weight to 36 fathoms of that wherein the experiment was made.—Hence, taking the denſeſt of all bodies, *v. gr.* gold, whoſe gravity is about 14630 times greater than that of *air* in our orb, it is eaſy to compute, that this *air* would be reduced to the ſame denſity as gold, by the preſſure of a column of mercury 14630 times 28 inches high, i. e. 409640 inches, ſince the bulks of *air*, in that caſe, would be in the reciprocal ratio of the weights by which they are preſſed. Theſe 409640 inches, therefore, expreſs the height at which the barometer muſt ſtand, where the *air* would be as heavy as gold, and the number 3[illegible] lines, the thickneſs to which our column of 36 fathoms of *air* would be reduced in the ſame place.

Now, we know, that 43528 fathoms, which is the depth, where the above preſſure, and conſequent reduction take place, are only the 74th part of the ſemidiameter of the earth; and therefore, beyond that depth, whatever matter exiſts, it muſt be heavier than gold. It is not improbable, therefore, that the remaining ſphere of 6251538 fathoms diameter may be full of denſe *air*, heavier, by many degrees, than the heavieſt bodies which we know. Hence, again, as it is proved, the more *air* is compreſſed, the more does the ſame degree of fire increaſe the force of its ſpring, and render it capable of a proportionably greater effect; we may infer, that a degree of heat, which in our orb can only produce a moderate effect, may have a very violent one in ſuch lower orb; and that, as there may be many degrees of heat in nature, beyond that of boiling water, it is probable there may be ſome, whoſe violence, thus aſſiſted by the weight of the *air*, may be ſufficient to tear aſunder the ſolid globe. Mem. de l'Acad. an. 1703. For the true cauſe of earthquakes, ſee EARTHQUAKES.

This *elaſtic* property of *air* is ſuppoſed by many philoſophers to depend on the figure of its corpuſcles, which they ſuppoſe to be ramous; ſome maintain that they are ſo many minute *flocculi*, reſembling fleeces of wool; others conceive them rolled up like hoops, and curled like wires, or ſhavings of wood, or coiled like the ſprings of watches, and endeavouring to reſtore themſelves in virtue of their texture: ſo that to produce *air*, muſt be to produce ſuch a figure and diſpoſition of parts; and thoſe bodies only are proper ſubjects, which are ſuſceptible of ſuch diſpoſition; which ſhalds, from the ſmoothneſs, roundneſs, and ſlipperineſs of their parts, are not.

But

But Sir Isaac Newton (*Optics*, p. 371.) explains the matter otherwise; ſuch a texture, he thinks, by no means ſufficient to account for that vaſt power of *elaſticity* obſerved in *air*, which is capable of diffuſing into above a million of times more ſpace than it before poſſeſſed.—But, as all bodies are ſhewn to have an attractive and repelling power; and as both theſe are ſtronger in bodies, the denſer, more compact, and ſolid they are; hence it follows, that when by heat, or any other powerful agent, the attractive force is ſurmounted, and the particles of the body ſeparated ſo far as to be out of the ſphere of attraction; the repelling power commencing thence makes them recede from each other with a ſtrong force proportionable to that wherewith they before cohered; and thus they become permanent *air*. And he has proved, that particles, endeavouring to recede from each other with forces reciprocally proportional to the diſtance between their centres, will compoſe an *elaſtic* fluid, whoſe denſity ſhall be proportional to its compreſſion. Hence, ſays the ſame author, it is, that as the particles of permanent *air* are groſſer, and riſe from denſer bodies, than thoſe of tranſient *air*, or vapours, true *air* is more ponderous than vapour; and a moiſt atmoſphere is lighter than a dry one.

The *elaſtic* power of the *air* above illuſtrated and evinced, is the ſecond great ſource of the effects of this important fluid. By means of this, it inſinuates into the pores of bodies, poſſeſſing this prodigious faculty of expanding, which is ſo eaſily excited, that it muſt neceſſarily put the particles of bodies into which it inſinuates itſelf into perpetual oſcillations. Indeed, the degree of heat, and the *air*'s gravity and denſity, and conſequently its elaſticity and expanſion, never remaining the ſame for the leaſt ſpace of time, there muſt be an inceſſant vibration, or dilatation and contraction in all bodies.

We obſerve this reciprocation in ſeveral inſtances, particularly in plants, the *tracheæ*, or *air*-veſſels, of which do the office of lungs; for the contained *air* alternately expanding and contracting, as the heat increaſes or diminiſhes, by turns preſſes the veſſels, and eaſes them again; and thus promotes a circulation of their juices. See AIR-*veſſels*. Hence, we find, that no vegetation or germination will proceed *in vacuo*. Indeed beans have been obſerved to grow a little tumid therein; and this has led ſome to attribute that to vegetation, which was really owing to no other cauſe than the dilatation of the *air* within them. The *air* is very inſtrumental in the production and growth of vegetables, not only by invigorating their ſeveral juices, while in an *elaſtic* active ſtate, but, alſo, by greatly contributing in a fixed ſtate to the union and firm connexion of their ſeveral conſtituent parts.

From the ſame cauſe it is, that the *air* contained in bubbles of ice, by its continual action, burſts the ice; and thus glaſſes and other veſſels frequently crack, when their contained liquids are frozen. Thus, alſo, entire columns of marble ſometimes cleave in the winter time, from ſome little bubble of included *air*'s acquiring an increaſed elaſticity. From the ſame principle ariſe all PUTREFACTION and FERMENTATION; neither of which will proceed, even in the beſt diſpoſed ſubjects, *in vacuo*.

Since we find ſuch great quantities of *elaſtic air*, generated in the ſolution of animal and vegetable ſubſtances, a good deal muſt conſtantly ariſe from the diſſolution of theſe elements in the ſtomach and bowels, which is much promoted by it.

In reality, all natural corruption and alteration ſeem to depend on *air*; and metals, particularly gold, only ſeem to be durable and incorruptible, in virtue of their not being pervious to *air*.

AIR, *effects of the different ingredients of it.* *Air* not only acts by its common properties of *gravity* and *elaſticity*, but there are numerous other effects, ariſing from the peculiar ingredients of which it conſiſts.

Thus, 1. It not only diſſolves and attenuates bodies by its preſſure and attrition, but as a *chaos* containing all kinds of menſtrua, and conſequently poſſeſſing powers for diſſolving all bodies. It is known that iron and copper readily diſſolve, and become ruſty in *air*, unleſs well defended with oil. Boerhaave aſſures us that he has ſeen pillars of iron ſo reduced by *air*, that they might be crumbled to duſt between the fingers; and as for copper, it is converted by the *air*, into a ſubſtance much like the verdigriſe produced by vinegar.

Air. Boyle relates, that in the ſouthern Engliſh colonies the great guns ruſt ſo faſt, that, after lying in the *air* for a few years, large cakes of *ferugo martis* may be ſeparated from them. Acoſta adds, that in Peru the *air* diſſolves lead, and conſiderably increaſes its weight. Yet gold is generally eſteemed indiſſoluble by *air*; being never found to contract ruſt, though expoſed to it ever ſo long. The reaſon may be, that ſea ſalt, which is the only menſtruum capable of acting on gold, being very difficult to volatilize, there is but a ſmall proportion of it in the atmoſphere. In the laboratories of chemiſts, where *aqua regia* is prepared, the *air* becoming impregnated with an unuſual quantity of this ſalt, gold contracts a ruſt like other bodies.

Stones alſo undergo the changes incident to metals.—Thus, Purbeck ſtone, of which Saliſbury cathedral conſiſts, is obſerved gradually to become ſofter, and to moulder away in the *air*; and Mr. Boyle gives the ſame account of Blackington ſtone. He adds, that *air* may have a conſiderable operation on vitriol, even when a ſtrong fire could act no farther upon it. And he has found, that the fumes of a corroſive liquor work more ſuddenly and manifeſtly on a certain metal, when ſuſtained in the *air*, than the menſtruum itſelf did, which emitted fumes, on thoſe parts of the metal, which it covered; referring to the effects of the *efflutia* of vinegar on COPPER.

The diſſolving power of *air* is increaſed by heat, and by other cauſes. It combines with water; and, by acceſs of cold, depoſits part of the matter which was kept diſſolved in it, by a greater degree of heat. Hence the water, by being depoſited and condenſed upon any cold body, ſuch as glaſs, &c. in windows, forms fogs, and becomes viſible. *Air*, likewiſe, by means of its diſſolving power, accelerates EVAPORATION and DISTILLATION.

2. *Air* volatilizes fixed bodies. Thus, ſea-ſalt, being firſt calcined, then fuſed by the fire, and when fuſed expoſed to the *air* to liquify; when liquified ſet to dry, and then fuſed again, repeating the operation, will by degrees, be almoſt wholly evaporated; nothing but a little earth remaining. Helmont mentions it as an arcanum in chemiſtry, to render fixed ſalt of tartar volatile; but this is eaſily effected by *air* alone: for, if ſome of this ſalt be expoſed to the *air*, in a place replete with acid vapours, the ſalt draws the acid to itſelf, and, when ſaturated with it, is volatile.

3. *Air* alſo fixes volatile bodies. Thus, though ſpirit of nitre, or aqua fortis, readily evaporates by the fire; yet if there be any putrefied urine near the place, the volatile ſpirit will be fixed, and fall down in form of AQUA SECUNDA.

4. *Air* brings many quieſcent bodies into action; i. e. excites their latent powers. Thus, if an acid vapour be diffuſed through the *air*, all the bodies of which that is the proper menſtruum, being diſſolved by it, are brought into a ſtate proper for action.

In the various operations of chemiſtry, *air* is a very neceſſary and important agent; the reſult of particular proceſſes depending on its preſence or abſence, on its being open or cloſed. Thus, the parts of animals and vegetables can only be calcined in open *air*; in cloſe veſſels they never become any other than black coals. And theſe operations are effected by the changes to which the *air* is liable. Many inſtances might be alleged to this purpoſe. Let it ſuffice to obſerve, that it is very difficult to procure oil of ſulphur, *per campanum*, in a clear dry atmoſphere; but in a thick moiſt *air* it may be obtained with greater eaſe, and in larger quantities. So pure well-fermented wine, if it be carried to a place where the *air* is replenished with the fumes of new wine, then fermenting, it will begin to ferment afreſh.

The changes in the *air* ariſe from various cauſes, and are obſervable, not only in its mechanical properties, ſuch as gravity, denſity, &c. but in the ingredients that compoſe it. Thus, at Fahlun in Sweden, noted for copper-mines, the mineral exhalations affect the *air* in ſuch a manner, as to diſcolour the ſilver coin in purſes; and the ſame effluvia change the colour of braſs. In Carniola, Campania, &c. where are mines of ſulphur, the *air* ſometime becomes very unwholeſome, which occaſions frequent epidemic diſeaſes, &c.

The effluvia of animals alſo have their effect in varying the *air*; as is evident in contagious diſeaſes, plagues, murrains, and other mortalities, which are ſpread by an infected *air*.

The ſudden and fatal effect of noxious vapours has generally been ſuppoſed to be principally, if not wholly, owing to the loſs and waſte of the *vivifying ſpirit of air*. But Dr. Hales attributes this effect to the loſs of a conſiderable part of the *air*'s *elaſticity*, and to the groſſneſs and denſity of the vapours with which the *air* is charged. He found, by an experiment made on himſelf, that the lungs will not riſe and dilate as uſual, when they draw in ſuch noxious *air*, the *elaſticity* of which has been conſiderably diminiſhed. For having made a bladder very ſupple by wetting it, and then cutting off ſo much of the neck, as would make a hole wide enough to admit the biggeſt end of a large foſſet, to which the bladder was bound; and then having blown the bladder, he put the ſmall end of the foſſet into his mouth, and, at the ſame time, pinched his noſtrils ſo cloſe, that no *air* might paſs that way, and he could only breathe to and fro the *air* contained in the bladder, which, with the foſſet, contained ſeventy-four cubic inches. In leſs than half

a mi-

a minute, he found a considerable difficulty in breathing; and at the end of a minute, the bladder was become so flaccid, that he could not blow it above half full, with the greatest expiration which he could make; and at the same time, he could plainly perceive that his lungs were much fallen, in the same manner as when we breathe out of them all the *air* we can at once. Hence he concluded, that a considerable quantity of the *elasticity* of the *air* was destroyed; and that when the suffocating quality of the *air* was the greatest, it was with much difficulty that he could dilate his lungs in a very small degree. From this, and several other experiments, he inferred, that the life of animals is preserved rather by the elastic force of the *air* acting on their lungs, than by its vivifying spirit; and that candles and matches cease to burn, after having been confined in a small quantity of *air*; not because they have rendered the *air* effete by consuming its vivifying spirit, but because they have discharged a great quantity of acid fuliginous vapours, which partly destroy its elasticity, and retard the elastic motion of the remainder. He likewise found, that *air*, which passed through cloths dipped with vinegar, could be breathed to and fro as long again as the like quantity of *air*, which was not thus purified; so that sprinkling the decks of ships with vinegar may refresh the *air*; and this is confirmed by experience. But where the corruption of the *air* is much greater, as in close prisons, &c. nothing can be an adequate and effectual remedy but a VENTILATOR. He observed likewise, that *air* is not disqualified for respiration, merely by the additional moisture which it receives, but by some bad quality in that moisture. See his Statical Essays, vol. ii.

Dr. Priestley observes, that, when animals die upon being put into air, in which other animals have died, after breathing it as long as they could, it is plain, that the cause of their death is not the want of any *pabulum vitæ*, which has been supposed to be contained in the *air*; but because the *air* is impregnated with something stimulating to their lungs; for they almost always die in convulsions, and are sometimes affected so suddenly, that they are irrecoverable after a single inspiration. And he has found the same effect from any other kind of noxious *air*. He concludes, from subsequent experiments, that the *air* becomes phlogisticated in its passage through the lungs, by means of the blood. Experiments and Observations on Air, vol. i. p. 71. vol. ii. p. 31. vol. iii. p. 55. See *Air phlogisticated*, BLOOD, and RESPIRATION.

Vegetables likewise produce a change in the state of the *air*. Thus, when a great part of the clove-trees, which grow so plentifully in the island of Ternate, was felled at the solicitation of the Dutch, in order to heighten the value of that fruit, such a change ensued in the *air*, as shewed the salutary effects of the effluvia, or rather of the vegetation of those trees, and their blossoms; for the whole island, soon after they were cut down, being exceeding sickly. See *Air phlogisticated*.

The *air* is also liable to alterations from the season of the year. Thus, few subterraneous effluvia are emitted in the winter, because the pores are locked up by the frost, or covered by snow; the subterraneous heat being at work, and preparing a heat to be discharged in the ensuing spring. Again, from the winter solstice to the summer solstice, the sun's rays become more and more perpendicular, and consequently their impulse on the earth's surface more powerful; so that the glebe, or soil, is more and more relaxed, softened, and putrefied, till he arrives at the tropic; where, with the force of a chemical agent, he resolves the superficial parts of the earth into their constituent principles, water, oil, salt, &c. which are all swept away into the atmosphere.

The height and depth of the *air* produce a farther alteration; the exhalations not rising high enough, in any great quantity, to ascend above the tops of high mountains. Nor must drought and moisture be denied their share, in varying the state of the atmosphere; in Guinea, the heat, with the moisture, conduces so much to putrefaction, that the purest white sugars are often full of maggots; and their drugs soon lose their virtue; and many of them grow verminous: it is added, that in the island of St. Jago, they are obliged to expose their sweetmeats daily to the sun, in order to exhale the moisture contracted in the night, which would otherwise occasion them to putrefy.

On this principle depend the structure and use of the HYGROMETER.

For the refracting power of *air*, see REFRACTION.

After all, some of our more curious and penetrating naturalists have observed certain effects of *air*, which do not appear to follow from any of the properties, or materials, above recited. In this view, Mr. Boyle has conjectured a tenuity of subtleties about some unknown properties of the *air*. The phænomena of fire and flame *in vacuo*, seem, according to him, to argue some unknown vital substance diffused through the *air*, on account of which that fluid becomes so necessary to the subsistence of flame. Buffon supposes, that *air* is necessary to the subsistence of fire, because it is most adapted to acquire that expansive motion, which is the principal property of fire. On this account fire combines with *air*, in preference to any other substance, and in a more intimate manner, as being of a nature most nearly approaching to its own; and therefore *air* is the proper aliment and most powerful assistant of fire. Hist. Nat. Supps. vol. i.

But Dr. Priestley has deduced, from experiments, a much more rational explication of this matter. The *air* is a menstruum for the phlogiston emitted by burning bodies; which must cease to burn, when that menstruum is saturated with it. And he accounts in the same manner for the suffocation of animals in a confined space. When the phlogiston, emitted by burning bodies and breathing animals, can no longer be absorbed by the ambient *air*, both life and flame are extinguished. Exp. and Obs. &c. vol. i.

Dr. Priestley, improving upon the experiments and investigations of Boyle, Hales, Brownrigg, Black, Macbride, Cavendish, and others, has discovered many species of *air*, extracted by various processes from different kinds of substances; of which a summary account will be given in the following articles. See also his curious and valuable Experiments and Observations on different Kinds of Air, in five volumes. And for a compendium of the history of discoveries on this subject, Lavoisier's Essay's Physical and Chemical, vol. i. See also AIR, *fixed*.

AIR, *acid*, is a species of factitious *air*, which was first discovered by Mr. Cavendish; but its nature and properties were afterwards more fully investigated by Dr. Priestley. It was first produced from copper, by means of spirit of salt; but Dr. Priestley expelled it by heat from spirit of salt only, without any metallic solution; and he afterwards procured it by the same kind of process, whereby spirit of salt is made. For this purpose he filled a small phial with common salt, and poured upon it a small quantity of concentrated oil of vitriol; the fumes discharged in this process were received in a vessel previously filled with quicksilver, and standing in a bason of quicksilver, and appeared in the form of a perfectly transparent *air*; of such a nature, that it is a permanent elastic substance, not liable to be condensed by cold, like other vapours. This acid vapour extinguishes flame, which appears before the candle goes out, and when it is first lighted again, of a beautiful green, or rather light-blue colour; and it is heavier than common *air*, though in what proportion is not yet determined. Water inhibes this air, changes its aerial or elastic form, acquires, when thus impregnated, a very acid taste, becomes a very active solvent of iron, and generates *inflammable air*. Two grains and a half of rain-water will absorb no less than three ounce measures of this fluid, and thus saturated, will weigh twice as much as it did before. This *acid air* has a very strong affinity with phlogiston, and attracts it from other substances; such as inflammable spirits, expressed oils, oil of turpentine, charcoal, phosphorus, bees-wax, and even sulphur; and it is hereby converted into *inflammable air*.

The species of *air* now described may be called *marine acid air*, in order to distinguish it from the *vitriolic acid air*, which is obtained, by putting a small quantity of common oil to oil of vitriol, and gently heating the phial which contains them. When this kind of air is generated in great plenty, the top of the phial is filled with white vapours; it is equally transparent with the former, and has no greater affinity with quicksilver. It is as readily absorbed by the water as the other, and by its union forms the volatile or sulphureous *acid* of vitriol. It has the same property of extinguishing flame, and is heavier than common air. Ice is instantly dissolved in both of them. The *alkaline air* being mixed with this kind of *acid* vapour, produced a beautiful white cloud, and evidently appeared to be the lighter of the two: the substance formed by this combination was the vitriolic *sal ammoniac*, which is fixed or volatile, upon being exposed to the common *air*, according to the proportion of the two kinds of *air* in the compound. This species of *air* differs from the *marine acid air*, in not dissolving or corroding iron, though it becomes, when combined with water, a very powerful menstruum for this metal.

Another kind of *acid air* is the *vegetable*, which Dr. Priestley expelled by heat from exceeding strong concentrated *acid* of vinegar. A quantity of olive oil imbibed ten times its bulk of this *air*, and in consequence of the union became colourless like water, and less viscid than before. In this respect it differs from the other kinds of *acid air*, which deepen the colour of every species of oil, making them brown, and at the same time viscid, almost to the consistence of resin. The *vitriolic* and *vegetable acid air* very much resemble one another, and the only real difference, beside the *smell*, which is very remarkable, is that just mentioned.

In nature and properties the *fluor air acid* very much resembles the *vitriolic acid air*. It is fo called from the name of the fubftance from which it is extracted. See ACID *fluor*.

Dr. Prieftley procured this *air*, by pouring oil of vitriol upon the *fluor*, contained in a fmall phial, fitted with a ground ftopple and tube; firft without heat, and then by applying a very fmall degree of it, *air* was produced in great plenty, perfectly tranfparent, and confined by quickfilver, like the other kinds already defcribed. It formed a white cloud by iffuing from the tube, and attaching itfelf to the water that floats in the atmofphere, and yielded a very pungent fmell. The furface of water, as foon as it came into contact with this *air*, was rendered white and opake, by a ftrong film or incruftation, which made a feparation between the air above, and the water below it. When this cruft is broken, and the water rifes fo as to form a new furface, a freth incruftation takes place; and thus fucceffive layers will be produced, till every particle of *air* is united to the water. Thefe films, being collected and dried, yield a white powdery fubftance, ufually a little acid to the tafte, but when waffied in much pure water, perfectly infipid. Dr. Prieftley mentions another method, no lefs amufing in its effect, of combining this *air* with water. The incruftation is fo quick, that in lefs than an hour, two or three ounce meafures of water have been converted into this folid mafs; and in this way a very ftrong acid liquor may be obtained. Thefe appearances are explained, by fuppofing that the *vitriolic acid*, in uniting with the fpar, is in part volatilized, by means of fome phlogifton contained in it, fo as to form a *vitriolic acid air*; and that there is alfo combined with this *air* a portion of the folid earthy part of the fpar, which continues in a ftate of folution, till, coming into contact with the water, the fluid unites with the acid, and the earth is precipitated.

The effects of this vapour on fluids and folids are much the fame with thofe of the *vitriolic acid air*. There are two peculiar properties in which thefe two vapours agree; they both contain phlogifton, and in fuch a manner as to communicate it to the common *air* with which they are mixed, and to render it noxious. The electric fpark will alfo by a fingle explofion incruft the infide furface of a tube containing this kind of *air* with a deep-brown or black matter, and it will at every ftroke make the glafs more and more opake. Some reflection on the nature of the fpar which yielded this vapour, led Dr. Prieftley to try, whether the fame kind might not be procured from Mr. Canton's PHOSPHORUS, by means of oil of vitriol; and the trial fucceeded.

AIR, *alkaline*, is a fpecies of *factitious air* extracted by heat from volatile fpirit of fal ammoniac. This vapour, received into a veffel of quickfilver, ftanding in a bafon of the fame fluid, became a tranfparent and permanent *air*, not at all condenfed by cold. But Dr. Prieftley foon found, that the moft expeditious method of procuring it was from a mixture of 1 of powdered fal ammoniac, and 2 of ftaked lime. Large quantities of this vapour are readily imbibed and condenfed by water; and convert it into a volatile fpirit of fal ammoniac, ftronger, Dr. Prieftley fays, than he had ever feen, and than any, he apprehends, which can be made in the common way. The *alkaline air*, upon being mixed with nitrous *air*, occafioned a whitifh cloud, without producing any neutral falt; when water was admitted to this mixture, the *alkaline air* was abforbed, and the *nitrous air* remained, poffeffed of its peculiar properties. Alum undergoes a remarkable change by the action of this *air*. Its outward fize and fhape remain the fame, but the internal ftructure is quite changed; being hereby rendered opake, beautifully white, and in all refpects, to appearance, like alum which had been roafted. The *alkaline air* is ftightly inflammable; it diffolves ice as faft as a hot fire can do it. It is heavier than inflammable air, but lighter than marine *acid air*.

AIR, *artificial* or *factitious*, was ufed by Mr. Boyle to exprefs what the more ancient chemifts denominated *gas*, or *fpiritus fylveftris*, and which is now more generally known by the name of *fixed air*. It comprehends all thofe kinds of *air*, which are originally parts of fome folid fubftance, and exift in an unelaftic ftate; but which, by various analytical proceffes, are capable of being difengaged, and recovering their elafticity.

AIR, *atmofpherical* or *common*, conffts, according to Dr. Prieftley, of the nitrous acid and earth, combined with fo much phlogifton as is neceffary to its elafticity, and likewife fo much more as is requifite to bring it from a ftate of perfect purity, to the mean condition in which we find it. See AIR and ATMOSPHERE.

AIR, *dephlogifticated*, is a very extraordinary fpecies of *air* lately difcovered by Dr. Prieftley, to which he has given this name becaufe it is much purer than any other kind of *air*, and of courfe contains lefs phlogifton; which, on this hypothefis, verified by a variety of experiments, renders *air* noxious. This *air* was firft extracted from *mercurius calcinatus per fe*, by means of a burning lens; and in a feries of fubfequent experiments, it was procured from a variety of other fubftances, fuch as red precipitate, minium, and feveral other preparations of lead, and from all kinds of earths mixed with fpirit of nitre; the advantage being on the fide of the metallic and calcareous earths. This pure *air* was alfo extracted from other fubftances, befide *mercurius calcinatus* and red lead, without the addition of the fpirit of nitre; viz. from fedative falt, and Roman vitriol, flightly calcined. But the pureft which Dr. Prieftley ever obtained was from flowers of zinc, moiftened with fpirit of nitre, and put into a glafs phial with a ground ftopple and tube. This air is not imbibed by water, and appears to be a little heavier than common *air*. But the moft remarkable property belonging to it is its fuperior purity, which Dr. Prieftley has evinced by a variety of indubitable teffs. A candle let down into a jar filled with this *air* burns with a very vigorous flame, and the heat produced by it in thefe circumftances is remarkably great. The experiment is moft pleafing, when the *air* is only a little more than twice as good as common *air*; for when it is more highly dephlogifticated, the candle burns with a crackling noife, as if it was full of fome combuftible matter. A moufe was put into a glafs veffel, containing two ounce meafures of the *air*, extracted from *mercurius calcinatus*, and, though it would not have lived in common *air* longer than about a quarter of an hour, it lived in this *air* a full half hour; and when it was taken out feemingly dead, it was only chilled by the extreme cold; for upon being held up to the fire it revived, and feemed to have received no injury. Another moufe, in a fubfequent trial, lived three quarters of an hour in lefs than the former quantity. But the moft elegant and accurate teft of the purity of any kind of *air*, is the *nitrous air*. Dr. Prieftley put one meafure of *nitrous air* to two meafures of the *dephlogifticated air* laft mentioned; and he obferved a greater diminution than common *air* would have received by the fame treatment. A fecond meafure of *nitrous air* reduced it to two thirds of its original quantity, and a third meafure to one half; adding another half meafure, it was ftill more diminifhed, but not much; and another half meafure made it more than half of its original quantity: fo that, in this cafe, two meafures of this *air* took more than two meafures of *nitrous air*, and yet remained lefs than half of what it was. Five meafures brought it pretty exactly to its original dimenfions. Now as common *air* takes about one half of its bulk of *nitrous air*, before it begins to receive any addition to its dimenfions from more *nitrous air*, and this *air* took more than four half meafures before it ceafed to be diminifhed by more *nitrous air*, and even five half meafures made no addition to its original dimenfions, Dr. Prieftley concludes, that it was between four and five times as good as common *air*. This *air* then being capable of taking more phlogifton from *nitrous air*, it muft originally contain lefs of this principle.

Dr. Prieftley, in fome further proceffes examined, *air* between five and fix times as good as the beft common *air* he ever met with. Many experiments were made upon various fubftances, and upon red lead in particular, in order to determine by what means this kind of *air* came to be fo pure; and Dr. Prieftley was convinced in the refult that it was the nitrous acid which the red lead acquired from the *air*, that enabled it to yield this *dephlogifticated air*; and he obferves, that the red colour of *mercurius calcinatus*, and red lead, favours the fuppofition of their having extracted fpirit of nitre from the *air*. He further remarks, that *dephlogifticated air* is purified by ftanding in water; owing, probably, to its depofiting more *fixed air* in thefe circumftances. He adds, that fome mechanical contrivance may perhaps hereafter be thought of for conveying this pure *air* into rooms for the purpofe of purifying the noxious *air* contained in them. A mixture of one third of highly *dephlogifticated air*, and the reft *inflammable air*, in a phial, containing about 2 ounce meafure and a half, will caufe a report as loud as that of a common piftol; and judging by the eye, not lefs than forty or fifty times as loud as with common *air*, of which there muft be about two thirds in quantity, to make *inflammable air* explode to the greateft advantage. And it may be inferred, that, if it were poffible to fire gun-powder in this kind of *air*, a tenth part of the charge would in all cafes fuffice. The force of fire would be very confiderably augmented, by blowing it with *dephlogifticated air*, inftead of common *air*: and the prodigious heat which this *air* affords, may be ufefully applied by chemifts in a variety of ways. It would likewife be very falutary as a medicine, in certain morbid cafes, when the common *air* would not be fufficient to carry off the phlogiftic putrid effluvium faft enough. But in a healthful ftate of the body, it might not be fo

proper

proper; for, as a candle burns out much faſter in this than in common *air*, ſo we might *live out too faſt*, ſays Dr. Prieſtley, and the animal powers be too ſoon exhauſted in this pure kind of *air*. 'Who can tell, he 'adds, but that in time pure *air* may become a faſhion-'able article in luxury. Hitherto only two mice and 'myſelf have had the privilege of breathing it.' From a late publication we learn, that Mr. Cavendiſh is of opinion, that *dephlogiſticated air* is only WATER deprived of its phlogiſton. Phil. Tranſ. vol. lxxiv. part i. art. 13.

AIR, *fixable* or *fixed*, may, in the largeſt ſenſe of the term, include all the different kinds of *air*, which are the ſubjects of theſe articles; ſince they are all capable of being imbibed by ſome ſubſtance or other, and conſequently of being *fixed* in them, after they have been in an elaſtic ſtate. This kind of *air*, being ſpecifically heavier than common *air*, is found at the bottom of pits: it extinguiſhes candles, &c. and kills animals that breathe it; and on this account has been called the *chokedamp*. However, the above appellation was firſt uſed by Dr. Black, profeſſor of chemiſtry at Edinburgh, to expreſs that particular ſpecies of *factitious air*, which adheres to all calcareous earths, magneſia, and alkaline ſalts, with different degrees of force; and which may be ſeparated from theſe ſubſtances, and again combined with them. This elaſtic matter was but very imperfectly known to the ancient chemiſts before the time of Paracelſus. It was called by them *ſpiritus ſylveſtris*. Paracelſus, and his contemporaries, imagined, that this fluid is the ſame with the *air* which we breathe. Van Helmont, the diſciple of Paracelſus, made it the ſubject of particular inquiry, and gave it the name of *gas*. This ſubſtance, according to him, is diſcharged from fermenting bodies, and may be diſengaged from ſal ammoniac, and from vegetables. It is this likewiſe which eſcapes from ignited gunpowder and charcoal. To the effluvia of this *gas*, he alſo aſcribes the fatal effects of the Grotto del Cani in Naples, the ſuffocation of workmen in the mines, the accidents occaſioned by the vapour of charcoal, and that noxious *air* which is found in cellars, where ſpirituous liquors are fermenting. Van Helmont likewiſe obſerved, that a great quantity of this vapour is diſengaged from earths and metallic ſubſtances, by their effervescence with acids; and has applied his theory to the explication of ſeveral phenomena in the animal œconomy. He ſuppoſed, that the *gas* was different from the *air* which we breathe, and that it has a great affinity with water; and he appears to have been acquainted with ſeveral properties of this fluid, which are now more generally known and underſtood. Tractatus de Flatibus; and, Complexionum atque Mixtionum Elementalium Figmentum. Mr. Boyle repeated Van Helmont's experiments *in vacuo*, in condenſed and in open *air*; and he gave the *gas* of the foreign chemiſts the new name of *artificial* or *factitious air*. Both Van Helmont and Mr. Boyle obſerved, that this ſpecies of *air* eſſentially differs from that of the atmoſphere; as the latter is neceſſary to the exiſtence of animals, whilſt the other is noxious and fatal. Mr. Boyle demonſtrated, that artificial *air* ſeparated from vegetable ſubſtances, is not always the ſame; and that the *air* which is produced by the explosion of gunpowder, exhibits phenomena peculiar to itſelf; and he farther obſerved, that ſome bodies, ſuch as ſulphur, amber, camphor, &c. diminiſh the bulk of *air* in which they burn. Boyle's Works, vol. iv.

Dr. Hales purſued this inquiry with great induſtry, and with very conſiderable ſucceſs. He not only ſhewed, that *air* entered into the compoſition of moſt bodies, animal, vegetable, and mineral, but eſtimated the proportion which it bore to the reſt of the compound. He obſerved, that certain ſubſtances and operations generate *air*, and others abſorb it: imagining, however, that the diminution of *air* was ſimply a compound from the common maſs, without inducing any alteration in the properties of the remainder. Dr. Hales likewiſe examined the mineral waters, and particularly thoſe of Pyrmont; and to the great quantity of *air* which they contain, he attributed the ſpirit and briſkneſs of thoſe waters. But, though he made many important diſcoveries, ſome of which are recited in the courſe of theſe articles, and for the reſt of which the reader muſt be referred to his works, and particularly to chap. vi. of his Vegetable Statics, he ſtill apprehended, that the *air* ſeparated from bodies, as well as that which had been burned or reſpired from animals, was not different from that of the atmoſphere; and that its particular effects were owing to ſome noxious vapours, whereby its elaſticity was impaired or deſtroyed, foreign to its own nature. He likewiſe attributes the abſorption of this kind of *air* by water, not to the affinity which it bears to water in itſelf conſidered, but to the warmth of the water.

It has already been obſerved, that Dr. Seip was the firſt who diſcovered the impregnation of the mineral waters by the *mephitis* or *fixed air*: and that Dr. Brownrigg further inveſtigated the nature of this principle which enters into their compoſition, and whence they derive their peculiar taſte and effect. See ACIDULÆ.

Dr. Black farther inveſtigated the chemical nature and effects of this principle, and explained many phenomena in this part of ſcience, which had been hitherto deemed unaccountable. Such was the effervescence of abſorbent earths, and alkaline ſalts, with acids, and the change of the mild calcareous earths into quick-lime, by heat, whereby they become cauſtic, or acquire the property of corroding, and burning animal and vegetable ſubſtances, in conſequence of the expulſion of the *fixed air*, which neutralizes them. And he has alſo informed us, that the lime-ſtone loſes nearly the ſame weight by diſſolution in acids, as by calcination; and that it recovers its former weight, when it has been precipitated in the form of a calcareous earth, or with all its *air*. Eſſ. and Obſ. Phyſ. and Liter. vol. ii.

For an account of the oppoſition which Dr. Black's theory met with in Germany, ſee ACIDUM *pingue*.

In 1764, Dr. Macbride publiſhed his Experimental Eſſays, containing a variety of curious facts and obſervations relating to the nature and properties of *fixed air*. From him we learn, that a conſiderable quantity of this *air* is diſcharged, not only from effervescing ſubſtances, and fermenting vegetables, but likewiſe from all putrefying animal ſubſtances; and to the preſence of this fluid he aſcribes their cohesion and firmneſs. He advances a ſtep farther, and obſerves, that fleſh which has begun to putrefy, by having loſt a portion of the *fixed air*, which entered into its compoſition, may recover its former ſweetneſs, by reſtoring to it the *fixed air*, of which it had been deprived. In the courſe of his experiments he diſcovered, that putrid diſeaſes, and the ſea-ſcurvy, owe their origin to the privation of that certain quantity of *air*, which is neceſſary to a ſtate of ſalubrity; and that the beſt antidote againſt theſe diſeaſes muſt be derived from ſubſtances and preparations capable of furniſhing an abundance of *fixed air*. On theſe principles he recommends the uſe of wort in the ſcurvy. The antiſeptic quality of this fluid was a very important and uſeful diſcovery. Dr. Macbride was led to it by a previous obſervation of Sir John Pringle.

Mr. Cavendiſh made ſeveral valuable additions to the knowledge which had been already gained on this ſubject. An account of his experiments may be found in the Philoſ. Tranſ. for 1766 and 1767, vol. lvi. vol. lviii. and vol. lxxiv. part i. art. 13. He has accurately aſcertained the quantity of *fixed air* contained both in fixed and volatile alkali, according to their reſpective weight. He has alſo determined the ſpecific gravity of this fluid, as well as of *inflammable air*, ſhewing that the former is 14 heavier than common *air*, and the latter ten times lighter. He has likewiſe ſhewn, that *fixed air* may be mixed with water, and that it will abſorb a quantity more than equal to its own bulk; that the quantity imbibed by it is greater as the water is colder, and that it flies off again upon being heated and expoſed to the common *air*. To him we owe the diſcovery, that water acquired from its abſorption of diſſolving calcareous earths; in conſequence of which Mr. Lane found, that it would diſſolve a conſiderable quantity of iron, and become a ſtrong chalybeate. Phil. Tranſ. for 1769, vol. lix.

The next ſtep in this department of ſcience was the invention of a convenient apparatus for generating *fixed air*, and for impregnating water with it; and this was effected by Dr. Prieſtley, in the year 1772, though he had made and uſed artificial waters impregnated by the ſame kind of *air*, ariſing from fermenting wort, as early as 1768. See PYRMONT.

Having brought down the hiſtory of *fixed air* to this period, the curious reader muſt be referred to Dr. Prieſtley's Obſervations, &c. ſo often cited in theſe articles, for an account of his numerous and valuable experiments; obſerving, that he has happily availed himſelf of every fact that had been previouſly diſcovered, and extended our acquaintance with this principle in all its various forms, and in the phenomena that attend it, far more than any of his predeceſſors in theſe inquiries. One obſervation, however, ſhould be mentioned, viz. that *fixed air* is capable of forming an union with phlogiſton, and in this ſtate, it is immiſcible with water.

Mr. Bewley has proved, by very ſatisfactory experiments, that *fixed air* is an acid *ſui generis*; and Dr. Prieſtley apprehends, that it is a modification of the nitrous acid, containing phlogiſton and earth. It has been ſince ſhewn by Mr. Kirwan, to the conviction of Dr. Prieſtley, that *fixed air* conſiſts of pure elementary or reſpirable *air* and phlogiſton; and that 100 grains of *fixed air* contain 14,661 of phlogiſton and 85, 339 of elementary *air*. Phil. Tranſ. vol. lxxii. part i. art. 15.

The preceding diſcoveries, and others, the recital of which the nature of this work will not admit, have been already ſucceſsfully applied to medical purpoſes, and pro-

mise to be of very considerable utility. Dr. Percival, Mr. Hey, and others, have made various trials of this new medicine, as *fixed air* may be called, in putrid, and other disorders, and found it efficacious and useful. Notice shall be taken of the cases to which it has been applied, under subsequent articles, where it may be properly introduced.

M. Baumé, in his Chemistry, condemns the general application of the term *fixed air*; and he thinks that the fluid so called should retain the denomination given it by Dr. Hales, viz. *detached* or *elastic air*; and that *fixed air* is only common *air*, impregnated with foreign substances, which it holds in solution, and that it should be examined, only with respect to the nature and qualities of such substances.

AIR, *inflammable*, is that species of *air*, which, by being lighter than common *air*, occupies the upper parts of subterraneous places, and has been commonly found in mines and coal-pits, where it is called the *fire damp*; because it is liable to take fire, and to explode like gunpowder. It was little known, otherwise than as an object of curiosity, and by the fatal effects which it had often produced, till Mr. Cavendish began to make experiments upon it. We learn from him how to produce it in great abundance, by dissolving zinc, iron, and tin, in the diluted vitriolic acid, or spirit of sea-salt. He has shewn, that it is essentially different from the *mephitic*, or *fixed air*, being only the tenth part of the weight of common *air*; and produced a variety of inflammable mixtures, by combining it with common *air*. Dr. Priestley has extracted it from other substances, animal, vegetable, and mineral; and observes, that it emits a very offensive smell, according to the nature of the substance by which it is generated; and the more violent the effervescence producing it, so much the more *inflammable* will be the *air*, and the more offensive the smell; and the quantity obtained depends on the degree of heat employed in the process. He shews how this kind of *air* may be mixed with water, and deprived of its inflammability. Distilled water imbibed about one fourteenth of its bulk of this *air*, but occasioned no sensible difference of taste. The electric spark, which in *fixed air* is exceedingly white, is of a purple or red colour in *inflammable air*; and Dr. Priestley infers from hence, that the *inflammable air* may contain particles which conduct electricity, though very imperfectly. This *air*, he observes, consists chiefly, if not wholly, of the union of the vitriolic or marine acid vapour with PHLOGISTON: but he has since found that *inflammable air* and phlogiston are the same substance. The refractive power of this *air* has been found by Mr. Warltire to be greater than that of common air. Water, in which it is agitated, imbibes as much of the phlogiston as contributes to make it *inflammable*; and in consequence of this process it becomes fit for respiration; and by a continuance of it, at length extinguishes flame. See DAMPS.

AIR, *mephitic*, is applied to *fixed air*, to that which is *inflammable*, and to many other kinds, since they are equally noxious when breathed by animals; but it is usually appropriated to the former species of *air*. See AIR *fixable*.

AIR, *nitrous*, a name given by Dr. Priestley to that kind of *air* which was first produced by Dr. Hales from the Walton pyrites, by means of spirit of nitre. Dr. Hales observes, that the mixture of this with common *air* occasioned an effervescence, and was attended with a turbid red colour, and an absorption of part of the common *air*. Dr. Priestley procured the same kind of *air* from the solution of iron, copper, brass, tin, silver, quicksilver, bismuth, and nickel, in the nitrous acid, and of gold, and regulus of antimony, in *aqua regia*. He ascertained the phenomena taken notice of by Dr. Hales; and found, by many accurate trials, that upon a mixture of this *air* with common *air*, the latter is considerably diminished in quantity; and that the former is wholly decomposed, when the quantity of it admitted to common *air* is such as is merely sufficient to diminish it to the utmost. He adds, that the diminution and decomposition, to which *nitrous air* is subject, result from two different causes: one is by substances, which seize upon its acid, and the other, those which lay hold of the phlogiston which it contains. One measure of *nitrous air* applied to two measures of common *air*, will diminish the mixture above one ninth of the quantity of common *air*; and if both be very pure, the diminution will be gradual, and in a day or two, there will remain only one fifth of the original quantity of common *air*; and yet this mixture retains very nearly the same specific gravity with common *air*. But the diminution of common *air*, by a mixture of *nitrous air*, is not more extraordinary, than the diminution which *nitrous air* itself is subject to, from a mixture of iron filings and brimstone made into a paste with water. When this is put to a quantity of *nitrous air*, it diminishes it so much, that no more than one fourth of the original quantity will be left. The proportion of common *air*, and *nitrous air*, above stated, forms the point of saturation between these two fluids; and if more *nitrous air* be afterwards added to the mixture, no effervescence nor redness will be produced; but it will make an addition equal to its bulk. *Nitrous air* makes no change either with *fixed* or *inflammable air*, or with any other *air* that is noxious; but the effervescence and diminution are peculiar to common *air*, or such as is fit for respiration, and very nearly, if not exactly, proportional to its salubrity. And hence Dr. Priestley was led to adopt this species of *air* as a test, by which to estimate the goodness of *air*, and the kind as well as degree of the injury which it sustains. In order to explain the peculiar effects produced by *nitrous air* on common *air*, he made use of a green precipitate, procured by a solution of copper in nitrous acid, and extracted from it, by means of a burning lens, a quantity of *nitrous air*. When any volatile alkali was added to a mixture of *nitrous* and common *air*, in a state of effervescence, the jar was filled with white clouds, which precipitating in the form of fine snow, made a beautiful appearance, and proved to be a nitrous ammoniac. This, he supposes, was formed by the acid of the *nitrous air*, let loose in the decomposition of it by common *air*, while the phlogiston, which must be another constituent part of *nitrous air*, entering the common *air*, was the cause of its diminution; as it is also the cause of a similar diminution in a variety of other processes; so that, in reality, phlogiston is the test; and *air* is wholesome, in proportion to the quantity of phlogiston which it is able to take. See EUDIOMETER. Mr. Kirwan has found, that 100 grains of *nitrous air* contain 16,792 of phlogiston and 83,208 of nitrous acid.

Nitrous air is extremely noxious both to plants and animals. It is capable of being mixed with water; distilled water imbibing about one tenth of its bulk of this kind of *air*; and it communicates to the water a very acid and astringent taste. It is also absorbed in different degrees by æther, oils, spirit of wine, and alkali, the several sorts of acids, and, in general, by any substance that has a near affinity either with its phlogiston, or with any other of its constituent parts. It is likewise one of the strongest antiseptics; and Dr. Priestley suggests, that future preparations of it may be used with success for checking or correcting putrefaction in the intestinal canal, or other parts of the animal system.

AIR, *phlogisticated*. Under this general denomination may be included all those different kinds of *air*, which are diminished and rendered noxious by the burning of candles, insomuch that a common candle consumes, as it is called, a gallon of *air* in a minute, the respiration of animals, the putrefaction of vegetable or animal substances, the effervescence of iron filings and brimstone, the calcination of metals, the fumes of charcoal, the effluvia of paint made of white lead and oil, a mixture of *nitrous air*, or other similar processes. All these processes, Dr. Priestley observes, agree in this one circumstance, and he apprehends, in no other, that the principle, which the chemists call phlogiston, is set loose; and therefore the diminution of the *air* is in some way or other the consequence of the *air* becoming overcharged with it. This kind of air is rather lighter than common air.

Thus, we find, that many causes combine to produce very considerable alterations in the state of the *air*, whereby it becomes less fit for respiration, and other purposes of nature; and if there were no provision for restoring its salubrity, it must, in time, become universally injurious and fatal. Dr. Priestley, in the course of his inquiries on this subject, has discovered the great restoratives, which are provided for this purpose. One of these is vegetation. In order to ascertain this fact, he put a sprig of mint, in a vigorous state, under a glass jar, inverted in water; and he found, contrary to his expectation, that this plant not only continued to live, though in a languishing way, for two months; but that the confined *air* was so little corrupted by the effluvia of the mint, that it would neither extinguish a candle, nor kill a small animal, which he conveyed into it. He found, likewise, that *air*, vitiated by a candle left in it till it was burnt out, was perfectly restored to its quality of supporting flame, after another sprig of mint had vegetated in it for some time. And, in order to shew, that the aromatic flavour of the plant had no share in producing this effect, he observed, in a variety of other experiments, that vegetables of an offensive smell, and even such as had scarce any smell at all, but were of a quick growth, proved the best for this purpose. Nay more, the virtue of growing vegetables was found to be an antidote to the baneful quality of *air*, corrupted by animal respiration and putrefaction; and he infers from a number of similar facts, that the injury, which is continually done to the atmosphere, by the respiration of so many animals, and the putrefaction of such masses of

both vegetable and animal matter, is, in part at leaſt, repaired by the vegetable creation; and, notwithſtanding the prodigious maſs of *air* that is corrupted daily by the above mentioned cauſes; yet, if we conſider the immenſe profuſion of vegetables upon the face of the earth, growing in places ſuited to their nature, and conſequently at full liberty to exert all their powers, both inhaling and exhaling, it can hardly be thought, that the remedy is not adequate to the evil. Dr. Franklin, in a reflection on this diſcovery, expreſſes his hope, that it will give ſome check to the rage of deſtroying trees that grow near houſes, which has accompanied our late improvements in gardening, from an opinion of their being unwholeſome; adding, from long obſervation, that there is nothing unhealthy in the *air* of woods. 'Since the 'Americans have their country habitations in the midſt 'of woods, and no people on earth enjoy better health, 'or are more proliſic.' Dr. Prieſtley has ſince diſcovered that light is neceſſary to enable plants to purify *air*: however pure *air* is not produced by light on plants, but only by the purification of the impure *air* to which the plants have acceſs. Obſ. and Exp. on *Air*, vol. v p. 18. 24. &c.

The ſea, and other large bodies of water, are the ſecond reſource, which nature has provided for reſtoring the ſalubrity of corrupted *air*. Dr Prieſtley found, that all kinds of noxious *air* were reſtored by continued agitation in a trough of water; the noxious eſſluvia being firſt imbibed by the water, and thereby tranſmitted to the common atmoſphere. And he hence concludes, that the agitation of the ſea, and of large lakes and rivers, muſt be highly uſeful for the purification of the atmoſphere; the putrid matter being abſorbed by the water, and imbibed by marine, and other aquatic plants, or applied to purpoſes yet unknown. Exp. and Obſ. vol. v ſect. 2. and 4.

This ingenious philoſopher apprehends, that the agitation of water, and the vegetation of plants, purify noxious *air*, by abſorbing part of the phlogiſton with which it is loaded; and that this phlogiſtic matter is the moſt eſſential part of the food and ſupport of both vegetable and animal bodies. Ib. vol. i. p. 138. 139.

For an account of Dr. Prieſtley's numerous experiments and obſervations on theſe ſeveral ſpecies of *air*, the reader is referred to the excellent work already cited, which has furniſhed the greateſt part of the preceding articles.

AIR, *innate*, in *Anatomy*, is a fine aerial ſubſtance, ſuppoſed, by ſome anatomiſts, to be incloſed in the labyrinth of the inner EAR, and to miniſter to the due conveyance of ſounds to the ſenſory.

But the exiſtence of ſuch *innate air*, has been called in queſtion, and rendered very improbable. See EAR.

AIR, in *Medicine*, &c. makes one of the ſix NON-NATURALS.

From obſervations on bleeding in rheumatiſms, and after taking cold, it is evident, the *air* can enter with all its qualities, and vitiate the whole texture of the blood, and other juices.

From the palſies, vertigoes, and other nervous affections cauſed by damps, mines, &c. it is evident, that *air* thus qualified can relax and obſtruct the whole nervous ſyſtem. And from the colics, fluxes, coughs, and conſumptions produced by damp, moiſt, and nitrous *air*, it is evident it can corrupt and ſpoil the noble organs, &c. See ATMOSPHERE, and preceding articles.

AIR, in *Muſic*, ſignifies the MELODY, or the inflexion of a muſical compoſition

The word is alſo uſed for a tune, or ſong itſelf, that is, for a compoſition whoſe movements are juſt and equal; and the times, eſpecially the firſt of ſuch meaſure, well marked—being uſually to be played pretty quick and lively, unleſs there be ſomething to indicate the contrary; as, *largo*, or *affettuoſo*, &c.

Thus we ſee an *air* of Lully: Handel's *airs*, with their ſymphonies and accompaniments, are made into concertos for the violin, &c.

AIR, in *Mythology*, was adored by the heathens under the names of Jupiter and Juno; the former repreſenting the ſuperior and finer parts of the *atmoſphere*, and the latter the inferior and groſſer parts. The augurs alſo drew preſages from the clouds, thunder, lightning, &c.

AIR, in *Painting*, &c. denotes the manner and very life of action; or it is that which expreſſes the diſpoſition of the agent.

It is ſometimes alſo uſed in a ſenſe ſomewhat ſynonymous with geſture or attitude.

AIR-*bladder*, a kind of *veſicula* found in the bodies of fiſh, by means whereof they are enabled to ſuſtain themſelves in any depth of water, and either to riſe or ſink at pleaſure. The *air-bladder* is the ſame with what is otherwiſe called the *ſwim*, or *ſwimming-bladder*.

Dr. Prieſtley conjectures that this is not the only uſe of theſe *bladders*; but that the *air* incloſed in them may anſwer ſome farther purpoſe in the animal œconomy of fiſhes.

The diſcovery of the uſe of the *air-bladder* took its riſe from obſerving, that a bubble of *air* in riſing from the bottom of a fluid, continually dilates till it reaches the top, by reaſon of the continual diminution of the weight, or preſſure, of the incumbent water. For the *air*, in the bladder is like the bubble, more or leſs compreſſed, according to the depth the fiſh ſwims at, and takes up leſs or more ſpace; and conſequently the body of the fiſh, part of whoſe bulk this bladder is, is greater or leſs, according to the ſeveral depths, though it retains the ſame weight. The rule of hydroſtatics is, that a body heavier than ſo much water as is equal in quantity to the bulk of it, will ſink; a body lighter, will ſwim; a body of equal weight will reſt in any part of the water. By which rule if the fiſh in the middle region of the water, be of equal weight with an equal bulk of the water, the fiſh will reſt there, without any tendency either upwards or downwards; and if the fiſh be deeper in the water, its bulk becoming leſs by the compreſſion of the bladder, and yet retaining the ſame weight, it will ſink and reſt at the bottom: on the other ſide, if the firſt be higher than the middle region, the *air* dilating itſelf, and the bulk of the fiſh conſequently increaſing, without any increaſe of the weight, the fiſh will riſe and reſt at the top of the water.

Perhaps the fiſh by ſome action can emit *air* out of the bladder, and afterwards out of its body; and alſo when there is not enough, take in more *air*, and convey it to this bladder; in which caſe it will be no wonder, that there ſhould be always a fit proportion of *air* in the bodies of all fiſhes, to ſerve their uſe, according to the depth of water they live in: perhaps alſo by ſome muſcle the fiſh can contract this bladder beyond the preſſure of the weight of water; and perhaps it can by its fides, or ſome other defence, keep off the preſſure of the water, and give the *air* leave to dilate itſelf. In theſe caſes, the fiſh will be helped in all intermediate diſtances, and may riſe or ſink from any region without moving a fin. Phil. Tranſ. N° 114.

If the *air-bladder* of a fiſh be pricked or broken, the fiſh preſently ſinks to the bottom, unable either to ſupport or raiſe itſelf up again. Flat fiſhes, as ſoles, plaice, &c. which always lie groveling at the bottom, have no *air-bladder*.

In moſt fiſhes there is a manifeſt channel, leading from the gullet, or upper orifice of the ſtomach, to the *air-bladder*, which doubtleſs ſerves for conveying *air* into it. In a ſturgeon Mr. Willughby obſerved, that upon preſſing the bladder, the ſtomach preſently ſwelled; ſo in that fiſh it ſeems the *air* paſſes freely both ways. Poſſibly the fiſh while alive may have a power to raiſe up this valve, and let out *air* on occaſion.

All the cartilaginous kind want *air-bladders*: by what means it is they aſcend and deſcend in water, is yet unknown. The cetaceous kind, or ſea-beaſts, are alſo without the *air-bladder*: indeed as theſe differ little from quadrupeds, but in the want of feet, the *air* which they receive into their lungs in reſpiration, may ſerve to render their bodies equiponderant to water, and by conſtriction or dilatation of it, by the help of the diaphragm and muſcles of reſpiration, may poſſibly aſſiſt them to deſcend, or aſcend, in the water, by a light impulſe thereof with their fins. Moſt of the EEL-kind have bladders, yet they can hardly raiſe themſelves in the water, by reaſon of the length and weight of their tails; the *air-bladder* being near their heads, may help them to lift up their heads and fore part. Ray's Wiſd. of God, &c. p. i. p. 26. Phil. Tranſ. N° 115

There is great diverſity in *air-bladders*, in reſpect of figure, ſubſtance, ſituation, and connection, in different fiſh.

In ſome, the *air-bladder*, is divided into two, e. gr. in *carps*; and in others, into three. Needham maintains, that all fiſh which have teeth in their jaws have only a ſingle *air-bladder*; whereas thoſe without teeth have a double one, or, which amounts to the ſame, the *air-bladder* of theſe laſt is divided into two cells. Sig. Redi refutes this diſtinction; giving inſtances of fiſh with teeth, whoſe *air-bladder* is double; and of others without teeth, who have only a ſingle *air-bladder*.

The water-ſnake, in lieu of a bladder has a large membranous *air-bag* on its back, which empties and fills with *air* at pleaſure, by an aperture, which it can ſhut very cloſe, from without inwards, by means of a ſort of valve, ſo that the leaſt globule of water cannot enter without its conſent. By this artifice it can enlarge or leſſen the bulk of its body, and inhabit all depths of the water; though a conjecture has been advanced by Mr. Ray, that it is by the help of water which they take in, and let out, by two holes in the lower part of their abdomen, near to the ventricle. They ſink in the water, by letting in ſome of it at theſe holes; the orifices whereof are opened and ſhut at pleaſure, by means of proper muſcles. The water being thus received into the cavity of

their abdomen, ſerves to make them preponderate the water, and deſcend; when they would aſcend again, a compreſſion is made by the muſcles of their abdomen, and the water forced out again, at leaſt ſo much as ſuffices to give the degree of levity wanted. Ray's Wiſd. of God, p. ii. p. 346.

In the Phil. Tranſ. vol. lxiv. part i. p. 205. art. 29. an. 1774, there is an account of certain receptacles of *air* in birds, which communicate with the lungs, and are lodged both among the fleſhy parts, and in the hollow bones of thoſe animals, by John Hunter, F. R. S. who does not minutely deſcribe all the particular communications of this kind in birds; but mentions, however, a number of general facts, ſufficient for the introduction of this ſubject into natural hiſtory, and for opening a more particular enquiry into the final cauſe of this peculiarity in the ſtructure of birds, hitherto unobſerved or uninveſtigated.

AIR-*chamber*, is a name given by Dr. Henſhaw to a room contrived for obtaining the benefit of change of *air*, without going out of the houſe. According to his whimſical propoſal, it is to be twelve feet ſquare, and air-tight, furniſhed with a very large pair of organ bellows, to or from which, *air* is to be conveyed through the wall by a copper pipe, with valves for opening inwardly and outwardly as occaſion ſhall require. With theſe bellows, the *air* in the room is either to be condenſed and made heavier, by forcing *air* in, or lighter and rarer, by conveying *air* out of the room. See his Aero-Chalinos, or Phil. Tranſ. N° 133. See VENTILATOR and *Blowing*-WHEEL.

AIR-*gun*, ſee WIND-*gun*.

AIR-*pump*, a machine, by means whereof the *air* may be exhauſted out of proper veſſels.

The uſe and effect of the *air-pump* is, to make, what we popularly call, a *vacuum*; but this, in reality, is only a degree of rarefaction ſufficient to ſuſpend the ordinary effects of the atmoſphere.

By this machine, therefore, we learn, in ſome meaſure, what our earth would be without an atmoſphere; and how much all vital, generative, nutritive, and alterative power, depend upon it.

The principle on which the *air-pump* is conſtructed, is the elaſticity of the *air*; as that on which the common, or water-pump is founded, is the gravity of the ſame *air*.

The ſtructure of the *air-pump* is, *in itſelf*, more ſimple even than that of the water-pump.—The latter ſuppoſes two principles, gravity and elaſticity likewiſe: ſo that the water-pump muſt firſt be an *air-pump*, i. e. it muſt rarefy the *air* before it can raiſe the water.—In effect, water, being a dormant unelaſtic fluid, needs ſome external agent to make it aſcend; whereas *air* aſcends in virtue of its own elaſtic activity: its natural tendency is, to ſeparate, and leave a *vacuum*; and all that remains for art, is to prevent the ambient *air* from ſupplying the place of that which thus ſpontaneouſly flies away.

To make water aſcend, the force wherewith it is preſſed downwards, is either to be diminiſhed or increaſed in one part more than another; like a balance *in æquilibrio*, one of whoſe ſcales may be made to riſe, either by diminiſhing its own weight, or increaſing that of the other: the water, therefore, recedes from the common centre of gravity, by the very power wherewith it tends towards it, indirectly or ſecondarily applied; becauſe, two ſimilar centripetal forces being made to act contrary to each other, what in the one over-balances the other, muſt have the effect of a centrifugal force.—Whereas, the principle whereby *air* is rarefied or diminiſhed, does not reſpect the centre of the earth, but the centres of its own particles; being no other than a certain implanted power, whereby they immediately tend to recede from each other.

The invention of this noble inſtrument, to which the preſent age is indebted for ſo many fine diſcoveries, is aſcribed to Otto de Guerick, the celebrated conſul of Magdeburg, who exhibited his firſt public experiments with it, before the emperor and the ſtates of Germany, at the breaking up of the imperial diet at Ratiſbon, in the year 1654.

Dr. Hook, and M. du Hamel, indeed, aſcribe the invention of it to Mr. Boyle; but that ingenious author frankly confeſſes de Guerick to have been beforehand with him. In a letter which he wrote to his nephew, lord Dungarvan, at Paris, about two years after Schottus's book was publiſhed, he introduces the acknowledgment of his obligation, for the diſcovery of this uſeful machine, to what he had heard of it, though he had not then peruſed it, by that well-applied paſſage of Pliny, *benignum eſt et plenum ingenii pudoris fateri per quos profeceris*. Some attempts, he aſſures us, he had made upon the ſame foundation, before he knew any thing of what had been done abroad: but the information he afterwards received from Schottus's Mechanica Hydraulico-Pneumatica, publiſhed in 1657, wherein was an account of de Guericke's experiments, firſt enabled him to bring his deſign to any thing of maturity. From hence, with the aſſiſtance of Dr. Hook, after two or three unſucceſsful trials, roſe a new *air-pump*, more eaſy and manageable than the German one; and hence, or rather from the great variety of experiments that illuſtrious author applied it to, the engine came to be denominated *machina Boyliana*, and the *vacuum* produced by it, *vacuum Boylianum*.

AIR-*pump*, *ſtructure and uſe of the*. The *baſis* or eſſential part in the *air-pump*, is a metalline tube, anſwering to the barrel of a common pump, or ſyringe; having a valve at the bottom, opening upwards; and a moveable piſton or *embolus*, anſwering to the ſucker of a pump, furniſhed likewiſe with a valve opening upwards. The whole, duly fitted to a veſſel, as a recipient.

The reſt, being only circumſtances chiefly reſpecting convenience, have been diverſified and improved from time to time, according to the ſeveral views and addreſs of the makers. That of Otto de Guerick, being leſs artful, laboured under ſeveral defects, in reſpect of the force neceſſary to work it, which was very great, and the progreſs very ſlow: beſide that it was to be kept under water; and allowed of no change of ſubjects for experiments. Mr. Boyle, by degrees, removed ſeveral of theſe inconveniences, and alleviated others: but ſtill the working of his pump was laborious, by reaſon of the preſſure of the atmoſphere, a great part of which was to be removed at every exhauſtion, after a *vacuum* was nearly arrived at.—But this inconvenience has ſince been removed by Mr. Haukſbee, who, by adding a ſecond barrel and piſton to the former, to riſe as the other fell, and fall as it roſe, made the preſſure of the atmoſphere on the deſcending one, of as much ſervice as it was of diſſervice in the aſcending one.

Some of the Germans have alſo brought the *air pump* to do the oppoſite office of a condenſer: but this is not to make the inſtrument ſo much the better, as more complex.

The ſtructure of the air-pump, as now made among us, with all its advantages, is repreſented in *Tab. Pneumatics, fig.* 16.

It conſiſts of two brazen barrels or cylinders, repreſented by *a a a a*; which communicate with each other by a canal paſſing between them at *d d*; and with the receiver *e e e e*, by means of the hollow wire *b b*, one end whereof opens into the canal of communication, and the other into a like canal *a a*; which penetrating the plate *i i i i*, opens into the receiver.

Within the cylinders are two emboli, or ſuckers, made of braſs, and fitted with cork and leather to the cavities of the barrels, ſo as exactly to fill the ſame; each being furniſhed with its valve, and terminating at top in a rack *c c*, by which it is worked.

At the bottom of either barrel is another valve, by which the *air* may paſs out of the communicating canal *d d*, and conſequently out of the hollow wire and the receiver itſelf, into the cylinder, below the piſton; from whence by the valves of the piſton it may proceed into the upper ſpace of the cylinder, and thus into the open *air*.

For the application of this machiniſm.—The winch *h h* being turned upward and downward, its ſpindle *f*, catching by its teeth into the racks, will raiſe and depreſs the two piſtons, alternately.

Mr. Vream, a late pneumatic operator, made an improvement in Haukſbee's *air-pump*, by reducing the alternate motion of the hand and winch to a circular one. In his method, the winch is turned quite round, yet the piſtons are raiſed and depreſſed alternately: by which the trouble of ſhifting the hand backward and forward, as well as the loſs of time, and the ſhaking of the pump, are prevented. See the contrivance for this purpoſe deſcribed in Clare's Motion of Fluids, p. 154.

Now the conſequence of depreſſing a piſton is, that the *air* before incloſed between it and the bottom of the cylinder, being thus extended into a leſs compaſs, will, by its elaſtic force, which now exceeds the preſſure of the atmoſphere, puſh up the valve of the piſton, and thus eſcape; till that little which remains be of the ſame denſity with the external *air* incumbent on the valve.

This done, and the ſame piſton being again raiſed in its turn, from the bottom of the cylinder to the top, the little *air* being left, will of neceſſity expand itſelf, ſo as to poſſeſs the whole ſpace of the cylinder thus deſerted by the piſton: upon which, its force or preſſure upon the valve at the bottom of the cylinder being now inconſiderable, the other denſer *air* of the receiver, hollow wire, and canal of communication, by their ſuperior elaſtic force, will lift up the valve, and thus paſs into the cylinder of rarefied *air*, till both be of the ſame degree of denſity.

And thus is the *air* in the receiver diminiſhed at each elevation of the piſton, by the quantity of a cylinder-

full;

full: abating for what little remained between the depreſſed piſton, and the bottom: ſo that, by thus repeating the operation again and again, the *air* in the receiver is at length rarefied to ſuch degree, that its denſity does not exceed the thin *air* remaining in the cylinder when the piſton is raiſed: which done, the effect of the *air-pump* is at an end; the valve cannot now be opened, or, if it could, no *air* would paſs it; there being a juſt equilibrium between the *air* on each ſide.

To judge of the degree of exhauſtion, there is added a gage, *ll*; conſiſting of a tube, whoſe upper orifice communicates with the receiver; the lower being immerged in a baſon of mercury, *m m*. Hence, the *air* in the tube rarefying as faſt as that in the receiver, in proportion as the exhauſtion advances, the mercury will be raiſed by the preſſure of the column of external *air*, prevailing over that of the column of *air* included; till the column of *air*, and mercury together, become a balance to that of the external *air*. When the mercury is thus riſen to the ſame height as it ſtands in the barometer, which is indicated by the ſcale of inches added to the gage, the inſtrument is a juſt Torricellian tube; and the vacuum may be concluded to be as perfect as that in the upper end of the barometer.

To let *air* again into the exhauſted receiver, the cock *n* is to be turned, which makes a communication with the external *air*; upon which the *air* ruſhing impetuouſly in, the mercury in the gage immediately ſubſides into the baſon.

To the *air-pump* belongs a large apparatus of other veſſels, accommodated to the divers kinds of experiments.

There are ſeveral inconveniences attending *air-pumps*, of the common form, though much improved from what they uſed to be formerly. Theſe inconveniences are enumerated, and a method ſhewn to remedy them, by Mr. Smeaton.

The principal improvements ſuggeſted by Mr. Smeaton reſpect the diſpoſition of the valves, of the piſton, and of the gage. Inſtead of one hole for the valves, he makes uſe of ſeven, all of an hexagonal ſhape, and of equal ſize; one being in the centre, and the other ſix round it; ſo that the valve is ſupported at proper diſtances by a kind of grating, made by the ſolid parts between theſe holes. In order to remedy the inconvenience attending the piſton's not exactly fitting the barrel, the top of the barrel is ſhut up by a plate, having in the middle a collar of leather, through which the cylindrical rod works, that carries the piſton. His gage conſiſts of a bulb of glaſs, in ſhape reſembling a pear, and ſufficient to hold about half a pound of quickſilver. It is open at one end, and the other is a tube hermetically ſealed at top. A ſcale divided into parts of about one tenth part of an inch, and anſwering to a 1000th part of the whole capacity, is annexed to it. The gage, during the exhauſtion of the receiver, is ſuſpended therein by a ſlip-wire. When the pump is worked as much as is thought neceſſary, the gage is puſhed down, till the open end is immerged in a ciſtern of quickſilver placed underneath. The *air* being then let in, the quickſilver will be driven into the gage, till the *air* remaining in it becomes of the ſame denſity with the external; and as the *air* always takes the higheſt place, the tube being uppermoſt, the expanſion will be determined by the number of diviſions occupied by the *air* at the top. See Phil. Tranſ. vol. xlvii.

Mr. Smeaton's *air-pump* has only one barrel.

This ingenious artiſt has ſucceeded ſo well in his conſtruction of the *air-pump*, as to be able to rarefy *air* a thouſand times; whereas the beſt of the common *air-pumps*, eſteemed good in their kind, and in complete order, never rarefied it above one hundred and forty times. Mr. Smeaton's *air-pump* is worked with much more eaſe than any other, and acts alſo as a condenſing engine, by the very ſimple *apparatus* of turning a cock. So that this *air-pump* is an univerſal engine, for ſhewing any effect ariſing from an alteration in the denſity or ſpring of the air; and with a little addition may be made to ſhew the experiments of the *air*-FOUNTAIN. See GAGE, WIND-*gun*, &c. Phil. Tranſ. vol. xlvii. p. 422.

AIR-*pump*, *portable*, differs principally in ſize, and in the ſtructure of the gage, from that above deſcribed. The gage conſiſts of a glaſs tube, bent in the form of a ſyphon, hermetically ſealed at one end, and open at the other. The longeſt leg is four inches, each of which is divided on an adjoined ſcale into twenty equal parts. After conſiderable exhauſtion, the gage begins to act: and whilſt the quickſilver falls in one leg, it riſes in the other; and the quantity of *air* remaining will be determined by the difference of the height at which it ſtands in both tubes. This gage is placed under a ſmall receiver on a plate, communicating by a pipe with the main pipe, that leads from the receiver, to be exhauſted to the bottom of the barrels.

AIR-PUMP, *laws of rarefaction in the receiver of it.*—1. For the proportion of *air* remaining at any time in the receiver, we have the following general theorem.—'In a 'veſſel exhauſted by the *air-pump*, the primitive or na'tural *air* contained therein, is to the *air* remaining, as 'the aggregate of the capacity of the veſſel and of the 'pump (i. e. the cylinder left vacant in an elevation of 'the piſton, with the wire and other parts between the 'cylinder and the receiver) raiſed to a power whoſe ex'ponent is equal to the number of ſtrokes of the piſton, to 'the capacity of the veſſel alone raiſed to the ſame power.' M. Varignon gives an algebraical demonſtration of this theorem, in the Memoires de l'Acad. Roy. an. 1693, p. 233, ſeq. Id. an. 1705, p. 307, ſeq. but it may be alſo demonſtrated pneumatically, thus:—Calling the *air* remaining after the firſt ſtroke, the *firſt reſidual*; that after the ſecond, the *ſecond reſidual*, &c. and remembering that the *air* in the receiver is of the ſame denſity as that in the cylinder, when the piſton is raiſed; it is evident, that the quantity of *air* in the receiver, is to the quantity of *air* in the cylinder, wire, &c. as the capacity of the receiver to that of the cylinder, and conſequently, the aggregate of the *air* in the receiver and the cylinder, i. e. the whole primitive *air*, is to the *air* in the veſſel alone, i. e. to the firſt reſidual *air*, as the aggregate of the capacity of the receiver and the cylinder, to the capacity of the receiver alone. After the ſame manner it may be proved, that the quantity of the firſt reſidual *air*, is to the ſecond reſidual, as the aggregate of the capacity of the receiver and cylinder to the capacity of the veſſel alone. And the ſame proportion does the ſecond reſidual bear to the third, and ſo of the reſt. Hence, the product of the primitive *air* into the firſt, ſecond, third, fourth, &c. reſiduals, is to the product of the firſt reſidual into the ſecond, third, fourth, fifth, &c. as the product of the capacity of the receiver and cylinder together, multiplied as often into itſelf as the number of ſtrokes of the piſton contains units, is to the factum ariſing from the capacity of the receiver alone, multiplied as often by itſelf; that is, as the power of the aggregate of the capacity of the receiver and cylinder together, whoſe exponent is the number of ſtrokes of the piſton, to the capacity of the veſſel alone, raiſed to the ſame power. Conſequently, the primitive *air* is to the laſt reſidual, in the ratio of thoſe powers.

2. The number of ſtrokes of the piſton, together with the capacity of the receiver and cylinder with the wire, &c. being given; to find the ratio of the primitive *air* to the *air* remaining:

Subtract the logarithm of the capacity of the receiver, from that of the ſum of the capacity of the receiver and the cylinder; then, the remainder being multiplied by the number of ſtrokes of the piſton, the product will be a logarithm, whoſe natural number ſhews how oft the primitive *air* contains the remainder required.

Thus, if the capacity of the receiver be 460, that of the cylinder 580, and the number of ſtrokes of the piſton 6; the primitive *air* will be found to the remaining *air*, as 146.4 to 1.

For, ſuppoſe the capacity of the veſſel $= v$, that of the cylinder and veſſel together $= a$, the number of ſtrokes of the piſton $= n$, and the remaining *air* $= 1$. Since the primitive is to the remaining *air* as a^n to v^n, the primitive *air* will alſo be to the remaining *air*, as $a^n \div v^n$ to 1. Conſequently, if the remaining *air* be 1, the logarithm of the primitive *air* is $a - v \times n$.

3. The capacity of the receiver and the barrel being given; to find the number of ſtrokes of the piſton required to rarefy the *air* to a given degree.

Subtract the logarithm of the remaining *air* from the logarithm of the primitive *air*; and the logarithm of the capacity of the receiver, from that of the aggregate of the capacity of the receiver and cylinder; then, dividing the former difference by the latter, the quotient is the number of ſtrokes required.

Thus, if the capacity of the cylinder be ſuppoſed 580, that of the receiver 460, and the primitive *air* to the remaining *air*, as 146.4 to 10: the number of ſtrokes required will be found to be 6. See Wolf. Elem. Math. tom. ii. p. 289, &c. Cotes's Hyd. and Pneum. Lectures, Lect. 13. Beſides the effects, and the *phænomena* of the *air-pump*, recounted under the articles VACUUM, AIR, &c. we may add ſome others; which, related at large, make the ſubſtance of Mr. Boyle's Phyſico-Mech. Exper.—As, that the flame of a candle in *vacuo* uſually goes out in a minute, though it ſometimes laſts two, but the wick thereof continues ignited after; and even emits a ſmoke, which aſcends upwards.—That a kindled charcoal is totally extinguiſhed in about five minutes, though in open *air* it remain alive half an hour; that it goes out by degrees, beginning from the top and the outſides.—That red-hot iron is not affected by the abſence of the *air*; and yet that ſulphur or gunpowder will not be lighted

thereby;

thereby, but only fuſed.—That a match, after lying ſeemingly extinct *in vacuo* a long time, revives again upon the re-admiſſion of the *air*.—That a flint and ſteel ſtrike ſparks of fire as copiouſly *in vacuo* as out of it; and that the ſparks move in all directions, upwards, downwards, &c. here as in the *air*.—That magnets and magnetic needles, are the ſame *in vacuo* as in *air*.—That ſmoke in an exhauſted receiver, the luminary being extinct, gradually ſettles to the bottom in a darkiſh body, leaving the upper part clear and tranſparent; and that inclining the veſſel ſometimes on one ſide, and ſometimes another, the fume keeps its ſurface horizontal, after the nature of the other fluids.—That the ſiphon does not run *in vacuo*.—That water freezes *in vacuo*.—That heat may be produced by attrition in the exhauſted receiver.—That camphor will not take fire *in vacuo*; and that gun-powder, though ſome grains of a heap be kindled by a burning-glaſs *in vacuo*, will not give fire to the contiguous grains.—That glow-worms loſe their light in proportion as the *air* is exhauſted, and at length become totally obſcure: but upon the re-admiſſion of *air*, preſently recover it all.—That vipers and frogs ſwell much *in vacuo*, but will live an hour and half, or two hours; and though ſeemingly quite dead in that time, came to life again in ſome hours in the *air*.—That ſnails ſurvive ten hours; and eels, or glow-worms, two or three days; leeches five or ſix.—That oyſters will remain alive *in vacuo* twenty-four hours without harm.—That the heart of an eel taken out of the body, continues to beat *in vacuo*, more nimbly than in *air*; and this for a good part of an hour.—That warm blood, milk, gall, &c. undergo a conſiderable intumeſcence and ebullition *in vacuo*.—That a mouſe, or other animal, may be brought, by degrees, to ſurvive longer in a rarefied *air*, than naturally it does.—That *air* may retain its uſual preſſure, after it is become unfit for reſpiration.—And that ſilk worms eggs will hatch *in vacuo*.

AIR-SHAFTS, among *Miners*, denote holes or ſhafts let down from the open *air* to meet the adits, and furniſh freſh *air*. The damps, want, and impurity of *air*, which occur, when adits are wrought 30 or 40 fathoms long, make it neceſſary to let down *air-ſhafts*, in order to give the *air* liberty to play through the whole work, and thus diſcharge bad vapours, and furniſh good *air* for reſpiration: the expence of which *ſhafts*, in regard of their vaſt depths, hardneſs of the rock, drawing of water, &c. ſometimes equals, nay exceeds, the ordinary charge of the whole ADIT.

Sir Robert Murray deſcribes a method, uſed in the coal-mines at Liege, of working mines without *air-ſhafts*. Phil. Tranſ. N° 5.

When the miners at Mendip have ſunk a groove, they will not be at the charge of an *air-ſhaft*, till they come at ore; and for the ſupply of *air* have boxes of elm exactly cloſed, of about ſix inches in the clear, by which they carry it down about twenty fathoms. They cut a trench at a little diſtance from the top of the groove, covering it with turf and roda diſpoſed to receive the pipe, which they contrive to come in ſide-ways to their groove. four feet from the top; which carries down the *air* to a great depth. When they come at ore, and need an *air-ſhaft*, they ſink it four or five fathoms diſtant, according to the convenience of the breadth, and of the ſame faſhion with the groove, to draw as well ore as *air*. Phil. Tranſ. N° 39.

AIR-THREADS *of ſpiders*. See THREADS.

AIR-VESSEL, in *Hydraulics*, is a name given to thoſe metalline cylinders, which are placed between the two forcing-pumps in the improved fire-engines. The water is injected by the action of the piſtons through two pipes, with valves, into this veſſel; the *air* previouſly contained in it will be compreſſed by the water, in proportion to the quantity admitted, and by its ſpring force the water into a pipe, which will diſcharge a conſtant and equal ſtream; whereas in the common ſquirting engine, the ſtream is diſcontinued between the ſeveral ſtrokes.

AIR-*veſſels*, in PLANTS, are certain canals, or ducts, where by a kind of RESPIRATION is effected in vegetable bodies.

Air-veſſels ſtand diſtinguiſhed from SAP-*veſſels*; the former anſwering to the *trachea*, and lungs of animals; the latter to their lacteals, and blood-veſſels.

Dr. Grew, in an enquiry into the motion and cauſe of the *air* in vegetables, ſhews, that it enters them various ways, not only by the trunk, leaves, and other parts above ground, but at the root. For the reception, as well as expulſion of *air*, the pores are ſo very large in the trunks of ſome plants, as in the better ſort of thick walking canes, that they are viſible to a good eye without a glaſs; but with a glaſs, the cane ſeems as if it were ſtuck full of large pin-holes reſembling the pores of the ſkin in the ends of the fingers, and ball of the hand. In the leaves of the pine, through a glaſs they make an elegant ſhow, ſtanding almoſt exactly in rank and file throughout the length of the leaves.

But though the *air* enters in part at the trunk and other parts, eſpecially in ſome plants, yet its chief admiſſion is at the root: much as in animals, ſome part of the *air* may continually paſs into the body and blood by the pores of the ſkin; but the chief draught is at the mouth. If the chief entrance of the *air* were at the trunk, before it could be mixed with the ſap in the root, it muſt deſcend; and ſo move not only contrary to its own nature, but in a contrary courſe to the ſap: whereas by its reception at the root, and its tranſition from thence, it has a more natural and eaſy motion of aſcent. See CIRCULATION *of ſap*.

The ſame is farther argued, from the fineneſs and ſmallneſs of the diametral apertures in the trunk, in compariſon of thoſe in the root; which nature has plainly deſigned for the ſeparation of the *air* from the ſap, after they are both together received thereinto. Grew, Anat. of Root, chap. iii. p. 127.

Air-veſſels are found in the leaves of all plants, and are even diſcoverable in many without the help of glaſſes; for upon breaking the ſtalk or chief fibres of a leaf, the likeneſs of a fine woolly ſubſtance, or rather of curious ſmall cob-webs, may be ſeen to hang at both the broken ends. This is taken notice of only in ſome few plants, as in *ſcabious*, where it is more viſible: but may alſo be ſeen more or leſs in moſt others, if the leaves be very tenderly broken. This wool is really a ſkein of *air-veſſels*, or rather of the fibres of the *air-veſſels*, looſed from their ſpiral poſition, and ſo drawn out in length. Id. ibid. chap. iv. p. 155.

That *air* is inſpired by vegetables, has been fully proved by Dr. Hales, in his Statical Eſſays; and he has in many inſtances ſhewn, that *air* freely enters the veſſels of trees, and that it is in great abundance wrought into their ſubſtance. But as to particular *air-veſſels* in plants, he ſeems to ſpeak doubtfully. He ſays, by way of queſtion, may not the uſe of thoſe ſpiral wreaths, that are coiled round the inſides of thoſe veſſels, which are ſuppoſed to be *air-veſſels*, and which are manifeſtly to be ſeen in ſeveral trees: as alſo in the leaves of the vine and ſcabious, may not theſe be deſigned by nature to promote the quicker aſcent of *air*, by being in ſome meaſure conformed to its elaſtic contortions? For ſuch ſpiral wreaths ſeem to be altogether uſeleſs, for promoting the aſcent of any liquor, as the ſap, which aſcends moſt freely through innumerable other capillary veſſels, having no ſuch ſpiral coils in them: not that we are to ſuppoſe the *air* in its elaſtic ſtate actually to touch, and thereby to be determined in the courſe of theſe ſpirals, as any liquor would be. But as the *rays* of light, when they are reflected from a ſolid body, are found to be reflected, without actually touching the reflecting body in the point of reflection; ſo it is not unreaſonable to ſuppoſe, that elaſtic *air* may, like light, be diverted from one courſe, and ſo be determined to another, by the ſolid bodies it approaches, without touching them, but rebounding like light from thoſe ſolid bodies near the point of contact.

Dr. Hales has obſerved, that theſe ſpirals are coiled in a courſe oppoſite to the courſe of the ſun, that is, from weſt to eaſt. Vide Static. Eſſ. vol. ii. p. 265, 266.

AIRA, in *Botany*, *hair-graſs*, a genus of the *triandria digynia* claſs. See DARNEL.

AIRANI, in *Church-Hiſtory*, a ſect of Arians, in the fourth century, who denied the conſubſtantiality of the Holy Ghoſt with the Father and the Son.

They are otherwiſe called *Aerianſtæ*, and are ſaid to have taken their name from one *Airan*, who diſtinguiſhed himſelf at the head of this party, in the reigns of Valentinian and Gratian.

AIRING, in the general ſenſe of taking, or going into the freſh air, is too well known to need any explanation.

The word is particularly uſed for exerciſing horſes in the open air; which is of the greateſt advantage to theſe animals. It purifies the blood, purges the body from groſs humours, and enures the creature to fatigue, ſo as not to be hurt by it, when much greater than on theſe occaſions; and it teaches him, as the jockies expreſs it, how to make his wind rake equally, and keep time with the other motions of his body. It alſo ſharpens the ſtomach, and keeps the creature hungry; which is a thing of great conſequence, as hunters and racers are very apt to have their ſtomach fall off, either for want of exerciſe, or from the too violent exerciſe which they are often expoſed to.

If the horſe be over-fat, it is beſt to air him before ſun-riſe, and after ſun-ſetting; and, in general, it is allowed by all, that nothing is more beneficial to theſe creatures, than early and late *airings*.

Some of our modern managers, however diſpute this; they

they say, that the cold of these times is too great for the creature, and that if, in particular, he is subject to catarrhs, rheums, or the like complaints, the dews and cold fogs, in these early and late *airings*, will be apt to increase all those disorders. Nature, we see, also points out the sun-beams as of great use to these animals; those which are kept hardy, and lie out all night, always running to those places where the sun-shine comes, as soon as it appears in a morning.

This should seem to discommend those *airings* that are to be made before sun-set, and a little time after sun rise; and as to the caution, so earnestly inculcated by Markham, of using these early and late *airings* for fat bodies, it is found unnecessary by many; for they say, that the same effect may be produced by *airings* at warmer times, provided only that they are made longer: and that, in general, it is from long *airings* that we are to expect to bring a horse to a perfect wind, and sound courage.

AIRS, in *Horsemanship*, denote the artificial or practised motions of a managed horse.

Such are the *demi-volt*, *curvet*, *capriole*, *croupade*, *balotade*, *stop*, and *leap*; also, *advancing*, *yerking*, and *bounding*.

Some authors take *airs* in a more extensive sense; and divide them into *low* and *high*.

The *low airs* include the natural paces, as *walking*, *trotting*, *galloping*, and *terra-a-terra*. To which may be added *prancing*, *foling*, *stopping*, and *turning*.

The *high*, or *raised airs*, are all such motions as rise higher than the *terra-a-terra*; as the *demivolt*, *curvet*, &c.

AIRY *triplicity*, among *Astrologers*, the signs of Gemini, Libra, and Aquarius. See TRIPLICITY.

AISAMENTA, in *Law*. See EASEMENT.

AJUBAIPITA *Brasiliensium*, in *Botany*, a name given to a shrub that bears a black fruit like an almond, which yields a great deal of oil.

AJUGA, in *Botany*, the name of a genus of plants, of the *didynamia gymnospermia* class, according to Linnæus, which are called by Tournefort, and other authors, BUGULA.

AJURU-CATINGA, in *Ornithology*, the name of a Brasilian parrot. It is of the size of a pullet, and all over of a very fine bright green; its eyes are red, and the skinny circle about them is white; its beak and legs are also white. Marcgrave.

AJURU-CURAU, in *Ornithology*, the name of a Brasilian species of parrot, of the size and shape of the common green parrot, of which there are two kinds. The first an extremely beautiful one with a blue crown; the throat and sides of the head are of a fine yellow, and all the rest of the body of a chearful green: the long-winged feathers are half black, and half of a fine strong yellow, and at their ends variegated with blue and green; and the tail edged with red, black, and blue. The other kind has the same colours differently disposed; its head is yellow, with a whitish cast; the throat and sides of the head about the eyes are of a clearer yellow; and there is a sea green spot near the head.

Besides these, there is also yet another variety, the species of which have all the colours of the first kind, but have an admixture of black about the head, a yellow spot on the crown, another of the same colour below the eyes, and a blue one under the throat. Ray.

AJURU-PARA, in *Ornithology*, the name of a Brasilian species of parrot of a small size, all over of a beautiful green, and with white legs, a white beak, and white skinny circles round its eyes. Marcgrave.

AJUTAGE, or AJUTAGE, in *Hydraulics*, part of the apparatus of an artificial fountain, or *jet d'eau*; being a sort of tube, fitted to the mouth, or aperture of the vessel; through which the water is to be played, and by it determined into this, or that figure.

The word is formed of the verb *ajouter*, *to adapt*.

It is chiefly the diversity in the *ajutages*, that makes the different kinds of fountains. And hence by having several *ajutages* to be applied occasionally, one fountain comes to have the effect of many.

Mariotte enquires into the best kind of *ajutages*, or spouts for *jets d'eau*, affirming from experiment, that an even polished round hole, in the end of the pipe, gives a higher jet than either a cylindric, or a conical *ajutage*; of which yet the latter is the better. Vide Trait. du Mouvem. des Eaux, part 4. Phil. Trans. N° 181.

The various sorts of *ajutages*, their structure, application, &c. see under FOUNTAIN.

AIX LA-CHAPELLE *waters*, are volatile, sulphureous, aluminous, powerfully penetrating, resolvent, and containing a portion of iron. The three most noted hot waters in Europe, are those of Aix-la-Chapelle, Bourbon, and Bath. Of these the first are the lowest, the most nauseous, purgative, and abundant in sulphur; the last is least so.

AIZOON, in *Botany*, a name given by some authors to HOUSELEEK. It is a distinct genus of the *icosandria pentagynia* class, in the Linnæan system; the calyx of which is divided into five segments, without petals, and the capsule has five cells, with five valves. There are three species.

AKOND, an officer of justice in Persia, who takes cognizance of the causes of orphans and widows; of contracts, and other civil concerns.—He is the head of the school of *law*, and gives lectures to all the subaltern officers; he has his deputies in all the courts of the kingdom, who, with the second *sadrus*, make all contracts.

AL, an Arabic particle, prefixed to words, to exalt, or give them a more emphatical signification,—As, in *Alcoran*, *Algebra*, &c.

ALA, or ALD, in our *Ancient Writings*, signifies as much as *old*, *ancient*.—This being prefixed to the names of places, expresses their antiquity; as Aldborough, Aldgate, &c.

ALA, a Latin term, literally signifying *wing*, used, in *Anatomy*, for several parts of the body, which bear some resemblance to the figure of a wing.

Thus, the lobes of the liver are sometimes called *alæ*.

The loft, spongious bodies in the *pudendum muliebre*, usually called the *nymphæ*, are denominated *alæ*.

The two cartilages of the nose, which form the nostrils, are called *alæ*.

And the same denomination is given to the tip of the AURICLE. It is also applied to the processes of the *os sphenoides*.

ALA, in *Botany*, a name given by the Latin writers of *medicine*, in the later ages, to the *balsamum*, or ELECAMPANE.

ALA is also used in *Botany*, for the angle which the leaves, or the stalks or pedicles of the LEAVES, form with the stem, or branches of the plant from which they arise. This angle is usually acute, and always is directed upwards.

ALÆ is sometimes also applied to the angle formed by the branches themselves, with the stem; which is also observed to be very regular and uniform.

ALA has several other different significations. It most frequently is used to express the hollow of the stalk of a PLANT, which, either the leaf, or the PEDICLE of the LEAF, makes with it, or it whether turning, or *axis*, placed between the stalk, or branch of a plant, and its leaf, from whence a new offspring is wont to put forth. Sometimes it is taken also for a little branch, as when we say, a flock, or stem of a plant, is armed with many *alæ*, because these small branches stand out from it, in form of so many wings.

ALÆ is also used to signify those petals, or leaves of the papilionaceous flowers, placed between those others which are called the *vexillum* and the *carina*, which make the top and bottom of the flower. Instances of flowers of this structure are seen in the flowers of pea and beans, in which the top-leaf, or petal, is the *vexillum*, the bottom the *carina*, and the side ones the *alæ*.

ALÆ is also used for those extremely slender and membranaceous parts of some seeds, which appear as wings placed on them, as in the *plumeria*, the fruit of the trumpet-flower, the fruit of the maple, and the like, which are called by botanists *alated* seeds.

ALÆ is, finally, used also for those membranaceous expansions, which run all the way along the stems of some plants, and are therefore called *alated* stalks.

ALÆ, in *Anatomy*, is sometimes applied to the arm-pits, otherwise called *axillæ*. These parts abound with glands, and are great receptacles of humours; whence a rank smell sometimes exhales, called *fœtor alarum*.

ALÆ, in the *Military Art*, the two wings or extremes of an army, ranged in form of battle.

ALABARCHA, in *Antiquity*, a kind of magistrate among the Jews of Alexandria, whom the emperors allowed them to elect, to have the superintendency of their policy and decide differences and disputes, which arose among them.

ALABARDA, the name of a spear anciently used by the Helvetians and Germans.

ALABASTER, in *Natural History*, a kind of stone, softer than marble, yet harder than plaister of Paris: used for the making of figures, and other ornaments of sculpture. Some derive the word from *albus*, because of the whiteness of this stone.—Others, from ἀλαβαστρον, which they form from the privative α. and λαμβανω. *capio*, *to take*; this stone being too smooth and slippery for the hand to fasten hold of it.

It is found of all colours; some extremely white and shining, which is the most common; some reddish or tawny; and some is called *onyx* from its colour, which resembles that of the *onyx*, though very different from it in its nature.

Alabaster cuts very smooth and easy, and is much used among sculptors, for little statues, vases, and columns.

They sometimes also employ it as plaister of Paris: in order to which, they burn and calcine it; after which

80085

mixing it up with water to a thin consistence, it is cast into a mould, where it readily coagulates into a firm body.

Alabaster, Mr. Boyle obſerves, being finely powdered, and thus let in a baſon over the fire, will, when hot, aſſume the appearance of a FLUID, by rolling in waves, yielding to the ſmalleſt touch, and emitting vapour; all which properties it loſes again, on the departure of the heat, and diſcovers itſelf a mere incoherent powder.

The fineneſs and clearneſs of this ſtone render it, in ſome meaſure, tranſparent; whence it has been ſometimes alſo employed for windows. There is a church at Florence ſtill illuminated by *alabaſter*-windows, inſtead of panes of glaſs, there are ſlabs of *alabaſter* near fifteen feet high, each of which forms a ſingle window, through which the light is conveyed.

Naturaliſts alſo mention divers extraordinary kinds of *alabaſter*, *fiſh*, *ſolid*, *variegated*, *Indian*, *Carmanian*, *German*, &c. Grew ſpeaks of a *baſtard* ALABASTER, ſpotted, which he calls GYPSUM *variegatum*, wherein there are divers ſorts and colours in the repoſitory of the Royal Society. Theſe all make a ſtrong effervescence with ſpirit of nitre. They are found in Bohemia, Miſnia, &c. Of theſe lightly burnt, is made what is popularly called PLASTER of Paris.

Ancient authors ſpeak much of the medicinal virtues of *alabaſter*, as aſtringent. Some recommend it as a ſpecific in a dyſentery. But modern phyſicians ſcarce allow it in either of theſe characters. Yet ſome diſpenſatories ſtill retain a preparation of it under the title of *unguentum alabaſtrinum*, preſcribed for the head-ach.

The countries of Europe, which abound moſt in *alabaſter*, are Germany, toward Coblentz; the province of Maconnois, in the neighbourhood of Cluni in France; Italy, toward Rome; where that of Montalsino is particularly remarkable not only for its whiteneſs, but alſo for the bigneſs of its blocks, ſome of which are ſo large, that ſtatues as big as the life may eaſily be cut out of them. F. Labat, in his journey to Italy, obſerves, that there are quarries of *alabaſter*, in the neighbourhood of the village called de la Tolfa, near Civita Vecchia; there is alſo *alabaſter* to be found in ſome places of Lorrain; but it is not much eſteemed.

Cornelius le Brun, in his Voyage to the Levant (tom. v. p. 284) refutes, that he has ſeen mountains of *alabaſter*, which are diſtant about a hundred and fifty leagues weſt from Archangel.

A new manufacture of *baſſo relievo*, from a ſingular ſpecies of factitious *alabaſter*, has been lately eſtabliſhed by Mr. Letapie, at the baths of St. Philip, in Tuſcany. The ſtream at theſe baths depoſits a peculiar kind of ſand, which when collected and condenſed in the cavities of any body employed to oppoſe its current, acquires the nature, hardneſs and colour of *alabaſter*, and aſſumes the forms of thoſe cavities in which it is thus lodged. See Abbé Rozier's Obſervations, &c. for June, 1776.

ALABASTER is alſo uſed for a vaſe, wherein odoriferous liquors were anciently put.

The reaſon of the denomination is, that veſſels for this purpoſe were frequently made of the *alabaſter*-ſtone, which Pliny and other ancients repreſent as peculiarly proper for this purpoſe.

Several critics will have the box mentioned in the Goſpels as made of *alabaſter*, to have been of glaſs. And though the text ſay, that the woman broke it, yet the pieces ſeem miraculouſly to have been united, ſince we are told, the cuſtom-box was purchaſed by the emperor Conſtantine, and preſerved as a relic of great price.

Others will have it, that the name *alabaſter* denotes the form rather than the matter of this box. In this view, they define *alabaſter*, by a box without a handle, deriving the word from the privative *a*, and λαβη, *anſa*, *handle*.

ALABASTER is alſo ſaid to have been uſed for an ancient liquid meaſure, containing ten ounces of wine, or nine of oil.

In this ſenſe, the *alabaſter* was equal to half the *ſextary*.

ALABASTRA, in a *plant*, are thoſe little herbaceous leaves which encompaſs the bottoms of flowers, particularly the roſe. See CALYX, &c.

Some, with ſingulus, explain *alabaſtra*, by the globe or roundiſh bud of the roſe juſt peeping out.

ALABASTRITES, *alabaſtrites*, in *Natural Hiſtory*, the name of a genus of foſſils allied to the marbles, and defined to be ſtones compoſed of large ſeparate concretions, of great brightneſs, and an elegant, but ſhattery ſtructure, not very hard, not giving fire with ſteel, fermenting with acid ſolutible in ſcids, and calcining in a ſlight fire.

ALABASTRITES is often uſed as ſynonymous with *alabaſter*. But Anſelmus Boetius diſtinguiſhes between *alabaſter* and *alabaſtrites*, in making the criterion of the former to be its ſoftneſs, that it may be cut with a knife; and of the latter, that it is ſo hard that it cannot be ſo cut.

Grew ſpeaks of a ſort of *alabaſtrites*, repreſenting the tranſverſe ſection of the trunk of a tree.

ALABASTRUM *dendroides*, in *Natural Hiſtory*, a name given by authors to a ſpecies of alabaſter, found in great abundance in the province of Hohenſtein, and famous for the elegant delineations of trees, and other figures deſcribed in it. See GYPSUM.

ALACUOTH, among Arabian *Phyſicians*, an infirmity of the nerves, whereby a perſon in the act of venery, lets go at the ſame time his *ſeed*, &c.

ALADINISTS, a ſect among the Arabs, anſwering to free-thinkers among us.

The *Aladiniſts* multiplied greatly under the two learned kings Almanſor and Miramolinus.

ALAISE, in *Heraldry*, the ſame with *bumetty* or RACCOURCY.

ALALCOMENIUS, in *Ancient Chronology*, the Boeotian name for the Athenian month MAIMACTERION, which was the fourth of their year, and anſwered to the latter part of our September and beginning of October.

ALAMANNICUM, in *Antiquity*, a tribute impoſed on the people by the emperor Alexius Angelus, for raiſing the ſum of fifteen talents of gold, to be paid the *Alamanni*, as the conditions of a peace ſtipulated with them.

The eccleſiaſtics themſelves were not exempted from this tax.

ALAMIRE, or *A-LA-MI-RE*, among *Muſicians*, a note of the modern SCALE of muſic. See NOTE.

ALAMODALITY, *alamodalitas*, is defined by a late writer, a ſtudy or endeavour to accommodate a man's ſelf in point of behaviour, dreſs, converſation, and other actions of life, to the reigning taſte or cuſtom, from a motive of complaiſance, and to avoid the imputation of ill-breeding.

ALAMODALITY *of writing*, *alamodalitas ſcribendi*, is defined, by the ſame perſon, a particular ſtudy or endeavour of learned men to adapt the productions of their minds, both as to the choice of ſubject and the manner of treating it, to the genius or taſte of the times, in order to render them more acceptable to the readers.

A German writer, under the name of Geamonius, has a diſſertation on *alamodality in writing*.

ALAMODE, in *Commerce*, a thin, light, gloſſy black ſilk, not quilted or croſſed; chiefly uſed for womens hoods, and mens mourning ſcarves.

The name is French, though not given in the country to this fabric, for which they have no other name but *taffetas noir lustre*.

The importation of theſe ſilks is regulated by ſeveral acts of parliament. See 4 and 5 W. and M. cap. 5.—5 and 6 W. and M. cap. 20.—6 and 7 W. III. cap. 18.—8 and 9 W. III. cap. 36.—9 and 10 W. III. cap. 43.—5 Anne, cap. 10. 20.

ALANA-GIBBA, a name given to the yellowiſh-white TRIPOLI.

ALANA-TERRA, Engliſh *ether*; it is eſteemed drying and aſtringent; its principal uſe is to mix with ſalts in diſtillation, in order to keep them from melting. It is thought that this ſtone is what the ancients called the SAMIAN *ſtone*.

ALANFUTA, in the Arabian *Phyſic*, the name given to a vein between the chin and under lip, anciently uſed to be opened againſt a ſtinking breath.

ALANORARIUS, in our *Ancient Cuſtoms*, a keeper or manager of ſpaniels, or ſetting-dogs, for the ſport of hunting, hawking, &c.

The word is formed from the *Gothic*, *alan*, *a greyhound*.

ALAPOULI, in *Natural Hiſtory*, the name of an Eaſt Indian tree, a ſpecies of the *bicumba*, which is uſed in medicine as a purge and vomit, mixt with the ſeeds of muſtard.

ALAQUECA, a medicinal ſtone brought from the Indies, in ſmall gloſſy fragments; much prized by ſome for its efficacy in hæmorrhages, when applied externally.

ALARAF, in the Mahometan *Theology*, the partition wall that ſeparates heaven from hell.

Alaraf gives the denomination to the ſeventh chapter of the Alcoran, wherein mention is made of this wall. Some take it for a ſort of *limbus* for the patriarchs, prophets, &c. Others place here ſuch whoſe good and evil works do exactly balance each other, that they neither deſerve reward nor puniſhment.

ALARES, in *Antiquity*, are ſuppoſed by ſome authors to have been a kind of *militia*, or ſoldiery, among the Romans; ſo called from *ala*, a *wing*, becauſe of their lightneſs and ſwiftneſs in the combat.

Others make them a people of Pannonia; but others, with more probability, take *alares* for an adjective, *i. e.* equeſtri, and apply it to the Roman cavalry; becauſe placed in the two wings, or *alæ* of the army, for which reaſon, a body of horſe was called *ala*.

ALARES *muſculi*, in *Anatomy*. See PTERYGOIDAEI.

ALARIS *vena*, the inmoſt of the three veins in the bend of the arm.

ALARM, properly denotes a ſudden apprehenſion, conceived from ſome noiſe, or report, which makes men run to their arms, and ſtand on their guard.
The word is French, formed from the Italian *all' arme, to arms*; whence *gridare all' arme*, q. d. *to call to arms*.
Alarms are either true, that is, founded on juſt notice, or falſe.

ALARMS, *falſe*, are frequently given by an enemy, either to fatigue the other's army, or by way of diverſion; to keep themſelves ſafe and quiet from attacks. To remedy the inconveniences of formal *alarms*, and prevent the horror and confuſion of trumpets, and noiſe of warlike cries, the captains uſually give the *alarm*, by ſilent advice, without noiſe.

ALARM-*poſt*, is the ground appointed to each regiment, by the quarter-maſter-general, for them to march to, in caſe of an *alarm*.
In a garriſon, the *alarm-poſt* is the place where every regiment is ordered to draw up, on ordinary occaſions.

ALARM, in *Fencing*, denotes a ſtep, or ſtamp, made on the ground with the advancing foot.
This anſwers with what is otherwiſe called an appel, or challenge.

ALARM, or rather ALARUM, is alſo uſed for an inſtrument to awaken perſons at a certain hour: one very ſimple contrivance of this kind, is that uſed by weavers. See WEAVERS-*alarm*.

ALARM-*bell*, that which is rung to call the people together on ſome ſuch occaſion as a fire, mutiny, or the appearance of an enemy. This is what the French call *tocſin*.

ALASCANI, in *Church Hiſtory*, a ſect of Antilutherans, whoſe diſtinguiſhing tenet, beſides their denying baptiſm, is ſaid to have been this, that the words, *This is my body*, in the inſtitution of the euchariſt, are not to be underſtood of the bread, but of the whole action, or celebration of the ſupper.
They are ſaid to have taken the name from one Joannes a Laſco, a Poliſh baron, ſuperintendant of the church of that country, in England.

ALASTROR, among *Alchemiſts*, denotes lead; though ſome will have it to ſignify CALX.

ALATED *quadrupeds*. See QUADRUPED.

ALATED *leaves*, among *Botaniſts*, thoſe made up of ſeveral pinnated ones; as in the *orobus*. See LEAF.

ALATERNOIDES, a name given by botaniſts to the CASSINE.

ALATERNUS, in *Botany*, the *rhamnus* of Linnæus. See BUCKTHORN, and PRIVET.

ALAUDA, in *Ornithology*, a genus of the order of *paſſeres* and claſs of *aves*, in the Linnæan ſyſtem. See LARK.

ALAUDA, in *Ichthyology*, ſee BLENNIUS.

ALB, ALBA, ALBE, a robe, or veſtment, of white linen hanging down to the feet, and tied round the waiſt of the wearer with a girdle or ſaſh. It was anciently embroidered with various colours, ornamented with fringe, wherein the Romiſh prieſts performed divine ſervice.
The *alb* correſponds to the ſurplice among us.—The rubric of Edward VI. diſtinguiſhes between them. It takes its name from its colour, *albus*, *white*.
In the ancient church it was uſual with thoſe newly baptized to wear an *alb*, or white veſtment, for eight days; and the Sunday after Eaſter was called *Dominica in albis*, on account of the *albs* worn by the Neophytes, who were baptiſed on Eaſter day. The *albs* were alſo worn by laymen living in monaſteries.
ALB. See AUBE.

ALBADARA, ſignifies in Arabic the *ſeſamoids* bone of the firſt joint of the great toe, which is about the ſize of a ſmall pea. Its uſe is to that joint much the ſame as the *patella* is to that of the knee.

ALBA FIRMA, or ALBUM, was a yearly rent, payable to the chief lord of a hundred; ſo called, becauſe paid wholly in white money, or ſilver, and not in corn, which was called *black mail*.

ALBA TERRA, among *Alchemiſts*, denotes the philoſophers ſtone, compounded of mercury and ſulphur.

ALBANENSES, ſee ALBIGENSES.

ALBANI, in *Middle Age Writers*, denote ſtrangers or foreigners: anſwering to what we call aliens.

ALBANI, in *Antiquity*, a college of PRIESTS, or prieſts of Mars inſtituted by Tarquin, and denominated from mount Albanus, the place of their reſidence.

ALBANUM, among *Chemiſts*, denotes ſalt of urine.

ALBARA, or ALBORA, among *Phyſicians*, a mixt ſpecies of malignant itch, compounded of the *morphew*, *ſerpigo*, and *lepra*.
The *albora* partakes moſt of the nature of the leproſy; ſome make it the ſame with the *lenes*, VITILIGO, or MORPHEW. See ALPHOS. It ſignifies likewiſe the white POPLAR.

ALBARAZIN, or ALBAZARIN, a kind of Spaniſh wool.

ALBARDEOLA, in *Ornithology*, a name given by many authors to the *platea*, or SPOON-*bill*, a bird approaching to the nature of the HERON.

ALBARII, in *Antiquity*, properly denoted thoſe who gave the whitening to earthen veſſels, &c. in which ſenſe they ſtood contradiſtinguiſhed from *vitellatores*, who whitened walls.

ALBARIUM *opus*, in the *Ancient Building*, the incruſtation or covering of the roof of houſes with white plaiſter, made of mere lime. The workmen were called *albiſti*, or *albarii*.
This is otherwiſe called *opus album*. It differs from *teſtarium*, which is a common name given to all rooting or cieling, including even that formed of lime and ſand, or even lime and marble; whereas *albarium* was reſtrained to that made of lime only.

ALBATI *equi*, in *Antiquity*, was a denomination given to thoſe horſes in the games of the *Circus*, which were diſtinguiſhed by white cloths or furniture.
In which ſenſe, *albati* ſtands contradiſtinguiſhed from *roſſati*, *graſſati*, and *veneti*.

ALBATROSSE, the name of a large ſea-bird, common about the Cape of Good Hope, Cape Horn, and in many other places. This is a thieviſh creature, and principally feeds on the prey which another ſea-bird, called the *booby*, provides for itſelf.
It is ſaid that the head of the *albatroſſe* changes from brown to a fine ſcarlet, while it ſits on its eggs, and afterwards becomes brown again.

ALBELEN, in *Ichthyology*, the name of a fiſh of the truttaceous kind, called alſo *aſſunis*, and much reſembling the *ſarra*. It is caught in the German and other lakes, and is found from five or ſix to twelve pounds weight, but that more rarely. Its colour is a fine ſilvery white.

ALBELLUS, a ſpecies of *anſeres*, in the Linnæan ſyſtem, belonging to the genus of MERGUS.

ALBEOLA, a ſpecies of *anas*.

ALBERNUO, a kind of cambler, or barracan, that comes from the Levant by the way of Marſeilles.

ALBERTISTS, a ſect of ſcholaſtics, denominated from their leader Albertus Magnus.

ALBESA, a kind of ſhield uſed by the ancient Albenſes, a nation of the Marſi.

ALBICILLA, in *Natural Hiſtory*, a name given by ſome authors to that ſpecies of eagle commonly called PYGARGUS, from the whiteneſs of part of its tail.

ALBIGENSES, a ſect about Thouloufe and Alb, in Languedoc, whence they derived their name; who, in the twelfth century, became remarkable for their oppoſition to the diſcipline and ceremonies of the church of Rome. See REFORMATION.
They were alſo known by various other names: as, Petrobruſſians, Arnoldiſts, Cathari, Patarins, Publicans, Tifferans, Bon-hommes, Paſſagers, &c. Some will have them to be the ſame with the Albanenſes; and they who think them different, attribute the ſame opinions to both. They were a party of the Paulicians, who migrated from Bulgaria and Thrace into other countries. Their firſt ſettlement was in Italy, whence they ſent out colonies into almoſt all the other provinces of Europe. It is ſaid that Peter Bruys was the firſt that brought them into Languedoc, about the year 1126. See PETROBRUSSIAN.
The Romaniſts tax the *Albigenſes* with abundance of heterodox opinions; as, for inſtance, that there are two Gods, the one infinitely good, and the other infinitely evil: that the good God made the inviſible world, and the evil one that which we live in; with the reſt of the Manichean tenets.
But this ſeems to be one of thoſe pious frauds allowed particularly in that church, which eſteems it a kind of merit to blacken hereſies, and thoſe whom they chuſe to call ſo.
However this be, the *Albigenſes* growing formidable in a little time, that a holy league, or croiſade, was agreed upon among the catholics; and war denounced againſt them, the pope himſelf raiſing the firſt ſtandard.—In 1229, a peace was ſtruck up, and an inquiſition eſtabliſhed at Thouloufe, from which time the *Albigenſes* dwindled by little and little, till the times of the Reformation, when ſuch of them as were left fell in with the VAUDOIS, and became conformable to the doctrine of Zuinglius, and the diſcipline of Geneva.

ALBINI, in *Antiquity*, ſee ALBARIUM *opus*.

ALBIREO, a ſtar of the third or fourth magnitude, in the conſtellation CYGNUS.

ALBOGALERUS, in Roman *Antiquity*, a ſacerdotal cap, or ornament, worn by the *flamen dialis*, which is otherwiſe called *galerus*.

ALBORAK, in the Mahometan *Theology*, the beaſt on which the prophet is ſaid to have rode in his extraordinary aerial journies. It is repreſented as of an intermediate

diate shape and size between an ass and a mule; and many fabulous accounts are given of it by the Arabian commentators.

ALBORO, in *Ichthyology*, a name by which the ERYTHRINUS, a small red fish caught in the Mediterranean, is commonly known in the markets of Rome and Venice.

ALBUCA, in *Botany*, a distinct genus in the Linnæan system, belonging to the class of *hexandria monogynia*.

ALBUCUS, a name used by some for the white *ephemeris*.

ALBUGINEA, in *Anatomy*, the outermost coat, or tegument of the eye, otherwise called ADNATA, and *conjunctiva*. It takes its name *albuginea* from its whiteness; it being this that forms what we call the *albugo*, or white of the EYE.

ALBUGINEA is also applied to the third coat of the testicles; so called from its colour, which is white.

It is a strong thick membrane, very smooth on the outer surface; the inner, which adheres to the substance of the testicle, being rough and uneven. Into its upper part are inserted blood-vessels, nerves, and lymphatics, which from thence send divers branches into the substance of the testicles. See TUNICA.

ALBUGINEUS is applied, by some, to denote the aqueous humour of the eye.

ALBUGO, or ALBUM *oculi*, the same with *albuginea*, or the *white of the eye*.

ALBUGO is a whitish, dense, opaque spot, or film, growing on the horny tunic, by which it loses its native colour, and becomes white and opaque.

The *albugo* is the same with what is otherwise called LEUCOMA.

It is most commonly the consequence of inflammations, by the extravasation of humours, between the membranes of this tunicle; and particularly in the small-pox by the suppuration of pustules upon this part; but they sometimes arise from scars left after punctures in the *cornea*, from swords, knives, glass, &c. from burns, or from caustic substances falling into the eye, or by a peculiar tunic growing to the eye itself.

The cure is various, according to circumstances. If the disorder arises from inspissated humours, an attenuating diet and medicines, especially sudorific decoctions and infusions, together with phlebotomy, scarifications, blisters, and *pediluvia*, are useful. Cold and astringent *collyria*, especially those of white vitriol, are here pernicious: whereas warm applications are of the greatest service. But if these disorders be of long standing, there is little or no hope of a cure.

If the disorder proceeds from abscesses, or a suppuration of matter, after an inflammation, betwixt the *lamina* of the *cornea*, which they elevate like a pea, or pearl, whence they are sometimes called *pearls*, an incision ought to be made into the *cornea*, to discharge the included matter. But neither this nor any other method will succeed, so as to preserve the eye sight clear, if the matter be lodged deep.

If the pustules take their rise from burns, or the small-pox, the contained matter must be discharged, and the pellicle must be removed with *alum. ust. cum sacchar. cand. & aver. tyst. pp.* applied every day to the *cornea*.

Spots in the *cornea* arising from wounds, scars, or the abuse of vitriolic *collyria*, are seldom curable.

Dr. Mead tells us of several cures of the *albugo*, performed by means of an eye-powder, which he recommends. The receipt is this: take of common glass any quantity, pound it in a mortar to a very fine powder; then add an equal quantity of white sugar-candy, and levigate the mixture till it becomes impalpable.

A little of this powder put into the eye with a quill, every day, gradually wears off the spot.

Another method of removing the speck, is to have it pared by a surgeon every day with a knife: but this seems a doubtful remedy.

ALBULA, in *Ichthyology*, a genus of fishes of the trutta-ceous kind, having no teeth.

ALBULA *Indica*, the name of a small fish, resembling a herring caught about the shores of the East Indies, and called by the Dutch the WIT-fish. Ray.

ALBULA *nobilis*, the name of one of the trutta-ceous fishes, caught in great plenty in the lakes of Germany, and other places.

ALBULA is also a name given, by some naturalists, to mineral waters of the aluminous kind; hence endued with an astringent quality, and of use in wounds.

The word is Greek, in which language it signifies the same.

ALBUM, in *Literary History*, is used to denote a kind of table, or pocket-book, wherein the men of letters with whom a person has conversed, inscribe their names, with some sentence, or motto.

This is called by divers names and titles, as *album amicorum, repositorium amicorum*, &c.

The famous Algernon Sydney being in Denmark, was by the university of Copenhagen presented with their *album*, wherempon he wrote these words:

——*Manes hæc inimica tyrannis*
Ense petit placidam sub libertate quietem.

ALBUM, in *Antiquity*, denotes a white table, or the like, whereon names, or other matters, were to be inscribed, or entered.

Hence we meet with *album prætoris, album decurionum, album judicum*, &c.

The high priest entered the chief transactions of each year into an *album*, or table, which was hung up in his house for the public use.

ALBUM, in *Natural History*, is used for the white of an egg: more properly called *albumen*.

ALBUM, among *Chemists*, is used for white lead, popularly called *cerussa*.

ALBUM is also used, among *Alchemists*, for a tincture pretended to transmute metals.

ALBUM is also applied, in *Pharmacy*, as a title, or epithet, of divers compound medicines. Thus we meet with *unguentum album camphoræ*, &c.

ALBUM *Græcum*, dog's white dung, is a medicinal drug, in the present practice, used with honey to cleanse and deterge, chiefly in inflammations in the throat; and for the mush part outwardly, as a plaster; but as Dr. Quincy observes, seldom to any great purpose. See Neumann's Works, p. 585.

Some speak of its use internally, in the *angina*, and other inflammations; as also in the dysentery, colic, &c. and to prevent burns from rising into blisters.

ALBUM *rigrum* is used, among *Medical Writers*, for mice-dung, by some also called *musserda*.

ALBUM *oculi*, among *Anatomists*, denotes the *tunica adnata*; sometimes also called *albugo*; popularly the white of the EYE.

ALBUMEN *ovi*, in *Natural History*, and in *Medicine*, the white of an EGG.

ALBURN, or AUBURN *colour*, a whitish brown, or mixt colour, partaking of red and white.

ALBURNUM, in *Physiology*, the exterior part of the wood of a tree, next the BARK.

ALBURNUS, in *Ichthyology*, the name of a fresh water fish, commonly known in English by the name of the BLEAK. It is common in our rivers, and in those of Germany and elsewhere, and is esteemed a well tasted fish. It is most in season in September. It is a species of the *cyprinus* of Linnæus.

ALBURNUS *lacustris*, in *Ichthyology*, a name given by the writers who have copied Gesner's errors, to the *bolonus* of the ancients, or the *pallerus*, or *pleistus*, of the moderns.

ALBUS *piscis*, the white fish, in *Ichthyology*, a name by which Salvian has called the fish more usually called the *capito lacustris*, and seeming the same with the blue chub, or, as it more frequently called, the JEWTLING.

Also a fish is a species of the CYPRINUS, called by the Italians *albo*.

ALCA, in *Ornithology*, see ALKA.

ALCAHEST, see ALKAHEST.

ALCAICS, in the *Ancient Poetry*, a name common to several kinds of verses; so called from the poet Alcæus, the inventor of them.

The first species of *Alcaics* consists of five feet, of which the first may be either spondee, or iambic; the second is an iambic; the third, a long syllable; the fourth, a dactyl; and the fifth, a dactyl, or amphimacer: as these of Horace.

Omnes eodem cogimur, omnium
Versatur urna, serius, ocyus,
Sors exitura.

The second species of *Alcaics* consists of two dactyls, and two trochees: as

Exilium impositura cymbæ.

Besides these two kinds of verses, which are properly called *dactylic Alcaics*, there is a third sort, called simply *Alcaic*, whereof the first is an *Epitrite*, the second and third are *Choriambuses*, and the fourth a *Bacchius*; as,

Cur tendit fluvium Tiberim | tangere? cur | illorum P

ALCAIC *Ode* consists of four strophes, each of which contains four verses: the two first are *Alcaic* verses of the first kind; the third an iambic dimeter hypercatalectic, i. e. of four feet, and a long syllable: as,

Sors exitura, & nos in æternum.

The fourth is an *Alcaic* of the second kind.—The entire *Alcaic* strophe is as follows:

Omnes eodem cogimur, omnium
Versatur urna, serius, ocyus,
Sors exitura, & nos in æternum
Exilium impositura cymbæ.

ALCAID, in matters of *Policy*, an officer of justice among the Moors, Spaniards, and Portuguese.

The word is also written *alcade, alcalde*, and *alcayd*: sometimes also *alcaldes*.

It is originally Arabic, compounded of the particle *al*, and the verb *hadi*, or *ahad, tenuit, gessit, administravit*.

The

The emperor of Morocco's court conſiſts chiefly of ſeven or eight *alcaids*, his devoted ſlaves.

The *alcaid*, or governor of a city or caſtle in Barbary, hath ſovereign juriſdiction in civil and criminal concerns; and all fines and puniſhments are inflicted at his pleaſure.

In ſome places the *alcaids* are much the ſame with the emperor's tax-gatherers.

Alcaid, among the Spaniards, &c. is a kind of inferior judge, or miniſter of juſtice, who takes cognizance of cauſes in the firſt inſtance, and anſwers in good meaſure to the French *prevoſt*, and an Engliſh juſtice of peace.

They had alſo their *alcaid* of the whores, who took cognizance of caſes of whoredom, and adultery. This officer was otherwiſe called *alcaid* of honour. Du-Cange.

ALCALI, ſee ALKALI.

ALCALIZATION, or ALKALIZATION, which ſee.

ALCANNA, a coſmetic powder, much uſed in the Levant, made of the leaf of a ſpecies of ſhrub frequent in Barbary.

ALCANNA, or ALCANA, by the Turks called *hnah*, a dying drug, brought from Egypt and the Levant, being the leaves of a plant called by botaniſts *liguſtrum Egyptiacum*, or the Egyptian *privet*. The Egyptians call it *cus hanne*. The colour drawn from theſe leaves is either red or yellow, according to the manner of the preparation; yellow when ſteeped in common water, and red when infuſed in vinegar, or alum-water.

The people of Cairo make a conſiderable traffic of theſe leaves; which they reduce to a powder called *archenda*, much uſed by the women to dye their nails and hair of a golden-yellow hue.—From the berries of *alcana* an oil is extracted, of a very agreeable ſmell, and ſome uſe in phyſic, as a calmer, called oil of Cyprus, a name which is ſometimes alſo given to the plant. Phil. Tranſ. abr. vol. x. ii. 741.

ALCANNA is alſo a denomination given by ſome to iſinglaſs, or ICHTHYOCOLLA, and the ANCHUSA.

ALCANTARA,—*Order of* ALCANTARA, an ancient military order. The preciſe year of its inſtitution is not ſettled among antiquaries.

The knights of *Alcantara* make the ſame vows as thoſe of Calatrava, and are only diſtinguiſhed from them by this, that the croſs fleur de lys, which they bear over a large white cloak, is of a green colour: they poſſeſs thirty-ſeven commanderies.

By the terms of the ſurrender of *Alcantara* to this order, it was ſtipulated, that there ſhould be a confraternity between the two orders, with the ſame practices and obſervances in both; and that the order of *Alcantara* ſhould be ſubject to be viſited by the grand-maſter of Calatrava. But the former ſoon releaſed themſelves from this engagement, on pretence that their grand-maſter had not been called to the election of that of Calatrava, as had been likewiſe ſtipulated in the articles.

After the expulſion of the Moors, and the taking of Granada, the ſovereignty of the order of *Alcantara*, and that of Calatrava, was ſettled in the crown of Caſtile, by Ferdinand and Iſabella.

In 1540, the knights of *Alcantara* ſued for leave to marry; which was granted them.

The hiſtory of this order is chiefly taken up in expeditions againſt the Moors, and broils with their neighbours.

ALCE, in *Zoology*, the ELK.

ALCEA, in *Botany*, VERVAIN-MALLOW.

Mr. Tournefort enumerates twenty ſpecies of this *alcea*, which is a medicinal herb, whoſe virtues are much the ſame with the mallow, but in leſs degree. It is uſed as an emollient, and is an ingredient in plaiſters. Diſcorides mentions the root, drank with wine or water, as a remedy againſt dyſenteries and ruptures.

There is a ſpecies of this plant called *alcea Indica*, the ſeeds of which the Egyptians dry, and of which they mix the powder in their coffee, to make it more effectual in ſtrengthening their head, ſtomach, &c.

ALCEA *veſicaria*, the *bladder alcea*, in *Botany*, the name of a ſpecies of KETMIA.

ALCEDO *vocalis*, in *Ornithology*, a name by which Bellonius, Aldrovandus, and ſome others, have called the red ſparrow.

ALCEDO, a genus of birds belonging to the order of *picæ*, and comprehending fifteen ſpecies. The characters are, that the beak is three-cornered, thick, ſtraight, and long; the tongue is ſhort, fleſhy, ſmooth, and acute, and the feet are formed for walking.

ALCHATA, in *Ornithology*, a ſpecies of the TETRAO.

ALCHEMIST, a perſon who profeſſes ALCHYMY.

ALCHIMELECH, the Egyptian *moliat*. Ray's Hiſt. Plant.

ALCHIMELLA, ſee LADY's *mantle*.

ALCHITRAM, among the *Alchemiſts*, denotes ſometimes the oil of juniper, ſometimes liquid pitch and ſometimes *arſenic*, prepared by ablution.

This is otherwiſe written *alchieram*, and *alchiteran*; ſometimes *alchytran*, and *altytran*.

ALCOLLEA, a kind of food in uſe among the weſtern Moors, being fleſhy meat, pickled, dried, boiled, and potted.

ALCHYMY, or ALCHEMY, a higher, or more refined kind of CHYMISTRY, employed in the more myſterious reſearches of the art.

The word ſeems compounded of the Arabic augmentative particle *al*, and the Latin *chymia*, Egyptian *hemie*, or Greek χυμια, *chemiſtry*. Though ſome object to this origin, and deny the Arabic any ſhare in the compoſition of the word; urging, that *alchemia* occurs in an author who wrote before the Europeans had any commerce with the Arabians, or the Arabians any learning, i. e. before the time of Mahomet.

The name *alchymy*, however, is really of no ancient ſtanding: the firſt time it occurs, is in Julius Firmicus Maternus, an author who lived under Conſtantine the Great, and who, in his Matheſis 3. 15. ſpeaking of the influence of the heavenly bodies, affirms, 'that if the 'moon be in the houſe of Saturn, at the time a child is 'born, he ſhall be ſkilled in *alchymy*.'

The great objects or ends purſued by *alchymy*, were, 1. The making of gold, which is attempted three different ways; by ſeparation, by maturation, and by tranſmutation; which laſt is to be effected by means of what they call the *philoſophers ſtone*.

With a view to this end, *alchymy*, in ſome ancient writers, is alſo called *ſecretum*, *poetice*, and χρυσοποιητικη, *chryſo-poetice*, q. d. the art of making gold.—And hence, alſo, the artiſts themſelves are called *ſecreti*, *makers*; and χρυσοποιηται, *gold-makers*.

2. An univerſal medicine, adequate to all diſeaſes. See ELIXIR.

3. An univerſal diſſolvent, or ALKAHEST.

4. An univerſal ferment; or a matter, which being applied to any ſeed, ſhall increaſe its fecundity to infinity: if, e. gr. it be applied to gold, it ſhall change the gold into the philoſophers ſtone of gold; if to ſilver, into the philoſophers ſtone of ſilver, i. e. into a matter which tranſmutes every thing into ſilver; and if to a tree, the reſult is, the philoſophers ſtone of the tree, which tranſmutes every thing, to which it is applied, into trees. See a Hiſtory of *Alchymy*, and its Principles, &c. Dr. Lewis's Commerc. Philoſoph. Techn. p. 199, & ſeq. and PHILOSOPHERS *ſtone*.

The origin and antiquity of *alchymy* are much controverted.—If regard may be had to legend and tradition, it muſt be as old as the flood. But in effect, not one of the ancient poets, philoſophers, or phyſicians, from Homer till four hundred years after Chriſt, mention any ſuch thing. The firſt author who ſpeaks of making gold, is Zoſimus the Panopolite, who lived towards the beginning of the fifth century, and who has an expreſs treatiſe, Περι της ιερας τεχνης της τ χρυσου και τ αργυρου ποιησεως, *Of the divine art of making gold and ſilver*, ſtill extant, in manuſcript, in the French king's library.

Kircher aſſerts, that the theory of the philoſophers ſtone is delivered at large in the table of Hermes; and that the ancient Egyptians were not ignorant of the art, but declined to proſecute it. They did not need to tranſmute gold; they had ways of ſeparating it from all kinds of bodies, from the very mud of the Nile, and ſtones of all kinds: however, he adds, theſe ſecrets were never written or publiſhed, but confined to the royal family, and handed down traditionally from father to ſon.

Kircher, inſtructed in all the ſecrets of chemiſtry, has fully expoſed the artifices and impoſtures of *alchemiſts*.

An *alchemiſt* puts into a crucible the matter which is to be converted into gold; this he ſets on the fire, blows it, ſtirs it with rods; and, after divers operations, gold is found at the bottom of the crucible, inſtead of the matter firſt put in: this there are a thouſand ways of effecting, without any tranſmutation. Sometimes it is done, by dexterouſly dropping in a piece of gold concealed between the fingers, ſometimes by caſting in a little of the duſt of gold, or ſilver, diſguiſed under the appearance of ſome elixir, or other indifferent matter; ſometimes a crucible is uſed which has a double bottom, and gold put between the two; ſometimes the rod uſed to ſtir the matter is hollow, and filled with the duſt of the metal deſired; at other times there is metal mixed with the charcoal, the aſhes of the furnace, or the like. Mr. Harris very properly diſtinguiſhes *alchemy* from *chemiſtry*; and defines the former to be *ars ſine arte, cujus principium eſt mentiri, medium laborare, et finis mendicare*; and the Italians have a proverb, *non ti fidiare al alchemiſta provero o medico amalato*. The ruin which has attended this deluſion has occaſioned ſeveral ſtates to make ſevere laws againſt pretences to *alchemy*. The Romans formerly baniſhed all ſuch as profeſſed it; and the ſacred canons likewiſe directed the thunder of their cenſure againſt them:

them. Diocletian and Cæsar directed all books which treated of this subject to be burnt. Rymer furnishes us with a licence for practising *alchymy*, with all kinds of metals and minerals granted to one Richard Carter, in the year 1476. Rym. Fœd. tom. xii. Nevertheless, we have had severe laws against *alchymy*, and multiplying of metals, as much as against coining itself.

The best writers in *alchymy*, according to the judgment of Boerhaave, are Geber, Morienus, Roger Bacon, Ripley, Raim. Lully, Bern. count Trevisanus, John and Isaac Holandus, Sendivogius, Basil Valentine, Artephius, Paracelsus, Irenæus Philalethes, and Van Helmont. See Petri Borelli, Bibliotheca Chymica, five Catalogus Librorum Philosophicorum Hermeticorum, Par. 1654, 12mo. It contains an account of about four thousand writers.

ALCHYMY is also used, in a less proper sense, for the art of common *chemistry*.

In which sense, Libavius has published a Practice of Alchymy, describing the preparations of the chief chemical medicines. And. Libavii Praxis Alchemiæ, h. e. de Artificiosa Præparatione Præcipuorum Medicamentorum. Francof. 1604. 8vo.

ALCIBIADUM. See ALCIBIUM.

ALCIBIUM, in *Botany*, a word used sometimes by the ancients as an epithet for a kind of *echium*, or viper's bugloss, and sometimes as the name of a peculiar plant.

ALCMANIAN, in the *Ancient Poetry*, a kind of lyric verse, or metre, consisting of two dactyls, and two trochees. Such, e. gr. is

Virginibus puerisque canto.

The word is formed from *Alcman*, the name of an ancient Greek poet, in great esteem for his *Erotics*, or amorous compositions.

Some authors assign other *Alcmanian* verses, composed of three *dactyls*, and a long syllable:

E. gr. *Munera lætitiamque Dei.*

Others give an *Alcmanian*, composed of a *dactyl*, *spondee*, and another *dactyl*, and a long syllable:

E. gr. *Ne dubita, nam vera fides.*

ALCOHOL, or ALKOOL, in *Chemistry*, an Arabic term, chiefly understood of the purest spirit of wine, raised, or rectified, by repeated distillations, to its utmost subtility and perfection.

The word is formed from the Arabic or Hebrew קָלָה, *haul*, *to attenuate*, *subtilize*.

Alcohol is the most complete production of vegetable fermentation; and, when brought to its highest degree of perfection, is the lightest *fluid* next to *air*; perfectly transparent, very thin, most simple, totally inflammable, without producing any smoke, or diffusing any disagreeable scent while it is burning; is exceeding volatile, without leaving any *faces*; absolutely immutable in distillation, extremely expansible by heat, very easily disposed to ebullition by fire, of a very pleasant smell, and of a particular grateful taste. All the humours of the human body that we are acquainted with, it coagulates in an instant, excepting the pure water and urine; whilst it hardens all the solid parts, and thus preserves both from putrefaction, or spontaneous colliquation. It preserves the bodies of insects, fish, birds, and other animals that are put into it, from corruption, or alteration, for ages, if closely stopped. With water, vinegar, any acid liquors, oils, and pure volatile alkaline salts, it suffers itself to be mixed, and that nearly of an equable mixture; gummy and resinous substances it dissolves. So that we are acquainted with no liquid, produced either by nature or by the art of *chemistry*, that is capable of being united with more bodies than *alcohol*, but in a particular manner it proves an excellent vehicle for the *spirituous rectors* of vegetables, which, by uniting with it, may be extracted from its proper body, retained, and applied to medicinal and other uses.

In the human body, by its smell, taste, and vapour, it wonderfully quickens, gratefully affects, and invigorates the animal, natural, and vital spirits, nerves, and brain. Flames fed by *alcohol* of wine, though of the same bigness with other flames, cause different degrees of dilatation in metals. See Collect. Acad. tom. i. p. 113.

Since there are various, and sometimes very inviting occasions, in which chemists, and other artificers, stand in need of the true and purest *alcohol*, the least remainder of water rendering the operation unsuccessful, it is absolutely necessary we should have some marks by which we may be able to distinguish whether our *alcohol* be pure or not. The principal of these are,

1. If the supposed *alcohol* contains any oil dissolved in it, and so equally distributed through it, that it is no other ways perceptible than upon the pouring of water into it, the mixture will grow white, and the oil will separate from the *alcohol*.

2. If any thing of an acid lies concealed in *alcohol*, a little of it mixed with the alcaline spirit of sal ammoniac, will discover the acid by an effervescence; for otherwise there would be only a simple coagulation.

3. If there be any thing in an alkali intermixed, it will appear by the effervescence excited by the affusion of an acid. As for other salts, they are seldom found in it.

4. But it is a matter of greater difficulty to discover whether there be any matter intermixed with it; and therefore chemists have contrived certain methods by which this may also be determined, of which the best is this. Take a chemical vial with a long narrow neck, the bulb of which will hold four or six ounces of *alcohol*. Fill this two thirds full with the *alcohol* you intend to examine, into which throw a dram of the purest and driest salt of tartar, coming very hot out of the fire; then mix them by shaking them together, and set them over the fire till the *alcohol* be just ready to boil. Being thus shaken and heated, if the salt of tartar remain perfectly dry, without the least sign of moisture, we are sure that there is no water in this *alcohol*.

The internal use of *alcohol* is highly destructive to the animal frame, as among other inconveniencies, it dries and contracts the nerves, and coagulates the juices. *Alcohol*, however, and fermented spirits in general, are of good service externally applied in many cases. Thus spirit of wine, especially camphorated, is a very good addition to fomentations designed to resolve inflammations whether external or internal.

Pure *alcohol* likewise, according to Boerhaave, is the best of styptics. According to Juncker, it is a combination of the acetous acid, phlogiston, and water; but the ablest chemists are not yet agreed as to the constituent principles of this fluid.

ALCOHOL is sometimes also used for a very fine, impalpable powder, which women in the East make use of as a kind of *fucus*. Dr. Shaw, in his Travels, speaking of the women in Barbary says, that none of those ladies think themselves completely dressed, until they have tinged their hair, and edges of their eye-lids with *al-ka-hol*, the powder of lead ore. From this impalpable powder the name was transferred to other subtile powders, and afterwards to spirits of wine, exalted to its highest purity and perfection. See PORPHYRISATION.

ALCOHOL, in the Arabian *Astrology*, is when a heavy slow-paced planet receives another lighter one within its orb, so as to come in conjunction therewith.

ALCOHOL *Martis*, filings of steel reduced to an impalpable powder, by turning it into rust with urine, then levigating it, and mixing it with a large quantity of water; that is, about a gallon to two pounds and a half of filings. After it has stood a quarter of an hour, the upper part of the water is to be poured off, and evaporated to a dryness. The powder at the bottom is to be put into a paper in the form of a sugar-loaf, and washed, by gradually pouring its hot-water, till it is freed from the nitrous salts. With regard to the remaining green powder, the same process is to be repeated.

Mulgrave has a great opinion of this preparation, as a remedy to bring back the gout from the nobler parts to the joints. He prescribes it thus: take of *alcohol martis* from five to ten grains, *theriaca Andromachi* from half a scruple to one drachm, mix these with as much syrup of clove-july-flowers, as is sufficient to make a bolus.

ALCOHOLIZATION, in *Chemistry*, the rectification of a vinous spirit.

This is otherwise called *alcalisation*.

Alcalisation, according to Stalkey, denotes the circulation of a volatile spirit on a fixed alkali, till such time as out of the two arises only one neutral body, different from both the former. *Alcoholization* is one way of volatilizing alkalis.

ALCOHOLIZATION is also used for PULVERIZATION.

ALCOLA is used by alchemists for the tartar of wine.

Alcola is found in three different forms, viz. 1. Resolved, or reduced into an impalpable substance. 2. Sandy, or voided under the appearance of small grains of whitish or reddish sand. 3. Mucilaginous, or viscous.

ALCOR, in *Astronomy*, a small star adjoining to the large bright one in the middle of the tail of URSA *major*.

The word is Arabic. It is a proverb among the Arabians, applied to one who pretends to see small things, but overlooks much greater, *Thou canst see Alcor, and yet not see the full Moon.*

ALCORAN, or AL KORAN, the Mahometan bible; or revelations, doctrine, and prophecies, of the pretended prophet Mahomet.

It is vulgarly called *Alcoran*; but the first syllable of the word is nothing more than an article signifying *the*; and therefore the true orthography of the word is *Al Coran*, or *Al Koran*, that is *the Koran*. It is derived from the Arabic word *karaa*, *to read*, and signifies *the reading*, or what ought to be read. Thus Mahomet gave it this title

by

by way of eminence, in imitation of the Jews and Chriſtians, who call the Old and New Teſtament *Scripture*; and the *Bible*, i. e. the book.

It is the common opinion among us, that Mahomet, aſſiſted by one Sergius, a monk, compoſed this book; but the Muſſulmen believe it as an article of their faith, that the prophet, who, they ſay, was an illiterate man, had no concern in inditing it; but that it was given him by God, who, to that end, made uſe of the miniſtry of the angel Gabriel; that, however, it was communicated to him by little and little, a verſe at a time, and in different places, during the courſe of twenty-three years.—'And hence, ſay they, proceed the diſorder and confuſion viſible in the work;' which, in truth, are ſo great, that all their doctors have never been able to adjuſt them. For Mahomet, or rather his copyiſt, having put all theſe looſe verſes promiſcuouſly in a book together, it was impoſſible ever to retrieve the order wherein they were delivered.

Thoſe twenty-three years which the angel employed in conveying the *Alcoran* to Mahomet are of wonderful ſervice to his followers: inaſmuch as they furniſh them with an anſwer to ſuch as tax them with ſuch glaring contradictions wherewith the book is full: thoſe contradictions they piouſly father upon God himſelf; alledging that in the courſe of ſo long a time, he repealed and altered ſeveral doctrines and precepts which the prophet had before received of him.

M. D'Herbelot thinks it probable, that when the hereſies of the Neſtorians, Eutychians, &c. had been condemned by œcumenical councils; many biſhops, prieſts, monks, &c. being driven into the deſerts of Arabia and Egypt, furniſhed the impoſtor with paſſages, and crude ill-conceived doctrines, out of the Scriptures; and that it was hence that the *Alcoran* became ſo full of the wild and erroneous opinions of thoſe heretics.

The Jews alſo, who were very numerous in Arabia, furniſhed materials for the *Alcoran*; nor is it without ſome reaſon that they boaſt twelve of their chief doctors to have been the authors of this work.

The *Alcoran*, it is to be obſerved, while Mahomet lived, was only kept in looſe ſheets: his ſucceſſor, Abubeker, firſt collected them into a volume, and committed the keeping of it to Haphſa, the widow of Mahomet, in order to be conſulted as an original; and there being a good deal of diverſity between the ſeveral copies already diſperſed throughout the provinces, Ottoman, ſucceſſor of Abubeker, procured a great number of copies to be taken from that of Haphſa; at the ſame time ſuppreſſing all the others not conformable to the original.

The chief differences, in the preſent copies of this book, conſiſt in the points, which were not in uſe in the time of Mahomet, and his immediate ſucceſſors; but were added ſince, to aſcertain the reading; after the example of the Maſſoretes, who added the like points to the Hebrew texts of Scripture.

The work is divided into *ſuras*, or chapters; and the *ſuras* are divided into little verſes, in Arabic called *ayat*, *ſigns* or *wonders*, which are all compoſed in a broken interrupted ſtyle, reſembling proſe rather than verſe.—The diviſion into *ſuras* is but of late ſtanding; the uſual number is one hundred and fourteen.

Beſide theſe unequal diviſions of chapter and verſe, the *Koran* is divided into ſixty equal portions, called *ahzab*, each of which is again ſubdivided into four equal parts. The chapters have different titles, which are uſually taken from the firſt word of note that occurs in them. Under the title, at the head of every chapter, except the ninth, is prefixed the following ſolemn form, called by the Mahometans the *biſmillah, in the name of the moſt merciful God*; which form, as well as the titles, are conſidered by ſome commentators of divine original, though others believe them to be human additions.

There are ſeven principal editions of the *Alcoran*; two at Medina, one at Mecca, one at Cufa, one at Baſſora, one in Syria, and the common, or vulgate edition. The firſt contains 6000 verſes, the others ſurpaſſing this number by 200 or 236 verſes; but the number of words and letters is the ſame in all; viz. 77639 words, and 323015 letters.

The *Alcoran* is held not only of divine original, but eternal and uncreated, remaining, as ſome expreſs it, in the very eſſence of God. The firſt tranſcript has been from everlaſting by God's throne, written on a table of vaſt bigneſs, in which are alſo recorded divine decrees, paſt and future. A copy from this table in one volume, on paper, was ſent down from the loweſt heaven, in the month of Ramadan, on the night of power. From whence it was delivered out to Mahomet by parcels, ſome at Mecca, and ſome at Medina; though he had the conſolation of ſeeing the whole once a-year, and in the laſt part of his life twice. Ten new chapters were delivered entire, the greater part only in ſeparate periods, which were written down from time to time by the prophet's amanuenſis, in ſuch a part of any particular chapter, as he directed. The firſt parcel that was revealed, was the firſt five verſes of the ninety-ſixth chapter, which the prophet received in a cave of Mount Harah, near Mecca.

The general aim of the *Alcoran*, was to unite the profeſſors of the three different religions, then followed in Arabia, idolaters, Jews, and Chriſtians, in the knowledge and worſhip of one God, under the ſanction of certain laws, and the outward ſigns of ceremonies, partly of ancient, and partly of novel inſtitution, enforced by the conſideration of rewards and puniſhments, both temporal and eternal, and to bring all to the obedience of Mahomet, as the prophet and ambaſſador of God, who was to eſtabliſh the true religion on earth, and be acknowledged chief pontiff in ſpiritual matters. The chief point, therefore, inculcated in the *Alcoran*, is the unity of God, to reſtore which the prophet pretended was the chief end of his miſſion. The reſt is taken up in preſcribing neceſſary laws and directions, frequent admonitions to moral and divine virtues, the worſhip and reverence of the Supreme Being, and reſignation to his will. One of their moſt learned commentators diſtinguiſhes the contents of the *Alcoran* into allegorical and literal; under the former are comprehended all the obſcure, parabolical, and enigmatical paſſages, with ſuch as are repealed, or abrogated; the latter, ſuch as are clear, and in full force.

The Muſſulmen dare not ſo much as touch the *Alcoran*, without being firſt waſhed, or legally purified; to prevent which, an inſcription is put on the cover or label: *Let none touch but they who are clean.* It is read with great care and reſpect, being never held below the girdle. They ſwear by it, take omens from it on all weighty occaſions; carry it with them to war, write ſentences of it in their banners, adorn it with gold and precious ſtones, and knowingly ſuffer it not to be in the poſſeſſion of any of a different religion. Some ſay that it is puniſhable even with death in a Chriſtian to touch it; others, that the veneration of the Muſſulmen leads them to condemn the tranſlating it into any other language as a prophanation; but theſe ſeem to be aggravations. The Mahometans have taken care to have their Scripture tranſlated into the Perſian, the Javan, the Malayan, and other languages; though out of reſpect to the original, theſe verſions are generally, if not always, interlineated.

The ſtyle of the *Alcoran* is generally allowed to be beautiful and fluent; eſpecially where it affects to imitate the prophetic manner, and ſcripture phraſeology; adorned with bold figures after the eaſtern manner, enlivened with flowery and ſententious expreſſions, and in many places, particularly where the majeſty and attributes of God are deſcribed, truly ſublime. On this miraculous circumſtance Mahomet reſts the credit of his divine miſſion. To this pomp and harmony of expreſſion ſome aſcribe all the force and effect of the *Alcoran*; but others ſuppoſe that the ſenſual pleaſures of paradiſe which are ſo frequently diſplayed to the imagination of the reader, are the chief allorements to which it owes its effect.

The number of commentaries on the *Alcoran* are ſo large, that the bare titles would make a huge volume.—Ben Olchair has written the hiſtory of them, intitled, *Tarikh Ben Olchair*. The principal among them are, Reidhavi Thaalebi, Zamalchichari, and Bacai.

Beſide the *Alcoran*, which is the *baſis* of the Mahometan faith, they have alſo a book containing their traditions, which they call *Sunna*.

The Mahometans have a *poſitive* theology, built on the *Alcoran* and tradition; as well as a *ſcholaſtical* one, built on reaſon.—They have likewiſe their caſuiſts, and a kind of canon law; wherein they diſtinguiſh between what is of divine, and what of poſitive right.

They have their beneficiaries too, chaplains, almoners, and canons, who read a chapter every day out of the *Alcoran*, in the moſques; and have prebends annexed to their office.—The *batib* of the moſque is what we call the parſon of the pariſh; and the *ſcheics* are the preachers, who take their text out of the *Alcoran*. See Sale's Tranſlation of the Koran, and Pre'iminary Diſcourſe.

ALCORAN is alſo uſed in a more limited ſenſe, for a portion or chapter of the Koran.

In which ſenſe, the word is ſynonymous with *ſura*.

ALCORAN is alſo figuratively applied to certain other books full of impieties and impoſtures.

In this ſenſe we meet with the *Alcoran* of the Cordeliers, which has made a great noiſe; where in St. Francis is extravagantly magnified, and put on a level with Jeſus Chriſt.

ALCORAN,

ALCORAN, among the Perſians, likewiſe ſignifies a kind of tower, or ſteeple, very high, and narrow; ſurrounded without, by two or three galleries, one over another; whence the Moravites, a ſort of prieſts, repeat their prayers thrice a day, with a very loud voice; making the tour of the gallery all the while, that they may be the better heard all round.

ALCORANISTS, among Mahometans, thoſe who adhere ſtrictly to the letter or text of the *Alcoran*, from an opinion of its ultimate ſufficiency and perfection. The Perſians are generally *Alcoraniſts*, as admitting the *Alcoran* alone for their rule of faith. The Turks, Tartars, Arabs, &c. beſides the *Alcoran*, admit a multitude of traditions.

The *Alcoraniſts*, among Mahometans, anſwer to much the ſame with the *Scripturiſts* among the Jews. The *Alcoraniſts* can find nothing excellent out of the *Alcoran*; are enemies of philoſophers, metaphyſicians, and ſcholaſtic writers. With them the *Alcoran* is every thing.

ALCOVE, in *Building*, a part of a chamber, ſeparated from the reſt by an eſtrade, or partition of columns, and other correſponding ornaments; in which is placed a bed of ſtate, and ſometimes ſeats, to entertain company.

The word is derived from the Spaniſh *alcoba*, and that from the Arabick *alcouf*, *a cabinet*, or *ſhooting-place*; or *ſolum elevatum*, *a tent*.

The word is popularly uſed to denote an incloſed garden-ſeat.

ALCYON. See HALCYON.

ALCYON, a name given by the ancients to the ISPIDA, or king-fiſher.

ALCYONIUM, in the Linnæan ſyſtem, is a genus of ZOOPHYTES. See CORALLINES, &c.

ALCYONIUM, in *Ichthyology*, a ſpecies of ALCEDO.

ALCYONIUM is alſo a name given by Lloyd to a peculiar kind of foſſile CORAL, of the ASTROITES kind, found in Wales. It is very plentiful in that country, and puts on the appearance of a ſort of marble, being bedded in a marbly matter for its matrix. Phil. Tranſ. N° 252.

ALDABARAM, in *Oſteology*, a name given by ſome to the *ſeſamoide* bones in the great toe.

ALDARU, in *Botany*, a name given by Avicenna, Serapion, and other writers of the Arabian nation, to the LENTISK tree.

ALDEBAC, in the *Materia Medica* of the ancient Arabian phyſicians, the name by which they have called BIRDLIME. They place this among the vegetable poiſons.

ALDEBARAN, an Arabian name for a fixed ſtar, of the firſt magnitude, in the eye of the ſign, or conſtellation, Taurus, or the Bull; and hence popularly called the *Bull's Eye*. Its longitude, latitude, &c. ſee among the reſt of the conſtellation TAURUS.

ALDER, *alnus*, in *Botany*, claſſed by Linnæus under the genus BETULA. Its characters are theſe: it hath male and female flowers, which are produced at remote diſtances on the ſame plant; the male flowers are digeſted into a long katkin, which is looſe, imbricated, and cylindrical; the female flowers are collected into a conical, ſcaly head, and are ſucceeded by ſcaly cones; the young fruit is of a ſquamoſe ſtructure, and loaded with *embrio* ſeeds; this finally increaſes in ſize, and becomes a regular fruit, containing a number of compreſſed ſeeds. There are two ſpecies, the wood of which is much eſteemed by turners, and is of great uſe for pipes to convey water, as it will laſt a long time under ground. See BORING.

The bark of the *alder*-tree is uſed by dyers in the preparation of ſome colours. It is a ſtrong ſtyptic, though rarely or never uſed medicinally, unleſs in fomentations and epithems, by the common people.

ALDER, *berry bearing*, or *black*, *frangula*, in *Botany*. This is ranged under the genus *rhamnus*, in the claſs of *pentandria monogynia*, by Linnæus. Its characters are theſe: the flower has one petal, cut into five ſegments; and it has five ſtamina, of the length of the petal; in the centre is ſituated a globular germen, which becomes a round berry, including two plain roundiſh ſeeds. There are two ſpecies.

ALDERAIMIN, in *Aſtronomy*, a ſtar of the third magnitude on the right ſhoulder of the conſtellation CEPHEUS.

ALDERMAN, among our ancient Saxon anceſtors, was the ſecond of the three orders or degrees of nobility.

The word, in its original, is *ealderman*; compounded of *ald*, *eald*; or *alder*, *elder*; and *man*, q. d. *Elderman*. *Atheling*, was the firſt rank of nobility, *alderman* the ſecond, and *thane* the loweſt.

It muſt be obſerved, however, that among our Saxon anceſtors there were ſeveral magiſtrates who bore the title of *alderman*. Among them there were *aldermannus totius Angliæ*, *aldermannus regis*, *comitatus*, *civitatis*, *burgi*, *caſtelli*, *hundredi*, *five wapentachii*, *& decemdecimarum*.

According to Spelman, the *aldermannus totius Angliæ*, ſeems to have been the ſame officer who was afterwards ſtyled *capitalis juſticiarius Angliæ*, or chief-juſtice of England; the *aldermannus regis* ſeems to have been an occaſional magiſtrate, anſwering to our juſtice of aſſize; and the *aldermannus comitatus*, a magiſtrate who held a middle rank between what was afterward called the earl, and the ſheriff; he ſat at the trial of cauſes with the biſhop: the latter proceeding according to eccleſiaſtical law, and the former declaring and expounding the common law of the land.

ALDERMAN, in the Engliſh *Polity*, an aſſociate to the mayor, or civil magiſtrate, of a city or town, for the better adminiſtration of his office.

The *aldermen* are an order of magiſtrates, in our cities, and moſt of the municipal, or incorporate towns, who form a kind of council, and regulate things relating to the policy of the place.—They ſometimes alſo take cognizance of civil and criminal matters, but that very rarely, and only in certain caſes.

Their number is not limited, but in ſome places is more, in ſome leſs, from ſix to twenty-ſix.

Out of theſe are annually elected the mayors, or chief magiſtrates of places; who, at the expiration of their mayoralty, return again into the body of the *aldermen*, whoſe delegates they were before.

The twenty-ſix *aldermen* of London preſide over the twenty-ſix wards of the city.

When one of them dies or reſigns, the wardmote chuſe a ſucceſſor, who is admitted, and ſworn into office, by the lord-mayor and court of *aldermen*.

All the *aldermen* are juſtices of the peace, by a charter of 15 Geo. II.

The *aldermen* of London, &c. are exempted from ſerving inferior offices; nor ſhall they be put upon aſſizes, or ſerve on juries, ſo long as they continue to be *aldermen*. 2 Cro. 585. See COURT.

Formerly there were alſo *aldermen* of the merchants, of hoſpitals, of hundreds, &c. See SENATOR.

ALDHAFERA, in the Arabian *Aſtronomy*, denotes a fixed ſtar of the third magnitude, in the Lion's mane.

ALDII, in *Antiquity*, ſervants who attended their maſters in expeditions to the wars.

Theſe were otherwiſe called *aldiones*, *aldionæ*, and *aldiionarii*.

ALDROVANDA, in *Botany*, a genus of the *pentandria pentagynia* claſs of plants; the calyx of which is divided into five ſegments, with five petals; the capſule has five valves, one cell, and ten ſeeds. There is one ſpecies.

ALE, a popular drink made from malt.

For the method of brewing *ale*, ſee BREWING.

This liquor is of ſuch antiquity in England, that we find mention of it in the laws of Ina, king of Weſſex. But the firſt aſſize of ale was fixed by the famous ſtat. 51 Hen. II.

Ale is chiefly diſtinguiſhed from beer, another potable liquor made from the ſame ingredients, by the quantity of hops uſed therein; which is greater in beer, and therefore renders the liquor bitterer, and fitter to keep.

The brewers alſo diſtinguiſh pale, or fine *ale*, brown *ale*, &c. Their ſeveral properties, effects, &c. ſee under MALT-*Liquor*.

The *zythum*, and *curmi*, mentioned by Tacitus, as the beverage of the ancient Germans, are ſuppoſed by Matthiolus to correſpond to our *ale* and beer.

The duties on *ale* and beer make a conſiderable branch of the revenue in England. They were firſt impoſed by the twelfth of Car. II. and have been continued by ſeveral ſubſequent acts of parliament to 1 Geo. III. which lays an additional duty of three pence per barrel. In the whole, the brewer of *ale* and beer for ſale, ſhall pay eight ſhillings for every barrel of either, above ſix ſhillings a barrel; and for every barrel of ſix ſhillings, or under, the ſum of ſixteen pence.

ALE, *cereviſia*, is alſo a denomination given to divers medicated liquors, or diet-drinks, whereof *ale* is the baſis or vehicle. The medicated *ales* make a large article in our old diſpenſatories. Such are the *cereviſia ſayatorica*, for the eyes; *cereviſia anti-arthritica*, againſt the gout; *cereviſia aſthmatica*, for the head; *cereviſia epileptica*, &c.

ALE, *gill*, is prepared by infuſing the dry leaves of *hedera terreſtris*, i. e. ground-ivy, in malt-liquor; which hereby becomes impregnated with the virtues of that ſimple; and is therefore reputed abſterſive and vulnerary; good in diſorders of the breaſt, and againſt obſtructions of the viſcera.

Gill is an Engliſh name of ground-ivy.

ALE, *Dr. Butler's purging*, is prepared of polypody, ſena, ſarſaparilla, anniſeeds, ſcurvygraſs, agrimony, and maiden-hair, put up in a bag, and hung in a veſſel of *ale*.

We

We also meet in *some* dispensatories with syrup of *ale*, made by boiling the liquor to a consistence; this is used, against obstructions in the kidneys, and the flour alus.

ALE-*beer*. See BEER.

ALE-BERRY, is *ale* boiled with bread, and mace; sweetened, strained, and drunk hot.

ALE-CONNER, an officer in the city of London, whose business is to inspect the measures of the public houses.—There are four of them; and they are chosen by the common-hall of the city.

ALE-*houses* must be licensed by justices of the peace, who take recognizances of the persons licensed, and of their sureties, viz. 10*l.* each, that they will not suffer unlawful gaming, nor other disorderly practices in their houses. Every person, excepting those who sell *ale* in fairs, neglecting to procure a licence, is liable to a penalty of 40*s.* for the first offence, 4*l.* for the second, and 6*l.* for the third, with all costs. The licence is granted on the first of September, or within twenty days after, at a general meeting of the justices for the division to which he belongs, upon his producing a certificate to his character, testified by living in a city, or town-corporate, this last circumstance is dispensed with, and continues in force for one year only. *Ale-house* keepers, selling *ale* in short measure, are liable to a penalty not exceeding 40*s.* and not less than 10*s.* and likewise in a fine of 10*s.* for permitting tipling, &c.

ALE-*measure*. See MEASURE.

ALE-*silver*, a rent, or tribute, yearly paid to the lord-mayor of London, by those who sell *ale* within the city.

ALE-*taster*, is an officer appointed, and sworn, in every court-leet, to take heed that there be a due size, and goodness of bread, *ale*, and beer, sold within the jurisdiction of the leet.

ALEA, in Roman *Antiquity*, signifies, in general, games of chance.

ALEA, in a more limited sense, is applied by Roman writers to a particular game played with dice, in a pair of tables somewhat after the manner of our back-gammon, or tric-trac. Instead of our men, they played with white and black stones, which were moved this way or that, as the dice directed.

Alea in this sense appears to have been the same game with what the Greeks called *petteia* and *duodecim*; the Romans sometimes *tabulæ*, *tesseræ*, and XII. *scriptæ*.

ALEA, the surname of Minerva, given to her by Aleus king of Arcadia.

ALEATORIUM, in Roman *Antiquity*, was the place where they played at *alea*.

The *aleatorium* was near the *sphæristerium*; that the sportsmen, when tired with the play, or more robust exercises, might refresh themselves in the *aleatorium*.*

ALEC, in *fabulous history*, a name given by Gaza, in his commentaries on Aristotle, to the fish called by that author *mormyr*, and by Ovid *momerida*. It is of the SPARUS kind.

ALECOST. See TANSY.

ALECTO, in *Mythology*, one of the three Furies; she is represented with vipers about her head and her wings, and armed with vipers, scourges, and torches. See a fine description of this Fury in Virgil, *Æn.* vii.

ALECTORIA, in *Natural History*, a stone said to be found in the stomach, liver, or rather gall-bladder, of old cocks.

The word is derived from ἀλεκτωρ, a *cock*.

It is ordinarily of the figure of a lupine, and seldom exceeds the bigness of a bean. It has abundance of virtues attributed to it; but most of them are fabulous.

This is otherwise called *alectorius lapis*, sometimes *alectorithion*, in English the cock-stone.

The more modern naturalists hold the *alectorius lapis* to be originally swallowed down, not generated in the stomach or gizzard of cocks and capons.

ALECTORICARDITES, in *Natural History*, a name given by Plot, to a figured stone resembling a pullet's heart, with the fat near the basis of it, and the coronary vessels descending from it.

The word is compounded of the Greek ἀλεκτωρ, *cock*, and καρδια, *heart*.

ALECTORIUS *lapis*, is used for a small species of *hyæunites*, or disjunct segment of a palate of a fish, approaching to the nature of the *chondrodes lapis*.

ALECTOROLOPHUS. See PEDICULARIS.

ALECTOROMANTIA, an ancient kind of divination, performed by means of a cock.

The word comes from ἀλεκτωρ, a *cock*, and μαντεια, *divination*.

This art was in use among the Greeks; and the usual manner of it was this. A circle was made on the ground, and divided into twenty-four equal portions, or spaces: in each of which spaces was written one of the letters of the alphabet, and upon each of these letters was laid a grain of wheat. This done, a cock was turned loose in the circle, and careful observation was made of the grains he pecked. The letters corresponding to those grains were afterwards formed into a word; which word was to be the answer desired.

It was thus that Libanius and Jamblichus fought who should succeed the emperor Valens; and the cock answering to the spaces ΘΕΟΔ, they concluded upon Theodore, but by a mistake, instead of Theodosius.

There are also other species of *alectoromantia*; in some the augury was taken from the crowing of the cock, wherein regard was had to the time of day, whether before noon or after; to which some added the consideration of the sign the sun was in, and the motion of the moon. Others speak of a kind of *alectoromantia* performed by help of a ring. Phil. Trans. N° 252.

ALECTRUONURUS, *crower*. See FESTUCA.

A-LEE, the situation of the helm, when it is pushed down to the lee-side of the ship, in order to put the ship about, or lay her head to the windward.

ALEGER, a name given to an inferior sort of vinegar, made of ale, or malt liquor, instead of wine. Power has given a description of the *ales* in *aleger*. V. Power, Exper. Philos. Obs. 3. p. 32.

ALEHOOF, in *Botany*. See GROUND-*ivy*.

ALEIPHA, from ἀλειφω, *I anoint*, in the *Materia Medica* of the ancients, a word used for all fatty bodies whatever. The oils of vegetables, and fat of animals, were all called by this general name. But these simple substances were not the only ones called by it, for it is very frequently used to express any sort of medicated oil impregnated with aromatic vegetables; but its general acceptation in this sense, was for such compositions as were intended to anoint the body; and therefore they were properly only vegetable or animal fats impregnated with the lighter parts of plants, and not clogged with an addition of powders, nor with wax, or any thing of that kind, which might have given them the consistence of ointments. The ancient physicians were very fond of these compositions, which they applied either to some diseased part only, or to the whole body, and after they had made the patient use the warm bath to relax and open the pores.

ALEMBIC, or LIMBEC, a chemical vessel, consisting of a matrass or body, fitted with a roundish head, terminating in a sloping tube, for the condensed vapours to pass through in distillation.

The word is formed of the Arabic particle *al*, and the Greek αμβιξ, a sort of earthen culinary vessel, mentioned by Athenæus and Hesychius. Though Matthæus Sylvaticus, in his Pandectæ Medicinæ, asserts the word *alembic* to be Arabic, and that it literally denotes the upper part of a distilling vessel.

Alembic is popularly understood of the whole instrument of distillation, with all its apparatus; but in the proper sense of the word, it is only a part of it; viz. a vessel usually of copper, whereof a concave, globular, metalline head is closely luted; so as to stop the rising vapours, and direct them into its rostrum, or beak.

The heat of the fire raising the volatile parts of the subject exposed in the bottom of the vessel, they are received into its head, where they are condensed, either by the coldness of the ambient air, or by water externally applied, and become a liquor, which runs out at the beak into another vessel called the RECIPIENT.

The head, or capital of the *alembic*, is sometimes incompassed with a vessel full of cold water, by way of refrigeratory; though this intention is now more commonly answered by a WORM-*tub*.

There are divers kinds of *alembics*; as an *open alembic*, which is also called *rostratus*, where the head and cucurbit are two separate parts; and a *blind alembic*, or blind head, where the capital is sealed hermetically upon the cucurbit. But the invention of RETORTS seems to have superseded the use of *alembics*.

ALEMBROTH, in the writings of the *Chymists*, a word used for a sort of fixed alkaline salt, which had the power of the famous alcahest, in dissolving bodies, opening the pores of most of all known substances, and thence, as well as by destroying sulphurs, promoting the separation of metals from their ores.

The word is said to be of Chaldee origin, and its natural meaning to be *plants ashes*, the *key of art*.

Some use the term *alembroth deflegmatum*, for salt of tartar.

ALEMDAR, an officer in the court of the grand signior, who bears the green standard of Mahomet, when the sultan appears in public on any solemn occasion.

ALENON, a word used by some of the old medical writers, as a name for the oil of sweet almonds.

ALEORE, ἀλεωρη, a word used by the old medical writers, for an intermission of ease, from the raging pains of any violent acute distemper.

ALERION, in *Blasonry*. See ALLERION.

ALES, a name given to a compound salt; it also signifies *centralled*, when used by physicians as an adjective.

ALETON, signifies meal. As Erotian and Hesychius explain it. It seems derived from ἀλέω, *to grind*, and to import the meal of any sort of corn. The word is frequently used by Hippocrates.

ALETRIS, *bastard* ALOE.

ALEUROMANCY, *aleuromantia*, derived from ἄλευρον, *meal*, and μαντία, *divination*, is the same with what was otherwise called *alphitomantia*, and *crithomantia*, and means an ancient kind of divination performed by means of meal or flour.

ALEXANDERS, in *Botany*, a genus of umbelliferous flowers. See ALISANDERS.

ALEXANDRIAN, in a particular sense, is applied to all those who professed or taught the sciences in the school of Alexandria.

ALEXANDRIAN is more particularly understood of a college of priests, consecrated to the service of Alexander Severus, after his deification.

ALEXANDRIAN *Copy*, is a manuscript, consisting of four volumes, in a large quarto size, which contains the whole Bible in Greek, including the Old and New Testament, with the Apocrypha, and some smaller pieces, but not quite complete. This manuscript is now preserved in the British Museum. It was sent as a present to king Charles I. from Cyrillus Locatis, patriarch of Constantinople, by Sir Thomas Rowe, ambassador from England to the grand signior, about the year 1628. Cyrillus brought it with him from Alexandria, where, probably, it was written. In a schedule annexed to it, he gives this account; that it was written, as tradition informed them, by Thecla, a noble Egyptian lady, about thirteen hundred years ago, not long after the council of Nice. But this high antiquity, and the authority of the tradition to which the patriarch refers, have been disputed; nor are the most accurate biblical writers agreed about its age. Grabe thinks that it might have been written before the end of the fourth century; others are of opinion, that it was not writ till near the end of the fifth century, or somewhat later. Those who are desirous of farther information concerning it, may consult the Prolegomena of Mills, Wetstein, and Grabe.

ALEXANDRIAN *Library* was first founded by Ptolemy Soter. Besides the books which he procured, his son Ptolemy Philadelphus added many more, and left in this library at his death a hundred thousand volumes; and the succeeding princes of this race enlarged it still more, till at length the books lodged in it amounted to the number of seven hundred thousand volumes. Part of this library consisting of four hundred thousand volumes was destroyed in the war which Julius Cæsar waged with the inhabitants of Alexandria; but it was again supplied anew by Cleopatra and others, and continued, though frequently plundered, to be very considerable and famous, till it was burnt by the Saracens in the 642d year of the Christian æra.

ALEXANDRIN, or ALEXANDRIAN, in *Poetry*, the name of a kind of verse, which consists of twelve, or of twelve and thirteen syllables, alternately; the rest, or pause, being always on the sixth syllable.

It is said to have taken its name from a poem on the life of Alexander, intitled, the *Alexandriad*; written, or at least translated into this kind of verse by some French poets; though others will have it so denominated from one of the translators, Alexander Paris.

This verse is thought by some very proper in the epopea, and the more sublime kinds of poetry; for which reason it is also called *Heroic Verse*.

It answers in our language to the hexameters in the Greek, and Latin; though according to some, it rather answers to the *senarii* of the ancient tragic poets. — Chapman's translation of Homer consists wholly of *Alexandrines*.

The advantage of the *Alexandrin* verse, and its keeping the rhimes from coming to near, and consequently hindering them from being so much perceived. To this may be added, that coming nearer to the nature of prose, it is fitter for theatrical dialogue, and supplies the office of the ancient iambics better than any other verse in rhime.

ALEXICACUS, something that preserves the body from harm or mischief. The word is compounded of ἀλέξω, *I drive away*, and κακὸς, *malum, evil*.

Alexicacus amounts to much the same with alexiterial. Count Rhodomanes gives this name more peculiarly to the spirit of wine-salt, and has published a work under that title.

ALEXICACUS, in *Antiquity*, was an attribute of Neptune, whom the many fishers used to invoke under this appellation, that their nets might be preserved from the *lupus*, or SWORD-*fish*, which used to tear them, and prevent the assistance which it was pretended the dolphins used to give the tunnies on this occasion.

ALEXIPHARMIC, in *Medicine*, expresses that property which a remedy, either simple or compound, hath to resist, or destroy every thing of a poisonous or malignant nature.

The word is derived from ἀλέξω, *arceo, I expel*; and φάρμακον, *poison*.

The ancients had a notion, that there was a poison in all malignant diseases, and in the generality of those whose cause was unknown. Whence *alexipharmic* became a denomination of all remedies and antidotes against malignant diseases, and of AMULETS.

Alexiterial, carminative, antidote, alexipharmic, and *counterpoison*, are all terms nearly of the same signification.

Alexipharmics are ordinarily divided into such as are general; and those more particular, supposed only to combat some particular disease. — But this division is founded more on speculation than experience.

Alexipharmic medicines in general contain a great number of volatile parts, and such as render the mass of blood fluid. The greatest part of them are aromatic and pungent to the taste. — Among the rest, it is true, there are some acid plants and juices; but these are only reckoned in the number, on account of their use in malignant and colliquative fevers.

Alexipharmics chiefly act by exciting, or increasing a diaphoresis, or perspiration; by which the noxious matter is thrown off. See SUDORIFIC.

Alexipharmics, whether simple or compound, are also esteemed preservatives against malignant and pestilential fevers; but they are to be used with caution; some of them being only proper in condensations, and others only in colliquations of the blood.

It is dangerous to administer *alexipharmics* to young people of plethoric habit, without previous evacuations; and Celsus advises only to promote a sweat, when the marks of one approaching are evident.

Alexipharmics are deemed proper correctors of OPIUM, when it produces sickness, nausea, &c. They are also serviceable in those diseases which proceed from external cold, and obstructed perspiration; as catarrhs, rheumatisms, fluxes, coughs, and glandular tumors. *Alexipharmics* make a large class of medicines; but the principal ones are these: 1. Of the animal kingdom, hartshorn, bezoars, and the bones and teeth of different animals. 2. Of the vegetable kingdom, the leaves and flowers of all the aromatic plants, especially such as are umbelliferous. 3. Of the mineral kingdom, the different preparations of antimony, the dulcified spirit of vitriol with alcohol.

ALEXITERIAL, in *Medicine*, a term of the same import with *alexipharmic*; but chiefly applied to the milk-water of that name, and remedies against the poisonous bites of animals.

But it is said by some authors that *alexiterials* differ from alexipharmics: thus, alexipharmics signify medicines against poisons taken internally; whereas *alexiterials* are remedies against the poisons of venomous animals inflicted externally.

ALFANDIGA, the name of the custom house at Lisbon.

ALFAQUES, among the Spanish Moriscos, were the clergy, or those who instructed them in the Mahometan faith.

The *alfaques* differed from the *morabites*, who answered to monks, or religious, among Christians.

ALFDOUCH, a name given by the Moors to a sort of *vermicelli*, which they make of flour and water, and are very fond of in their entertainments.

ALFECCA, in *Astronomy*, a name given to the star commonly called LUCIDA *coronæ*. It is also called *Alfeta*.

ALFET, anciently signified a large caldron, in which boiling water was put, for the accused to plunge his hand in up to the elbow, by way of trial or purgation.

ALGA, in *Botany*, the name of a genus of plants of the same kind with the FUCUS, or *sea-weed* of Linnæus, but they are composed of very long and narrow grassy leaves, or of long capillaceous filaments. Tournefort enumerates three species. Tournef. Inst. 580.

The *algæ* are some *marinæ*, or growing in the sea; others *fontanæ*, or produced in rivers; others *fossiles*, growing on springs; and some again grow on stones at the bottom of the water; others on shells by the shore; others even float on the surface of the water.

One of the most considerable of the tribe of *algæ*, is the common, called *alga vulgaris*; sometimes also *alga angustifolia tuberariorum*, as being used in the glass-works like kali.

Its ashes afford great plenty of fixed salt.

Some speak of its medicinal properties as aperient, vulnerary, and detersive.

It is said that the *alga marina* put under the roots of cole-worts, and other plants, will forward their growth.

Alga is popularly known in England by the name of *wrack*, being generally conceived rather as excrescences than

as regular plants; but this is unphilosophical, and falſe.

ALGÆ, *flags*, form one of the ſeven families of plants in the Linnæan diſtribution.

ALGALI, a name given, by ſome of the old chemical writers, to nitre.

ALGAROT, or ALGAROTH, in the Arabian *Chemiſtry*, a powder prepared of butter of antimony, being in reality no more than the *regulus* of that mineral, diſſolved in acids, and ſeparated again by means of ſeveral waſhings with luke-warm water, which imbibes thoſe acids. Some derive the name from *Algarath*, a phyſician of Verona, who, they ſay, invented the preparation.

This is alſo called *mercurius vitæ*, or ſimply *emetic powder*.—It purges violently, both upwards and downwards; and is more properly called *antimonium mortis*. See BUTTER *of* ANTIMONY.

By collecting all the lotions, and evaporating two third parts, what remains is a very acid liquor, called *ſpirit of philoſophical vitriol*.

There are divers ways of preparing *algarot*, as by precipitating the butter, or by diſtilling antimony, together with the ſweet ſublimate, or white precipitate of mercury.

ALGATRANE, a ſort of pitch found in the bay formed by the point of the cape of St. Helena, on the ſouth of the iſle of Plata.

ALGAVAREIA, the language anciently ſpoken by the Moriſcos in Spain.

The *Algavareia* was a ſort of Arabic, and ſtood contradiſtinguiſhed from the *Aljamiea*.

ALGEBRA, a method of reſolving problems, by means of equations.

Critics have given various etymologies of this word; but the moſt probable is from *gebr*, a word whence, by prefixing the particle *al*, we have formed *algebra*, which is pure Arabic, and properly ſignifies the reduction of broken numbers to a whole number.—However, the Arabs, it is to be obſerved, never uſe the word *algebra* alone, to expreſs what we mean by it; but always add it to the word *macabelah*, which ſignifies *oppoſition* and *compariſon*.—Thus *algebra almucabelah*, is what we properly call *algebra*.

Some authors define *algebra* the art of ſolving all problems capable of being ſolved; but this is rather the idea of analyſis, or the analytic art.

The Arabs call it, the *art of reſtitution and compariſon*; or, the *art of reſolution and equation*.—Lucas de Burgo, the firſt European who wrote of *algebra*, calls it, the *rule of reſtauration and oppoſition*.—The Italians call it, *regula rei & cenſus*, that is the rule of the root and the ſquare; the root with them being called *res*, and the ſquare *cenſus*.—Others call it *ſpecious arithmetic*; others, *univerſal arithmetic*.

Algebra is a peculiar kind of ARITHMETIC, which takes the quantity ſought, whether it be a number, or a line, or any other quantity, as if it were granted, and by means of one or more quantities given, proceeds by conſequences till the quantity at firſt only ſuppoſed to be known, or at leaſt ſome power thereof, is found to be equal to ſome quantity or quantities which are known, and conſequently itſelf is known.

Algebra is of two kinds, *numeral* and *literal*.

ALGEBRA, *numeral*, or *vulgar*, is that of the ancients, which only had place in the reſolution of arithmetical queſtions.—In this, the quantity ſought is repreſented by ſome letter or character; but all the given quantities are expreſſed by numbers. This is thought by ſome to have proved an introduction to the art of keeping merchants accounts by double entry.

ALGEBRA, *ſpecious* or *literal*, or the *new algebra*, is that wherein the given or known quantities, as well as the unknown, are all expreſſed or repreſented by their ſpecies, or letters of the alphabet.

This eaſes the memory and imagination of the vaſt ſtreſs or effort, required to keep ſeveral matters, neceſſary for the diſcovery of the truth in hand, preſent to the mind: for which reaſon this art may be properly denominated *metaphyſical geometry*.

Specious algebra is not, like the numeral, confined to certain kinds of problems, but ſerves univerſally for the inveſtigation or invention of theorems, as well as the reſolution and demonſtration of all kinds of problems, both arithmetical and geometrical.

The letters uſed in *algebra* do each ſeparately repreſent either lines or numbers, as the problem is arithmetical or geometrical; and together they repreſent planes, ſolids, and powers, more or leſs high, as the letters are in a greater or leſs number.—For inſtance, if there be two letters, *a*, *b*, they repreſent a rectangle, whoſe two ſides are expreſſed, one by the letter *a*, and the other by *b*; ſo that by their mutual multiplication they produce the plane *a b*. Where the ſame letter is repeated twice, as *a a*, they denote a ſquare. Three letters, *a b c*, repreſent a ſolid, or a rectangled parallelepiped, whoſe three dimenſions are expreſſed by the three letters *a b c*; the length by *a*, the breadth by *b*, and the depth by *c*: ſo that by their mutual multiplication they produce the ſolid *a b c*.

As the multiplication of dimenſions is expreſſed by the multiplication of letters, and as the number of theſe may be ſo great as to become incommodious; the method is only to write down the root, and on the right hand to write the index of the power, that is, the number of letters wherein the power to be expreſſed does conſiſt; as a^2, a^3, a^4, a^5; the laſt of which ſignifies as much as *a* multiplied five times into itſelf; and ſo of the reſt.

For the ſymbols, characters, &c. uſed in *algebra*, with their application, &c. See CHARACTER, and QUANTITY, &c.

For the method of performing the ſeveral operations in *algebra*. See ADDITION, SUBTRACTION, and MULTIPLICATION.

The origin of this art is very uncertain and obſcure.—The invention is uſually aſcribed to Diophantus, a Greek author, who wrote thirteen books, though only ſix of them are extant, firſt publiſhed by Xylander, in 1575, and ſince commented on, and improved by Gaſper Bachet, of the French Academy; and ſince by M. Fermat. And yet *algebra* ſeems not to have been wholly unknown to the ancient mathematicians, long before the age of Diophantus; we ſee the traces and effects of it in many places, though it looks as if they had deſignedly concealed it.—Something of it there ſeems to be in Euclid, or at leaſt in Theon upon Euclid, who obſerves that Plato had begun to teach it.—And there are other inſtances of it in Pappus, and more in Archimedes and Apollonius.

But the truth is, the analyſis uſed by thoſe authors is rather geometrical than *algebraical*: as appears by the examples thereof which we find in their works: ſo that we make no ſcruple to ſay, that Diophantus is the firſt, and only author among the Greeks, who has treated of *algebra* profeſſedly. This art, however, was in uſe among the Arabs much earlier than among the Greeks. And it is ſaid, that the Arabs too borrowed it from the Perſians, and the Perſians from the Indians.—It is added, that the Arabs carried it into Spain, whence, ſome are of opinion, it paſſed into England, before Diophantus was known among us.

The firſt who wrote on the ſubject in this part of the world, was Lucas Pacciolus, or Lucas de Burgo, a Cordelier; whoſe book, in Italian, was printed at Venice in 1494.—This author makes mention of Leonardus Piſanus, and ſome others, of whom he had learned the art; but we have none of their writings. He adds, that *algebra* came originally from the Arabs, and hence mentions Diophantus, which makes it probable, that this author was not then known in Europe. His *algebra* goes no farther than ſimple and quadratic equations.

After Pacciolus appeared Stifelius, a good author, but neither did he advance any farther.

After him came Scipio Ferreus, Cardan, Tartaglia, and ſome others; who reached as far as the ſolution of ſome cubic equations. Bombelli followed theſe, and went a little farther. At laſt came Nunnius, Ramus, Schoner, Saligmac, Clavius, &c. who all of them took different courſes, but none of them went beyond quadratics.

About the ſame time, Diophantus was firſt made public; whoſe method is very different from that of the Arabs, which had been followed till then.

In 1590, Vieta entered on the ſtage, and introduced what he called the *ſpecious arithmetic*, which conſiſts in denoting the quantities, both known, and unknown, by ſymbols or letters.—He alſo introduced an ingenious method of extracting the roots of equations, by approximations; ſince much facilitated by Raphſon, in his Analyſis Æquationum.

Vieta was followed by Oughtred, an Engliſhman, who, in his Clavis Mathematica, printed in 1631, improved Vieta's method; and has invented ſeveral compendious characters, to ſhew the ſums, differences, rectangles, ſquares, cubes, &c.

Mr. Harriot, another Engliſhman, contemporary with Oughtred, left ſeveral treatiſes at his death; and among the reſt, an Analyſis, or Algebra, which was printed in 1631, where Vieta's method is brought into a ſtill more commodious form; and this is much eſteemed to this day.

In 1637, Des Cartes publiſhed his Geometry, wherein he made uſe of the literal calculus, and the *algebraic* rules of Harriot; and as Oughtred in his Clavis, and Matth. Gheraldus, in his books of Mathematical Compoſition and Reſolution, publiſhed in 1630, applied Vieta's arithmetic to elementary geometry, and gave the conſtruction

traction of simple and quadratic equations; so Des Cartes applied Harriot's method to the higher geometry, explaining the nature of curves by equations, and adding the constructions of cubic, biquadratic, and other higher equations.

Des Cartes's rule for constructing cubic and biquadratic equations was farther improved by Tho. Baker, in his Clavis Geometrica Catholica, published in 1684, and the foundation of such constructions, with the application of *algebra* to the quadratures of curves, questions de maximis & minimis, the centrobaryc method of Guldinus, &c. was given by R. Sluzius, in 1668, as also by Fermat, in his Opera Mathematica; Roberval, in the Mem. de Mathem. & de Physique; and Barrow, in his Lect. Geomet.—In 1708, *algebra* was applied to the laws of change and gaming by R. de Montmort; and since by de Moivre, and James Bernoulli, and others. Thus much for the progress of *algebra*.—The Elements of the Art were compiled and published by Kersey in 1673, wherein the species, arithmetic, and the nature of equations, are largely explained and illustrated by variety of examples: the whole substance of Diophantus is here delivered; and many things added concerning mathematical composition and resolution from Ghetaldus. The like has been since done by Prestet in 1675, and by Ozanam in 1703.—But these authors omit the application of *algebra* to geometry; which defect is supplied by Guisnee in a French treatise expressly on the subject, published in 1705, and L'Hopital in his Analytical Treatise of the Conic Sections, in 1707.—The rules of *algebra* are also compendiously delivered by Sir Isaac Newton, in his Arithmetica Universalis, first published in 1707, which abounds in select examples, and contains several rules and methods invented by the author. This piece is rendered complete by Mr. Maclaurin's commentary on it, which is lately published and entitled a Treatise of Algebra.

Other writers on *algebra*, are Dr. Pell, who revised and published a piece of *algebra* first published in Dutch. In this the doctor has given us a peculiar method of his own for applying *algebra* to problems of various kinds; and introduced the way of registering the whole process in the margin. This method has been followed by Mr. Ward, and Mr. Hammond, in their treatises on this subject. Dr. Wallis published a treatise on *algebra*, both *historical* and *practical*, in the year 1685. There are many other treatises of *algebra*, of very various extent and value, that have been published since. See particularly Ward's Mathematicians Guide to *Algebra*; Jones's Synopsis; Wolfius's *Algebra*; Stanion's *Algebra*; Dodson's Mathematical Repository; Clairaut's Elements of *Algebra*; and Dr. Saunderson's Treatise of *Algebra*, in two volumes, quarto, which is the most comprehensive of any.

Algebra has been also applied to the consideration and calculus of infinites; from whence a new and extensive branch of knowledge has arisen, called the *doctrine of* FLUXIONS, or *analysis per aequationes*, or the *calculus differentialis*.—The authors on this subject, see under ANALYSIS.

ALGEBRAICAL, something that relates to *algebra*.

Thus we say, *algebraical* CHARACTERS, of symbols, curves, relations, &c.

ALGEBRAICAL *curve*, is a curve, wherein the relation of the abscisses to the semiordinates may be defined by an *algebraical* equation.

These are also called *geometrical lines*, or *curves*.

Algebraical curves stand contradistinguished to MECHANICAL or TRANSCENDENTAL ones.

ALGEBRAICAL *solution*. See RESOLUTION.

ALGEBRAIST, or ALGEBRISTE, is affectedly used in some writers for *algebra* itself. In which sense, we read of the application of *algebraists*.

ALGEBRAIST, a person skilled in *algebra*.

ALGEDO, the name of an accident which sometimes happens in a *gonorrhœa*, by the stoppage of the running soon after it appears. Calomel repeated so as to purge, brings back the running, and the difficulties and danger disappear.

ALGENEB, or ALGENIB, in *Astronomy*, a fixed star of the second magnitude, on the right side of PEGASUS.

ALGIABARII, a Mahometan sect of predestinarians, who attribute all the actions of men, good or evil, to the agency or influence of God.

The *Algiabarii* stand opposed to the ALKADARII.

ALGOIDES, in *Botany*, a name given by Vaillant to a genus of plants, called by Micheli and Linnæus, XANICHELLIA.

ALGOL, or *Medusa's Head*, a fixed star of the third magnitude, in the constellation PERSEUS.

ALGONQUIN, one of the chief American languages, spoken especially in Canada, or New France. The *Algonquin* is one of the two principal languages spoken in the Northern America, the other is the *Huron*.

It takes its name from an ancient people of the same denomination, now almost extinct, the Iroquois being the only remains.

The *Algonquin* tongue is spoken, with some diversity of dialects, by most of the natives from the river St. Laurence to that of Mississippi.

The baron la Hontan has given a little dictionary of the *Algonquin* language. Reland has also given a glossary of several words of the same. The first is entitled Mem. de l'Americ. Septentr. Hag. 1703; the last is in his Dissert. Misc. p. 3. diss. 3.

ALGOR, is used by some *Medicinal Writers*, to denote a preternatural coldness or chilness in a part. Musgrave speaks, in this sense, of an *algor* of the arm, attended with an *atrophy*.

ALGORAB, a fixed star, of the third magnitude, in the right wing of the constellation CORVUS.

ALGORITHM, an Arabic term, which some authors, and especially the Spaniards, make use of to signify the practical operation of the several parts of *specious* arithmetic, or *algebra*.

Sometimes it is also used for the practice of common arithmetic, by ten numeral figures.

Algorism is properly the art of numbering truly, and readily; and comprehends the six common rules of arithmetic.—It is sometimes called *logistica numerosa*.

Wallis, the *algorism* of integers, the *algorithm* of fractions, the *algorithm* of surds, &c.

ALGOSAREL, in *Botany*, a name used by Avicenna, and some other authors, for the common wild CARROT, or *daucus sylvestris*.

ALGUAZIL, in the Spanish Policy, a serjeant or official of a judge, or magistrate, appointed to see his decrees executed.

ALHABOR, among the Arabian *Astronomers*, is that star commonly called SIRIUS.

ALHAGI, the *camel thorn* BROOM of *Syria*. The inhabitants of Aleppo gather from it a new kind of *manna*, the grains of which are somewhat larger than *coriander*. The leaves are of a hot drying nature, and the natives use the flowers as a purgative: one handful of which boiled in water suffices for a dose.

ALHANDAL, a term in the Arabian *Pharmacy*, signifying *colocynth*.—The TROCHES of *alhandal*, or *trochisci alhandal*, are a kind of TROCHES composed of *colocynth*, *scammony*, and *gum tragacanth*.

The word is formed of the Arabic *hanbal*, or *handhal*, a name for *colocynth*.

They are esteemed good purgatives, and are used on divers occasions.

ALHEN, in *Natural History*, a name by which Dr. Shaw, and others, have called a genus of plants, since named by Linnæus LAWSONIA.

ALHIDADE, or ALIDADE, the index or label of an astronomical, or geometrical instrument, for taking of heights or distances.

The word is Arabic, and it signifies the same thing.—In Greek and Latin, it is called ΔΙΟΠΤΡΑ, *dioptra*, and *linea fiducia*, *fiducial line*.

The *alhidade* is a kind of ruler moveable on the centre of the instrument; and carrying two SIGHTS, which are erected perpendicularly at the two extremities of it.

ALHIRTO, in *Astronomy*, a fixed star of the third magnitude, in the constellation CASSIOPEIA. This is otherwise called *cephren Gedicæ*. Near this star, in the year 1600, appeared a new star, which lasted twenty-one years, and then disappeared again.

ALI gives a denomination to a sect or division, among the Mahometans, who adhere to the right of succession of *Ali*, the fourth caliph, or successor of Mahomet, and the reform of *Moslemanism* introduced by him. Sale's Prel. Diss.

The sectaries of *Ali* are more particularly called *Schiites*, and stand opposed to the *Sonnites*, or sect of Omar, who adhere to the law, as left by Mahomet, Abubeker, and Omar.

Ali was cousin of Mahomet, and son-in-law of that prophet, having married his daughter Fatimah. After Mahomet's death, great disputes arose about the succession; many stood for *Ali*, but Abubeker was preferred, and elected the first caliph. *Ali* took his turn, after the death of Othman.

The Persians are the chief adherents to the sect of *Ali*, whom they hold to have been the legitimate successor of Mahomet, and Abubeker an usurper. On the contrary, the Turks are of the sect of Omar, and hold *Ali* in execration, having raised a furious civil war among the *Mussulmen*.

The Persian emperors of the family of Sophi pretend to be the direct descendants from *Ali*; but the descent is very darkly made out.

The distinguishing badge of the followers of *Ali*, is a red turban, which is worn by the Persians, who are hence called in derision, by the Turks, *Kisilbash*, q. d. *red heads*.

Ali is reputed the author of divers works, particularly a Cabalistic, in great repute among the Arabs and Persians.

Persians; part of which has been published in English by Mr. Oakley.

ALJAMIA, is a name which the Moriscoes in Spain give to the language of the Spaniards.

Among other articles agreed on by the treaty, which was appointed by the emperor Charles V. in 1526, in favour of the Moriscoes, this was one, that the Moriscoes should no longer speak Algarena, i. e. Moorish, or Arabic, but should all speak *Aljamia*, i. e. Spanish, as it was called by the Moors, and all their writings and contracts should be in this language. Gordon's Mod. Traite, tom. 1. p. 25.

ALJARBUCHA, in *Natural History*, the Arabian name for a large kind of ray, common in that country, and good to eat, according to Bochart, who thinks it the same as the *shephon*, mentioned in Leviticus, and there declared unclean. Levit. xi. 3.

ALIAS, in *Law*, a second or further writ issued from the courts of Westminster, after a capias, &c. sued out without effect.

ALIBI, in *Law*, denotes the absence of the accused from the place where he is charged with having committed a crime; or his being *elsewhere*, as the word imports, at the time specified.

ALICA, in the *Ancient Physic* and *Diet*, a kind of food; but the various accounts given of it by authors, make it uncertain what it was; some representing it as a sort of grain, and others as an ointment made of grain.

The Greek word for *alica* was *zea*, which term, and *ptisana*, seem to have been general names for all spelt or hulled grain, beaten or ground into a pulp.

Bay, in his history, says the *alica* differs from the *zea*, as the grass from the *spires*.

ALIGARDE, in *Ancient History*, a term synonymous with praitorians.

ALICATICA, an Arabian weight.

ALICES, *in Anatomy*, fibres investing the small guts.

ALICULA, in *Zoology*, a kind of panicle found under the Peruvian cuirasses.

The *alicula* is a part of *allecula*: some explained it to be *femoralia*.

ALIDES, in the *Mahometan History*, the descendants of Ali, otherwise called *Fatimites*.

The *Alides* had a long struggle with the Ommiades, for the khalifate, or succession of Mahomet; which is the Mahometan papacy.

ALIE-KUVVE, a Lapland name given to a kind of fea-fowl, the history of which is given by Brunnichius. Ills. Not. tom. I. p. 186.

ALJEMBUTI, or, as some write it, *zembut*, a name given by the Arabians, Avicenna, and others, to a species of ACACIA, which they also call the Nebathæan pod, and cersion, or filiqua, and which some have supposed to be the same with the common carob; but they especially distinguish it, by saying that it is an astringent, whereas the carob is gently purgative; and that the fruit of it was given in hæmorrhages. Nay, Isidore goes so far as to say, that the acerb juice of the twigs was made of its fruit, while unripe.

ALIEN, in *Law*, a stranger, or person born out of the king's allegiance; or under the jurisdiction of another sovereign; and not naturalized, or made a denizen.

Of these there are two kinds; viz. *alien friends*, who are of those countries which are at peace and league with us; and *alien enemies*, who are of countries at war with us; to which some add a third, viz. *alien neutrals*.

A man born out of the land, but within the limits of the king's obedience, by which the law understands not only the king's dominions, but also the children of English parents out of the king's obedience, provided the parents at the time of the birth be of such obedience, is no alien, but a subject of the king; stat. 2. 25 Edw. III. commonly called the statute *De natis ultra mare*.

Also, that if one born out of the King's allegiance come and dwell in England, his children begotten here are not aliens, but denizens.

By the statute 11 and 12 W. III. cap. 6. all persons being the king's natural born subjects, may inherit as heirs to their ancestors, though their ancestors were aliens. Children of an ambassador to a foreign country by a wife who is an English woman, are natural born subjects by the common law. 7 Rep. 17. And if an English merchant living beyond sea, marries a wife there, and hath a child by her and dies, that child is born a denizen, and shall be heir to him, notwithstanding the wife be an alien. Cro. Car. 605. Persons born in English plantations are natural born subjects.

An alien can hold no land by descent or purchase, or let tenant by the courtesy, or in dower; and if he purchase, the king shall have it; but he may purchase a house for years for habitation, during his residence, as necessary for trade. If an alien merchant leaves the kingdom, the king shall have the lease; if he be no merchant, the king shall have his lease for years, though it were to his habitation; and by the stat. 32 H. VIII. there is a penalty for letting houses to aliens. 5 Rep. 70. — 7 Rep. 18. — 1 Inft. 2. 129. — 2 Inft. 740.

A devise of lands to an alien is void; and if a man be bound to an alien enemy in a bond, it is void to him, but the king shall have it.

Aliens, however, may obtain grants and preferral either by trade, &c. and may bring actions for the same; but an alien enemy cannot maintain any action whatever, nor obtain any thing lawfully within the realm. 1 Vaugh. 274.

Persons of this description are by several acts of parliament put under several other restrictions, with regard to carrying trades, taking apprentices, and are likewise debarred from being factors in the plantations, &c.

ALIENS duty, an impost laid on all goods imported into England by aliens, denizens, and even on certain goods imported by natural subjects, if they be brought in foreign bottoms, the same above what is paid by the same goods imported by British, and in certain shipping. 12 Stat. Car. II.

Aliens duty is otherwise called *petty custom*, and *navigation duty*.

Fish, dried or falted, and rodfish, at burning, not caught in British veffels, and cured by British, pay a double *aliens duty*.

Aliens duty now wholly exempted by the following acts. 12 Car. II. cap. 4. — 25 Car. II. cap. 6. — 1 Ann. cap. 27 — 6 Ann. cap. 20. — 8 Ann. cap. 7. — 9 Ann. cap. 6. — 8 Geo. I. cap. 15. — 11 Geo. I. cap. 29.

Scraggs, pedlars, and *hawkers*, pay alſo the duty of London, the property of the *aldermen*. The wine-ſtarting aliens are permitted to import foreign commodities into Great Britain. 22 Car. II. cap. 13.

ALIEN is sometimes used, in *Middle Age Writers*, for *separate*. Du Cange.

ALIENARE, in civil *law*. See ALIEN.

ALIEN *priories*, a subordinate kind of monasteries in England, belonging to, and dependent on, other monasteries in foreign countries. Vide Plowd. Mouast. Abr. p. 44.

ALIENATION, ALIENATIO, in *Law*, the act of making a thing another man's; or the altering or transferring the property, and poſſeſſion of lands, tenements, or other things, from one man to another.

To *alienate*, as alien in MORTMAIN, is to make over lands or tenements to a religious community, or some body *politic*.

To *alienate in fee*, is to ſell the fee-ſimple of any land, or other incorporeal right.

All perſons who have a right to lands, may generally *alienate* them to others; but ſome *alienations* are prohibited; ſuch as *alienations* by tenant for life, &c. whereby they incur a forfeiture of their eſtate. 1 Inſt. 222.

By the ſtatute of Edward I. a bar was put to *alienations*, by what we call *entails*, which is an expedient for preſerving perpetuities in families; but counter-expedients were deviſed to defeat this intent, and a practice was introduced of conveying eſtates by fines, and of barring remainders and reverſions by *recoveries*.

The ſtatute for *alienations* in Henry the Seventh's time, had a great effect on the conſtitution of this kingdom; as among other regulations of that reign, it tended to throw the balance of power more into the hands of the people. By the ſtat. 12 Car. II. cap. 24. fines for *alienations* are taken away.

Crown lands are only *alienable* under a ſtatute of perpetual redemption.

The council of Lateran, held in 1123, forbids any clerk to *alienate* his benefice, prebend, or the like.

By the laws of the ancient Jews, lands could only be *alienated* for the ſpace of fifty years. At each return of the jubilee, all returned again to the primitive owners, or their deſcendants, to whom the lands were originally allotted, as the firſt diſtribution of Canaan.

ALIENATO *a mensâ*. See ABDICATION.

ALIENATION *fine*, is an office to which all writs of covenants and entry, upon which fines are levied, and recoveries ſuffered, are carried, to have fines for *alienation* ſet and paid thereon.

ALIFORMIS *muſculi*, a pair of muſcles, ariſing from the *os ſacrum* and *os ilium*, and ending in the neck of the lower *os femoris*, towards the internal part of the thigh.

They are thus called from *ala*, *wing*, and *forma*, *ſhape*, as reſembling wings.

ALISPHENOIDES *proceſſus*, in *Anatomy*, the prominences of the os sphenoides.

ALIS *ordo*, ALIS *in regno*, are phraſes which often occur in our ancient records and hiſtories. Their meaning

ing has occasioned much dispute. Dr. Bayly will have them to signify only remains *in cavities* which Mr. Ettrel endeavours to refute, and shew that they denote the whole contents of the kingdom. Hist. of Eng. tom. 1. Appen.

ALIMA, among *Mineralists*, a kind of leaf found in gold mines, out of which lead is extracted.

ALIMENT, ALIMENTUM, in a *physical sense*, is whatever may be digested, and turned into chyle, so as to be afterwards converted into blood, for augmenting the body, or repairing its continual waste.

The word is formed of *alere*, *to nourish*. See CHYLIFICATION, DIGESTION, FOOD, and NUTRITION.

ALIMENT of plants. See PLANTS.

ALIMENTARY, ALIMENTAL, something that relates to aliment, or food.

The ancient physicians held, that every humour consists of two parts; an *alimentary*, and an excrementitious one.

ALIMENTARY *vessels*, *duct*, *alimentum*, is a name given by Dr. Tyson and some others, to that part of the body through which the food passes, from its reception into the mouth, to its exit at the anus; including the *pharynx*, *stomach*, and *intestines*.

Dr. Morgan considers the whole alimentary tube (including the stomach, intestines, and bladder) as constituting one gland; of the like nature, structure, and use with the other glands of the body.

Every gland has its vas *deferens*, *ductus*, and *reparatorius*, together with its constituent *secretory*, whence the matter is to be collected in first prepared by digestion, &c. in this grand primary concoctive gland, the *pharynx*, in the mouth of the stomach, and the *duodenum*, the first of the *intestines*, which is also the *vas deferens* common to the whole; the *ductus* is the *intestinum rectum*, and the *reparatorius* the *emulgents* from the aorta, or some branch of it; the *secretory* is common to the same common vas *deferens*, or common excretory duct. The whole parenchyma of this, as of every other gland, we grant, is by hairs, or fibrous, *filamentous* glandulous *colature* of arteries, and excrementary capillaments.

The whole *alimentary*, from its use, may be artificially divided into four parts. 1. That which conveys the food, called the *œsophagus*. 2. That which digests or concocts it, called the *stomach*. 3. That which further perfects the chyle, called the *intestines*. 4. That which expels the feces called the *rectum*. Phil. Trans. N° 444. p. 1555.

This duct is found to be the true characteristic of an animal, or *sentient vessel*; since there being no animal without it, and all never has it, being properly enough ranged under the class of animals. Plants receive their nourishment by the numerous ducts of their roots, but have no common receptacle for digesting the food received, or for carrying off the feces remote. But in all even the lowest of animals, we may observe a stomach and intestines; even where we cannot perceive any but indeterminate or any organs of the senses, unless that common one of touching as in oysters. Phil. Trans. N° 469. p. 1179 &c.

Dr. Willis produces arguments from the structure of the animal organs to make it more than probable that they are carnivorous. To this purpose, Dr. Tyson makes many observations. Phil. Trans. N° 180.

ALIMENTARY *canal*, or sometimes also understood of the thoracic duct.

ALIMENTARY *law*, or *ordinance*, was an old law among the Romans, whereby children were obliged to find sustenance for their parents.

ALIMENTARIA *puerl*, *boys* were certain children maintained and educated by the munificence of the emperors, in a sort of public places, not unlike our hospitals.

Trajan was the first that thought up any of these *alimentary boys*. He was imitated by Adrian. Antoninus Pius did the same for a number of maids, at the solicitations of Faustina; and hence, in some medals of that empress, we read PUELLÆ FAUSTINIANÆ.—Alexander Severus did the like, at the request of Mamæa; and the maids thus educated are called Mamæ.

ALIMENTATION is used by some naturalists, for what we more commonly call NUTRITION.

ALIMONY, ALIMONIA, property signifies nourishment, or maintenance; but in modern style, in Law, it denotes that portion, or allowance, which a married woman has for, upon any occasional separation from her husband, wherein she is not charged with elopement, or adultery.

This was anciently called *separalis sustentatio*, *separate maintenance*, and was recoverable only in the spiritual court, but now is recoverable also at common law.

Where a woman is divorced *a mensa et thoro*, she may sue her husband in the court Christian for alimony, or maintenance, out of his husband's estate, during the separation, either in the chancery, or in the spiritual court; and it will be allowed, except in the cases of elopement, and adultery, as aforesaid. 1 Hill. 235.

ALIPASTA, in *Botany*, a name given by some of the Greek writers to the common hemlock. It has been thus called, from its quality of pulling the appetite, and making it intolerable either of hunger or thirst.

ALINDESIS, in the *ancient Gymnastic Exercises*, a kind of exercise, wherein persons being besmeared with oil, rolled themselves naked in the dust.

The word is sometimes also written ALINDA.

ALIPA *lana*, in *Pharmacy*, a name given by Avicen to the grease left behind by Attick LUBRICK, and by others SUCK *pinguitie*.

ALIPANGOS, in the *ancient Greek*, an appellation given to any liquid medicines or lotions to be used on the naked body.

The word is sometimes also written ALIPANTES.—It is purely Greek, ἀλειφω, compounded of the preposition, and ἀλειφω, *I anoint*, or *smear*. In which sense ἀλειφα answers to *ceræ*, or plasters, which were for the most part called also by Celsus, *unguenta*.

Hence the name seems to the remedies applied to green wounds, to check the inflammation, and hasten their healing.

ALIPILARIUS, or ALIPILUS, in *Antiquity*, an officer belonging to the baths, who, by means of wax, and wax plasters, took off the hairs from the skin, of any person. The servants who performed this office were called *depilatores*, and *dropacistæ*.

The depilatories used to what the Greeks called ἀλειπτηρια.

The ancient Romans took it for a mark of cleanliness to keep the body free of hairs. To effect this, they were neither, according to the fashion of the times, to go without pains, with pincers and razor, and by the *alipilus*, or instrument for this purpose.

ALIPOW MEWIN CEVI, a kind of white *orpiment*, which is a strong purgative. It is to be found in several places of Languedoc, particularly near Celas, whence the name. Lemnius have given it as a remedy. It is sometimes applied to *fistulæ*, with good success, but is dangerous, since it is a much stronger purgative.

ALIPTA, among the *ancient Gymnastics*, is used to express a person who anoints the body with what was proper to combat, to run, and wrestle.

ALIPTICA is sometimes also used, in a more proper sense, for the direction, or superintendant of the exercises of the athletæ.

In which sense, ἀλειπτικη is synonymous with γυμναστικη, and SALTATIO.

ALIPTERIUM, among the *ancients*, a place in the *gymnasia* and *thermæ*, where the athletæ were anointed before their exercises.

The *aliptericus*, or *aliptarius*, was otherwise called ELEOTHESIUS, and *unctuarius*; sometimes also *cerarius*.

ALIQUANT *parts*, in the *Arithmetic*, are those which will not measure or divide any number exactly. Or an *aliquant part*, is that which being taken any number of times, is always greater or less than the whole. See ALIQUOT.

Thus 5 is an aliquant part of 12, for being taken twice, it falls short; and when taken three times it exceeds 12.

The *aliquant parts* of a pound, or 20s. are

1s. an *aliquant part* compounded of a tenth and 20th
2s. of a 5th and a tenth.
3s. of a 6th and a tenth.
4s. of two 5ths.
5s. of a 4th and a 5th.
6s. of a 6th and a 5th.
8s. of a half and a 20th.
10s. of a half and a tenth.
13s. 4d. a half, a tenth, and a 20th.
14s. of a half and a 5th.
15s. of a half and a 6th.
16s. of a half and a 10th.
18s. of a half, a 5th, and a tenth.
19s. of a half, a 5th, and a 20th.

1 — of a half, a 4th, and a 5th. See MULTIPLICATION.

ALIQUOT *parts*, in *Arithmetic*, are such parts of any number or quantity, as will exactly measure it, without any remainder.—Or it is a part, which being taken a certain number of times, becomes equal to the number, or integer.

The word is formed of *aliquot*, any number of times. Thus, 3 is an *aliquot part* of 12, because, being taken four times, it will just measure it.

The *aliquot parts* are as follow:

1s. — of 20s.	2s. 6d. an eighth.
5s. a fourth.	10 s. a tenth.
4s. a fifth.	3s. 4d. a fifteenth.
2s. a tenth.	1s. 8d. a thirtieth.
1s. 6d. a twentieth.	10d. a twenty-fourth.
6s. 8d. a third.	5d. a forty-eighth.
10s. a half.	

To multiply by the help of *aliquot parts*, see MULTIPLICATION.

We must not confound an *aliquot part* with that of a commensurable, for every *aliquot part* is a commensurable, but not *vice versâ*. Thus four is commensurable with 6, but is not an aliquot part of it. Phil. Trans. N° 47.

ALISANDER, a mineral, in Silesia, by some of the people among it called *Ore*. Its characters are these: it has an unpolished surface; the principles united by nature, the small cubes are cross'd they have no investation, but the appearance of the flowers are flower differently; the flowers have five leaves, which are of a flesh-colour, and the filaments the impression of the pistil surrounded by single filaments; the germen is situated under the flowers, supporting two styles, crowned by headed figures; the germen afterwards turns to an oblong fruit, which is divided in two, and is full of small seeds, which are kidney-form, convex on one side, and marked with transverse and plain on the other. They are inodorous.

Alisanders are to be sown in the autumn for sallading, etc. but is seldom now propagated; and as parsley is now entirely in garden, so formerly it was generally used in the kitchen, before celery and its sweet coolness, which both tastes alone of ourselves, and entirely supersedes the use of it.

The ancient Greeks have likewise distilled two different plants under the name of *alisanders*, the one of which is the *petroselinum Macedonicum* of Caspian Bauhin. The former of these plants grows wild and in rich ground, and the other grows in corn-fields and in rich ground, and in the driest and most barren situations. They are observed, that the seeds of the former have their virtues more active than those of the latter, and that the latter are more active than the roots of the former. The roots of the latter are observed to be more active in the autumn than in the spring, and the seeds of the former more active in the spring than in the autumn. The seeds of the latter are observed to be more active than the roots of the former, and the roots of the latter more active than the seeds of the former. The roots of the latter are observed to be more active than the roots of the former, and the seeds

sand-heat; and if, after rectifying the solvend, it be distilled therefrom, the body is left pure unfixt water, equal in quantity to its original salt, but deprived of its fossival virtues. Thus if gold be dissolved by the alkahest, the metal first becomes salt, which is possible gold; but when the solvend is by a further application drawn off distilled therefrom, it is left more elementary water. Whence it appears, that pure water is the last production or effect of the *alkahest*.

4. It suffers no change or diminution of force by distilling the bodies it works on, and therefore remains no retention from them; being the only immutable menstruum in nature.

5. It is incapable of mixture, and therefore remains free from fermentation and putrefaction; causing all as pure from the body it has dissolved, as when first put thereon, without leaving the least foulness behind.

Van Helmont had another menstruum, which he called *circulatum minus*, said to be prepared by a circulation of nine weeks, from equal parts of spirit of wine rectified three times, alcohol, or highly rectified spirit of wine, and vinegar twice rectified. These were more mixt than the great effects which may be produced by them separately, will readily believe that there by an intimate union may be converted into a menstruum number of things forming things, especially as we know that neuters *menstrua*, as this must be, will act upon some very hard bodies, which are no otherwise dissolvable by acid, alkaline, watery, or fuliginous *menstrua*.

There are various processes described, whereby the *alkahest* may be procured, yet many accountable, doubts of the possibility of such a menstruum. Though we have the expres testimonies of Paracelsus, Helmont, Philalethes, Starkey, Fuber, and others, that they were actually possessed of the secret, yet many among the later writers, as Boyle, Wedelius, Meyer, Neumann, Lefebure, parsist in holding it impossible, and even to involve contradictions.

Either such a menstruum does not exist, or else there is not any body in nature which may not become an *alkahest*. For although certain fossil ores have not hitherto been combined with others, the daily discoveries in the mystery of combinations formerly believed impossible, seem to prove, that by certain management, and certain circumstances, any substance may be combined with all others; or, in other words, that all bodies may be dissolved by any single substance.

Kunckel very well thews the absurdity of searching for an universal solvent, by asking, 'If it dissolves all substances, in what vessel can it be contained?'

The illustrious Boerhaave, after collecting every thing which has been told by Helmont and other chemists, with regard to this wonderful liquor, concludes in the following manner. 'Perhaps, says he, you may not be willing to know my opinion of this matter, and whether I believe that any of those chemists were ever masters of this great secrecy. To this I freely answer, Van Helmont complains, that the bottle was once given him: but that it was broken; and therefore he could not now make many experiments with this liquor. And Paracelsus does not say so many, and to great things of his solvent; and therefore I really do not know what to say to it. This, however, I will venture to say, that if you examine fossils and mercury, by every chemical method possible, you will never repent of your trouble.'

ALCHEMILLA is also said in a more extensive sense, so as to comprehend all fixed salts volatilized, and reduced into a quintessence.

ALKAHESTIC is used by some to denote the quality of bodies which are powerfully solvent.

In which sense, *alkahestic* amounts to much the same with menstruous, except that the latter imports a greater degree of the solutive power than the latter. See MENSTRUOUS.

ALKALESCENT, denotes a matter slightly *alkaline*, or which begins to turn to the *alkaline* and putrid fermentation.

ALKALI. See ALKALY.

ALKALIZE, in *Botany*. See KALIZE and SALTWORT.

ALKALINE, is a general term, denoting that has the properties of an ALKALY.

In this sense we say, *alkaline* salts, *alkaline* spirits, *alkaline* substances, &c.

ALKALINE, in *Chemistry*, is more peculiarly applied to SALTS which will petrify, and bear a strong fire, without flying away and combining to the air. To which limit their *alkaline* salts are said to belong.

ALKALINE *ferments*, in *Medicine*, denotes a menstruum lodged in the blood, which is dissolved by acidities and the like other things, both of organic and inorganic, as also deficient food, poisonous conditions, putrid effects on the lungs, tongue, and other parts in the mouth, &c. again in the stomach, a frequent *diarrhœa*, a fenfe of heat, laffitude, and general uneafinefs, a diffolution of the texture of the blood, the urine high coloured, and red. It produceth a putrefcency in the blood, &c. and is to be remedied by the fame means as the fea fcurvy, and other putrid diforders.

ALKALINE, or ALKALIZATE *bodies*, among *Chemifts*, are fuch as have their pores naturally fo formed, that they readily to be pierced, and put into motion, by the points of an acid pointed upon them.

ALKALIZATION, ALKALIZATIO, in *Chemiftry*, the act of impregnating a liquor with an *alkaline* fait.

This is done either to make it a better diffolvent, for fome particular purpofe; or to haſt the phlegm, fo as it may not rife in diſtillation, whereby the ſpirituous parts may go over more pure.

ALKALIZATION, is a name applied to operations, by which *alkaline* properties are communicated to bodies; or to thoſe by which *acids* is extracted from bodies which contain it, or in which it may be formed; as *e. g. ſpirit of wine* is ſaid to be *alkaliſed*, when it has been digeſted *per ſe* with *ſalt*, as part of which it imbibes, and thus acquires *alkaline* properties. On the other hand, when a mineral fait is decompoſed, in order to obtain its *alkaline* baſis, this fait is ſaid to be *alkaliſed*. Vegetable ſubſtances when reduced to aſhes, may alſo be ſaid to be *alkaliſed*; becauſe the aſhes contain fixed *alkali*.

ALKALY, ALKALI, or ALKALI, in *Chemiſtry*, a name originally given by the Arabians to a fait extracted from the aſhes of a plant called KALI; and by us *glaſs-wort*; but ſucceſsfully uſed in the making of glaſs.

Afterwards, the term *alkaly* became a common name for the Harrisian ſalts of the firſt kind; that is for ſuch ſalts as are drawn by lixivium from their aſhes.

And hence, again, became the original *alkaly* was found to ferment with acids; the name has ſince become common to all ſaleable ſalts, and all terreſtrial ſubſtances, which have that property.

ALKALY, then, in its modern extenſive ſenſe, is any ſubſtance, which, being mixed with an acid, occaſions an ebullition and effervescence.

And hence arile the grand diviſion of mineral bodies into the two oppoſite claſſes of *acids* and *alkalies*.

Beerhaave ſcarce takes this circumſtance to be enough to conſtitute any determinate claſs of bodies. In effect, *alkalies* are not of one ſimple homogeneous nature, but there are ſeveral ſorts of them.

The firſt are obtained from vegetable and animal ſubſtances, by calcination, diſtillation, putrefaction, &c. Such are ſpirit of urine, ſpirits of hartſhorn, ſalt of tartar, &c. The ſecond are of the terreſtrial kind; as ſhells, chalk, &c.

Theſe two ſpecies of *alkalies*, Boerhaave obſerves, differ widely from each other; having ſcarce any thing in common but their being ſaturated with acids. The firſt is a chaſs of natures, hard, ſcruſtate, inſipid, mild ſaline green bodies; the other, a ſet of ſoft, or ſoft reſolvable, odorous, ſapid, cauſtic, aperitive, and are penetrated by air. Hence, adds he, it is not to be wondered, that ſubſtances which muſt be allowed to be of ſuch oppoſite nature, ſhould be of the nature of an *alkaly*, and that ſuch a number whoſe property conſiſts in their being ſaturated with acids, ſhould be allowed to any mixt and genuine body, as chalk, &c. but other properties and conſiderations are to be taken for and particularly theſe laſt, which is purpoſely the manner of preparing, and the change of colour they occaſion in bodies.

With regard to this laſt circumſtance, thoſe liquors which, being poured on ſyrup of violets, change it to a green colour, are *alkalies*; as thoſe which turn it red, are acids. Thoſe out of other roots it alſo changes green; and out of others of a common red, as it is the ſyrup that acids give by out of violets, but of turnſole be poured, it turns that part, wherewith it comes in contact, green: having the ſame effect with the bodies of the firſt claſs, poured on ſyrup made ſharp by oil of tartar. But this change of colour is not peculiar to *alkalies*, ſince a ſolution of ſublimate in the marine acid changes the colour of ſyrup of violets to a green.

To the ſame effect, Dr. Hamberg obſerves, that 'a mixture of lead and bismuth being upon the ſolution of a body in acids, ſhews that it is an *alkaline* ſubſtance of the *alkaline* kind, and that many of them will move vegetable colours themſelves; ſo as ſometimes even to make blue, which *acids* never do.

The opinion of the ancient ferment only with acids, ſeems too haſtily taken up: for the different *alkalies* will ferment with one another; ſpirit of hartſhorn, ſpirit of wine, ſpirit of ſal ammoniac, and other volatile ſpirits of the *alkaline* kind, when in the dry form of ſalts, all ferment with ſalt of tartar, or other fixed [illegible] of the ſame material kind. Spirit of ſalt is an *alkaly*, in regard to [illegible]

...ture return, this method, for a few days, is thought to be sufficient preparation for the bath. The patient should be taken in a dry, or rainy day; when the sky is clear, and the wind south, west, or the last is obtained, by observing the letter by Mr. Ellicott.

ALLEGIANCE, See ALLEGIANCE and LIEGE-HOMAGE.

ALLEGIANCE, See ALLEGIANCE.

ALLEGIANCE, in Heraldry. See Feudal Coats.

ALLEGIANCE, in Law, is the natural bond or tie, which binds every subject to the king, in return for that protection which he affords him.

The duty of allegiance is founded in the original contract between king and people; antecedently to all express declarations of it, which are indeed only intended as a more solemn security of the same. For as all government is entered into for the sake of protection, so all subjects are bound to pay obedience to the government under which they live, from the general principles of reason and justice, unless they mean to renounce the benefits of society, and return back to the savage state. And, as this mutual compact is the solemn act of the whole community, it is binding upon every individual member of it, unless he openly renounces it when he comes to years of discretion, by declaring his intention to abjure the realm within a convenient time; or else by tacitly renouncing it, by acquiring lands in another country, or entering into actual service against his native prince. But, as the vigour of government will be destroyed, if it be shaken by frequent changes, the law therefore presumes every man's allegiance to be perpetual, when it is not expressly renounced for some of the reasons before mentioned.

The rule is laid down by the most orthodox writers in the following manner: that allegiance is the duty of the subject to the king, wherever the king's protection is due to the subject. This allegiance is either express or implied. Express allegiance is that which is taken by the oath of fealty, or homage, to every subject at the age of fourteen years. Implied allegiance is that which is due from every man that abides within the king's dominions, unless he openly renounces it. Local allegiance is the duty of all aliens, or strangers, while they continue within the king's dominions, for the protection they there enjoy. Natural allegiance is that which is due from all men born within the king's dominions immediately upon their birth. For infants owe allegiance to the king, though not bound by oath, while they remain under the king's protection: and this natural allegiance is equally binding with that which is express. Natural allegiance may be forfeited by the breach of it, by words or actions, which amount to treason or misprision. But local allegiance may be lost as soon as the party transfers himself to another country, with a design to settle there. And express allegiance, when once lawfully taken, can never be forfeited by any treason, unless the party abjures the realm, or lives for five years in a foreign country without returning upon the king's summons. Yet, if he returns after a war declared, he cannot plead his allegiance in excuse for treason committed during the war. Nor can a traitor be pardoned by the king, unless he takes the oath of allegiance, which is a declaration of faith, as well as a promise of obedience. And, in order to encourage the discovery of treasons, it is provided by the statute 1 Edw. VI. c. 12. that if any person, who has been engaged in any treason, shall discover his accomplices, so as they may be taken before the king in council, or before one of the chief justices, or lord lieutenant of a county, he shall be entitled to the king's pardon for the same, if he has not been the first discoverer of the offence of others.

ALLEGIANCE, in Scots Law, is a term borrowed from the feudal system, signifying the personal security, or the acknowledgment of a subject, whereby the lieges acquire protection.

The other ingredients are rolls-carts, horses, under-girths, mails, crammasies, stone wood, peats, and leaf wood, for which the horses are usually employed.

The crammasies answer to elderly coals in Hampshire, which grow together with pieces of heaps with it. It is called so because made from stones as can be gathered, the nature of which determines it, that the sand, which grows in a crammasie, it was where found in plentifully together. The manner of preparing the grain for making the crammasies is described in the First Treatise, &c.

Its touch of the ... especially, says De Quincy, among female patients, and in postpartance to them; but that author declares he found in that intention, and thinks it ought only to be regarded as a resource.

Count Mazzuchi, in an inquiry into the composition of the medicine, found, that some of the ingredients which the ancients prescribed, he found it, and which, on this account, he prescribed in the form of, by many modern practitioners, were discovered to the appearance of some of the ingredients, wherein is found, is evidently antiseptic, fulsome and rancid, and contains a great quantity of oil, differs in appearance in the different states of the disease, and highly prejudicial in diseases where the blood tends to putrefaction.

talling eaglets, *allerions*, and of reperfenting them fpread, without feet and beaks, is not above a hundred years old, and is of French invention; introduced to reperfent the Imperialifts as fubdued. Hence, Menage derives the word from *aquilaris*, a diminutive of *aquila*.

The *allerion*, reperfented *Tab. Heraldry fig. 1.* appears much the fame with the *martlet*, except that the wings of the latter are clofe, and it is reperfented, as it were, *paffant*; whereas the *allerion* is fpread, and is reperfented in *pale*. Add, that among our heralds, the *martlet* has a beak, which the *allerion* wants.

ALLEU, or ALLOUE, in *our Ancient Cuftoms*. See ALLODIUM.

ALLEVEURE, the fmalleft copper coin that is ftruck in Sweden; it is not worth quite two *deniers Tournois* of France.

ALLEVIARE, in *Old Records*, to LEVY or pay an accuftomed fine or compofition.

ALLEVIATION, denotes the act of making a thing lighter, and eafier to bear or endure.

The word is originally Latin, compounded of *ad*, *ad*, and *levis*, *light*.

In which fenfe, *alleviation* is fynonymous with *lightening*, and ftands oppofed to *aggravation*.

ALLEY, in *Gardening*, a ftraight parallel walk, bordered, or bounded on each hand with trees, fhrubs, or the like.

The word *alley* is derived from *aller*, *to go*; the ordinary ufe of an *alley* being for a walk, paffage, or thoroughfare, from one place to another.

Alleys are ufually laid either with grafs or gravel.

According to lord Bacon, "where *alleys* are clofe gravelled, "the earth putteth forth the firft year knot grafs, and after "fpire-grafs. The caufe is, that the hard gravel, or pebble, at the firft laying, will not fuffer the grafs to come "forth upright, but turneth it to feed way where it can; "but after that the earth is fome what footened at the top, "the ordinary grafs cometh up."

An *alley* is diftinguifhed from a *path* in this, that in an *alley* there muft be always room enough for two perfons, at leaft, to walk a breaft; fo that it muft never be lefs than five feet in breadth; and there are fome who hold, that it ought never to have more than fifteen.

ALLEYS, *crofs*, are the little *alleys* by the fides of the great one.

ALLEY, *front*, is that which runs ftraight in the face of a building.

ALLEY, *triangle of*, that which cuts the former at right angles.

ALLEY, *winding*, is that which cuts a fquare, clofet, parterre, &c. from angle to angle.

ALLEY, *fliping*, is that which, either by reafon of the lownefs of the point of fight, or of the ground, is neither parallel to the front, nor to the tranfverfe *alleys*.

ALLEY, in the *New Hufbandry*, implies the vacant fpace between the outermoft row of corn on one bed, and the neareft row to it on the next parallel bed; and it is ufually about four feet in breadth, exclufive of the partitions between the rows of corn in the beds. The firft hoeing of wheat is performed in the beginning of winter, and the earth is ploughed away from the rows into the intervals, which forms fmall ridges in the middle between the double rows. The fecond hoeing is in the fpring, which turns it back to the rows, leaving a furrow in the middle of the *alley*. The third hoeing is from the rows, after the wheat has bloffomed; this turns the earth into the intervals, forming fmall ridges there, as at the firft hoeing. The fourth hoeing returns the earth to the ridges, which is performed a month or more after the third hoeing. This commonly finifhes the hoe-hoeings, if the land is in good heart; otherwife one or two more hoeings are neceffary.

ALLEY, *in winter*, is that which has too great a defcent, and which, on that account, is liable to be damaged by floods; to prevent the ill effect whereof, it has plafhands of turf run acrofs it from place to place, which help to keep up the gravel.

This laft name is likewife given to an *alley* in a labyrinth, or wilderness, formed by feveral returns of angles, in order to render it the more folitary and obfcure, and to hide its exit.

ALLEY, in *Perfpective*, is that which is largeft at the entrance than at the exit; to give it the greater appearance of length.

ALLEY *of compartiment* is that which feparates the fquares of a *parterre*.

ALLGOOD, in *Botany*, *chenopodium*. See GOOSE-*foot*.

ALL-HEAL, *Hercules's*, in *Botany*, a name given to WOUNDWORT.

ALL-HEAL, *vipers*, *feabious*. See DEVILSBIT.

ALLIANCE, the union or connection of two perfons, or two families, by means of marriage; otherwife called AFFINITY.

The word feems formed of the Latin *adligatio*, q. d. a *tying together*.

The law of the *Twelve Tables* forbids all *alliances* between perfons of unequal rank and condition. And in Portugal, we are told, the daughters of the nobility are prohibited to *ally* with fuch as have never been in the wars.

ALLIANCE is alfo extended to the leagues or treaties concluded between fovereign princes and ftates, for their mutual fafety and defence; in which ftile they are the fame with what we otherwife call *confederacy*, *league*, &c. *Alliances* are a fpecies of treaties; which are ufually divided into treaties of peace, of commerce, and of *alliance*, properly fo called. Thefe are fometimes particularly denominated *foreign alliances*.

Alliances are variously diftinguifhed, according to their object, the parties in them, &c. Hence we read of equal, unequal, triple, quadruple, grand, offenfive, defenfive, &c. *alliances*.

ALLIANCE, *equal*, *fœdus inter æquos*, are thofe wherein one of the contracting powers promifes paffage, or protection, and the other fidelity and obfervance by which they feem to be diftinguifhed from equal *alliances*, wherein the two powers treat on a foot.

ALLIANCE, *offenfive*, that whereby the parties oblige themfelves jointly to attack fome other power. This ftands diftinguifhed from defenfive *alliance*.

The *triple alliance*, between England, Holland, and Sweden, is famous. So is the *quadruple alliance*, between England, Holland, the emperor, and the king of France.

Though the title of *allies*, *fœti*, of the Romans, was a fort of fervitude, it was much coveted. Ariarathes, we are told by Polybius, offered a facrifice to the gods by way of thankfgiving for having obtained this *alliance*. The reafon was, that thenceforwards people were fure not to receive any injuries except from them.

There were divers forts of *allies*: fome only united to them, by a participation of the privileges of Romans, as the Latins and Hamics; others by their very foundation, as the colonies; others by the benefactions they received from them, as Maffiniffa, Eumenes, and Attalus, who owed their kingdoms to Rome; others by three treaties, which tell, by a long *alliance*, became fubject, as the kings of Bithynia, Cappadocia, Egypt, and moft of the cities of Greece; laftly, others by compulfive treaties, and the law of fubjection, as Philip and Antiochus. For they never granted peace to an enemy, without making an *alliance* with him: but it, they never fubdued any people without ufing it as a means of fubduing others.

The forms or ceremonies of *alliance* have been various in different ages and countries. Among us, figning and fwearing, fometimes at the altar, are the chief: anciently eating and drinking together, chiefly offering facrifice together, were the cuftomary rites of ratifying an *alliance*. Among the Jews and Chaldeans, heifers or calves; among the Greeks, bulls or goats; and among the Romans, hogs were facrificed on this occafion. Among the ancient Arabs, *alliances* were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a fharp ftone, dipping herein a piece of their garments, and therewith fmearing their bodies, at the fame time invoking the gods Vanale and Allat, i. e. according to Herodotus, Bacchus, and Uranus. Among the people of Colchis, the confirmation of *alliances* in faid to be effected by one of the princes offering his wife's breafts to the other to fuck, which he was obliged to do till blood iffued.

It has been difputed, whether the ftates of the empire have a right of making *alliances*, without the emperor's participation. And whether the king of England be veffed with abfolute power of making *alliances* at difcretion, without content of parliament. De Dieudonné aflerts the negative. According to him, the contrary opinion owes its rife to the mere flattery of modern courtiers, having no foundation in the ancient laws and conftitution of the kingdom. King John and Richard II. were, according to this author, the firft that attempted any thing like it. It is certain there occur numerous inftances in hiftory, where the king has acted, or the parliament have offered, their advice, concerning the *alliances* to be made; but there are many others, at leaft of later times, wherein no fhoutfteps of any fuch conftitution appear.

There are inftances likewife where the parliament have declined giving any advice concerning fuch arduous matters.

ALLIARIA, in *Botany*. See *Dame's* VIOLET.

ALLIGATION, in *Arithmetic*, a rule or operation, whereby queftions are refolved, relating to the mixture of divers commodities or ingredients together, with the value, effect, &c. thereof in compofition.

The word is formed of *aligare*, *to tie together*, by reafon, perhaps,

perhaps, of a sort of *minuta*, or circular ligatures, ordinarily used to connect the several numbers together.

Alligation is of two kinds, *medial* and *alternate*.

ALLIGATION *medial* is, when, from the several quantities and rates of divers simples given, we discover the mean rate of a mixture compounded out of them.

The several cases will come under the following rules.

1. The quantity of the ingredients, and the prices of each, being given; to find the price or value of some part of the mixture.

Rule. As the sum of the quantities given,
Is to the sum of the said products;
So is one ounce of the mixture,
To its value.

Example. A refiner, or goldsmith, hath 12 ℥ of gold at 4*l.* per ℥, 8℥ at 4*l.* 5*s.* 3℥ at 4*l.* 6*s.* 8*d.* and 9℥ at 4*l.* 13*s.* 4*d.* per ℥; what is an ounce worth of all these melted together.

℥ of gold	*l.*	*s.*	*d.*	*l.*
12 × by	4	0	0 the product is	48
8 by	4	5	0	34
3 by	4	6	8	13
9 by	4	13	4	42
32 total				137 sum.

Then as 32 ℥ : 137*l.* :: 1 ℥ : 4*l.* 5*s.* 3*d.* ½, or to 4*l.* 5*s.* 3½*d.* By the same rule the value of any other quantity of that composition is to be found: as supposing 7 ℥.

For as 32 : 137 :: 7 : 30¼.

2. The prices of the several ingredients, and the sum paid or received for the mixture, being given; to find what quantity of each was bought or sold. Divide the sum paid or received, by the sum of the particular prices; the quotient is the answer.

3. The ingredients of a mixture being given, to augment or diminish the mixture proportionally.

Rule. As the sum of the particular quantities of the compound given,
Is to the whole quantity proposed to be augmented or lessened;
So is each particular quantity in the given compound,
To the due proportion required of that simple, sineness, &c.

Example. The compound in the foregoing instance is required to be augmented to 48 ℥: that is, 16 is to be added to 32, how much of each ingredient must be taken?

12		12 : 6	
8	Then as 32 : 16 : :	8 : 4	
3		3 : 1½	
9		9 : 4½	
32 sum.		16 sum.	

	l.	*s.*	*d.*	
So that there must be 18 ℥ of gold at	4	0	0	per ℥
12	4	5	0	
4½	4	6	8	
13½	4	13	4	

Sum = 48 for proof of the operation.

4. The nature, quality, &c. of the several ingredients of a mixture being given, to find the temperament or degree of sineness resulting from the whole. Place the several quantities of the mixtures in rows; against which place orderly their several qualities or sineness; and multiply each quantity by its own quality or degree of sineness: then, as the sum of the quantities is to their products, so is unity to the quality or sineness of the mixture.

5. The quantities of a mixture being given; to find the particular quantities of any ingredient in any part of the mixture.

Rule. As the total of the composition,
Is to the quantity of any simple in that composition,
So is the total quantity proposed, to be proportionably compounded,
To the quantity of each simple to be in that proposed quantity.

Example. How much of each ingredient (or price of gold mentioned in the first case) is in a pound, or 12 ℥ of the 32, being the compound given?

				l.	*s.*	*d.*	
	12	℥.	4½	at 4	0	0	per ℥.
As 32 : 12 : :	8	:	3	at 4	5	0	
	3	:	1¼	at 4	6	8	
	9	:	3¾	at 4	13	4	
	12 proof.						

6. Given the total of a mixture, with the whole value, and the values of the several ingredients; to find the several quantities mixed, though unequally.

This case admits of two varieties; first, where the mixture is of two simples; and secondly, when it consists of more than of two. For the first, the rule is—Multiply the total of the mixture by the least value, subtract the product from the total value; and the remainder is the first dividend; then take the said least value from the greatest valued ingredient, and the remainder is the first divisor. The quotient of this division shews the quantity of the highest-priced ingredient, and the other is the complement to the whole.

Thus, still referring to the first example, and assuming the two first terms of it:

Gold at 4*l.* per ℥
Ditto at 4*l.* 5*s.*

Total of the composition = 20 ℥. Total value 82*l.*
× 4 − 80
80 − by 2½) 2 (8 the
quantity of the highest-priced ingredient.

Secondly, when the quantities are more than two in number.

These kinds of questions, as in those of *alligation* alternate, admit of various answers, all of them true, and are called INDETERMINATE *problems*. They are best done by parcel, two at a time, as in the preceding operation.

ALLIGATION *alternate* is, when the rates or qualities of divers simples are given; and the quantity of each is required, necessary to make a mixture of the given rate or quality.

Alligation alternate shews the due proportion of several ingredients; and counterchanges the place of such excesses or differences as arise between the mean price and the extremes; ascribing that to the greater extreme which proceeds from the lesser: and contrarily.

The rules which obtain in *alligation* alternate are as follow: every greater extreme is to be linked with one lesser. If either of the extremes be single, and the other extremes plural, the single extreme is to be linked to all the rest.

If both greater and lesser extremes be not plural, they may be linked so diversly, that several differences may be taken and a variety of answers may be made to the question, yet all true; but if one of the extremes be single, there can be but one answer.

The numbers being linked, take the difference of each from the mean or common price; and place this difference against the number it is linked to, alternately.

Every number, linked with more than one, must have all the differences of the numbers it is linked to, set against it.

These differences resolve the question, when the price of every one of the ingredients is given without their quantities: and the demand is, to mix them so as to sell a certain quantity at a mean rate.

But when the quantity of one, with the price of all the ingredients, is given, and the demand is to know the quantities of the other ingredients; then, the rule of three is to be used.

And when the price of every ingredient is given, without any of their quantities, and the demand is to make up a certain quantity to be sold at a mean rate; then all the differences added together will be the first number in the rule of three; the whole quantity to be mixed, the second number; and each difference apart, the several third numbers; and so many sorts mixed, so many operations of the rule of three.

We shall add an example, wherein both the kinds of *alligation* have place. Suppose a mixture of wine of 119 quarts, required to be made of wines of the following prices, 7*d.* 8*d.* 14*d.* and 15*d.* per quart; and so, as that the whole may be afforded at 12*d.* per quart.

Having linked 8 to 14, and 7 to 15, and counterchanged their differences from the common price, 12*d.* the sum of their difference is found to be 145 by which dividing 119, the quotient is 82/145, or 8/5, or for convenience in operation

	Quarts.
8 \ 2	5 : 2 :: 17
14 / 4	5 : 1 :: 34
7 \ 3	5 : 3 :: 51
15 / 5	5 : 5 :: 17
14	119

Those who are curious to have a fuller explanation of this rule, may consult Ward, Wallis, Jaquet, Malcolm, and other books of *arithmetic*.

ALLIGATI, in *Antiquity*, the basest and most [illegible] slaves, whom they kept locked up, or with [illegible]. The Romans had three degrees, or orders [illegible] servants; the first employed in the manage[illegible] estates, the second in menial or lower func[illegible] family, the third called *alligati*, above mentioned.

ALLIGATOR, in *Zoology*, a name given [illegible] kind of CROCODILE in the West Indies.

An *alligator* smells so strong of musk, as to affect the water and air at a considerable distance.

ALLIGATOR *Pear*, *a species of* PEAR.

ALLIONIA, in *Botany*, a genus of the *tetrandria monogynia* claſs: having the common calyx oblong, ſimple, and three-flowered: the proper calyx obſolete; the corolla irregular, and the receptacle naked. There are two ſpecies.

ALLIOTH, in *Aſtronomy*, a ſtar in the tail of the Great Bear, whoſe obſervation is much uſed at ſea.

It is alſo written *allist*, and *aliet*, and literally denotes a *horſe*. The Arabs give this name to each of the three ſtars in the tail of the *Great* BEAR, on account of their appearing like three horſes, ranged for the drawing of a waggon. See URSA *major*.

To find the latitude or elevation of the pole, by this ſtar, ſee LATITUDE and POLE.

ALLIOTICUM (from ἄλλος, *to vary*), a *Galenical medicine*, which alters and purifies the blood, conſiſting chiefly of the roots of dandelion, ſuccory, fennel, and raiſins; with the herbs endive, common ox-eye, lettuce, ſorrel, fumitory, &c.

ALLIUM, *garlick*, a genus of the *hexandria monogynia* claſs. See GARLICK.

ALLOCATION, ALLOCATIO, the admitting or allowing of an article in an ACCOUNT; and paſſing it as ſuch.

ALLOCATION is alſo an allowance made upon an account; uſed in the *exchequer*.

ALLOCATIONE *facienda*, a writ directed to the lord-treaſurer, and barons of the exchequer, upon the complaint of ſome accountant; commanding him to allow him ſuch ſums as he hath in execution of his office lawfully expended. Reg. Orig. p. 206.

ALLOCATO *comitatu*, is a new writ of exigent allowed, before any other county-court holden, when the former has not been fully ſerved, or complied with, &c. Fitz. Exig. 14.

ALLODIAL, in *Ancient Cuſtoms*. See ALLODIUM.

ALLODIARIUS, the owner or proprietor of an *allodium*, or *allodial* lands: alſo uſed to denote a lord paramount of a manor.

This is otherwiſe written *alodiarius*, *aladerius*, *alvarius*, *alver*, *alverius*, and *alvetior*.

ALLODIUM, or ALLEUD, land held of a man's own right, without acknowledgment of ſervice, or payment of any new rent to another; and this is a property in the higheſt degree; but *feudum* is ſuch land as is held of another for which ſervice is done, or rent is paid, as an acknowledgment thereof. All the lands in England, except the crown-lands in the king's own hands, in right of his crown, are of the nature of FEUDUM, or FEE; for although many have lands by deſcent from their anceſtors, and others have bought land, it cannot come to any either by deſcent or purchaſe, but with the burden that was laid upon him who had *novel-fee*, or firſt of all received it from his lord; ſo that there is no perſon hath *directum dominium*, i. e. the very property or demeſne in any land, but the king, in right of his crown.

The origin of the word is controverted. Caſſeneuve ſays it is almoſt as obſcure as the head of the Nile. There are few of the European languages, from which one etymologiſt or other has not derived it; yet ſome, not improbably, take it for a primitive French word without etymon.

Bollandus explains *allodium*, to be *prædium, ſeu quævis poſſeſſio libera, juriſque proprii, & non in feudum alienſave onere accepta*.

After the conqueſt of the Gauls, the lands were divided in two ways; viz. into beneficia, *beneficia*; and *allodia*. Benefices conſiſted in lands given by the king to his officers and ſoldiers; either for life, or for a time fixed.

Allodia, or *alleuds*, were ſuch lands as were left in property to the ancient poſſeſſors.—The ſixty-ſecond title of the Salic law, is *de allodiis*; where the word ſignifies hereditary lands, or thoſe derived from a man's anceſtors. Whence *allodium* and *patrimonium* are frequently uſed indiſcriminately.

In the ancient capitulars of Charlemagne, and his ſucceſſors, we find *allodium* conſtantly oppoſed to *feu*; but, toward the period of the ſecond race of kings, it loſt the prerogative: the feudal lords obliging the proprietors of *allodial* lands to hold of them for the future. The ſame change alſo happened in Germany, &c.

The uſurpation of the feudal lords over the *allodial* lands went ſo far, that they were almoſt all either ſubjected to them, or converted into fees; whence the maxim *nulle terre ſans ſeigneur, no land without a lord*.

In the cuſtomary laws of France, we find mention made of two kinds of *allodiums*, viz.

ALLODIUM *nobile, alleu noble*, that to which *juſtitia* or juriſdiction was annexed; and which was alſo free from all homage and ſervice.

ALLODIUM *villanum, alleu roturier*, that to which no juriſdiction was annexed.

ALLOGIA, in *Antiquity*, denote winter-quarters appointed for the ſoldiery.

Some will have the word of French origin from *logement*; others, with more probability, from the Italian *allogare*, formed of *locus*, *place*.

ALLOM. See ALUM.

ALLONGE, in *Fencing*, a thruſt, or PASS at the enemy.

The word is French, formed of the verb *allonger*, *to lengthen out a thing*.

ALLOPHYLUS, in *Botany*, a genus of the *octandria monogynia* claſs. the calyx of which is a perianthium compoſed of four leaves of an orbicular figure, and two oppoſite ones, ſmaller than the others; the corolla conſiſts of four petals leſs than the cup; the germen is didymous, and the ſtigma divided into four parts. There is one ſpecies.

ALL SEED. See FLAX.

ALL-SPICE. See PIMENTO.

ALLOTTING, or ALLOTMENT *of goods*, in matters of *Commerce*, is when a ſhip's cargo is divided into ſeveral parts, bought by divers perſons, whoſe names are written on as many pieces of paper, which are applied by an indifferent perſon to the ſeveral lots or parcels; by which means the goods are divided without partiality; every man having the parcel which the lot with his name on is appropriated to. See INCH *of Candle*.

ALLOY, or ALLAY, in matters of *Coinage*, &c. a proportion of a baſer metal, mingled with a finer, or purer. The word ſeems derived from the French *loy*, *law*; in regard the *alloy* is fixed by law.

Minters never ſtrike any gold or ſilver coin without *alloy*, always mixing ſome copper with thoſe two metals, according to a certain proportion, ſettled by the rules of the MINT; which in France cannot be altered but by the king's edicts, proclamations or ordinances.

Braſs coin is made of an *alloy* of copper, mixed with a few parts of fine ſilver, regulated alſo by the prince. The jewellers, gold-wire drawers, gold-beaters, and gold and ſilverſmiths, are obliged to uſe *alloy* in the gold and ſilver they work, but it ought to be leſs than that of coin, to prevent their melting it in order to uſe it in their works; called by the French *billonage*, which is an unlawful melting of gold or ſilver coin. The braſs-founders alſo have their *alloy* of copper, pewter, and tin. This *alloy* differs according to what they deſign to caſt, whether ſtatues, guns, or bells. The pewterers in making their ſeveral veſſels, diſhes, plates, &c. alſo make uſe of an *alloy* of red copper, *regulus* of antimony, and ſome other minerals.

There are ſeveral kinds of *alloy*; ſuch as BRONZE, TOMBAC, BRASS, WHITE COPPER, &c.

Metallic ſubſtances cannot unite directly with earthy matters, not even with their own earths when deprived of their inflammable principle, and conſequently of their metallic properties. But in general it may be ſaid, that all metals may be *alloyed* with each other, although more or leſs eaſily, and although ſome of them have not yet been made to unite. As *metals* are bodies naturally ſolid, the firſt condition for their union is that they be fuſed; they then unite like all bodies that reciprocally diſſolve each other; and from theſe combinations new compounds reſult, which have the mixed properties of the component ſubſtances.

In *metallic alloys*, as in almoſt all other *metallic* combinations, phenomena appear which depart from the general rules of combination; and ſome of the properties of metals forming an *alloy* are altered, increaſed or diminiſhed by their union. The ductility, for inſtance, of a *metallic* compoſition is generally leſs than the ductility of the component metals alone and pure. The denſity or ſpecific gravity of metals and ſemi-metals, is alſo changed by *alloying* them with each other. Sometimes the ſpecific gravity of the compound is intermediate betwixt the ſpecific gravity of the component metals; ſometimes it is leſs, and frequently greater; this depends upon the nature of the metal.

ALLOYS, *metallic*, are either *natural* or *artificial*.

ALLOYS, *natural*, are thoſe made by *nature*, ſuch as moſt minerals containing ſeveral metals, *alloyed* with each other. Native gold is always more or leſs *alloyed* with ſilver; and native ſilver with gold.

ALLOYS, *artificial*, are thoſe made expreſſly for different uſes, or for the ſake of examining their properties.

There are two ſorts of *alloys* practiſed in the coinage of money: the one when gold and ſilver are uſed which have not yet been coined; the other when ſeveral ſpecies of coin, or ingots of different fineneſs are melted together to coin new money. The proportion of the *alloy* with the finer metal is eaſy in the firſt caſe; ſince when once the fineneſs of the ſilver or gold is known by refining, it is only adding to it the *alloy* of copper required by law, to bring it to the legal ſtandard.

In England the ſtandard of gold coin is 22 *carats* of fine gold, and 2 *carats* of *alloy*, in the pound troy: the French, Spaniſh, and Flemiſh gold are nearly of the ſame fineneſs.

nels. The pound weight is cut into 44 pieces and ½, each current for 21 shillings.

The standard of silver is 11 oz. 2 pennyweights troy of silver, and 18 pennyweights of *alloy* of copper. The *alloy* in gold coin is silver and copper, and in silver coin copper alone. Whether gold or silver be above or below standard, is to be found by ASSAY.

The chief reasons alledged for the alloying of coin are, 1. The mixture of the metals, which, when smelted from the mine, are not perfectly pure. 2. The saving of the expence it must otherwise cost if they were to be refined. 3. The necessity of rendering them harder, by mixing some parts of other metals with them, to prevent the diminution of weight by wearing, in passing from hand to hand. 4. The mixing of foreign gold or coin which is *alloyed*. 5. The charges of coinage, which must be made good by the profit arising from the money coined. 6. And lastly, the duty belonging to the sovereign on account of the power he has to cause money to be coined in his dominions. See GOLD, SILVER, REFINING, and ASSAYING. See a particular account of the *alloy* of gold, its usefulness, and its proportion in different coins, in Dr. Lewis's Commerc. P. Techn. p. 144. & seq.

According to the different proportions of *alloy*, money is of different degrees of fineness or baseness; and is valued accordingly in foreign exchanges.

The silver coin among the Romans was long kept to a great degree of purity; which was first broke in upon by the tribune Livius Drusus, who mixed with it an eighth part of copper. But the acts of his tribunate were afterwards annulled, and the money restored to its ancient fineness. Thus things remained till the time of the emperor Severus, who increased the *alloy* still more; yet on his medals he took the title of *restitutor monetæ*.

ALLUM, ALLOM, or ALUM, a kind of mineral salt, of an austere taste, leaving in the mouth a sense of sweetness, accompanied with a considerable degree of astringency.

The word *allum* comes from ἁλς, *salt*; or perhaps from the Latin *lumen*, light, because it gives lustre to colours.

ALLUM is a crystallizable salt, composed of vitriolic acid, united with an argillaceous earth. It dissolves sufficiently well in cold, but in much larger quantity in boiling water. Neumann says, that *allum* requires ten times, and other authors say that it requires fourteen times its weight of water to dissolve it. It retains half its weight of water in crystallizing; of which crystallization it is susceptible by the evaporation and cooling of the water in which it is dissolved. The figure of its crystals, like that of the crystals of other salts, varies according to the circumstances concurring during the crystallization.

In Italy this salt is obtained from a soft reddish stone, about Puteoli, from several kinds of earth; and in England from a whitish or bluish stone, called Irish slate.

ALLUM, *its generation and nature.*

As *vitriol* is produced from a sulphureous mineral, either simple or compound, that is, of iron and copper, so *allum*, which is, as it were, a kind of white vitriol, is also generated of a kind of sulphureous minerals, partly bituminous, partly luteous. Therefore the acid which is extracted from *allum*, called *spirit* of *allum*, seems to be of the same nature and properties with what is afforded by *vitriol*, whatever difference there is in the earths or receptacles in which both these kinds of salts are coagulated. For the *caput mortuum* of *vitriol* is of a metalline, that is to say, of an iron or copper-like quality; but the earth of *allum* seems to be a peculiar kind of ROLE, very spungy and subtle.

Chemists are generally agreed in opinion, that the acid of *allum* is the pure vitriolic; but the precise nature of its earthy base has been a subject of dispute. For a long time it was considered as a calcareous earth; but the late experiments of Pott, Margraaf and Baron, have shewn that calcareous earths, united with vitriolic acid, form selenites, and not *allums*; and that these and the earth of *allum* have no common distinguishing properties. M. Baron therefore conjectures, that the earth of *allum* is of a metallic nature. Others, on the contrary, as M. Geoffroy, Hellot, and Macquer have urged experiments to prove, that the earth of *allum* is contained in clays. M. Macquer, in particular, in a Memoir read to the Academy of Sciences at Paris in 1762, expresses his full conviction that the earth of *allum* has an entire and perfect resemblance to the purest clay; and he recites a variety of experiments and observations in support of this opinion.

Though *vitriol* and *allum* be produced, as it were, from the same matter, and from one sulphureous matrix; yet each of them is endued with peculiar properties and virtues. For *allum* and *vitriol* are very different in taste, and the common *vitriol* leaves no such astringency on the palate as is observed in *allum*. Again, a solution of *allum* makes no commotion nor precipitation in a solution of gold or silver, which a solution of *vitriol* is known to effect. Nor will a decoction of galls, or pomegranate flowers grow black, and be converted to ink, by the mixture and solution of *allum*, as with a solution of *vitriol*. Lastly, in *allum* the acid may be readily separated by the help of fire, from its earthy principle, in which it is inherent; but the case is otherwise with *vitriol*.

Allum and *sulphur* are both formed from the same chaos spirit, which, if it meets with a stony substance, forms *allum*; if with a bituminous one, *sulphur*.

Allum may easily be decomposed by various intermediate substances, saline alkalies, calcareous earths, iron, and any matter containing *phlogiston*, treated properly, &c. It is formed on the universal acid, or fluid salt combining with a chalky earth.—The same acid with a mercurial earth forms common *sea* SALT, and with a moist rocky, or clay earth, SAL *gemmæ*.

This system is confirmed, by what naturalists have observed concerning the origin of the native *allum* in the isle of Chio. That island is a hollow spungy rock, penetrated on all parts by the sea-water. M. Tournefort considers the whole as a natural laboratory, wherein the sea-water undergoes much the same action in it as in our retorts. By this means, an acid spirit is separated from it, which penetrating the substance of the rocks, dissolves and incorporates with them, and forms mines of *allum*. The forms hardly to be doubted, inasmuch as by pouring spirit of salt on common stones, or chalk, aluminous concretions are readily formed. The same spirit mixing with a BITUMEN under-ground, forms SULPHUR.

Some attribute the original of *allum* chiefly to a sulphureous principle acting on, corroding of, and coagulating with a mineral substance, usually of a terrene and stony, rather than metallic nature, though that metal be often contained in the *allum* stone. That the sulphur is the chief efficient and material cause of this production, seems to appear hence, that many *allum* stones distilled *per descensum*, yield good brimstone, and all *allum* stones, during calcination, emit a sulphureous steam. An inquisitive naturalist gathered from the very same rock, and that within a few inches of each other, *vitriol*, *allum*, and *sulphur*, all of them excellent in their kinds. Indeed these three minerals are so nearly allied, that an ingenious chemist shews us, he can by some artifices convert allum into *vitriol*, or *vitriol* into *allum*, the same to all intents and purposes, with the natural. Phil. Trans. N° 104.

Allum is ranked by Homberg, and others as an urinous neutral salt, on account of the urinous smell it exhales by burning, and its use in the volatilization of fixed salts. Yet some deny *allum* to belong to the class of *salts*, and rank it rather among stony substances; by reason that after dissolving *allum*, and precipitating the solution with oil of tartar *per se-quum*, the coagulation at the bottom resembles a stony *calx*, and being exposed to the fire, will neither melt nor sublime. The *ore* of *allum*, if mature, yields its salt immediately, and without trouble; but if less mature, it requires a previous calcination, as is the case in many of our English *allum* stones; and if very crude or immature, it must not only be burnt, but a long time exposed to the air before it will yield its salt. From this it appears, that the *allum* is not a genuine and native salt, but is composed by the acid of sulphur corroding some peculiar earth or stone, as vitriol is by its corroding some metal; and that, in both these operations, this corroding acid can sometimes perform its business, while it lies in the bowels of the earth; and sometimes, while it lies in the open air, though it failed of it when buried. Phil. Trans. N° 104.

Allum distilled into an acid spirit, with copper, or iron, becomes good *vitriol*; and *vitriol* freed from its metallic parts becomes aluminous; and being distilled, yields a spirit not to be distinguished by the taste from that of *allum*, and even scarce by the most accurate scrutiny.

Rectified oil of *vitriol*, or spirit of *sulphur*, of the same degree of strength, will sometimes concrete [illegible] and transparent substance, resembling crystal [illegible] and this substance is no way different, whether [illegible] by one or other of these ways, and in both [illegible] purest *allum*, so as not to be distinguishable [illegible] by tasting it. *Aqua fortis* is as well made [illegible] with *vitriol* and *nitre*.

Allum ores generally contain *vitriol* as well as [illegible] capable of great fermentation, when exposed to the air, though they would never have been subject to it while buried in the earth. They will become so hot in the

heap, that it is scarce possible to endure the hand upon them; and sometimes will break out into absolute flame. The acid and the sulphur they contain are the occasion of this, as, according to Simpson and some others, they are the cause of all subterraneal fermentations and heats; and the whole is not badly explained by the familiar instance of adding water to rectified oil of *vitriol*. The acid and the sulphur of that fluid are, as in these ores, so combined as not to exert their forces naturally against one another, but all is quiet as in these stones while under ground, but the water does to the one what the air does to the other; tends in a shrill, which not agreeing with either of the others, disturbs and sets their particles in motion, and the vessel containing the liquid becomes as hot to the touch in the one case, as the pebbles themselves are in the other.

Alum dissolves in water; what remains undissolved at bottom is a sort of *colcothar*, which soon dissolves in oil, or in spirit of vitriol; and hence arises some doubt whether *alum*, as it does not leave an earth behind, does properly belong to the class of salts. Mr. Boyle assures us that *alum-ore*, robbed of its *salt*, does, in tract of time, recover it again from the air.

ALUM, *the process of making it*.

The process of making *alum* at Whitby in Yorkshire is thus described by Mr. Ray, at the end of his collection of English words, not generally used. They take the mine or ore dug from the *desse* or rock, and laying it in great heaps, burn it with whins, or wood, till it be white. When it is sufficiently burnt, they harrow it into a pit, ten feet long, six broad, and seven fourths of a yard deep, where it is steeped in water during the space of eight or ten hours; then they draw out the liquor, which is only a laxivium impregnated with the *alum* mine, into troughs, by which it is conveyed to the *alum* house, into a deep cistern, about twenty yards in circumference, and three yards and a half deep. After the first water is drawn off from the mine into the pan, they do not presently call away the mother, but pour fresh water on it a second time; and after the second water is drawn off, which is much weaker than the first, they call out the mine, and put in new, and pour on fresh water as before. Out of the cistern they convey the laxivium by troughs into the pans, where it is boiled for the space of twenty four hours ordinarily. Then they take the liquor out of the pans, and examine it by weight, to know how much ley made of kelp, it will require, which for the most part is six inches of the pan's depth. This being put in, as soon as the liquor boils, or flows up, by the putting in of an iron coal-rake, or other iron instrument, they draw it off into a settler, and let it stand about an hour, that the sulphur and other dregs may settle to the bottom; which being done, it is drawn off into coolers, where it continues about four days and nights. The cooler being drawn about half full, they pour into it a quantity of urine, viz. about eight gallons into a cooler that contains about two hall tuns. Having thus stood about four days and nights, it is quite cool, and the *alum* crystallized to the sides of the cooler. Then they scoop out the liquor, which they call the mother, into a cistern, and put it into the pans again, with new laxivium, to be evaporated by boiling, &c. The *alum* that is thrown and crystallized on the sides of the cooler they scrape off, and wash with fair spring water, then throw it into a hag, where the water drains from it. Thence it is cast into a pan, called the *reaking* pan, and there stirred; after which it is scooped out, and conveyed by troughs into tuns, in which it stands about ten days, till it be perfectly cool and condensed; then they unhoop and have the tuns, and taking out the *alum*, chip it, and carry it into the store-house. The exact proportion of kelp does not appear in this process; for though the workmen told Mr. Ray, that the ley was six inches of the pan's depth, yet they did not tell him how deep the pans were. Phil. Trans. N° 252. See DOGGERS.

At Solfatera, near Puzzuoli, there is a considerable oval plain, the soil whereof is wholly saline, and so hot, that the hand cannot long endure it.—From the surface hereof, in summer time, there arises a fort of flour, or salino dust; which being swept up, and cast into pits of water at the bottom of the plain, the heat of the ground, i. e. of certain subterraneous spiracles, over which the coppers are placed, without any other fire, evaporates the water, and leaves the *alum* behind.

Alum is made at Cypella, in Thrace, by gently calcining the stone, and letting it diffolve afterwards in the air both in dews and rains; then boiling and crystallizing the impregnated waters.

ALUM, *its properties and uses*.

Alum is of some use in medicine, in quality of an astringent; but, being apt to excite vomiting, is not much used inwardly, and rarely without some smooth aromatic, as a corrector. It is proper for diseases where the principal ingredients are to fortify and constringe. It is said to be good in hæmorrhages of all kinds, especially uterine hæmorrhages; whether to correct the frequent return of the *menses*, or their too great abundance; to stop the flooding to which women with child are subject, or to moderate the flow of the too plentiful *lochia*. It is also said to be efficacious in the case of a *fluor albus*, *alum* mixed with honey cures the *aphthæ*, and with the juice of *knot-grass* is good for *exanthemata* and rheums in the ears; with cabbage leaves and boiled honey, it is effectual in the leprosy; and very good in warm water to make a fomentation for the itch. *Paronychia*, *pterygia*, and kibes; to scour away all nits and lice, and to anoint scalds or burns. It is used outwardly also in astringent lotions, and is an ingredient in several dentifrices and collyries.

It is a principal ingredient in dying and colouring, neither of which can be well performed without it.—It serves to bind the colour upon the stuffs, and has the same uses there, that gum water and glutinous oil have in painting. It likewise disposes stuffs to take the colour, and adds a degree of brightness and delicacy to it; as we see visibly in cochineal, and the scarlet grain. Without *alum* these dyes would be only confused stains, which might be washed out by water.

This effect of *alum* seems also owing to its styptic or astringent quality, by which it binds the finer parts of colours together, and prevents their exhaling. Hence also it preserves paper that has been dipped in its water, from sinking when wrote upon.

Vintners fine down their wines, &c. with *alum*; fishermen use it to dry codfish with; and bakers have mixed it with the flour to make their bread compact and white; to this last use of it, great objections have been made, but unjustly, for it is entirely innocent, and now seldom used. It is recommended from ten to twenty grains, mixed with an equal proportion of sugar, gum arabic, or spermaceti, as a cure for colics. Dr. Percival adds, that in about fifteen cases, he has employed it with success. Percival's Essays, vol. ii. p. 194.

Naturalists speak of divers kinds of *alum*, which may be reduced to two, *native* and *artificial*.

ALUM, *native*, are those prepared and perfected under ground, by the spontaneous operations of nature, mixing the proper ingredients, water, earth, and salt, or sulphur. It is found in the coal mines near Whitehaven.

These are either *liquid*, or *solid* and *concrete*.

ALUM, *liquid*, appears to be the primitive kind, as being that out of which the rest is formed.

It is not uncommon to find *liquid alum* in the places where subterraneous fires have raged. It is a milky thick liquor, and is found lodged in cavities of the strata of stone, when the sulphur and sal ammoniac have been sublimed away. The acid aluminous part of the matter will also escape with a great degree of heat, leaving in the place of the liquor only a dry flyptic, and hard flony matter. The liquor itself is of a very flyptic taste, and will yield one half its weight of pure crystalline *alum* on evaporation. Phil. Trans. N° 230.

ALUM, *solid* or *concrete*, is divided into fcilike *alum*, called by the Greeks *exyris*, as being soft and easily separable. This is said to bear a near resemblance to our *plumose alum*, only differing in this, that the former instead of whitish, is of a greenish hue. Some pretend to have done wonders with it against hæmorrhages, ludicrofs of the teeth, the itch, *pterygium*, *perus*, &c. In some of which its aluminous or astringent quality might be expected to do more harm than good.

ALUM, *rotunda*, *alumen rotundum*, called also *ovoydeum*, is found ordinarily in roundish masses, though sometimes angular.

ALUM, *fissile*, or *fossile*, is either composed of thin flakes, very friable to the fingers, or of *fibræ*, or whitish hairs, hence called *capillary*, usually *plumæ* ALUMI.

ALUM, *rock*, or *rosche*, is prepared from gypsum dooes cut from the rocks of the quarry, and stands contradistinguished from the common *alum*, or that prepared from earths. It is sometimes called *ice alum*. The method of making *alum* in Italy, is somewhat different from that described above.

It appears, that the names, *ice-alum*, and *rock-alum*, are synonymous, and confounded in *commerce*, because there is no difference in the price. There is this remarkable circumstance attends the crystallization of *alum*, that good crystals of this salt cannot be formed, unless an *alkaline lixivium* be added to the *laxivium* of *alum*, when set to crystallize.

Mr. Geoffroy had an exact information in Italy of the method of making *roche-alum* at Civita Vecchia. Near that city are quarries of a greyish or reddish stone, pretty hard, like the *travertin*. They calcine these stones in kilns, and then boil the *cole* in water over a strong fire. The water dissolves all the salt contained in the *cole*, and

there remains an insipid earth. The water thus impregnated is left to cool, and the salt shoots into crystals like tartar, about the sides and bottoms of the cask, which is a species of the *rock alum*, called ROMAN *alum*, the price of which is greater than that of common *rock alum*.

ALUM, *saccharine*, bears a near resemblance to sugar.—It is a composition of common *alum* with rose-water and whites of eggs, boiled together to the consistence of a paste, and thus moulded at pleasure. As it cools, it grows hard as stone. It is used as a cosmetic.

ALUM, *burnt, whence alum* is prepared by melting the salt in a fire-shovel, or crucible, and letting it bubble till it come to a white hard substance. This is used as an escharotic; it gently eats proud flesh, but leaves such a hardness on the part, as makes it little esteemed in that intention.

ALUM, *plume, alumen plumosum*, is a sort of saline mineral, of various colours, most commonly white bordering on green, resembling Venetian TALC, except that instead of scales, it rises in threads or fibres, resembling those of a feather; whence its name, from *pluma, feather*.

Some will have this to be the *lapis amiantus* of the ancients. It is chiefly found in the islands of Rhodes and Crete, where there are whole mountains of it. See Phil. Trans. vol. xxiv. ner. 48. an. 1704. p. 489.

ALUMEN *plumosum*, is also a name given by some chemists to a peculiar kind of sublimate of mercury, invented by Basil Valentine, whose name it also bears. It is a compound formed of arsenic, united with vitriolic acid.

ALLUMEN *fungitæ, or foliate*, a squamose or flaky stone, the same with what is otherwise called *lapis* SPECULARIS.

Some take this for the same with what the ancients called SCHISTOS.

ALUMEN *catini* is a name which some have given to the albus, or rather talc of the herb *kali*, used chiefly in the making of glass.

In this sense, *alumen catini* amounts to the same with what is more frequently called ALKALI.

ALUMEN *fecis* is made of the lees of wine, formed into round masses, dried by the sun, and then burnt or torrified so long by the fire, as to turn white. Its chief use is among the women of Italy, to dye the hair of a yellow colour, much affected in that country.

ALUM, *purified*, is that prepared by dissolving it in hot rain water, and evaporating it again, till it shoot into crystals.

By repeating this operation divers times, the fourness of the *alum* is much abated.

ALUM, *crude*, is the salt, such as produced at the *alum*-works, without further preparation. This stands contradistinguished from prepared *alum*.

It is used by some as a *mixture* against the itch and swellings of the feet; but rather palliates than works a thorough cure.

ALUM, *prepared*, is of divers kinds.—Under this class come *purified alum, saccharine alum, burnt alum, alum mineralized, tinctures of alum*, water, spirit, *oil, and oil of alum*.

ALUM, *Roman*, properly denotes a *rock alum*, of a red colour, prepared in the country near Rome.

In the genuine Roman *alum*, the red colour is not superficial but diffused through the whole substance of it; by which it may be distinguished from the spurious, or counterfeit kind, which is only the common English *alum* dyed red.

Alum mines are said to have been first found in Italy in the year 1460; and in 1526 king Henry VII. made a monopolizing grant of this commodity to Augustine Chigi, a merchant of Sienna. In the year 1608 the manufacture of *alum* was first invented, and successfully practised in England, meeting with great encouragement to Yorkshire, where it was first made, from Lord Sheffield, and other gentlemen of that county. King James I. by advice of his ministry, assumed the monopoly of it to himself, and therefore prohibited the importation of foreign *alum*; and in 1625 the importation of it was further prohibited by the proclamation of Charles I.

All the *alum* which is in commerce, is extracted by different operations from several *pyritous*, earthy, or stony matters, containing the vitriolic acid, and the earth proper for forming this salt. See PYRITES.

ALUM WATER, see ALUMINOUS *waters*.

ALUM WORKS, places where *alum* is prepared, and manufactured in quantities for sale. They differ from *alum* mines, as in the former an *artificial* ALUM, and in the latter *natural* ALUM, is produced.

ALLUMINOR, from the French *allumer, to lighten*, is used for one who colloureth or painteth upon paper, or parchment; and the reason is, because he gives light and ornament by his colours to the letters, or other figures. Such ornaments are styled illuminations. The word is used in stat. 1. R. III. cap. 9. But now such a person is called a *limner*.

ALLUMINOUS, any thing that contains *alum*, or partakes of the nature and qualities of that SALT.

Grew describes some extraordinary kinds of *alumineous* earths in the repository of the Royal Society.

ALLUMINOUS *waters* are those impregnated with the particles of that salt.

Alumineous waters make a species of those called mineral or medicinal waters.

Such is the Spa at Scarborough observed to be by Witty, Simpson, &c.

According to the last author, that which gives the essence to this water is an acid *alumineous* mineral salt, preying on, and dissolving a slight mixture of iron. Dr. Highmore objects, that supposing *alum* the principal ingredient in these waters, the properties of *alum* being to dry, to astringe, and to incrassate, how comes it to pass that they are pretended to be so highly deoppilative, and so beneficial to hypochondriac and cachectical persons, where their astringency should rather be noxious? Dr. Witty answers, that they do not derive these virtues from the *alum*, but from the other ingredients in them. It is disputed whether or no the bath at Lucca be *alumineous*. Phil. Trans. N° 47. N° 56. and N° 160.

We have also factitious waters under the denomination of *alumineous*; such is that called in the shops *aqua aluminosa magistralis*.

Its preparation is thus; take of *rock alum*, and white sublimate, *ana* ʒii. boil them in rose and plantain water, *ana* ℔i. till half is consumed; filter the remainder, and keep it for use.

This is prescribed against deformities of the skin, and often for the itch; but it is an uncertain remedy, and not to be used without caution.

ALLUSION, ALLUSIO, in *Rhetoric*, a figure whereby something is applied to, or understood of another, by reason of some similitude of name or sound.

The word is formed of *ad*, and *ludere, to play*.

Camden defines *allusion* a dalliance, or playing with words alike in sound, but unlike in sense; by changing, adding, or subtracting a letter, or two; whence words resembling one another become applicable to different subjects.

Thus the Almighty, if we may use sacred authority, changed Abram, i. e. high father, into Abraham, i. e. father of many.—Thus the Romans played on their tippling emperor Biberius Nero, by calling him Biberius Mero; and thus in Quintilian the sour fellow Placidus is called Acidus.

Allusions come very near to what we popularly call *puns*.

ALLUVION, ALLUVIO, in the *Civil Law*, a gradual addition or accretion made along the sea-shore, or the banks of large rivers.

The word is formed of *adluo, I wash to*, compounded of *ad* and *luo*.

The civil law places *alluvion* among the lawful means of acquisition; and defines it to be a latent imperceptible accretion.—Hence, where any considerable portion of ground is torn away at once, by an inundation, and joined to some neighbouring estate, this is not acquired by right of *alluvion*, but may be claimed again by the former owner.

Great alterations are made in the face and limits of countries, by *alluvions* of the sea, rivers, &c. Whole plains are sometimes formed by *alluvions*. It is controverted whether *alluvions* should be considered as fruits, and as such accruing to *usufructuaries*.

ALLY. See ALLIANCE.

ALMACANTARS, ALMACANTARAS, or ALMICANTHARATH, in *Astronomy*. See ALMUCANTARS.

ALMACANTARS *staff*. See ALMUCANTARS *staff*.

ALMADE, in *ship-building*, a small vessel used by the negroes of Africa, about four fathom long; and made usually of the bark of a tree.

The same name is also given to the vessels of Calicut in India, which are eighty feet long, and six or seven broad, and square sterned.

These are otherwise denominated *cathori*. They go with great swiftness. Wilson says, that they are sometimes thirteen paces long, sharp at head and stern, and that they are moved both by sails and oars.

In time of war, the king of Calicut has out two or three hundred of these vessels.

ALMAGEST, the name of a celebrated book composed by Ptolemy; being a collection of many of the observations and problems of the ancients, relating to geometry and astronomy.

In the original Greek it was called *μαθηματικὴ σύνταξις*, q. d. *greatest construction*, or *collection*: which last word *συναγὼγὴ*, joined

joined to the particle *al*, gave occasion to its being called *almagesti* by the Arabians, who translated it into their tongue about the year 800, by order of the caliph Al-Maimon.—The Arabic word is *almagisti*.

Ricciolus has also published a body of *astronomy*, which he intitles, after Ptolemy, the New Almagesti: being a collection of ancient and modern observations and discoveries in that science.

We have also a botanical *almagesti*, composed by Plukenet, being a kind of *pinax*, or general index of plants, containing the proper, and descriptive names, of upwards of six thousand. To which is a supplement, since published by the same author, have been added above one thousand others. A magestum Botanicum, sive Phytographiæ Pluckenetianæ Onomasticon, &c. Lond. 1696. fol.

ALMAGRA, in *Natural History*, a name given in later ages to an earth of the OCHRE kind, called *fil veticum* by the ancients. It is an ochre of a fine and deep red, with some admixture of purple, very heavy, and of a dense yet friable structure, and rough dusty surface. It adheres very firmly to the tongue, and melts freely and easily in the mouth, and is of an austere and strongly astringent taste; it stains the skin in touching it, and ferments very violently with acid menstruums; by which single quality, it is sufficiently distinguished from the *fil veticum*, to which it has in many respects a great affinity. It is found in immense quantities, in many parts of Spain; and in Andaluſia there are in a manner whole mountains of it. It is used in *painting*, and in *medicine*, being a very valuable astringent.

ALMAGRA, in the cant of chemiſts, denotes red *bole*, or RUDDLE; sometimes a lotion, or wash.

ALMALECI, in *Medical History*, a celebrated work, containing a ſyſtem of the ancient Arabian phyſic.

The word imports as much as the *royal work*.

Concerning the hiſtory, contents, &c. of the *almaleci*, ſee Freind's Hiſt. of Phyſ. p. ii. p. 36.

ALMANAC, a *calendar* or *table*, wherein are ſet down the days and feaſts of the year, the courſe of the moon, &c. for each month of the year.

The original of the word is much controverted among grammarians.—Some derive it from the Arabic particle *al*, and *manah*, *to count*.—Others, and among them Scaliger, rather derive it from *al*, and *manach*, the courſe of the months: which is contradicted by Gelius, who advances another opinion. He ſays, that, throughout the Eaſt, it is the cuſtom for ſubjects, at the beginning of the year, to make preſents to their princes; and, among the reſt, the aſtrologers preſent them with their ephemerides for the year enſuing; whence thoſe ephemerides came to be called *almanchi*, i. e. handfels, or new-year's gifts. To ſay no more, Veſtegan writes the name *almon-ac*; and makes it of Saxon original. Our anceſtors, he obſerves, uſed to carve the courſes of the moon, of the whole year, upon a ſquare ſtick, or block of wood, which they called *al-monaghi*, q. d. *all-moon-herd*.

The modern *almanac* anſwers to the *faſti* of the ancient Romans.

The neceſſaries for making an *almanac*, the reader will find under the article CALENDAR.

Henry III. of France very prudently decreed, by an ordonnance of 1579, that 'no *almanac*-maker ſhould preſume to give predictions relating to civil affairs, either of ſtates or private perſons, in terms either expreſs or covert.'

In the Philoſoph. Collect. we have a perpetual *almanac*, deſcribed by Mr. R. Wood.

Many forms of a head-*almanac* have been propoſed in ſome of our periodical publications; but the following diſtich will very well anſwer the purpoſe:

At Dover Dwells George Brown, Eſquire;
Good Chriſtopher Finch, And Dowſe Frier.

The twelve words anſwer to the twelve months; the firſt letter of each word ſtands in the Calendar againſt the firſt day of the correſponding month; and if the Dominical letter is known, it is eaſy to find on what day of the week any day of the month will fall throughout the year. In 1776, F being the Dominical letter, Dec. 25 is Wedneſday, becauſe the firſt day denoted by F is Sunday.

ALMANAC, *nautical*, is publiſhed annually, by anticipation, under direction of the commiſſioners of longitude. Beſide every thing eſſential to general uſe that is to be found in any *almanac* hitherto publiſhed, it contains many new and intereſting particulars; more eſpecially, the diſtances of the moon from the ſun and fixed ſtars for every three hours of apparent time, adapted to the meridian of Greenwich, by comparing which with the diſtances carefully obſerved at ſea, the mariner may readily, and with little danger of miſtake, infer his longitude to a degree of exactneſs, that may be thought ſufficient for moſt nautical purpoſes. And the publication of it is chiefly deſigned to facilitate the uſe of Mayer's lunar tables, by ſuperſeding the neceſſity of intricate calculations, in determining the longitude at ſea. It began with the year 1767, and has been continued ever ſince. See LONGITUDE.

ALMANAR, in the Arabian *Aſtrology*, denotes the preeminence, or prevalence of one planet over another.

ALMANDIN, or ALMANDINE, a precious ſtone of the RUBY kind, ſomething ſofter than the oriental ruby; and, as to colour, partaking more of that of the garnet than the ruby.

It is ranked among the richeſt of ſtones, and takes its name from Alabanda, a city of Caria, whence Pliny ſays it was brought.

ALMARIA, in our *Ancient Records*, the archives of a church, or the like.

ALMEHRAB, among *Mahometans*, denotes a niche in their moſques, which directs to the *kebla*, that is, to the temple of Mecca, to which they are obliged to bow their faces in praying.

The word is Arabic, where it is properly written *al mehrab*.

ALMEISAR, a celebrated game among the ancient Arabs, performed by a kind of caſting of *lots*, with arrows, ſtrictly forbid by the law of Mahomet, on account of the frequent quarrels occaſioned by it.

The manner of the game was thus: a young camel being brought and killed, was divided into a number of parts. The adventurers, to the number of ſeven, being met, eleven arrows were provided without heads or feathers; ſeven of which were marked, the firſt with one notch, the ſecond with two, the third with three, &c. the other four had no marks. Theſe arrows were put promiſcuouſly into a bag, and thus drawn by an indifferent perſon. Thoſe to whom the marked arrows fell, were obliged to pay the whole price of it.

Even the winners laſted not of the fleſh themſelves, more than the loſers; but the whole was diſtributed to the poor.

ALMELILETU is uſed by Avicenna, for a preternatural kind of heat, a degree more remiſs than that of a fever, and which ſometimes remains after a fever is gone.

ALMENE, a name given, by ſome of the Arabian writers, to the *prickly lotus* of Africa, called by ſome of the ancients *lotus acanthus*, and by Virgil *acanthus* only.

ALMERICANS, were the followers of Almeric, or Amaury, in the thirteenth century. They maintained that the power of the father continued no longer than the Moſaic diſpenſation; that the empire of the Son extended only to the thirteenth century; and that then the reign of the Holy Ghoſt commenced, when all ſacraments and external worſhip were to be aboliſhed, and the ſalvation of Chriſtians was to be accompliſhed merely by internal acts of illuminating grace. Their morals were as infamous as their doctrine was abſurd. Their tenets were condemned by a public decree of the council of Sens, in the year 1209.

ALMERY. See AUMERY.

ALMIGGIM *wood*, a word uſed in the Scriptures, to ſignify a beautiful and light ſort of wood. It has been conjectured to be ſeveral different ſorts of woods now in uſe; others think it has been loſt long ſince. But Meibomius proves, from the accounts of Joſephus, that it was the wood of the Indian pine, or fir-tree. This was excellent for its whiteneſs, as well as remarkably light, and therefore was uſed in muſical inſtruments.

ALMIZADIR, among *Alchemiſts*, is ſometimes uſed for verdegriſe; ſometimes for the proceſs of the philoſophers ſtone; and ſometimes for the *aqua mercurialis*, or *aqua philoſophorum*. See ALCAHEST.

ALMOGIZA, among Arabian *Writers*, denotes the limb, or circumference of the ASTROLABE.

ALMOHARRAM, one of the ſacred months of the ancient Arabs.

The word is Arabic, *al moharram*. It was the firſt month of the Arab year. On ſome occaſions they put off the obſervance of this month to the following month Safar.

ALMOIN, in *Law*. See FRANK-*almoin*.

ALMOND, *amygdala*, a kind of medicinal fruit, the produce of the ALMOND-*tree*.

ALMOND-*tree*, *amygdalus*, in *Botany*, the name of a genus of trees, of the *icoſandria monogynia* claſs, the characters of which are theſe: it hath a tubulous empalement of one leaf, which is cut at the brim into five obtuſe ſegments; the flower hath five oval, obtuſe, concave petals, which are inſerted into the empalement. After the flower is paſt, the germen becomes an oval compreſſed large fruit, with a thin, tough, hairy covering, having a longitudinal furrow;

furrow; this opens and falls away, leaving an oval compressed nut.

Mr. Miller enumerates four species of this tree; which is propagated by inoculating a bud of any of the species into the stock of a plum, peach, or *almond*, of another species, in the month of July.

The second year after their budding, they are to be removed to the places where they are to remain.

The best season for transplanting them, if far dry ground, is in October; but for a wet soil, February is always found the properest season.

The fruit of this tree is of two kinds, the sweet *almonds*, and the bitter *almonds*.

ALMONDS, *sweet*, are of a soft, grateful taste; and are reputed cooling, bedling, emollient, and nutritive: they are much prescribed in emulsions, and found of good effect in all disorders from choleric and acrimonious humours. Neumann says, that when roasted they are a *succedaneum* to coffee. The oil of sweet *almonds*, drawn without fire, is a safe and useful remedy in nephritic pains: it is also of good repute for costiveness, and for gripes in children.

For the manner of procuring it, see OIL.

Half an ounce of it may be taken for a dose, with thirty drops of the mineral anodyne liquor. Some reckon two kinds of sweet *almonds*, 1. Jordan, which are the larger, longer, and dearer kind, chiefly sold to be eat with raisins. 2. Valentian and Barbary *almonds*, which are those from whence the oil is procured. Hough. Collect. N° 434. tom. ii. p. 76.

The tree that bears them is called *amygdalus sativa*. Their chief medical uses are to soften and obtund acrimony, and to render resinous substances soluble in water, and in the animal fluids. Neumann's Works, p. 389.

ALMONDS, *bitter*, are held aperient, detersive, and diuretic; and, on those accounts, they are commended in obstructions of the liver, spleen, uterus, &c. Some esteem them good to take off the effects of drunkenness. Accordingly, Plutarch relates, that Drusius's physician, a great drinker, took down at every cup five bitter *almonds*, to allay the heat and fumes of the wine.

The *expressed* oil of bitter *almonds* is as tasteless as that of the sweet: it is much used to soften and deterge the wax out of the ear.—Some affirm, that *bitter almonds* are poisonous to birds, particularly: and Neumann adds, to all animals that come into the world blind. It is said that hogs, fed plentifully with, so that they may be easily taken with the hand: that this is a secret practised among the Bohemians; and that the husks, remaining, after the oil is expressed, have the same effect.

The kernels of bitter *almonds* give much the same relish in distillation, as the kernel of the cherry; on which account, some practise the making of a counterfeit cherry brandy with them. They are also frequently used instead of apricot kernels, in RATAFIA. See the chemical history of *almonds*, in Neumann, at large.

ALMONDS, *sweet*, and *bitter*, contain an expressible oil, and farinaceous earth: the bitter part of *bitter almonds* is not expressed with the oil, but may be dissolved by digestion in aqueous, and spirituous liquors, and with these may be distilled. Waters distilled from *bitter almonds*, or from mealy other bitter vegetables, fruits, and flowers, which have a similar flavour to them, are poisonous to birds, to some animals, and have sometimes been so to men. It is chiefly, if not solely, in the matter which arises in distillation that the noxious qualities of the *bitter almonds* reside. Dr. Lewis. See more in Neumann's Works, p. 389. and n.

Almonds give the denomination to a great number of preparations in confectionary, cookery, &c. wherever they are the basis; as *almond* cakes, *almond* cream, crisped *almonds*, *almond* milk, *almond* paste, *almond* snow, &c. With sweet *almonds* blanched (that is, put into warm water a while, which makes them slip their skins) and water, is made *almond* milk, frequently used as a cooler in emulsions, &c. V. Hough. Collect. N° 434.

There is a preparation also called *almond-butter*, made of cream and whites of eggs boiled; to which is afterwards added, blanched *almonds*: the whole set over a slow fire, till it become thick.

ALMONDS are also a fruit which serves instead of small money, in several parts of the East Indies; particularly where the *cowries*, those small shells which come from the Maldives, are not current.

ALMOND, *dwarf*. See PERSICA.

ALMOND, *Indian*. See BRABEJUM.

ALMONDS, *amygdalæ*, in *Anatomy*, denote two glands of the *fauces*, more properly called the *tonsils*.

These are commonly called *almonds of the ears*; but ought rather to be denominated *almonds of the throat*.

They are two rough glands placed on the sides of the *fossa* of the tongue, under the common membrane of the *fauces*, with which they are covered.

Each of them has a large oval *sinus*, which opens into the *fauces*; wherein are contained a great number of lesser ones, which discharge through the great *sinus*, a mucous and slippery matter into the *fauces*, *larynx*, and *œsophagus*, for the moistening and lubricating of those parts.

When the *œsophagus* muscle acts, it compresses the *almonds*; and as they are subject to inflammations, they frequently are the occasion of what the common people call a *sore throat*.

ALMOND, or ALMAN-*furnace*, is a peculiar kind of furnace, used in refining; to separate all kinds of metals from cinders, parts of melting pots, tests, bricks, &c.

The *almond-furnace*, called also the *sweep*, is usually six feet high, four wide, and two thick: it is built of brick, and having a hole in the middle of the top, eight inches over, which grows narrower towards the bottom, where, on the fore part, it ends in a point, encompassed with a semicircle of iron, to keep in the melted metal. About the middle of the back, there is another hole, to receive the nose of a pair of bellows, which require the continual strength of two men to work.

The matter, then, on which the operation is to be performed, being beat small, they kindle charcoal in the furnace, to anneal it; and when hot, they throw in two or three shovels of coals to one of the forementioned stuff; and so proceed during the whole work, parting lay upon lay, of one and the other. After eight or ten hours, the metal begins to run; and when the receiver below is pretty full, they lade it out with an iron ladle, and cast it in lows, in cavities, or forms made with ashes. In this furnace the refiners of silver out of lead melt the slags of the LITHARGE left in this operation, and reduce them into lead again. See FURNACE.

ALMOND, a measure in Portugal for OIL. The Portuguese sell their oil by *almonds*, twenty-six of which make a butt, or pipe.

ALMONDS, *amondes*. Thus the French lapidaries, and looking-glass makers, call those pieces of rock crystal, or cast crystal, which they cut with a wheel, giving them a figure something like that fruit. They are used to adorn branch-candlesticks, and other furniture made of glass or crystal.

ALMONER, anciently also written AUMNER, an officer in a king's, prince's, or prelate's household, whose business is to distribute alms to the poor.

The *lord almoner*, or *lord high almoner*, of England, is an ecclesiastical officer, usually a bishop; who is to visit and relieve the sick, poor widows, prisoners, and others in necessity: for which purpose, he has the forfeiture of all deodands, and the goods of *felos de se*, which he is to dispose of to the poor.

He has likewise, by an ancient custom, a privilege to give the first dish, from the royal table, to whatsoever poor person he pleases; or instead thereof, an alms in money.

He also distributes to twenty four poor men, nominated by the parishioners of the parish adjacent to the king's palace or residence, to each, four-pence a day in money, and an alms of bread and small beer; each person first repeating the Creed, and the Lord's prayer, in presence of one of the king's chaplains, deputed by the lord *almoner* to be his *sub almoner*; who is also to scatter new coined two-pences in the town and place through which the king passes in his progress. See MAUNDY-*Thursday*.

He has also the charge of several poor pensioners to the crown below stairs; consisting of such as have spent their youth, and become superannuated, in the king's service; or the widows of such honourable servants as died poor, and were not able to provide for their wives and children: whom he duly pays. Chamberlayne's State of Great Britain, p. 98.

Under the lord *almoner*, besides the *sub-almoner*, there is a yeoman, and two grooms of the *almonry*, chosen by his lordship.

The French kings have their great *almoners*, first *almoners*, ordinary or quarterly *almoners*, &c.

Great *almoner*, *grand-aumonier*, is the highest ecclesiastical dignity in that kingdom. To him belongs the superintendency of all hospitals, and houses of lepers. The king receives the sacrament from his hand. He says mass before the king, in all grand ceremonies and solemnities.

ALMONER is also applied in *Ecclesiastical Writers*, to the DEACONS of churches.

ALMONER is also used, in *Hybernian of the Middle Age*, for him appointed by a prelate to distribute his alms to the poor. In this sense, *almoner* amounts to much the same with what has been since denominated *executor*.

ALMONER is also sometimes used for a person who left alms to the poor, by his last will.

ALMONER is sometimes also used for a legatee.

In this sense, it is the rule, that the same person could not both be *almoner* and heir.

ALMONER is also a more fashionable title given, by some writers, to chaplains.

In this sense we meet with *almoner* of a ship, *almoner* of a regiment.

ALMONRY, or AUMERY, the office or lodgings of the almoner; also the place where the alms are given. See AMBRY.

ALMS, *eleemosyna*, something given out of charity or pity to the poor.

The ecclesiastics anciently subsisted wholly on *alms*.—The *alms* of the primitive Christians were divided into three parts; one whereof belonged to the bishops, another to the priests, and a third to the deacons and subdeacons.—Sometimes they divided them into four; the last of which went to the poor, and to the repairing of churches.

The Romans extend the term *alms* to that which is given to the church, or to other pious uses.—Hence, what the church holds on this footing, is called *tenure in alms*.

Alms are of divers kinds.

ALMS, *paschal*, *eleemosyna paschales*, were those distributed at the solemnity of Easter, attended in some places with other acts of humility, as washing of feet, &c.

ALMS, *reasonable*, *eleemosyna rationalis*, a certain portion of the effects of persons dying intestate, set apart for the use of the church and the poor.

ALMS *of plough lands*, *eleemosyna carucarum*, or *eleemosyna terræ aratrix*, was a tax anciently paid for the benefit of the poor, at a penny for each plough-land.

ALMS *of the king*, denote what was otherwise called *Peter-pence*.

These were sometimes also called *alms* of St. Peter.

ALMS are divided by MAHOMETANS, into *voluntary* and *legal*.

ALMS, *voluntary*, are those left to every man's discretion, to give more or less as he sees fit.

The *voluntary alms* are properly denominated, by the Arabs, *sordechad*.

No religious system is more frequent or warm in its exhortations to *alms*-giving than the Mahometan. The Alcoran represents *alms* as a necessary means to make prayer be heard.

ALMS, *legal*, those of indispensible obligation, as being commanded by the law, which directs and determines both the portion to be given, and the kind of things it is to be given of.

The *legal alms* are properly called, by the Mahometans, *zacat*, either on account of their increasing a man's store, or of their purifying the remaining part of his substance.

Some writers have given these the denomination of tithes, but improperly; since, in some cases, they fall short, and in others exceed the proportion of a tenth.

ALMS, *charter of*, *charta eleemosynaria*, that whereby a thing is given to the church.

ALMS, *assize*, among the French, is also used for a compulsory payment, imposed by way of punishment, to be converted to pious or charitable uses.

In all adjudications to the king's right, there is an *alms* reserved. This amounts to what among us is usually called *forfeiture to the poor*.

ALMS-*box*, or *chest*, a small chest, or coffer, wherein anciently the *alms* were collected, both at church and at private houses. This is also in common use in several places.

The *alms-chest*, in churches, is a strong box, with a hole in the upper part, having three keys, one to be kept by the parson, or curate, the other two by the churchwardens.

The erecting of such *alms-chest* in every church was introduced by an act in 27 H. VIII. and it is enjoined by the Book of Canons, as also the manner of distributing what is thus collected among the poor of the parish.

ALMSFEOH, or ALMESFEOH, among our Saxon ancestors, *alms-money*; that is, PETER-PENCE, anciently paid in England on the first of August; called also *romescot*, *romefeoh*, and *hearthpenning*.

ALMS-HOUSE, a petty hospital; or an edifice built by a person in a private capacity, and endowed with a revenue, for the maintenance of a certain number of poor, aged, or disabled people.

ALMUCANTARS, in *Astronomy*, are circles parallel to the HORIZON, imagined to pass through all the degrees of the MERIDIAN.

The word is formed of the Arabic *almucantharat*.

As the meridians pass through the several degrees of the equator, the *almucantars* pass through those of the meridian of any place.

The *almucantars* are the same thing with regard to the azimuths and horizon, that the parallels are with regard to the meridians and horizon.

They serve to shew the height of the sun and stars; and are described on many quadrants, &c. being also called PARALLELS *of altitude*.

ALMUCANTARS, *staff*, is an instrument usually made of pear-tree or box, having an arch of fifteen degrees; used to take observations of the sun, about the time of its rising and setting, in order to find the amplitude and consequently the variation of the compass.

ALMUCIUM, or ALMUTIUM, in *Middle Age Writers*, denotes a kind of cover of the head, part of it pendant over the neck and shoulders, worn chiefly by the ancient canons and monks.

The word is also written *almucia*, *amucia*, *almucilla*, *armutia*, and *amucia*.

The *almucium* appears to have been much the same with what is otherwise denominated *cappa magna*.

The *almucium*, though proper only to religious, was sometimes also assumed by laymen, princes, and even women of quality.

The part which covered the head was of a square form, making, as it were, four horns, as may be seen from the ancient pictures of canons. Hence appears the origin of the square caps, bonnets, &c. still retained in cathedrals and universities, which are no other than the upper part of the *almucium*, without the lower.

ALMUCIA is also used in some *Italian Writers*, for the furs, or skins, worn by the canons, on their left arms, in the manner of muffs.

ALMUDHERIS, in the Arabian *Astrology*, a kind of dignity, or pre-eminence according to a planet in some place, either from its disposition or benign aspect.

ALMUG-*tree*, a kind of wood mentioned in Scripture, imported by Solomon from Ophir, and used in the making of rails and pillars of the temple. 1 Kings, ch. x. ver. 11, 12. 2 Chron. ch. ii. ver. 8.

ALMUGEA, in *Astrology*, denotes a certain configuration of the five planets, in respect to the sun and moon, correspondent to that which is between the hours of those planets, and the sun's and moon's hours.

Thus Saturn will be in the *almugea* of the sun, when distant from him the space of five signs in succession, or in the *almugea* of the moon, when he is at the same distance, only contrary to the succession of the sign.

ALMUTAZAPHUS, a magistrate of Arragon, whose office is to search houses for stolen goods, weigh the bread, measure the wine, &c.

ALMUTHEN, in the Arabian *Astrology*, the planet which has the dispofal of 5 place, that is, surpasses the rest in the number and efficacy of dignities, regard being had to the essential points, viz. *exaltation*, *terms*, *trigon*, and *phasis*.

This is otherwise called *almuthesis*.

ALNABATI, in the *Materia Medica*, a name given, by Avicenna and Serapion, to the FILIQUA *dulcis*, or carob-tree. They called both this and the ACACIA, by the common name *chorroub*, or *churrub*; but they sufficiently distinguish this, not only by this appellation, but by telling us it was a gentle purge, whereas the other was astringent.

ALNAGE, or AULNAGE, q. d. ell-measure; the measuring of woollen manufactures with an ell, and the other functions of the ALNAGER.

The word is French, formed of *aune*, or *alne*, an *ell*.

All the attempts which our forefathers made for regulating manufactures, when left to the execution of any particular officer, in a short time resolved into a TAX on the commodity, without respect to the goodness thereof.—As is most notorious in the case of *aulnage*, which was intended for a proof of the goodness of the commodity; and to that purpose a seal was invented, as a signal that the commodity was made according to their statute; which seals, it is said, may now be bought by thousands, and put on what the buyers please. Sir Jos. Child's Disc. on Trade.

It is probable that the abuses here mentioned by Sir Josiah Child did, among other reasons, give occasion to the clause 11 and 12 W. III. cap. 20. by which *aulnage* duties are wholly taken away.

ALNAGER, ALNEGER, or AULNEGER, q. d. *measurer by the ell*; signifies a sworn public officer, who, by himself, or deputy, is to look to the assize of woollen cloth made throughout the land, i. e. the length, width, and work thereof; and to the seals for that purpose ordained.

The office of king's *alnager* seems to have been derived from the statute of Richard I. A. D. 1197, which ordained that there should be only one weight and one measure, throughout the kingdom; and that the custody of the assize, or standard of weights and measures, should be committed to certain persons in every city and borough. His business was, for a certain fee, to measure

all cloths made for ſale, till the office was abolished by the ſtatute 11 and 12 W. III. cap. 20.

ALNAM, in *Botany*, a name uſed by ſome, for PENNY-ROYAL.

ALNASI, in the *Mahometan Law*, the puniſhment or the obſervation of a ſacred month to a profane month.

ALNUS, in *Botany*, the ALDER.

ALNUS *baccifera*, the berry-bearing *alder*, in *Botany*, a name given, by ſome writers, to the *frangula*.

ALNUS alſo denotes a part in the ancient theatres, at the greateſt diſtance from the ſtage.

ALOA, in *Antiquity*, a Grecian feaſt, celebrated by the Athenian huſbandmen, in honour of Ceres, as inventreſs and protectreſs of corn and tillage.

The word is ſometimes alſo written ἅλως. It is formed of ἅλως, *grange*, or *barn*; it being in theſe places that much of the ſolemnity paſſed.

Authors are not agreed as to the time or occaſion of the celebration of the *aloa*. Some ſuppoſe it to have been before the beginning of harveſt; others will have it to have been a rejoicing after harveſt, not unlike our HARVEST-*home*.

ALOE, a name applied in three different things. 1. To a very precious and ſcarce tree. 2. To a plant from the roots and leaves of which a drug, very uſeful in phyſic is extracted. 3. To that drug itſelf.

Moſt authors miſtake the plant and tree for each other; becauſe, no doubt, we have but little knowledge of the tree; and the drug which the plant produces is much better known, and of much greater uſe.

The *aloe*-tree grows in China, in the kingdom of Lao, and in Cochinchina, Champac, and Sumatra. It is about the ſame height and form as the olive-tree; its trunk is of three colours, and contains three ſorts of wood: the heart is that of *lignum*, or *calambac*, which is dearer in the Indies than even gold itſelf; it ſerves to perfume cloaths and apartments; and is a ſovereign cordial in fainting fits, and againſt the palſy. It deſtroys the *tinea* and *ſcarabee* in children. It is uſed in ſacrifices, as incenſe, by the Chineſe, and all the heathen Moors. It is alſo uſed to ſet the moſt precious jewels that are worked in the Indies.

The *aloe* wood is very highly valued; and divers ſtrange fables have been invented, as to the origin of the tree that yields it; ſome feign that it grew in Paradiſe, and was only conveyed to us by means of the rivers overflowing their banks, and ſweeping off the trees in their way. Others ſuppoſe it to grow on inacceſſible mountains, where it is guarded by certain wild beaſts, &c.—The Siameſe ambaſſadors to the court of France, in 1686, who brought a preſent of this wood from their emperor, firſt gave the Europeans any conſiſtent account of it.

ALOE-*plant*. The characters of this plant are theſe: the flower is liliaceous, and conſiſts of one petal, which is of a tubular form, and is divided into ſix ſegments at the edge. In ſome ſpecies of this genus, the cup, and in others the piſtil, finally becomes a fruit, or ſeed-veſſel, of an oblong cylindric form, divided into three cells, and containing flat and ſemicircular ſeeds. Tournefort ranges this plant in his ninth claſs, and Linnæus in his ſixth, called *hexandria monogynia*; becauſe the flowers have ſix ſtamina and one ſtyle.

Mr. Miller enumerates twenty-five ſpecies of this plant, which grow in divers parts to the Eaſt and Weſt Indies; and are alſo found in ſome countries of Europe, as Spain, and particularly the mountains of Sierra Morena.—Its leaves are green, very thick, hard, and prickly, yielding a kind of ſtrong threads, whereof laces may be made.

The ſoil in which theſe plants thrive beſt, is one half freſh, light earth, from a common; and if the turf is taken with it, and rotted, it is much better; the reſt ſhould be white ſea-ſand, and ſifted lime rubbiſh, each of theſe two, a fourth part; mix theſe together ſix or eight months at leaſt before it is uſed, obſerving to turn it over often in this time. The middle of July is a very proper ſeaſon to ſhift the plants; at which time you may take them out of the pots, and with your fingers open the roots, and ſhake out as much of the earth as poſſible, taking off all dead or mouldy roots, without wounding the young freſh ones: then fill the pot about three parts full of the above mentioned earth, putting a few ſtones at the bottom of the pot to drain off the moiſture; and after diſpoſing the roots in ſuch a manner as to prevent their interfering too much with each other, put in as much of the ſame earth, as to fill the pot almoſt to the brim, ſhaking the plant in as to let the earth in between the roots, and letting it cloſe to the roots with your hand, to place it firmly in the pot; then water them gently, and ſet them abroad in a ſhady place, where they may remain for three weeks, giving them gentle waterings, if the weather be hot and dry.

Toward the latter end of September, in a dry day remove them into the houſe again, obſerving to give them as much free open air as poſſible, while the weather continues warm; but if the nights are cool, you muſt ſhut up the glaſſes, and give them air only in the day; and as the cold increaſes, you muſt decreaſe opening the glaſſes, only giving them gentle waterings till the middle of October, when you muſt abate them according to the heat of the houſe in which they are kept. For thoſe plants which are placed in a ſtove, will require to be watered at leaſt once a week, moſt part of the winter, whereas thoſe which are kept in a green-houſe, without artificial heat, ſhould not be watered in the winter oftner than once in a month.

The tender ſorts ſhould conſtantly remain in the ſtove, or be removed to the ſummer to an airy glaſs-caſe, where they may have free air in warm weather, but be protected from the rain and cold. With this management the plants will thrive and increaſe; and ſuch of them as uſually flower, may be expected to produce them in beauty at their ſeaſons.

Some *aloes* are arboreſcent, inclining to make large trees, breaking forth into branches; others are ſo ſmall that a whole plant does not exceed the bigneſs of a crown-piece. Some grow cloſe to the ground, others are more ſhining, and have their crown of leaves raiſed upon a ſtem, ſomewhat above the earth. The kind moſt common in our gardens, with ſome few other ſorts, are brought from America; but the greateſt varieties, and, as ſome think, the beſt kinds, come from Africa, chiefly from the Cape of Good Hope.

The two kinds moſt conſiderable, the one for its curioſity, the other for its uſe, are the *aloe Americana*, or flowering *aloe*, and the *aloe Africana*, or drug *aloe*.

The American *aloe* ſeldom flowers in cold climates. See AGAVE.

ALOE, *boſtard*, *alcetris*, in *Botany*, a genus of the *hexandria monogynia* claſs; the corolla is funnel-ſhaped, and furrowed; the ſtamina are inſerted in the baſe of the ſegments; and the capſula has three cells. There are three ſpecies.

ALOE, *water*, *ſtrutiaria*, in *Botany*, a genus of the *polyandria hexagynia* claſs. Its characters are theſe: it has but one flower incloſed in a compreſſed obtuſe ſheath, compoſed of two leaves, which are keel-ſhaped, and permanent; the empalement of the flower is of one leaf, trifid, and erect; it has three almoſt heart-ſhaped petals, which are twice the ſize of the empalement, and about twenty ſtamina, inſerted in the receptacle of the flower, terminated by ſingle ſummits; the germen is ſituated under the empalement, ſupporting ſix ſtyles, divided in two parts, crowned by ſingle ſtigmas; the germen becomes an oval capſule, narrowed on every ſide, having ſix angles, and as many cells, filled with oblong incurved ſeeds. We know but one ſpecies, which is ſhaped like the *aloe*, and grows plentifully in ſtanding waters in the iſle of Ely, and other places. Linnæus mentions two ſpecies.

ALOES, in *Medicine* and *Pharmacy*, the inſpiſſated juice of a particular ſpecies of the foregoing plant, much uſed as a purgative remedy, but very improper for ſuch as are ſubject to the piles.

The juice, or extract, for Neumann thinks it is the true extract of *aloes*, is uſually diſtinguiſhed into three kinds.—The firſt, which is called *Socotorine*, as being brought from Socotora, is the pureſt and moſt tranſparent; being friable, moderately black in the lump, but of a beautiful yellow colour when broken. It is brought in ſkins from the Levant and Eaſt Indies.

The ſecond is called *hepatic*, becauſe of its liver-colour: it is reſinous, ſmells ſtrongeſt like myrrh, has a yellow colour when pounded, and is brought from China and Barbadoes. Some confound this with the following ſort; as, in effect, there are but two ſorts commonly known in our ſhops.

The third is the moſt impure, the blackeſt, and the ſtrongeſt. It was formerly uſed by the Indians to pitch their veſſels with; and is of little uſe among us, excepting for horſes and cattle; for which reaſon it is called *caballine*, i. e. *horſe-aloes*. It is prepared in Jamaica and Barbadoes, and brought over in large gourds.

A late writer deſcribes the preparation of *aloes* thus: the leaves being pulled from the roots of the tree with the hand, or an inſtrument, and preſſed, diſtil a juice, of which the thick part will ſubſide, and the thinner is poured off, and put in the ſun till it dries and hardens, in which time it gains a yellow colour. This is called *aloe Socotorina*. The thicker part remaining is put into another veſſel, and by being inſpiſſated in the ſun, gains a liver-colour, and is called *aloe hepatica*. The thickeſt part is called *caballina*, or horſe-*aloes*.

The general nature of theſe three kinds is the ſame: their particular differences conſiſt in the different proportions of gum to their reſin, and in their flavours, which

which render them more or less disgustful for internal use. Good *aloes*, Neumann says, must be glossy, not very black, but brown; when chewed, rubbed, or cut, of a yellow colour; compact, but easy to break; easily soluble, of an unpleasant smell, and an extremely bitter taste. Such as is black, firm, and hard to break, we may suspect, he says, to be adulterated.

From M. Boulduc's analysis by extraction, it appears, that the *Socotrine aloes* contains scarce half the quantity of resin or sulphureous matter, and about a third more of saline substance than the *hepatic*. As for the horse-*aloes*, it is so impure, and contains so much earth in proportion to its sulphur and salts, that it deserves not to be regarded.

The different proportion of the principles of the *Socotrine* and *hepatic aloes*, might well be the cause of their different properties. As the resinous part of *aloes*, contrary to other cathartics charged with resin, is little or nothing purgative; the *Socotrine*, which has the least of that resin, has been always preferred to the *hepatic* for inward use, and on the contrary, the *hepatic*, which has more of it, excels as much the other in its external usefulness, for cleansing wounds, and closing the lips of recent cuts, &c. M. Boulduc equals it in that respect to the natural balsams. It is plain enough that these effects are the natural result of the resinous and balsamic parts. The salts of the *aloes* are very active, and corrode the extremities of the veins, where the fibres are finest; whence proceed hæmorrhages. Therefore it highly concerns us that the saline part, which wants to be restrained by the resinous, be not separated from it: and yet this is the case in several preparations of *aloes*, when they have not been made by skilful hands. They have rejected the resinous part as too gross and good for nothing, because it kept at the bottom of the solution. Hist. de l'Acad. Roy. des Scienc. 1708. It is very observable that the essence of *aloes* stains the glass wherein it has been kept for some time of a deep red colour, covering it as it were with a coat of fine transparent varnish, which no other essence does. Neumann's Works, p. 307.

Aloes is extremely bitter, and purgative, whence some have called it *sol naturæ*: externally applied, either in substance or tincture, it prevents putrefaction and gangrene. Its bitterness makes it so nauseous, that it is rarely used in liquid forms, but it is generally made into pills, whereof half a dram is an ordinary dose. Scarce any of the officinal purging pills are without this in their composition.

Its cathartic virtue is best employed in watery, cold, and corpulent constitutions, as it heats and attenuates; being bad for thin and hectic constitutions. It is accounted efficacious in promoting the menses; and is also good to destroy worms. Guy Patin decries *aloes* as a fiery and noxious drug, which heats and dries the liver, disposes towards a dropsy, causes the piles, &c.

The *aloes*, as imported, is usually too foul for medicinal purposes, as having a mixture of straws, flicks, or gritty matter. To purify it, they gently dissolve it in water enough to pass it conveniently through a flannel cloth when warm, and afterwards evaporate it to a consistence. Some for this purpose use spirit of wine, and others spirit of tartar, under the notion of better correcting the *aloes*; but that dissolvent seems most suitable, which leases the drug its native qualities, after refinement, referring it to the physician afterwards to correct it in prescription as he pleases.

This drug applied to sores will cause a purging. Thus we find in the Medical Essays, that a pastil made of myrrh, *aloes*, and honey, having been put every day into a cavity formed by an ulcer in the bone, the patient had a constant purging, which ceased the day after the *aloes* was omitted. Med. Ess. Edinb. vol. v. art. 241. where it is also observed, that the tincture of *aloes* applied to ulcers and carious bones, frequently brings on a purging.

Aloes is a prime ingredient in *elixir proprietatis*, and *species hiera picræ*, with which the *tinctura sacra* is made.

Aloes was used among the ancients, in embalming, to preserve bodies from putrefaction. Of this *aloes*, interpreters understand that to have been which Nicodemus, in the Gospel, brought to embalm the body of Christ. John, ch. xix. ver. 39.

Several authors have treated expressly on *aloes*; as Bejer and Major; Duroftantius, on its substance; Marquis, on its virtues; Martinez, on its choice; Fuchsius and Pisæus, on its opening the veins. Many particulars also relating to *aloes* are given occasionally by botanic and pharmaceutical writers.

ALOE *rosata*, is a preparation of the *Socotrine aloes*, made by dissolving it in juice of damask roses, and evaporating it to the consistence of a paste. Then more juice is added, and the evaporation repeated, again and again.—This is held a gentler and safer cathartic than the *aloes* alone. If this be dissolved in a good quantity of the fresh juices of roses, violets, borage, and bugloss, mixed in equal proportions, and afterwards reduced by evaporation to its former consistence, the extract, thus prepared, is called ALOE *succotato*, and with the addition of one third its weight of cream of tartar, ALOE *succotata tartarizata*.

ALOE *violata*, is prepared by means of the expressed juice of violet flowers; and mixed with half its weight of cream of tartar; it is called *aloe violata tartarea*.

ALOE is applied by some writers, to a kind of mineral juice produced in Judea.

This is called *solfaic*, mineral, or metalline *aloe*.—Some dispute the existence of any such *aloe*. Others suppose it to be no other than the ASPHALTUS.

ALOES, *lignum*. This wood, of which we have spoken before, by the Indians and Portuguese is called *calamba*, or *calambac*; being the same with what is otherwise called by medical writers *agallochum*, and *aquilarium*.

Grew describes a piece of *lignum aloes*, with its own gum growing on it, in the repository of the Royal Society. See Grew, Mus. Reg. Soc. p. ii. s. i. p. 179.

ALOEDARY, *alocdarium*, ἀλοηδάριον, denotes a purging medicine, wherein *aloes* is an ingredient.

This amounts to the same with what we otherwise call an ALOETIC.

ALOEDARY is also used for a history of the class of plants under the denomination of ALOES.

ALOETICS, *medicines* wherein *aloes* is the chief or fundamental ingredient.

Aloetics open the orifices of the vessels, and are on this account found hurtful in cases of hæmorrhages, particularly at the nose, also in the *tenesmus*, *hæmorrhoids*, &c. The immoderate use of *aloetics* tends to produce hæmorrhoids, hypochondriac pains, and inflations.

Joannius has a treatise expressly on *aloetic* pills.

ALOEUS, a species of *scarabæus* or *beetle*, found in America.

ALOGIANS, ALOGI, or ALOGIANI, a sect who denied that Jesus Christ was the *Logos*, or eternal Word; and on this ground also rejected the Gospel of St. John as spurious.

The word is compounded of the privative α, and λογος q. d. *without Logos*, or *Word*.

Some ascribe the origin of the name, as well as of the sect of *Alogians*, to Theodore Byzantium, by trade a currier, who, having apostatized under the persecution of the emperor Severus, to defend himself against those who reproached him therewith, said, that it was not God he denied, but only man. Whence his followers were called in Greek ἀλογοι, because they rejected the Word. But others, with more probability, suppose the name to have been first given them by Epiphanius in the way of reproach. They made their appearance towards the close of the second century.

ALOGOTROPHIA, in *Medicine*, an irregular nutrition of some part, attended with a vicious figure or conformation thereof, as in the rickets.

If the bones of the *vertebræ* of the back receive too much nutriment on one side, as sometimes happens in children, an incurvation necessarily ensues, which, as Charleton expresses it, is produced by an *alogotrophia*.

ALOIDES, in *Botany*, a name used by some for the *aloe paludris*, or fresh *water* ALOE, called in some parts of England, *water soldier*; and by Linnæus, *stratiotes*.

ALOOF. See LUFF.

ALOPECIA, in *Medicine*, a total falling off of the hair in certain parts, occasioned either by the defect of nutritious juice, or by its vicious quality corroding the roots of it, and leaving the skin rough and colourless.

The word is formed from αλωπηξ, *vulpes*, a *fox*; whose urine, it is said, will occasion baldness; or because it is a disease which is common to that creature.

The *alopecia* properly differs from *defluvium capillorum*, as in the former, certain parts or patches are left, entirely bald, whereas in the latter, the hair only grows immoderately thin. It also differs from the *ophiasis*, as this latter creeps in spires about the head, like the windings of a serpent, whereas the former is not confined to any figure. See PLICA *Polonica*.

The cause as well as cure of the *alopecia* is the same as that of the *ophiasis*; though some would make a difference; urging that the primary intention in the former is to correct or carry off the vicious humours; in the latter, to supply the want of nutriment to the cutaneous parts.

The remedies which remove the proximate cause of this malady, are called *psilanoutpectica*. *mutfyaritica*. Here, first, if any corrupt hairs still remain, they are to be drawn out either with tweezers, or by *depilatories*; or the place must be shaved by a razor. Then the head is to be washed every night at going to bed, with a ley prepared

pared by boiling the ashes of vine-branches in red wine. A powder made by reducing hermodactyls to fine flour, is also recommended for the same purpose.

In cases where the baldness is total, a quantity of the finest burdock roots are to be bruised in a marble mortar, and then boiled in white wine, until there remains only as much as will cover them. This liquor, carefully strained off, is said to cure baldness, by washing the head every night with some of it warm. A ley made by boiling ashes of vine branches in common water, is also recommended with this intention. A fresh-cut onion rubbed on the part, until it be red and itch, is likewise said to cure baldness.

A multitude of such remedies are every where to be found in the works of Valesius de Taranta, Rondeletius, Hollerius, Trincavellius, Celsus, Senertus, and other practical physicians.

ALOPECIA is also used by Galen for a change of the hair to another colour.

ALOPECIAS, in *Ichthyology*, a name of the *vulpes marinus*, or *Sea* FOX.

ALOPECOPITHECOS, in *Natural History*, a name derived from the Greek, and given by Aldrovand and others to that strange creature the OPOSSUM.

ALOPECURUS. *See Fox-tail* GRASS.

ALOPEX, in *Zoology*, a species of the CANIS, with a straight tail, and black tip. It is commonly called the *Sable fox*.

ALOSE, a sort of fish, somewhat like the *sardine*, or *pilchard*, in shape, but much larger. Some will have it to be the shad, but it is quite another fish, and is very scarce in England. It is one of those called passage-fish, as fish of a season, because it never swims out of the sea into rivers, but in the spring.

The roes of *alofes* are as much valued in the East Indies, as those of the sturgeon in Russia, and form a very lucrative article of trade.

ALOUCHI, a kind of sweet-scented gum, which runs from the tree that produces white cinnamon.

ALP, in *Zoology*, an English name used by some for the BULL-FINCH.

ALPAGE, *alpagium*, in *Ancient Writers*, denotes the privilege of feeding cattle on the ALPS or high mountains, or a sum paid for the purchase of such a right.

This is otherwise called *Appatuum*.

ALPACNA, an animal much like the *llamar*, and *vigonar*, except that its legs are shorter, and its muzzle thicker and flatter, so that it somewhat resembles a human face. The inhabitants of Peru reckon this animal among the beasts of burden, and make it carry a hundred weight. Of its wool they make stuffs, ropes, and bags, and of its bones combs for weavers. They even make an advantage of its excrement, using it for fuel.

ALPAM, is the *Mimosa indica flore tripetalo filiquis tortilibus parva absque seminibus repletis*.

The stem of this plant, which divides itself twice or thrice, is covered with a bark of an ashy green colour, inodorous, and of an acid astringent taste. The branches are of a whitish wood, have a green pith running through them, and are distinguished into joints. The root is red, composed of a great number of capillary fibres. The leaves are of a narrow, oblong form, terminating in a point, of a deep green on the outside, but pale within. They have a smell not ungrateful, and taste somewhat acrid. The flowers, which are of a dark purple colour, and inodorous, grow on very slender round pedicles, sometimes two or three together. To the flowers succeed the pods which are sharp, pointed, round, and full of a carnose pulp, without any discernible seeds. It bears flowers and fruit as well at the end of the year as in the beginning, and is always full of leaves.

One part of this shrub, made into an ointment with oil, is a powerful remedy in case of the scab, and old ulcers. The juice of the leaves, with *calamus aromaticus*, is good against the venom of serpents.

ALPHA, the name of the first letter of the Greek alphabet.

The word is originally Hebrew, formed from *aleph*, the name of the first letter in the Hebrew alphabet.

The Greek *alpha* answers to what in English we call simply A.

Alpha, according to Plutarch, was placed at the head of all the letters, because in the Phœnician language, it denotes an ox; which, with regard to use and service, is the first among beasts.

ALPHA, in *Composition*, denotes, sometimes, *privation*, in the same sense with *a*, or, *without*; sometimes augmentation, as *ayeiρω*, *assemble*; and sometimes union, as *αμα*, *together*. See A.

ALPHA, is also used as a letter of order, to denote the *first*; and of number to signify *one*; but when it was a numerical letter, a little stroke, or an acute accent, was drawn above it thus, A', to distinguish it from the mere A, which was a letter of order.

ALPHA and *Omega*, in the *Divine Writings*, signify the beginning and the end, or the first and the last (viz. before and after all things); and therefore the hieroglyphic of God is formed of these two letters A and Ω.

These two letters were made the symbol of Christianity, and were accordingly engraved on the tombs of the ancient Christians, to distinguish them from those of idolaters.

ALPHA is particularly used among *ancient Writers*, to denote the chief or first man of his class or rank.

In this sense the word stands contradistinguished from *beta*, which denotes the *second* person.

Plato was called the *alpha* of the wits; Eratosthenes, keeper of the Alexandrian library, whom some called a second Plato, is frequently named *beta*.

ALPHA is also a title given by some ancient writers to the Jewish legislator Moses. The reason of the application is much controverted.

ALPHABET, the several letters of a language disposed in their natural or accustomed order.

The word is formed from the names of the two first letters of the Greek *alphabet*, *alpha*, *beta*: which were borrowed from those of the Hebrew, *aleph*, *beth*.

In the English *alphabet* we reckon 26 letters, viz. *a b c d e f g h i j k l m n o p q r s t u w x y z*. See each under its proper article, A, B, C, &c.

But as there is a much greater number of different sounds in our language, it is not without reason, that some grammarians maintain, that there ought to be a greater number of letters: as also, that the double letters, *x*, *y*, and *w*, and the superfluous ones, *c*, and *q*, should be retrenched.

The French *alphabet* contains only 23 letters. Pasquier indeed maintains it to consist of 25, because he adds the two double letters, *æ* for *ae* and *œ* for *oe*; but those are only abbreviatures. The abbé d'Angeau, on better grounds, reckons 34 different sounds in the French tongue; and urges, that the *alphabet* ought of consequence to consist of 34 different characters, setting aside the double letters *x* and *y*, and the superfluous one *q*.

The difference between languages, with respect to the number of letters in their *alphabets*, is very considerable: the Hebrew, Chaldee, Syriac, and Samaritan *alphabets*, have each 22; the Arabic 28; the Persian 31; the Turkish 33; the Georgian 36; the Coptic 32; the Muscovite 43; the Greek 24; the Latin 23; the Sclavonic 27; the Dutch 26; the Spanish 27; the Italian 20; the Indians of Bengal 21; the Bramas 19.

The Ethiopic has no less than 202 letters in its *alphabet*, there being seven vowels, which they combine with each of their 28 consonants; to which they add 20 other aspirated syllables. The like is said of the Tartarian; each of their letters is a syllable, having one of the vowels joined to its consonant; as *le*, *li*, *lo*, &c.

The Chinese have no *alphabet*, properly speaking; except we call their whole language their *alphabet*; their letters are words, or rather hieroglyphics, and are in number about 80,000. See Phil. Trans. vol. lix. an. 1769, N° 66.

In effect, *alphabets* were not contrived with design, according to the just rules of reason and analogy; but have been successively framed, altered, &c. as occasion offered. And hence many grievous complaints as to their deficiencies; and divers attempts to establish new, and more adequate ones in their places. Bishop Wilkins charges all the *alphabets* extant with great irregularities, with respect both to the order, number, power, figure, &c. As to the order, it appears inartificial, preposterous, and confused; in that the vowels and consonants are not reduced into classes, with such order of precedence and subsequence as their natures will bear. Even the Hebrew order is not free from this imperfection.

As to number, they are both redundant and deficient; redundant, either by allotting several letters to the same power and found; as in the Hebrew ס and צ, and the ordinary Latin *c* and *k*, *f* and *ph*: or by reckoning double letters among the simple elements of speech; as in the Hebrew ץ, the Greek ξ and ψ, the Latin *q*, *cu*, *x*, *es*, and the *j* consonant, or *jod*—Deficient in divers respects, especially in regard of vowels, of which there are seven or eight kinds commonly used, though the Latin *alphabet* only takes notice of five; wherein two, viz. *i* and *u*, according to our English pronunciation, are not properly vowels but diphthongs.

Add, that the difference among vowels in respect of long and short, is not sufficiently provided for: the ancients, we know, used to express a long vowel by doubling its character; as *amaabo*, *vaata*, *ooo*, *fooste*, *feetiferfimus*; though the vowel *i*, instead of being doubled, was frequently prolonged, as *scribis*, *vivo*, *vivus*.

The ways used in English for lengthening and abbreviating

vising vowels, viz. by adding *e* quiescent to the end of a word, for prolonging a syllable; and doubling the following consonants, for the shortening of a vowel, as *wane wanna, ware warr*, &c. or else by inserting some other vowel, for the lengthening of it, as *meet met, read red*, &c. are all improper; because the figo ought ever to be where the sound is.

As to their powers, again, those are not always fixed to the same signification; the vowels, for instance, are generally acknowledged to have each of them several sounds: *vocales omnes pluriformes*, says Lipsius; and Vossius assures us, the ancients used their vowels in very different ways, *aliquando tenuius exilinsque, nunc crassius, nunc intermedio sono*. Thus the power of the vowel *i* is expressed in writing no less than in six several ways, viz. by *e*; as in *be, me, he, ye*; by *ee*, in *three, free, we*; by *ie*, in *field, yield, shield, chief*; by *ea*, in *near, dear, hear*; by *ee in people*; by *i*, in *privilege*. So is the power of the vowel *e*; as in *all, awl, aw, south, caught*; which are only various ways of writing the same long vowel; besides the other distinct ways of expressing the same vowel when used short: again, the power of the vowel *o* is written five ways: *o*, as in *to, who, move*; *oe*, as in *doe*; *ow*, in *bore, more, now*; *ou*, in *could, would*; *oo*, in *two*: and so of the rest.—Nor are the consonants of more determinate powers; witness the different pronunciation of the same letter *c* in the same word *circe*; and of *g* in *negligence*.—To say no more, the letters *c, j, s*, are used alike, to denote the same power; and the letter *ſ* is commonly used for *s*; and which is yet worse, some letters of the same name and shape, are used at one time for vowels, and at another for consonants; as *j, v, w, y*; which yet differ from one another, says bishop Wilkins, *sicut corpus & anima*.

From this confusion in the power of letters, there arise divers irregularities; as, that some words are distinguished in writing, which are the same in pronunciation; e. gr. *esſe* and *eſſe*, &c. and others are distinguished in pronunciation, which are the same in writing; as *get, acquire*, and *get, gagates*, &c. Hence also the Latin *mare* is a diſſyllable, and the Engliſh *male* is a monoſyllable.

The names also, in most *alphabets*, are very improperly expressed by words of divers syllables; *alpha, beta*, &c. in which respect, the Roman and our Engliſh *alphabets*, which only name the letters by their powers, have a great advantage over the rest.

Lastly, their figures are not well concerted; there being nothing in the characters of the vowels answerable to the different degrees of aperture; nor in the consonants, analogous to the agreements or disagreements thereof. Wilkins's Eſſ. towards a real Character, &c. b. i. c. 4.

All these imperfections are obviated in the *universal alphabets*, or characters, of M. Lodwick, bishop Wilkins, &c. See *Universal* CHARACTERS.

In the French king's library, is an Arabic work, intitled *Sephat Alachum*; containing divers sorts of *imaginary alphabets*, which the author distinguiſhes into *propoſitional, mystical, philoſophical, magical, talismanical*, &c.

Monsieur Leibnitz had it in view to compoſe an *Alphabet of Human Thoughts*. Mem. de l'Acad. Roy. an. 1716.

It is no wonder that the number of letters in moſt languages ſhould be ſo small, and that of the words ſo great; ſince from a calculation made by Mr. Preſter, it appears, that, allowing only twenty-four letters to an *alphabet*, the different words or combinations that may be made out of thoſe twenty-four letters, taking them firſt one by one, then two by two, three by three, &c. would amount to the following number, 1 391,724288,887252,999425, 128493,402200. See COMBINATION.

It may be here obſerved, that every combination may make a word, even though that combination have not any vowel in it; becauſe the *e* mute, or quieſcent, inſinuates itſelf imperceptibly between the conſonants, or after the conſonants, where they are but two, the latter of which would not be heard without it.—The uſe of this ſilent *e* is very remarkable in the Armenian, Welſh, and Dutch languages; wherein the generality of words have ſeveral conſonants together.

Nor muſt it be omitted, that every ſingle letter may make a word: which is very apparent, where the letter is a vowel; words of that kind being found in moſt languages. Thus, *a* and *o* make words in the Greek; *a, o*, in the Latin; *o, i, a*, in Engliſh; *a, o, y*, in French; *o, e, i, o*, in Italian; *o, y*, in Spaniſh; *a, e*, in the Portugueſe; *i*, in moſt languages, and even in the Dutch and Swediſh. Any conſonant alſo becomes a word, by adding an *e* mute to it in pronunciation.

In ſhort, though a conſiderable number of the poſſible combinations of twenty-four letters were retrenched, yet the number remaining would ſtill be immenſe, and vaſtly ſuperior to that of the words in any language known.

Of all known languages, the Greek is looked upon as one of the moſt copious, the radices only of which are eſteemed about 3244, but then it abounds exceedingly in compounds and derivatives. Biſhop Wilkins thinks theſe may be moderately computed at about ten thouſand. Hermannus Hugo, indeed, aſſerts, that no language has ſo few as 100,000 words; and Varro is frequently quoted by learned men, as if he affirmed that there are in the Latin no leſs than 5,000,000; but upon inquiring into the ſcope of the paſſage, biſhop Wilkins obſerves, that this number is not intended by him to expreſs the juſt number of words in the Latin; but the great variety made thereof, by the inflection and compoſition of verbs.—To this purpoſe he lays it down, that there are above one thouſand radical verbs in the Latin; and that each verb admits of five hundred ſeveral varieties. He farther ſuppoſes, that each of theſe may be compounded with nine prepoſitions; as, *eſſio, receſſio, acceſſio, deceſſio, praeceſſio, proceſſio, ſucceſſio*, &c. which amounts to five millions. See WORD.

Concerning the origin and progreſs of *alphabetical* writing, ſee LETTERS and WRITING.

ALPHABET, in matter of *Polygraphy*, is a duplicate of the key or cypher, which each of the parties correſponding are to keep by them.

It is properly an *alphabet* of the uſual letters diſpoſed in their order; oppoſite, or underneath which, are the ſecret characters correſponding thereto, with the blank or uſeleſs letters, and the other ſigns or ſymbols ſerving to obſcure and render it difficult to decipher. See DECIPHERING.

ALPHABET, among *Merchants* and *Traders*, is a kind of index, with the twenty-four letters in their natural order, in which are ſet down the names and ſurnames of thoſe with whom open accounts are kept; and which refers to the folios of the ledger where thoſe accounts are written, in the form of debtor and creditor; ſerving to find eaſily, and without any trouble, ſuch accounts as are neceſſary to be turned to.

ALPHABET, among the French, ſignifies alſo thoſe punches or iron tools, which engravers upon metal uſe to engrave the ſeveral letters, or characters, which belong to their works, either for legends, or for other inſcriptions.

The book-binders have alſo ſmall braſs tools, which they call alphabets, and with which they put the titles, and the number of the volume, on the back of books.

ALPHÆNIX, white barley-ſugar, to which is given an extraordinary name, to render it more valuable. This ſugar, which is thought good for colds, is made of common ſugar, which is boiled until it becomes eaſy to crack, when they pour it upon a marble table, greaſed with oil of ſweet almonds, and mould it in various figures with a braſs crouchet. It is eaſily falſified with ſtarch.

ALPHARD. See COR *hydræ*.

ALPHERATZ, in *Aſtronomy*, a fixed ſtar of the third magnitude in AQUARIUS.

This is otherwiſe called *alpharatz*. Some alſo give the denomination *caiſ alpharatz*, and *marchab alpharatz*, to two other ſtars in the right ſhoulder of PEGASUS.

ALPHESERA, in *Botany*, a name by which the Arabian, and ſome other authors, expreſs the white BRYONY.

ALPHESTES, in *Ichthyology*, the name of a fiſh, called by others CINÆDUS, ſeeming to approach very much to the *turdus*, or *wraſſe* kind, but having the rays or nerves of its back-fin prickly all the way to the tail; whereas the *turdi* have only the anterior rays of that fin prickly, the reſt ſmooth. It is a ſmall fiſh, and is always caught about the ſhores, and among rocks: its back is purple, and its ſides and belly yellowiſh. Its mouth is ſmall and has thick and fleſhy lips. Geſner.

ALPHETA, in *Aſtronomy*, a fixed ſtar in the northern crown: otherwiſe called *lucida coronæ*.

ALPHITIDON, in *Surgery*, a ſpecies of *fracture*, wherein the bone is broke into a great number of ſmall parts, or particles.

The word is formed of ἀλφιτον, *farina, flour*; q. d. a bone ground to flour or powder.

ALPHITOMANTIA, in *Antiquity*. See ALEUROMANCY.

ALPHONSIN, is the name of a ſurgeon's inſtrument uſed in the extraction of bullets from the body.

The *Alphonſin*, ſo called from its inventor Alphonſus Ferrier, a phyſician of Naples, conſiſts of three branches, which are cloſed together by means of a ring. The inſtrument thus cloſed, being conveyed into the wound to the bullet, the operator draws back the ring towards the handle, upon which the branches, opening themſelves, lay hold of the ball: after this he puſhes the ring again, from the haft, whereby the branches graſp the bullet ſo firmly, that it muſt needs come out with them.

ALPHONSINE *Tables*. See TABLES.

ALPHOS, in *Medicine*, a diſtemper deſcribed by Celſus, under the name of *vitiligo*; wherein the ſkin is rough, and becomes ſprinkled as it were with drops of white; and thence denominated *lunea*. Where the ſpots are

black, it is called *nigra*; and is also called, *melæne*. It bears the same relation to the *lenes*, as the *scabies* to the *lepra*; the first is superficial and cutaneous, the second sinks deeper into the flesh. The *alphos molus*, and *lenes* are but one and the same disorder, only differing in its degree of inveteracy.

ALPIEU. See BASSET.

ALPINE. See CISALPINE.

ALPINIA, in *Botany*, so called from Prosper Alpinus, a celebrated botanist, who died in 1616, a genus of the *monandria monogynia* class. Its characters are these: the flower has one *stamen*, and one style; it is cut into six parts at the top, and has a swelling tube, with three spreading lobes. We know but one species of this genus, *viz.* the white branching *alpinia*, with leaves like the flowering reed. This plant is a native of the West Indies, from whence it has been brought into some of the curious gardens of Europe, where it must be preserved in a warm stove, and the pots plunged into a hot-bed of tanner's bark, otherwise it will not thrive in this country. The leaves decay every winter, and are pushed out from the roots every spring like the ginger and *maranta*, so should be managed in the same manner as is directed for those two plants; and may be propagated by parting their roots, when the leaves decay. It grows naturally in most places in the West Indies.

ALPISTE, or ALPIA, a sort of seed used to feed birds with, especially when they are to be nourished for breeding. The *alpiste* seed is of an oval figure, of a pale yellow inclining to an isabel colour, bright and glossy. It is an article of the corn-chandlers and seedsmen's trade.

ALPS, in *Geography*, besides its proper signification, by which it denotes a certain chain of mountains, which separate Italy from France and Germany, is sometimes used as an appellative to denote any mountains of extraordinary height.

In this sense, Ausonius, and others call the Pyrenean mountains, *Alpes*; and Gellius, the Spanish *Alpes*, *Alpini Hispani*.

Sidonius gives the same appellation of *Alpe* to mount Athos. Other authors speak of Norman *Alpi*, *Alpes Arvernæ*, *Alpes Asbriconsis*, *Alpes Delphinæ*, *Alpes Romanicæ*, *Alpes Bastarnicæ*.—The Appennines are also called by Johannes Villenest, *Alpi D'Appennino*.

ALPS is also used to denote pastures on the mountains, wherein cattle are fed in the summer time; or rather in the vallies, and spaces between the mountain tops. Some will have this to be the primary signification of the word *Alpes*, which is supposed by these authors literally to denote the streights or apertures between hills.

ALQUIER, which is also called *cantar*, a liquid measure for oil used in Portugal. It contains six *canadas*, or *cantaros*. Two *alquiers* make an *almeide*, or *almuide*.

ALQUIER is also a measure for grain, at Lisbon.

ALQUIFOU, or ARQUIFOU, as the merchants spell it, a sort of mineral *lead*, very heavy, easily reduced into powder, and hard to melt. When it is broken, it parts into shining scales, much like the colour of needles of antimony. The potters use it to give their works a green varnish. In England it is commonly called *potter's ore*. It is found in Cornwall; the potters mix manganese with it, and then the varnish, or glazing on their wares, becomes of a blackish colour.

ALRAMECH, or ARAMECH, in *Astronomy*, the Arabic name of a star of the first magnitude, otherwise called ARCTURUS.

ALRATICA, among the Arabian *Physicians*, is where the *vulva*, or *vagina*, of a woman is imperforate, or at least the *foramen* smaller than ordinary, whether naturally, or by accident.

ALRAUPE, in *Ichthyology*, a name given by the Germans to the *muftela fluviatilis*, or eelpout, a species of the GADUS.

ALRUKAB, in the *Materia Medica*, a word used by Avicenna, and others of his nation, for what was called by the Greeks *opos libanotes*, and *manna thuris*. This was the fragments of frankincense, which were broken off from the larger pieces in the collecting or packing up, and were most esteemed in medicine, as being the driest and purest kind.

ALRUM, in the *Botanical Writings of the Ancients*, a name given to the tree which produces the *bdellium*. This gum was originally known to be the exudation of a tree growing in Arabia and the East Indies, and well known to Avicenna, and others, and by all of them called by that name.

ALRUNES, a name given by the ancient Germans to small figures of wood of which they made their LARES.

ALSADAF, in the *Materia Medica*, a name given by Avicenna and Serapio, to the *unguis odoratus*, and also to the *murex*, or purple fish, of the shell of which it was supposed to be a part.

ALSAHARATICA, a name used in *Botany*, by some, to signify the *parthenium*, or FEVERFEW.

ALSCHARCUR, in the *Materia Medica*, a name given by Rhases, and some others of the old writers, to the SKINK, a small animal of the lizard kind, used in medicine as a cordial, and as a provocative to venery.

ALSCNEFU, in *Botany*, a name used, by some authors, for WORMWOOD.

ALSEBON, a name given, by some of the chemical writers, to *sea-salt*.

ALSIMBEL, in the *Materia Medica*, a name given by Avicenna and others, to the *spikenard* of India. It is thus called from its having the appearance of a spike, or ear, and also *simbalath*, a word which signifies its being a *congeries* of many spikes, or ears, and such is much of the *nardus Indica*, or Indian *spikenard*, that we receive at this day.

ALSINASTRUM, in *Botany*, the *adonis* of Linnæus; a name given by Vaillant to a genus of plants, on account of their general resemblance to the *alsines*, or *chickweeds*. The characters of the *alsinastra* are these: the flower and fruit are the same with those of the *alsine*; but the flower-cup in these is composed only of one leaf, whereas in those it is made up of several. Tournefort mentions two species. Inst. 244.

ALSINE, CHICKWEED, in *Botany*, a genus of the *pentandria trigynia* class of plants, the calyx of which is a perianthium, consisting of five concave, oblong, and acuminated leaves; the corolla consists of five equal petals, longer than the cup; the fruit is an oval covered capsule, containing only one cell, with three valves; the seeds are numerous and roundish. There are three species.

ALSINELLA, in *Botany*, the name by which Dillenius calls the plant *fagina*.

ALSINOIDES, the *bufonia* and *montia* of Linnæus.

ALSIRAT, in the Mahometan *Theology*, a bridge laid over the middle of hell, finer than a hair, and sharper than the edge of a sword, over which people are to pass, after their trial on the day of judgment.

To add to the difficulty of the passage, Mahomet affures, that the *alsirat*, narrow as it is, is befet with briars and thorns; none of which, however, will be any impediment to the good, who shall fly over it like the wind; Mahomet and his musfulmen lead the way; whereas the wicked by the narrowness of the path, the entangling of the thorns, and extinction of the light, which directed the former to paradise, will soon mifs their footing, and tumble headlong into hell, which is gaping beneath to receive them. Vide Sale's Prelim. Disc. to Koran, sec. iv. p. 99. See MAHOMETANS.

ALSTROEMERIA, in *Botany*, a genus of the *hexandria monogynia* class; the corolla of which hath six petals, with two lower petals, tubulous at the base, and declining flamina. There are three species.

ALT, in *Mufic*. See DIAGRAM and SCALE.

The word is formed of the Latin, *altus*, *high*.

ALTAR, ALTARE, ARA, a place or pile whereon to offer sacrifice to some deity.

The Jews had their brazen *altar*, for burnt-offerings, and a golden *altar*, or *altar* of incense.

Among the Romans, the *altar* was a kind of pedestal, either square, round, or triangular; adorned with sculpture, with basso relievos, and inscriptions, whereon were burnt the victims sacrificed to idols.

According to Servius, those *altars* set apart for the honour of the celestial gods, and gods of the higher class, were placed on some pretty tall pile of building; and for that reason were called *altaria*, from the words *alta* and *ara*, a high elevated *altar*.—Those appointed for the terrestial gods, were laid on the surface of the earth, and called *aræ*.—And, on the contrary, they dug into the earth, and opened a pit for those of the infernal gods, which they called *βόθρον χθονιον*, *scrobiculi*. But this distinction is not every where observed; the best authors frequently use *ara* as a general word, under which are included the altars of the celestial and infernal, as well as those of the terrestrial gods. Witness Virgil, Ecl. 5.

——*Et quatuor aras*,

Where *aræ* plainly includes *altaria*; for whatever we make of Daphnis, Phœbus was certainly a celestial god. So Cicero, pro Quinct. *Aras deluebraque Hecates in Græcia vidimus*.

The Greeks also distinguish two sorts of *altars*; that whereon they sacrificed to the gods, was called *βωμος*, and was a real *altar*, different from the other, whereon they sacrificed to the heroes, which was smaller, and called *ἐσχαρα*. Pollux makes this distinction of *altars* in his Onomasticon: he adds, however, that some poets used the word *ἐσχαρα*, for the altar whereon sacrifice was offered to the gods.—The Septuagint version does sometimes also use the word *ἐσχαρα*, for a sort of little low *altar*, which may be expressed in Latin, by *craticula*; being a hearth, rather than an *altar*.

The Jews also gave the name *altars* to a kind of tables occasionally raised in the country or field, whereon to sacrifice to God. In such a place, *he built an* altar *to the Lord*.

Altars were of divers kinds, with regard to their qualities, use, matter, form, accidents, and the like, and were sacred to gods, heroes, virtues, vices, diseases, &c. Thus we read of inner and outer, stationary and portable, public and private *altars*, &c.

Altars are doubtless as ancient as sacrifices themselves; consequently their origin is not much later than that of the world.—Gen. ch. iv.

Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood. Some carry them as far back as Adam, whose *altar* is much spoken of by Jewish, and even Christian writers.—Others are contented to make the patriarch Enoch the first who consecrated a public *altar*. Be this as it will, the earliest *altars* we find any express testimony of, are those erected by Abraham.

ALTAR *of Adam*, in *Antiquity*, is pretended, by some rabbins, and others, to have been erected by the first man, soon after the fall; when being overwhelmed with sorrow, a promise was made him, by the ministry of the angel Hazriel, that a redeemer should be sent. In gratitude for this news, and for a perpetual remembrance thereof, Adam is said to have built an *altar*, and sacrificed on it a heifer.

The reliques of this *altar* have been mentioned by several writers of late ages.

ALTAR is sometimes also used, among Christians, for a square table, placed on the eastern side of a church, raised a little above the floor, and set apart for the celebration of the eucharist.

Its form is not borrowed, either from that of the heathen *altars*, or even from that of the Jews in the temple; but, as the eucharist was instituted by Jesus Christ, at supper, and upon a table, the modern *altar* is made in form of a table; whence it is more usually, and even more significantly, denominated *Communion Table*.

In effect, the denomination *altar* is founded on this supposition, that the eucharist is a proper sacrifice; which, though the standing doctrine of the church of Rome, is utterly denied by most of the reformed.

In the primitive church, the *altars* were only of wood; as being frequently to be removed from place to place. But the council of Paris, in 509, decreed that no *altar* should be built but of stone.

At first there was but one *altar* in each church; but the number soon increased; and from the writings of Gregory the Great, who lived in the sixth century, we learn, that there were sometimes in the same church twelve or thirteen. In the cathedral of Magdeburg there are no less than forty-nine *altars*.

The *altar* is sometimes sustained on a single column, as in the subterraneous chapels of St. Cæcilia, at Rome, &c. and sometimes by four columns, as the *altar* of St. Sebastian of Crypta Arenaria; but the customary form is, to be a massive of stone-work, sustaining the *altar-table*.

These *altars* bear a resemblance to tombs: to this purpose, we read in church-history, that the primitive Christians chiefly held their meetings at the tombs of the martyrs, and celebrated the mysteries of religion upon them. For which reason it is a standing rule to this day in the church of Rome, never to build an *altar*, without including the relics of some saint in it.

In lieu of proper *altars*, the Greeks in process of time made use of ANTIMENSIA.

ALTAR *of Prothesis*, is a name given by the modern Greeks to a smaller, preparatory kind of *altar*, whereon they bless the bread, before it be carried to the large *altar*, where the solemn liturgy is performed.

F. Goar maintains, that the table of *prothesis* was anciently in the sacristy, or vestry; which he makes appear from some Greek copies, where sacristy is made use of in lieu of *prothesis*.

ALTAR, is also used, in *Church History*, for the oblations or contingent incomes of the church.

In ancient days they distinguished between the church and the *altar*. The tithes, and other settled revenues, were called the *church*, *ecclesia*; and the other incidental incomes, the *altar*.

ALTAR, in *Astronomy*. See ARA.

ALTAR-*thane*, in our *Ancient Law Books*, denotes a priest, or parson of a parish.

In this sense the word is synonymous with *church-thane*.

ALTARAGE includes not only the offerings made upon the altar, but also the profit that arises to the priest on account of the altar.

ALTARIST, *altarista*, properly denotes the vicar of a church, who serves the altar, and to whom the altarage, or produce of the altar, is assigned for his maintenance. Du-Cange.

The *altarist* is sometimes also called *altaruriar*, sometimes *altar priest*.

ALTARIST is also used for *chaplain*.

ALTASRIF, in *Literary History*, the title of a medicinal book written in Arabic, describing the method of practice in use among the Arabs.

It was written by Alsaharavius, an author in the fifteenth century, and translated into Latin by P. Ricius, in 1519. Concerning the history and contents of the *Altasrif*, see Freind, Hist. Phys. p. ii. p. 124, seq.

ALTAVELA, in *Ichthyology*, the name of a flat cartilaginous fish, of the *squalus* marine kind; but with its wings as they are called, that is, its thin and flat sides, broad and obtuse towards their lower part. The fishermen, from the resemblance these flat sides have to wings, have an opinion that this fish can fly. The tail is very short, scarce being of half the length of the body. Its flesh is solid, and well tasted, and it always sells well in the markets. It is caught in the Mediterranean, and is frequently brought to market at Rome. Fab. Columna.

ALTE *& basse*, in *Middle Age Writers*, denotes sovereignty, or a thing done with the supreme power. Du-Cange.

ALTERANT, or ALTERATIVE, in *Medicine*, a property, or power, in certain remedies, whereby they induce an *alteration* in the body, and dispose it for health and recovery, by correcting some indisposition, without occasioning any sensible evacuation.

Alteratives, therefore, must generally be either such remedies as destroy some prevailing acrimony in the *primæ viæ*, or in the juices; or else such as resolve concretions in the blood-vessels, and dispose them, when thus resolved, to pass out of the body by perspiration, or some of the least remarkable evacuations.

Alteratives are generally divided into four kinds, which are, *absorbents* for imbibing and blunting the acid juices; *temperating medicines* for checking and mitigating the rage of the bilious intemperies; *penetrating medicines* for dissolving and attenuating the thick and viscid juices; and, in fine, *demulcents* for sheathing and mitigating their burning and corrosive acrimony.

We meet with medicines of the purgative kind, represented by practical writers as *alterants*; the *colocynth* particularly by Helmont; for all medicines which operate in the farthest palliges, they frequently include under that appellation. Phil. Trans. No 369.

Dr. Woodward enquires into the efficacy of several of the most celebrated *alterants*, and endeavours to show on what little foundation their great use is established. Of this number, according to him, are the absorbents, *cortex Peruvianus*, bitters, salts, steel, and its preparations, mineral waters, &c.

The more efficacious and useful *alterants*, according to the same writer, are cordials, stomachics, attenuants, *mercurius dulcis*, vegetable oils, mucilages, certain absorbents, and some preparations of opium.

According to this learned physician, all that is commonly alledged concerning the change of the principles, or ferments of diseases, by *alterant* remedies, is merely chimerical and imaginary; that there is no change made to the advantage of the human body, without a successive renovation, and discharge of what is hurtful, and a supply of in place by something innocent.

The primitive and constituent elements of bodies never change their figure, magnitude, solidity, or gravity, but remain still the same as at the creation. Hence some infer, 1. The vanity of all pretences to the transmutation of metals. And, 2. The folly of pretending to change the mass of blood, by those remedies called *alterants*.

The mixtures and combinations of the primitive elements are almost infinite, and their alterations as to sensible and external appearances are so too. It may be added, that among *alterant* medicines, there are several which change the scene of the symptoms; others suspend the action of the morbific matter for a time; and others diminish the sensibility of the organs. But these remedies, which hold the morbific principles captive for a time, are only palliatives, and even, in some accounts, dangerous, since they may as well captivate other principles necessary to life. Woodward gives the preference to evacuants, as being the only medicines capable of freeing the machine from that which incommodes it.

Some take a contrary course, and ascribe even the salutary effects of evacuants to their *alterative* nature. This has been alledged of mercury in the venereal disease; the like is urged concerning mineratives, which some maintain do not work a cure by evacuation, so much as by alteration. The like is alledged of *ipecacuanha* in the cure of dysenteries, and of divers other enmities, in cases of apoplexies. In effect, evacuating medicines, as they do not separate the good from the bad, seem indifferently disposed, either to do harm or good. See Woodward's State of Physic, *passim*.

ALTERATE. See SESQUIALTERATE.

ALTERATION, Alteratio, in *Physic*, the act of changing the circumstances and manner of a thing; its general nature and appearance remaining the same.—Or, it is an accidental, and partial change in a body: without proceeding so far, as to make the subject quite unknown, or to take a new denomination thereupon. Or, it may be defined, the acquisition or loss of such qualities as are not essential to the form of the body.

Thus a piece of iron, which *before* was cold, is said to be *altered*, when it is made hot; since it may still be perceived to be iron, is called by that name, and has all the properties thereof.

In this, *alteration* is distinguished from *generation* and *corruption*; those terms expressing an acquisition or loss of the essential qualities of a thing.

The modern philosophers, after the ancient chemists and corpuscularians, hold all *alteration* to be effected by means of local motion. According to them, it always consists either in the emission, accession, union, separation, or transposition of the component particles.

Aristotle makes a peculiar kind of motion, which he calls the *motion of alteration*.

ALTERATION is also, in *Medicine*, to denote a change in the state and qualities of an animal body, in respect of temperature or constitution, health or sickness.

In this *sense*, *alteration* includes both *evacuation* and *accretion*.

ALTERATION is more strictly taken for a change in the quality of the body, contradistinguished from *evacuation* and *apposition*.

In which sense, *alteration* is the effect of medicines called ALTERANTS.

Alteration is chiefly applied in respect of the fluids, or humours of the body. When applied to the solids, it is chiefly in respect of the humours, or the motions of them.

ALTERATION is sometimes also applied in respect of the vital motions of the body.

Thus specifics are applied to alter and rectify convulsive and other disorderly motions. The *alteration* of the humours is either extrinsic, or intrinsic.

ALTERATION, *extrinsic*, is a change produced in the sensible appearances, as colour, thickness, and the like.

ALTERATION, *intrinsic*, is a change in the primitive *crasis*, or constitution of a fluid.

ALTERATION, in a sense still more strict, denotes that conversion which the food undergoes, to render it nourishment.

In this sense *alteration* both includes the digestion performed in the stomach; and the assimilation in the habit of the body.

It is disputed among physicians what the *alteration* is which the food undergoes.—Some reduce it to a mere comminution or trituration.—Others assert a total transubstantiation. See DIGESTION.

ALTERATION, in *Botany*, denotes the conversion of one body into another by similitude.

ALTERATION *of quantities*, among *Algebraists*, denotes what we otherwise call *variation*, or permutation.

ALTERATIVE, *Medicine*, the same with ALTERANT.

ALTERCATION, a debate or contest between two friends, or acquaintance.

The word comes from *altercari*, which anciently signified to converse or hold discourse together.

Thus, we say, they never come to an open quarrel; but there is continually some little *altercation* or other.

ALTERCUM, in *Botany*, a name by which some of the old authors express the *hymenum*, or HYMENE.

ALTERITY is used by some philosophers for DIVERSITY. The word is formed of the Latin *alter*, *another*.

Alterity amounts to the same with what others call *aliety*, *alietas*.

ALTERN *base*, a term in *Trigonometry*, contradistinguished from *true base*, thus—In an oblique triangle, the true base is either the sum of the sides; in which case, the difference of the sides is called the *altern base*; or, the true base is the difference of the sides; in which case, the sum of the sides is called the *altern base*.

ALTERNALL, or ALTERNATIVE, is understood of several things which succeed, or are disposed after each other by turns.

Thus, an *alternate*, or *alternative* office, or trust, which is that discharged by turns; so, two general officers, who command each his day, are said to have the command *alternately*.

In *Botany*, the leaves of a plant are said to be *alternate*, or placed *alternately*, when there is a correspondence between the two sides of a branch; the leaves of the one standing a little above those of the other, not one opposite to the other.

ALTERNATE, in *Arithmetic*. See ALLIGATION.

ALTERNATE *angles*, in *Geometry* are the internal angles made by a line cutting two parallels, and lying on the opposite side of the cutting line; the one below the first parallel, and the other above the second.

Thus *n* and *u*, and *x* and *y* (Tab. II. *Geometry*, *fig.*) are *alternate* angles.

There are also two *external* angles, *alternately* opposite to the internal ones. See PARALLEL.

ALTERNATE *ratio* or *proportion*, is where the antecedent of one ratio is to its consequent, as the antecedent of another to its consequent; the very same ratio, in this case, being *alternately* in respect of the antecedents to each other, and the consequents to each other.

Thus, if A : B :: C : D; then *alternately*, A : C :: B : D.

ALTERNATE, in *Heraldry*, is used in respect of the situations of the QUARTERS.

Thus in quarterly *quarterly*, the first and fourth quarters are *alternate*; and are usually of the same nature. And the like holds of the second and third.

ALTERNATION, in its primary sense, denotes a succession by turns.

ALTERNATION is more particularly used, among *Grammarians*, for distinction, as in saying thus or that.

ALTERNATIONS, a term sometimes used to express the divers changes, or alterations of *orders*, in any number of things proposed.

This is also called *permutation*, &c. and is easily found by a continual multiplication of all the numbers beginning at unity.

Thus, if it be required to know how many changes or *alternations* can be rung on six bells, multiply the numbers 1, 2, 3, 4, 5, 6, continually one into another; and the last product gives the number of changes.

ALTERNATIVE, is particularly used for the choice of two things proposed.—In this *sense* we *say*, to take the *alternative* of two propositions.

ALTHÆA, in *Botany*, a genus of the *monadelphia polyandria* class. See MARSH-MALLOW.

ALTIMETRY, Altimetria, the art of taking or measuring ALTITUDES or heights, whether accessible or inaccessible.

The word is compounded of *altus*, *high*, and *μετρον*, *water*, *to measure*.

Altimetria makes the first part of geometry; including the doctrine and practice of measuring both perpendicular and oblique lines; whether in respect of height, or depth.

ALTIN, a money of account in Muscovy; worth three *copecs*, one limmered of which make a *ruble*, worth about four shillings and six pence sterling.

ALTINCAR, among *Mineralists*, a species of factitious salt used in the fusion and purification of metals.

The *altincar* is a sort of dun powder. Divers ways of preparing it are given by Libavius.

ALTITH, in *Botany*, a name given by some authors to the plant of which the *opo panicis* of the shops is the gum.

ALTITUDE, Altitudo, in *Geometry*, the third dimension of body, considered with regard to its elevation above the ground—called also *height* or *depth*.

ALTITUDE *of a figure*, is the distance of its vertex from its base, or the length of a perpendicular let fall from the vertex to the base.

Thus, KL (*Tab. Geometry*, *fig.* 19.) being taken for the base of the rectangle-triangle, KLM; the perpendicular KM will be the *altitude* of the triangle.

Triangles of equal bases and altitudes are equal, and parallelograms whose bases and altitudes are equal to those of triangles, are just the double thereof.

ALTITUDE, in *Optics*, is usually considered as the angle subtended between a line drawn through the eye, parallel to the horizon, and a visual ray emitted from an object to the eye.

For the laws of the vision of *altitude*, see VISION.

If through the two extremes of an object, S and T (*Tab. Optics*, *fig.* 23.) two parallels, TV and SQ be drawn; the angle TVS, intercepted between a ray passing through the vertex S, and terminating the shadow thereof in V, makes, with the right line TV, what is called, by some writers, the *Altitude of the Luminary*.

ALTITUDE, in *Cosmography*, is the perpendicular height of an object, or its distance from the horizon, upwards. *Altitudes* are divided into *accessible* and *inaccessible*.

ALTITUDE, *accessible*, of an object, is that whose base you can have access to, i. e. measure the nearest distance between your STATION, and the foot of the object on the ground.

ALTITUDE, *inaccessible*, of an object, is that when the foot or bottom of it cannot be approached, by reason of some impediment; such as water, or the like.

There are three ways of measuring *altitudes*, viz. *geometrically*, *trigonometrically*, and *optically*.—The first is somewhat indirect and unartful; the second is performed by means of instruments for the purpose; and the third by shadows.

The instruments chiefly used in measuring of *altitudes*, are the

the quadrant, theodolite, geometrical quadrant, or line of chords, &c. the descriptions, applications, &c. whereof, see under their respective articles QUADRANT, THEODOLITE, and QUADRANT.

ALTITUDE, *to find inaccessible.* To measure an accessible *altitude, geometrically.*—Suppose it required to find the *altitude* AB (*Tab. IV. Geometry, fig.* 9.) of the flagstaff DE perpendicularly on the ground, or such height as any equal the height of the tower FH, may jump perpendicularly on the ground with your feet to the staff, at E, and D prove in the same right line with the eye C to the length CA is equal to the *altitude* AB. If some other lower point, as F, prove in the line with E, and the eye, you must remove the staff, &c. nearer to the object: on the contrary, if the line continued from the eye over E, mark out some point above the *altitude* required, the staff, &c. are to be removed further off, till the line CE cut the very point required.—Thus, measuring the distance of the eye C from the foot of the object A, the *altitude* is had; from CA = AB.

Or thus: at the distance of thirty, forty, or more feet, plant a staff DE (*fig.* 8.) and at a distance from this, as C, plant another shorter one, so as that the eye being in F, E, and B, may be in the same right line therewith. Measure the distance between the two staves, GF; and between the shortest staff, and the object, HF; as also, the difference of the height of the staves, GE.—To GF, CE, and HF; find a fourth proportional HH.—To this add the *altitude* of the shorter staff, EC. The sum is the *altitude* required, AB.

To measure an accessible *altitude*, trigonometrically.—Suppose it required to find the *altitude* AB (*Tab. Trigonom. fig.* 23.) choose a station in E; and with a quadrant, theodolite, or other graduated instrument duly placed, find the quantity of the angle of altitude ADC. Measure the shortest distance of the station from the object, viz. DC; and this of consequence is perpendicular to AC.

Now, C being a right angle, it is easy to find the line AC; hence, in the triangle ACD, we have two angles, viz. D and the complement, and a side opposite to one of them, CD, the opposite side to the other may be easily found by this canon: As the sine of the angle A is to the given side opposite thereto DC; so is the sine of the other angle D to the side required CA. See TRIGONOMETRY.

To the side thus found, adding BC, the sum is the perpendicular *altitude* required.

The operation is best performed by logarithms. See LOGARITHM.

If there happen an error in taking the quantity of the angle A (*fig.* 24.) the true *altitude* BD will be to the false one BC, as the tangent of the true angle DAB, to the tangent of the erroneous angle CAB.

Hence, such *error* will be greater as a greater *altitude* than is less; and hence also the error is greater, if the angle be lesser, than if it be greater. To avoid the inconveniencies of both, the station is to be pitched on at a moderate distance: for that the angle of *altitude* DAB, may be nearly half right.

Again, if the instrument were not horizontally placed, but inclined, e. gr. to the horizon in any angle, the true *altitude* will be to the erroneous one, as the tangent of the true angle is that of the erroneous one.

To measure an accessible *altitude* optically, by the shadow of the body, see SHADOW.

To measure an accessible *altitude* by the geometrical quadrant. Suppose it required to find the *altitude* AB (*Tab. IV. Geom. fig.* 9.) choosing a station as pleasure in D, and measuring the distance thereof from the object DB; mark the quadrant this and that way, till the top of the tower A appear through the sights.

If, then, the thread cut the right shadows, GF, as the part of the right shadow cut off is to the side of the quadrant, EG to the distance of the station DB, so the part of the *altitude* AE, to the thread on the vertical shadows, fey, as the side of the quadrant is to the part of the vertical shadow cut off, fe, is the distance of the station DB, to the part of the *altitude* AE.

AE, therefore, being found in either case, by the rule of three, and the part of the *altitude* EB added thereto, the sum is the *altitude* required. See QUADRANT.

ALTITUDE, *to measure an inaccessible, geometrically.* Suppose AB (*fig.* 8.) an inaccessible *altitude*, to find you cannot measure to the foot of it. Find the distance CA, or FH, as taught under the article DISTANCE; then proceed with the rest as in the article for accessible distances. See STAFF. To measure an inaccessible *altitude*, *trigonometrically.*—Choose two stations, G and E (*Tab. Trigonom. fig.* 25.) in the same right line with the required *altitude* AB, and at such distance from each other, DF, as that neither the angle FGD be too small, nor the other station G too near the object AB. With a proper instrument take the quantity of the angles ADC, AFC, and CFE. See ANGLE. And also measure the interval FD.

Then in the triangle AFD, we have the angle D, given by observation; and the angle AFD, by subtracting the observed *altitude* AFC, from two right angles; and consequently the third angle DAF, by subtracting the other two from two right angles; and also the side FD; from whence the side AF is found by the canon above laid down, in the problem of accessible *altitudes*. And again, in the triangle ACF, having a right angle C, an observed angle F, and a side AF, the side AC, and the other CF, are found by the same canon. Lastly, in the triangle FCB, having a right angle C, observed angle CFB, and a side CF, the other side CB, is found by the same canon.

Adding, therefore, AC, and CB, the sum is the *altitude* required, AB.

To find an inaccessible *altitude* by the shadow, or the geometrical quadrant.—Choose two stations as D and H (*Tab. IV. Geom. fig.* 9.) and find the distance DH.—Or observe what part of either the right or verted shadow is cut by the thread.

If the right shadows be cut in both stations, fey. As the difference of the right shadows in the two stations, is to the side of the square; so is the distance of stations GC to the *altitude* EA.—If the thread cut the verted shadows at both stations, fey. As the difference of the verted shadows answering to the two stations, is to the lesser verted shadows, so is the distance of the station GC, to the interval AE.—Which being had, the *altitude* EB is also found by means of the verted shadow in G; as in the problem for accessible *altitudes*.—Lastly, if the thread in the first station G, cut the right shadows, and in the latter, the verted shadows: fey, as the difference of the product of the right shadow into the verted, subtracted from the square of the side of the quadrat is to the product of the side of the quadrat into the verted shadow, so is the distance of the stations GC, to the *altitude* required AE.

The utmost distance at which an object may be seen, being given, to find its *altitude*.—Suppose the distance DB (*Tab. Geography, fig.* 9.) turn this into degrees, by which means you will have the quantity of the angle C: from the former of this angle subtract the radius DC.—the remainder will be AD, in such parts, wherof DC, is 100000.—Then fey, as 100000: is to the value of AB in such parts, as is the semidiameter of the earth BC 36065570, to the value of the *altitude* AB in Paris feet. Suppose e. gr. the *altitude* be required of a tower AB, whose top is visible at the distance of five miles: then will DC be 20, from whole sine 100000 168, subtracting the whole sine, 100000, the remainder AB is 168, which will be found 331 Paris feet.

The method of taking considerable terrestrial *altitudes*, of which those of mountains are the greatest, by means of the BAROMETER, is very easy and expeditious. This is done by observing on the top of the mountain how many inches, &c. the mercury in it falls below what it was at the foot of the mountain. When this is done, you will have its *altitude* by the help of a table calculated for that purpose. A very accurate table of this kind may be found in the Hist. de l'Acad. Roy. des Scien. 1703, and 1705, calculated by M. Cassini; and also in the Phil. Trans. Hamen's and Halley's Abr. vol. vi. p. 32. See BAROMETER.

ALTITUDE, *determination*, in *Mechanics*, is sometimes used for the height, wherein a falling body acquires, by acceleration, a certain velocity. Hermannus, *Phoron.* lib. i.

ALTITUDE *of the eye*, in *Perspective*, is a right line let fall from the eye, perpendicular to the geometrical plane.

ALTITUDE, in *Astronomy*, is the distance of a star, or other point, in the mundane sphere, from the horizon.

This *altitude* may be either TRUE or APPARENT. If it be taken from the rational, or real horizon, the *altitude* is said to be *true*, or *real*; if from the apparent, or sensible horizon, the *altitude* is *apparent*. Or rather, the apparent *altitude* is such as it appears to our observation; and the true is that sum which the refraction has been subtracted.

The true *altitudes* of the sun, fixed stars, and planets, differ but very little from the apparent *altitudes*; because of their great distance from the centre of the earth, and the smallness of the earth's semidiameter, when compared thereto. But the difference between the true apparent *altitude* of the moon is about 32'.

The *altitude* of a star, or other point, is properly an arch of a vertical circle, intercepted between the alligned point and the HORIZON. Hence

ALTITUDE, *meridian.* The meridian being a vertical circle; a *meridian altitude*, that is, the *altitude* of a point in the meridian, is an arch of the meridian intercepted between it and the horizon.

To observe the *meridian altitude* of the sun, of a star, or other phenomenon, by means of the quadrant, see MERIDIAN *Altitude*.

To observe a *meridian altitude* by means of a gnomon, see GNOMON.

The sun's *altitude* may also be found without a quadrant, or any the like instrument, by erecting a pin or wire perpendicularly, as in the point C (*Astronom. fig.* 62.) from which point you have described the semicircle AF. Make CE equal to the height of the pin or wire, and through E draw ED parallel to CA, and make it equal to CG, the length of the shadow; then will a ruler, laid from C to D, intersect the quadrant in B; and BA is the arch of the sun's *altitude*, when measured on the line of chords.

An irregularity has been observed in the apparent *altitudes* of the stars near the MERIDIAN. On some occasions of the stars near the meridian, when they are mounting towards the meridian, they appear to fail, and after gaining the meridian, to rise. Hist. Acad. Scienc. 1719. p. 75.

M. Parent suggests a new method of taking *altitudes* at sea, by a common watch.

Upon theorie, the difference between the rising and setting of the two stars, or the sum thereof, is greater, as they are farther distant from one another.

Now, the astronomical tables (mentioned in the tables of the right ascensions and declinations of all the fixed stars, it is easy, after observing the difference of time between the rising of two stars, to distinguish that part of the difference which arises from their different positions from that which arises from the obliquity of the sphere.—But such difference is the precise height of the pole of the place of observation.

Indeed, the ship not being immoveable, but changing place between the two observations, seems to be the method under some difficulty; but to the Mr. Parent answers, that a small aberration either of the ship's longitude or latitude, will make no sensible error; and that if she have gone a large distance between the two observations, it is easy reckoning how much it is, and accordingly allowing for it. See SAILING.

ALTITUDE, *rule of the sun*, may be compared by the following rule, proposed by Mr. Lyons for nautical purposes. By the rules in the Nautical Almanac, for 1771 find the logarithm sine; subtract it from the rising found answering to the given distance of time from noon in the tables of the same Almanac; the remainder is the logarithm of a number, which subtracted from the natural sine of the sun's meridian *altitude*, leaves the natural sine of the *altitude* at the required time. For finding the *altitude* of the moon or a star, he gives the following rule. From the table above mentioned, take out the sine, corresponding to the latitude of the place, and the time from the preceding the meridian; add to it the logarithm cosine of the sun's declination, and the logarithm cosine of the latitude of the place; the sum, abating twenty from the index, is the logarithm of a number, which subtracted from the natural sine of the star's meridian *altitude*, leaves the natural sine of the *altitude* at the given times. These rules are of great importance in determining the longitude at sea. See Naut. Alm. for 1778.

In taking of *altitudes* from the visible horizon, where great exactness is required, an allowance is to be made for refraction, and the height of the observer's eye above the surface of the sea.

ALTITUDE *of the pole*, is an arch of the meridian, intercepted between the pole and the horizon.

The *altitude of the pole* coincides with the latitude of the place.

To observe the *altitude* or ELEVATION of the pole, see POLE.

ALTITUDE *of the equator*, is the complement of the *altitude* of the pole to a quadrant of a circle. See ELEVATION *of the equator*.

To find the *altitude* of the star, &c. by the globe, see GLOBE.

ALTITUDE *of the tropic* amounts to the same with what is otherwise called the *greatest altitude* of the sun.

ALTITUDE *of the heavens*, or of stars here in it, is variable by the refraction, according to the quantity of which the horizon is either elevated or depressed more or less.

ALTITUDE *of the moon's atmosphere* is thought, by some, to be much greater than that of the earth; the former being said to reach three-score French leagues. But the existence of this atmosphere has been disputed and denied by modern astronomers. See MOON.

M. Bofe has proposed a method of discovering the *altitude* of the earth's atmosphere, the like of which was first given by Kepler, viz. by the magnitude of the arch wherein the sun is said to sink below the horizon, when the CREPUSCULUM begins or ends.

ALTITUDE *of the narrow bounds* in 1760, has been much controlled, viz. whether it were above the atmosphere, or within the limits of it: the former opinion being defended by Dr. Halley, the latter by Mr. Hillier. The same contest, which is given to seamen to favour the latter.—Besides, it appears not by any observation to have been above thirty-eight miles high. See ATMOSPHERE *Barometer*. Phil. Trans. N° 369.

ALTITUDE, in speaking of lands, is more frequently expressed by the term depth.

The ingenious Dr. Hales, in his Vegetable Staticks, proposed a method for measuring unfathomable depths of the sea, on the principles of which Dr. Desaguliers contrived an instrument called a *sea-gage*, which was tried before the Royal Society, and is described in the Phil. Trans. N° 403. A more particular description of this instrument by Dr. Hales himself is as follows.

Suppose AB (*Tab. II. Miscellany*, fig. 20.) to be an iron tube, or antiquet vessel, of 20 inches, as fifty inches, having its upper end A well close; if this tube be let down in this position about thirty-three feet into the sea, a column of water of that height is nearly equal to the mean weight of our atmosphere, and consequently from a known property of the air's elasticity, it will be compressed into half the space it took up before, so that the water will ascend half way up the tube: and if the tube be let down thirty-three feet deeper, the air will be compressed into $\frac{1}{3}$ of its first dimensions, and so on $\frac{1}{4}$, $\frac{1}{5}$, &c. the air being continually compressing in proportion to the incumbent weight; whence by knowing to what height the water has ascended in the tube we may readily know to what depth the tube has descended into the sea.

Now to measure the depth of one thick column of sea-water: first, by a line let the iron tube, with a weight at its bottom, sink about thirty-three feet, which depth in salt-water will nearly answer to the weight of one and a mean height of the barometer; then draw up the tube, and observe how far the water has.

If the specific force of water be equal to one atmosphere, then the air will be so high as to fill exactly one half of the tube. But if the water rise higher or lower than half the tube, then by the rule of three fay, as the number of inches the water rises is to 20, so is thirty-three to the number of feet, measuring the depth of the column required. For example, suppose the water rises when the tube is let down thirty-three feet, only 9 inches, then fay, 9 : 20 :: 33 : 73$\frac{1}{3}$ feet the depth of each column, which being once known, the number of columns of water is to be multiplied by this number of feet, whereby the depth of the sea in that will be known.

But since, when an instrument has descended to the depth of 99 columns, or 99 times 33 feet, the air will be so compressed into the 100 part of its bulk, that is, into half an inch, the diameter both of the tube below and also above that will be very small, that the difference in weight of several columns of water will not be sensible. So that an instrument of no greater length than this would scarcely give an account of millions of but a mile's depth, that is 5280 feet, or 80 columns, depth of water. The length of this instrument to 4, 5, or 10 times that length, would obviate this defect, and make the differences of the degrees of descent much more sensible. But it is next to impracticable to make a metallene tube of 3000 a length, and if it were made, it would be to great to be easily broken, the difficulty may be obviated in the following manner.

Let there be a globular metallene vessel, of iron or copper, nearly of this form (*Fig. 21. Tab. II. Mi.*), whose capacity within may be equal to some convenient capacity of the metallene tube, X, X, &c.; let the globular body be firmly screwed in the metallene tube, at E, E, with a leathern collar well soaked in tallow and some matter in the shoulder, or junction, thereby to secure the joint in the most exact manner. Let there be a small hole at X for the admission of water freely in, and let some coloured oil be poured into the globular body, to fill it up to the hole, X. Let there be also provided a thunder rod, A A, screwed, or soldered into the cover of the tube at B, which rod is to be of some or other and use, therein to rest on the top of the tube at pleasure; and rod must also have a small piston, or stopper to the upper end, which will prevent its being damaged by falling upon the sides of the tube.

The capacity of tube must be estimated by the number of sea-water to, when the rod and piston must be fixed at that place.

Now since the lower part is supposed to contain some terms as much as the tube X A, which is the same thing as if the tube were continued down to the bottom, the air in the globular vessel will act as if it were in the capacity of the tube, and the same will be the case at the depth of 99 times 33 feet, or 3267 feet, for then the air will be compressed into the 100 part of its space it took up at the surface of the sea, and the water will have entered the tube to the height of 99 inches, or 8 feet 3 inches, and the remainder will be the air in the globular vessel and tube. Now if the whole length of the tube be 20 feet, the air will be compressed into $\frac{1}{3}$ of its first dimensions, when the depth of the water will be 66 feet, and the height of the water in the tube 13 feet 2 inches, and the remainder will be the air in the globular vessel and tube. And so on, the greater the depth of the water, the greater will be the height of the water in the tube, and the less the space of the air in the globular vessel and tube, and the greater the pressure of the incumbent water, and consequently the greater the density of the air in the globular vessel and tube, and the greater the number of columns of water to be multiplied by the number of feet, whereby the depth of the sea in that will be known.

Now since, when an instrument has descended to the depth of 99 columns, or 99 times 33 feet, the air will be so compressed into the 100 part of its bulk, that is, into half an inch, the diameter both of the tube below and also above that will be very small, that the difference in weight of several columns of water will not be sensible. So that an instrument of no greater length than this would scarcely give an account of millions of but a mile's depth, that is 5280 feet, or 80 columns, depth of water. The length of this instrument to 4, 5, or 10 times that length, would obviate this defect, and make the differences of the degrees of descent much more sensible. But it is next to impracticable to make a metallene tube of 3000 a length, and if it were made, it would be to great to be easily broken, the difficulty may be obviated in the following manner.

Let there be a globular metallene vessel, of iron or copper, nearly of this form (*Fig. 21. Tab. II. Mi.*), whose capacity within may be equal to some convenient capacity of the metallene tube, X, X, &c.; let the globular body be firmly screwed in the metallene tube, at E, E, with a leathern collar well soaked in tallow and some matter in the shoulder, or junction, thereby to secure the joint in the most exact manner. Let there be a small hole at X for the admission of water freely in, and let some coloured oil be poured into the globular body, to fill it up to the hole, X. Let there be also provided a thunder rod, A A, screwed, or soldered into the cover of the tube at B, which rod is to be of some or other and use, therein to rest on the top of the tube at pleasure; and rod must also have a small piston, or stopper to the upper end, which will prevent its being damaged by falling upon the sides of the tube.

The capacity of tube must be estimated by the number of sea-water to, when the rod and piston must be fixed at that place.

Now since the lower part is supposed to contain some terms as much as the tube X A, which is the same thing as if the tube were continued down to the bottom, the air in the globular vessel will act as if it were in the capacity of the tube, and the same will be the case at the depth of 99 times 33 feet, or 3267 feet, for then the air will be compressed into the 100 part of its space it took up at the surface of the sea, and the water will have entered the tube to the height of 99 inches, or 8 feet 3 inches, and the remainder will be the air in the globular vessel and tube. Now if the whole length of the tube be 20 feet, the air will be compressed into $\frac{1}{3}$ of its first dimensions, when the depth of the water will be 66 feet, and the height of the water in the tube 13 feet 2 inches, and the remainder will be the air in the globular vessel and tube. And so on, the greater the depth of the water, the greater will be the height of the water in the tube, and the less the space of the air in the globular vessel and tube, and the greater the pressure of the incumbent water, and consequently the greater the density of the air in the globular vessel and tube, and the greater the number of columns of water to be multiplied by the number of feet, whereby the depth of the sea in that will be known.

that length) that it, within five inches of the top of the tube; and consequently the rod *A* will be found tinged with the oil, within five inches of its top.

Suppose again the instrument to have descended to the depth of 198 columns, of 33 feet each; then the air will be compressed within $\frac{1}{40}$ part of the whole, that is, nearly within $2\frac{1}{2}$ inches of the top of the tube. In this case the instrument will have descended 6567 feet: that is, one mile and a quarter, and 132 feet.

Suppose again the instrument to have descended to the depth of 399 columns, then the air will be compressed into $\frac{1}{80}$ part of the whole, that is, nearly within one inch and a quarter of the top of the tube. In this case the instrument will have descended two miles and a half, wanting 53 feet, which may probably be the greatest depth of the sea.

The larger the capacity of the vessel K, L, M, N, O, the deeper will the engine be enabled to sink, the instrument being made stronger, and its joints being secured in proportion.

The instrument being thus prepared, a large buoy, *i*, must be fixed to it, which ought to be a solid piece of light wood, well turned, to prevent the water's being pressed into the lap-vessels *f*, and at it may rise at a considerable distance from the ship, it may be advisable to fix on the top of the buoy broad tins of tin, properly painted, so as to be easily seen.

In order to sink the instrument, a weight must be fixed to it in the following manner. See the diagram. W is a weight of ballast, hanging by its chest-hook T, to the socket *f f*, which forkes is screwed fast to N Q. The hook is retained in its place by the catch *k* of the spring O, while the machine is descending; but as soon as W touches the ground at the bottom of the sea, the catch O *k* sinking by the descending force, a little below the upper part of the hole *k*, is thereby at liberty to fly back, and to let go the weight; then the buoy rises up to the surface of the water with the machine. Springs might also be fixed on the inside of the socket *f f*, so as to fly back in the same manner, when the weight reaches the ground. It might be advisable to keep an exact account of the flay of the machine under water, which might be done by a watch, or by a pendulum vibrating seconds. As Dr. Hooke found upon trial, that a leaden ball which weighed two pounds, fixed to a wooden ball of the same weight, and both let down in fourteen fathom water, reached the bottom in fourteen seconds, and the detached wooden ball ascended to the surface in fourteen more. If this machine descended and ascended greater depths with the same velocity, it would reach to the depth of a mile in fourteen minutes, and reascend in the like time. This, however, might be a vague estimate, until experience has furnished a rule.

This machine was tried in various depths of the Thames, and answered very well, always returning, and leaving the ballast behind. It was afterwards tried near the Bermudas, where several ships were in company; but though a good look-out was kept for three or four hours, it was not seen to return. Hales's Statics, vol. ii. p. 328.

ALTITUDE *of the sea's surface* is not every where the same, as appears from the drift of CURRENTS setting things out of one sea into another.

ALTITUDE *of the mercury*, in the BAROMETER, is marked by degrees placed on the face of the instrument, the variations of which are the chief object of *barometrical* observations.

The mean altitude of the mercury at London is about 29 inches.—The extreme *altitudes* are 27½ inches, and 31; inches. Some suggestions have been made, as if the *altitude* of the mercury were regularly greater in the morning than in the evening; as least laughing of this kind was observed to hold for a considerable time at Berlin. Hist. Ceel. Rep. Lett. tom. xii. p. 239.

ALTITUDE *of the pyramids in Egypt* was measured so long ago as the time of Thales, by means of their shadow: which makes one of the first geometrical observations we have an exact account of. Plutarch has given an account of the manner of this operation, which according to this author, was done by erecting a staff perpendicular upon the end of the shadow of the pyramid; and by two triangles made by the beams of the sun, he demonstrated, that there was the same proportion between the staff and its shadow as between the pyramid and the shadow. Stanl. Hist. Philos. p. 109.

ALTITUDES, in astrology, denotes the second of the five essential dignities, which the planets acquire in virtue of the signs they are found in.

In this sense, *altitude* is otherwise called *exaltation*.

ALTITUDE *of the meridional*, is the *altitude* of the poll degree of the ecliptic, reckoned from the orient, or east point. See MONADICAL.

ALTITUDE, *reduction of*, is an arch of a vertical circle, or *S. (Vid. Astronomy, fec. 28.)* whereby the *altitude* of a star, or other body, is increased by means of the refraction.

ALTITUDE, *parallax of*, is the difference CB (*Vide Astron. fig. 27.*) between the true and apparent place of a star; or, the difference BC, between the true distance of a star AB, and the observed distance AC, from the zenith A. The parallax diminishes the *altitude* of a star, or increases its distance from the zenith.—To find the parallax of *altitude*, see the PARALLAX.

ALTITUDE *of motion*, is a term used by Dr. Wallis for the measure of any motion, estimated according to the line of direction of the moving force.

ALTITUDE, *circle of*. See CIRCLE.

ALTITUDE, *parallels of*. See PARALLELS.

ALTITUDE, *quadrant of*. See QUADRANT.

ALTITUDE, *reflecting*, *equal*, is that used to observe a celestial object, when it has the same altitude on the east and west sides of the meridian, or in the morning and afternoon. This instrument consists of a telescope about thirty inches long (with two vertical, and three or five horizontal wires in its focus) supported on the end of an iron bar, or axis, thirty inches long, and about an inch in diameter; the axis being fastened in a vertical position, by passing through a hole in one end of a brass box, whose other, or lower end, fastens the lower joint of the axis. The box, which is about twenty-one inches long, with ends about four inches square, has only two sides, which are fixed at right angles. Three ends of these sides project four flat arms with a hole in each, whereby the box is, by screws, fixed in a vertical position to an upright post. On the lower end of the box lies a brass plate, which slides in grooves, and can, by means of a screw, be gently moved forwards or backwards; in this plate is a fine punched hole, to receive the smooth conical point, into which the lower end of the axis is inserted. On the upper end of the box are two plates, which slide also in grooves; and, by the means of screws, can be gently moved sideways, till their angular notches embrace the axis, which, in this part, is made perfectly cylindrical, and very smooth. To the upper part of the axis is fixed, by its collar, a brass sextant of an inch, or 60°, or a radius of seven or eight inches, and with the arch downwards, so that the centre is just above the top of the axis. Also a foldeched is fixed at right angles across the axis, just under the arch, so as to be clear of the upper end of the box. To the under part of the telescope is fixed a brass semicircle, of the same radius with the sextant, both arches having a common centre-pin. In the semicircle is a groove cut through the plate parallel to its limb, to receive two screw-pins, which go into the sextantal arch, near its ends; by these screw-pins, the two arches may be pressed close, and the telescope fixed in any desired elevation; which might be nearly ascertained, by graduating the semicircle, and putting a Vernier's scale on the sextant.

When this instrument is used, the box is fixed to the post, and the axis put into the box, bringing the conical point drop into the punched hole; the level is screwed on, and the telescope is annexed, observing to adjust the centre and orthogonal; then by the help of the screw-plates at the bottom and top ends of the box, the vertical position of the axis is corrected, so that the time and of the air-bubble in the level may stand at the same point through the whole revolution of the axis, which will thereby be known to be then truly vertical, so that the telescope will describe a parallel of *altitude*. The tube, thus adjusted, is to be directed to the sun, or star, and fixed at the desired elevation, by pressing the two arches together with the two screw-pins. This instrument is very useful in adjusting clocks, &c. and comparing *equal* and *apparent* time.

ALTITUDE *of Equal*, or *of* ALTO *or* *of* BASSO, *in Law*, figures the absolute coherence of all differences, small and great, high and low, in some subsistent person. *Fines antiqui*, *fol. 2. pro Hollowes Vide de Finis*, *& Thomas Coster to 2. Rep. Reporter fol. 61.* *Allo & in Bullo, is where no quarter between; viz. a quadrate quarels pendent below as to centre.—Nor of reverse, right as also to bullo against Bullo supponunt colunaris.*

ALTO *relievo*. See RELIEVO.

ALTOLIZOM, among some *Chemists*, denotes the *tartar Parcelsi*, well beaten, calcined, and boiled to the form of an oil, called also *philosophic*; because it is a better fate.

ALTUMAL, a term used to denote the mercantile style, or dialect.

In this sense, we meet with *altumal cant*, to denote the language of petty traders and cars.

ALVAH, the wood wherewith Moses sweetened the waters of Marah. Exod. ch. xv. ver 25.

The name of this wood is not found in Scripture, but the Mahometans give it that of *alvah*, and pretend to

trade

trace its history from the patriarchs before the flood: Josephus, on the contrary, says, that Moses used the wood which he found next lying before him.

ALVARID, among the Spanish Moors, denotes a lodge. The word is also written *alvaridas*. In this sense, *alvaridas* amounts to much the same with what is otherwise called ALCAID.

ALVARISTS, in *Church History*, a *sect*, or branch of modern Thomists, denominated from Alvarez, whose method and principles they follow.

The *Alvarists* differ from the ancient Thomists, in that the former are asserters of sufficient grace, the latter of efficacious grace. The former come near to the Jesuits, the latter to the Jansenists.

ALUCITA, a subdivision of insects belonging to the genus of PHALENA and of the *lepidoptera* order, in the Linnæan system; comprehending eight species.

ALUCO, in *Ornithology*, the name by which authors have called the common white owl; or, as we commonly call it, the barn-owl, or church-owl.

ALUDELS, in *Chemistry*, subliming pots, or vessels used for the sublimation of mineral powers. *Vide* CHEMISTRY, *Ch. fig.* 20.

Aludels are a large range of earthen tubes, or pots without bottoms; fitted one over another, and sloping from the lowest to the top. The lowest is adapted to a pot placed in the furnace, wherein the matter to be sublimed is lodged. And at the top is a head, to retain the flowers which ascend the highest.

The *aludel*, which terminates this tube above, ought to be closed in its upper part, or to have but a very small opening. The tube composed of these *aludels* is nothing but a kind of capital, or head, that may be enlarged or lengthened at pleasure, and adapted to a cucurbit. This apparatus is intended to collect and retain dry and volatile matters, which may be reduced into flowers by SUBLIMATION. It may be employed for the preparation of flowers of *sulphur*, of *arsenic*, of *antimony*, of benjamin, &c.

ALVEARIUM, in *Anatomy*, the bottom of the *meatus*, or hollow of the auricle, or outer EAR.

The *alvearium auriculæ* is a cavity, terminating at the *meatus auditorius*, wherein that bitter yellowish excrement is collected, called *cerumen*, or EAR-WAX.

ALVEARIUM also signifies a bee-hive.

The word is formed of *alveus*, a *channel*, or *cavity*; in allusion to the *alveoli*, or cells, in bee-hives.

Some of the ancients use also the word *alvearium* for a bee-house, more usually called among us APIARY.

ALVEARIUM is sometimes also used in anatomy, to denote a collection.

In which sense, *alvearium auriculæ* is much the same with what we otherwise call *thesaurus*, *cerumen*, or the FAECES. Vide Boerhaave's published *alvearium* of laws.

ALVEHEZIL, among the *Arabian Physicians*, denotes what we ordinarily call *fuliginous*, or EVAPORATION.

ALVEOLI, in *Anatomy*, those little sockets in the jaws, wherein the teeth are fixed.

The *alveoli* are lined with a membrane of exquisite sense, which seems to be nervous, and is wrapt about the roots of each tooth, from whence, and from the nerve, proceeds that pain called *clavus*, or TOOTH-ACH. Of these *alveoli* there are usually fifteen in each jaw.

ALVEOLI is more especially used, among *Naturalists*, for those waxen cells in the combs of bees, wherein their honey is deposited.

ALVEOLUS, in *Natural History*, the name of a marine body, found frequently fossile, sometimes lodged in the cavity of the *belemnites*, and sometimes loose; and in this last case, often so large, that we cannot suppose any *belemnites* ever to have existed so large as to have been able to contain it. We do not meet with them at this day in their recent state, but what we find of them fossile, are ever larger at one end, and tapering to a point at the other, and are composed of several hemispheric cells, five or many more times joined into one another, and having a *siphuncle*, or pipe of communication, like that in the shell-animal. These are sometimes found perfect and whole, but much more frequently truncated, or wanting a part of their lowest end. Klein.

ALVERES, in *Botany*, a name used, by some, for the *pericardium*, or *os cordis*.

ALVEUS properly denotes a channel.

Alveus, in *Botany*, by some, *thalamus*, is the tunid lateral branches arising from the *receptaculum* upon which the *calyculus* stands.

ALVEUS is also used, in *Antiquity*, to denote a small vessel, or boat, made out of the trunk of a single tree, by boring or cutting it hollow.

Such was that wherein Romulus and Remus are said to have been exposed.

ALVIDUCA, a term used by some writers for laxative or purgative medicines.

The word is compounded of *alvus* and *duco*, *I draw*.

ALUM, ALMEN. See ALEMA.

ALUMEA, in *Botany*, a name given by some of the old Latin writers to the plant otherwise called *lutea* or *mala*, and by the Greeks *cynara*. It was the same our *gentiles tinctorius*, or dyer's weed, and was used by the dyers and by the ladies, to tinge their hair yellow, the colour that was esteemed most beautiful in those times.

ALUNGU, in *Natural History*, is a word of the Malabar language, and the name given by the Malabarians to an animal resembling a large *lizard*, except as to head and tail, which are both pointed. It is a German ell, or 3 long, and as broad as is half an ell. It is a species of the *stellio* of Linnæus, and belongs to the family of *amphibia*, which have no teeth, but a long round tongue, with which they catch the ants. Phil. Trans. vol. lx. N° 6. an. 1770.

ALUS, in the *Materia Medica* of the ancients, a name given to two different plants.

ALUSMA *Caramanica*, in *Botany*, a term used sometimes to express a plant growing in Caramania, and sometimes a preparation of that plant, or pigment made from it. The word frequently occurs in the writings of Avicenna and Serapion.

ALVUS, among *Anatomists*, is sometimes used to express the lower belly, or venter.

ALVUS is more usually taken among *Physicians*, for the state and condition of the *fæces*, or excrements, contained within that cavity.

Thus, when a person is laxative, it is called *alvus lubrica*; and, when costive, *alvus astricta*.

They who are of a loose belly in their youth are generally costive in their old age; and they who are bound in youth are often loose when old. A laxer state in youth, and rather bound than loose in old age, is most desirable.

Blunders of the belly are labour, sitting in a chair, fuller's clay laid over the body, diminution of food, eating once a day instead of twice, little drinking, and that only after a full meal, rest after meals. On the contrary, things which loosen the belly, are, walking and eating more than usual, sleeping after meat, accompanying draughts with eating; and it ought to be observed, that a vomit binds a loose belly, and loosens a bound one; and that a vomit taken immediately after meat binds the belly, but delayed until a considerable time after, loosens the same. Celsus.

ALWAIDI, a sect of Mahometans, who hold that all great crimes are unpardonable, and the eternal reprobation to ensue.

The *alwaidis* stand in opposition to the MORAITI. They attribute little efficacy to the sacrament in the salvation of men, other than the toil of the ploughman.

ALYBAS, in the *Materia Medica*, a species of *realgar*, particularly by some physicians for the purging of bile. Some write the word *alybus*, and it seems to be also *Galen* used *alybum*, *arsenic*, for a mineralogic, or medicine that gently purges.

ALYPON MONTIS CRETÆ, called the WHITE STRIPE, a plant which grows in several parts of France, particularly in Provence and Languedoc. It is a kind of STAEAS.

ALYSUM, in *Botany*, a name given, by some authors, to a species of *lunaria*, the THLASPI of *Tournefort*. See SPORGE.

ALYSSUM is likewise a name given, by some authors, to a species of *conyza*, distinguished by Mr. Tournefort, by the name of ALYSSUM *montanum foliis incanis, flore purpureo*, the purple flowered MOUNTAIN *alyssum* of Vernic, with willow-like leaves.

ALYSUM is also a name given to the *clematis* of Linnæus.

ALYSSON, in *Botany*, a name given, by some authors, to the HYPERICUM, or gold of pleasure.

ALYSSON, *crystallinum*, the AIZOON of Linnæus.

ALYSSUM, called *saxatile*, by Tournefort. See MADWORT.

ALYTARCHIA, in *Antiquity*, a priest of Antioch in Syria, whose office was to lead up the *mollybdobrii*, or *effeminate*, naked men with whips in their hands, who attended at the games or spectacles of the *athletæ*, encouraged them to behave themselves, and, on occasion, forced to preserve good order, and keep off the crowds.

The office who presided at the Olympic games was also sometimes denominated alytarch.

Some will have them to be the same with the *hellanodicæ*, or as others opinion are Faber and Pricæus.

Van Dale shows them to be different offices; not but that the *alytarchi* might sometimes be substituted for the *hellanodicæ*, to perform some parts of their functions.

The *agonothetæ* were the same with what were called, in some other places, *editæ*.

ALZACHI, in the *Materia Medica*, the name given, by the

the Arabian *Physicians* to that kind of gourd called in the shops the CITRUL, and by the people of some parts of Italy, the *anguria*. It is an oblong, and usually cylinder gourd, and contains in its cavity a considerable quantity of water, which is drank by people of the places where the plant is common, to quench thirst. It contains seeds of an oblong figure, flatted, and covered with a hard skin.

ALZAGIAT, in the *Materia Medica*, a name given, by the Arabian writers, to all the vitriolic minerals. It is also written *zegi*, or ZEGI.

ALZARAC, in the *Materia Medica* of the Arabians, a name given to a kind of CAMPHOR, which was coarse, and of a brown colour. It seems to have been the same with our rough camphor, as imported from the Indies, before it is purified.

ALZIZ, in the *Materia Medica*, a name given by Serapion and Avicenna, to the roots of the *iris*. The word *Zic* is the name of a river in Africa, according to Leo; and the roots probably had this name from their being found in great plenty on the banks of that river, the *iris* always growing in wet places.

ALZUM, in *Botany*, a name given, by the ancients, to the tree which produces the gum BDELLIUM. It is also written *alzum* and *alzam*, which last seems the proper way. The gum of this tree was called, by the Arabians, *sadet*, and the same word *sadet* is used as the name of a fruit of a palm-tree.

AMA, in *Ecclesiastical History*, denotes a vessel wherein wine, water, or the like, were held, for the service of the eucharist.

In this sense, the word is also written *amula*; sometimes also *huma* and *humala*.

AMA is sometimes also used for a wine-measure, as a cask, pipe or the like.

AMA, AME, or rather AMES, *ames*, a sort of cake. Arcæus uses this word to express the quantity of hellebore which is sufficient for a dose in strong constitutions, when given in a *syrup*.

AMABYR, or AMOBYR, in some *Ancient Customs*, the price of a maidenhead; or a sum of money to be paid the lord upon marrying a maid of his manor. This custom is said to have anciently obtained in Wales, where *amobyr* was paid to the prince; also in the honour of Clun belonging to the earl of Arundel, till earl Henry, in the time of queen Mary, in consideration of sixty pounds, released it to all his tenants by the name of the custom of *amobyr* and *chevage*.

AMADOW, a kind of *black-match*, tinder, or touch-wood, which comes from Germany. It is made of a sort of large mushrooms, or spungy excrescences, which commonly grow on old trees especially oaks, ash, and firs. This substance being boiled in common water, and afterwards dried and well beaten, is then put into a strong ley prepared with salt-petre, after which it is again put to dry in an oven. The druggists sell this match wholesale in France, and several hawkers retail it.

Some give to the *amadou* the name of *pyrotechnical sponge*, because of its aptness to take fire.

AMADOWRY, a kind of cotton which comes from Alexandria by the way of Marseilles.

AMAIN, or AMAYNE, a sea term, used by a man of war, to his enemy; and signifying *yield*.

Hence, *to strike amain*, is, to lower, or let fall, the top-sails.

The word is also written *amayne*. Waving *amain*, is to make a sign to another vessel, by waving a bright sword, or other thing, as a demand for striking its top-sails. This is commonly done either in the fore-top, or on the poop.

AMAIN is also a term used in letting down a thing, by a tackle, into the hold, or elsewhere, in the lowering a yard, or the like, to denote, that the sailors are to let go that part of the rope, which they held before and let it run at once, or suddenly.

AMALGAMA, or AMALGAM, in *Chemistry*, a mass of MERCURY, united and incorporated with a METAL.

The word *amalgama* is formed of the Greek, μαλ, *together*, and γαμειν, *to join*; and is applied to the ALLAYS of metallic metals with *mercury*, which is capable of being *alloyed* more or less easily with almost all metallic substances.

The *amalgama* of *mercury* with lead, is a soft, friable substance, of a silver colour.

By washing and grinding this *amalgama* with fair warm water in a glass mortar, the impurities of the metal will mix with the water; and by changing the water, and repeating the action again and again, the metal will be further and further purified. Boerhaave mentions it as one of the greatest secrets in chemistry, to contrive to bring off the liquor, at last, as clear and unsullied as when first poured on the *amalgama*, which, he says, might afford a method of making the nobler metals, or procuring them from the baser.

This philosophical way of purifying metals, may be easily applied to all the metals, except iron and copper.

AMALGAMATION is either done in the *dry*, or in the *humid* way.

AMALGAMATION *in the dry way*, is performed in a mortar for the purpose, described by Barber and others.

AMALGAMATION *in the humid way*, is when part of the metal is first dissolved in its proper *menstruum*, and afterwards precipitated into an *amalgama*, by the addition of MERCURY.

This operation is denoted by chemists by the letters A A A.

The *amalgams* of gold, silver, tin, lead, zinc, bismuth, and copper, with quicksilver, are all white; and when the quantity of metal is large in proportion to that of the mercury, they thicken into a kind of paste.

All METALS, except iron and copper, spontaneously unite and *amalgamate* with mercury; and gold with the greatest facility; silver the next; then lead, and tin; copper, and regulus of antimony, with difficulty; iron, and, as Mr. Geoffroy says, *cobalt*, hardly at all; but with all other metals, and semi-metals, mercury may easily be *amalgamated*. The *amalgamation* of all metals with mercury is much facilitated by heat; but with respect to the metals which unite with difficulty with mercury, it cannot be effected without heat. All metals ought to be divided into very small parts, when they are to be *amalgamated* by *trituration*, without fusion or heat.

AMALGAMATION *of copper*. The *amalgamating* mercury with copper is a very difficult process, mercury not mixing well with that metal unless when in fusion, and the heat sufficient to keep it in that state being great enough to evaporate the mercury. *Trituration*, however, may be made to supply the place of heat, first reducing the copper to an exceeding fine powder. This *amalgama* boiled in river water, and then distilled in a retort, and cohobated twice, leaves the copper, in form of a new metal, of the colour of gold, and more ductile than before. Shaw's Lectures, p. 433.

Amalgamation of copper may likewise be performed by dissolving the metal in *aqua fortis*, diluting the solution with twelve times the quantity of pure water, then heating it, and putting into it polished plates of iron; by this means the copper will be precipitated to the bottom, and the iron dissolved. Pour off the liquor, and wash the precipitated powder with hot water, till it becomes insipid. The powder being well dried, and put into a glass mortar, with an equal quantity of hot mercury, an *amalgama* will be made.

AMALGAMATION *of gold* is usually performed by heating the *fumina* of plates of that metal red-hot; after which, quicksilver, previously heated, is to be poured upon them, and the mixture is to be stirred with a little iron rod, till it begins to rise into smoke. It is then thrown into a vessel full of water, where it coagulates, and becomes manageable.

This *amalgamation* is in great use among goldsmiths and gilders; who, by this means, render gold fluid and ductile for their purposes. Such mixture or *amalgama* being laid on any other metal, for instance, copper; and this afterwards placed on the fire to evaporate, the gold will be left alone on the surface of the copper; which makes what we call GILDING.

The blackness adhering to the *amalgama* may be washed away with water; and a great part of the mercury may be pressed out through a linen cloth; and the rest being evaporated in a crucible, by a gentle and gradual heat, the gold remains behind in an impalpable powder, which admits better of being burnished than that which is procured by grinding of gold-leaf. Gold retains about thrice its own weight of mercury. See *Tables of* AFFINITY.

The method of extracting gold by *amalgamation* is thus described by Dr. Lewis: the gold sands, first cleared of grosser particles by water, are dried, and a small proportion, less than a hundredth part of their weight, of mercury, is poured on them; the whole is well kneaded together, that the mercury may penetrate, as much as possible, into all the interstices between the grains; upon which it imbibes the atoms of gold it meets with, and the sand is afterwards washed off with water. In the mines of the Spanish West Indies, where the gold is bedded in stones, the stony matter is reduced to a very fine powder, that every atom of the gold may be laid open to the mercury. The powder is soaked for some time in a solution of common salt; the mercury is squeezed in through a linen cloth, so as to fall like dew all over the surface; and the mixture being well stirred and kneaded, a gentle heat is applied, by which the aqueous

tivity of the mercury is so far increased, that the incorporation of the gold with it, which in the cold requires about thirty days, is effected by this method in five or six days.

There is another method of expediting the *amalgamation*, described by Alonso Barba. He puts the powder, with a suitable quantity of mercury and water, into a deep copper vessel fixed in a furnace, and applies a fire sufficient to keep the water boiling. He likewise employs a small wooden mill to affist the ebullition of the water in giving motion to the earthy powder, which continually rising and falling down again, is brought into frequent contact with the mercury at the bottom, so as to give out its gold to the mercury in as many hours as the common process without heat requires days.

When the gold is judged to be united with the mercury, the earthy powder is washed off by water, so as to leave the *amalgam* clean. The gold-dust, or *shining*, dispersed through the sweepings of the gold-smiths shops, are recovered also by *amalgamation* with mercury. Com. Phil. p. 193, &c. See Gold.

AMALGAMATION *of iron*. It is well known that this operation has been reckoned extremely difficult, if not absolutely impossible. However, M. Navier succeeded in combining mercury with iron by the following process. Having made strong solutions of iron and of mercury separately in distilled vinegar, he put equal quantities of each into a matrass, which he placed in *balneo Mariæ*. As soon as the liquor became very hot, there began to be formed on its surface, and within it, an extremely light, fine, white substance, resembling snow, which evidently contained mercury and iron, in a saline form, intimately united with each other. The liquor being filtered, left behind this snowy substance, which, when washed and dried, appeared to be a silvery mass, made by the union of innumerable crystals in the form of thin plates, without acidity or acrimony. Mem. de Math. & de Phyf. vol. vi. Mem. 2.

AMALGAMATION *of lead* is thus performed. Melt a proper quantity of pure lead in an iron crucible, remove the veffel from the fire, and when the metal is a little cooled, pour to it an equal weight of clean mercury, which will immediately enter the lead with a hiffing noife. Stir the mixture well together with an iron rod, and when cold, it will appear in the form of a foftith brittle mafs, called the *amalgam* of mercury with lead.

Bifmuth promotes the action of mercury upon lead in a remarkable manner. Mercury impregnated with one fourth, one eighth, one twelfth its weight of bifmuth, diffolves maffes of lead, in a gentle warmth, without the agitation, or triture, or comminution, or melting heat, neceffary for uniting lead with pure mercury. Lewis's Ed. of Neumann's Works, p. 93.

AMALGAMATION *of platina*. Dr. Lewis rubbed together one ounce of *platina* with fix ounces of pure quickfilver, together with a little common falt and water, and a few drops of fpirit of falt, in an iron mortar. After the grinding has been continued for about fix hours, the grains of *platina* appeared to be coated with the quickfilver, fo as to cohere together in a kind of imperfect *amalgam*. After repeating the experiment feveral times, and evaporating the mixture, he always found, upon examining the dark-coloured powder, intermingled with fhining particles which remained, that a part of the *platina* was diffolved by the mercury, and that the undiffolved grains were coated with it. Com. Phil. &c. p. 508.

AMALGAMATION *of filver* is performed much after the fame manner with that of gold; or it may be previously diffolved in *aqua fortis*, and then precipitated. Mr. Gellert obferves concerning this *amalgam*, that its fpecific gravity is not only greater than the intermediate fpecific gravity of the mercury, and of the filver, but that it is even greater than the fpecific gravity of mercury, although filver is much lighter. Metall. Chym. tom. i.

This *amalgam* is ufed in the operation of filvering, and alfo in making the *Silver Drops*.

The method of extracting filver by *amalgamation* is this: wafh the ores, earthy ftones, fands, &c. in which filver lies hidden in its metallic form, and when well waffied, infufe them in very ftrong vinegar in a clean wooden, or glafs veffel; about one tenth part of alum muft alfo be firft boiled, and diffolved in the vinegar; let the vinegar entirely cover the ore, and leave it thus for one or two days. Decant off the vinegar, and wafh the macerated powder in pure warm water, till the water becomes quite infipid, when juft poured upon it; dry the powder, and put it into an iron mortar; then add mercury four times the quantity of the dried powder, and with a wooden peftle fitted to the fize of the mortar with a large round head, beat the whole till every part of the powder is recovered of a blackifh colour, by the minute globules of mercury mixt with it; at this time pour water on the whole, and continue rubbing it with the peftle for fome time; pour out the turbid water, and add freth, till all the loofe powder is waffied off; then dry the *amalgam* with a fponge. Cramer's Art of Affaying, p. 232.

To feparate the filver from this *amalgam*, fpread a piece of leather over a wide earthen or glafs veffel, fold it up in the form of a bag, and put the *amalgam* into it; tie the *bag* very firmly at the top, and fqueeze it very hard, and the greateft part of the mercury will be forced through into the veffel placed underneath; untie the *bag*, and all the filver and gold, if there be any there, will be found remaining in it, with about an equal quantity of the mercury mixed with it. Put this paffe into a glafs retort, fet it in a fand heat, adapt on a receiver, with a quantity of water in it; let the nofe of the retort be immerfed in the water, make a fire confiderably ftrong, and the mercury will all be driven into the receiver, falling into the water with a hiffing noife. If you hear a crackling in the retort, diminifh the fire a little; when no more quickfilver can be driven over by a great fire, let the retort grow cool, then take it away, and fplit it by means of a thread dipped in brimftone tied round the belly of the retort, and then fet the fire-tube on the mark, and in an open fire run it, with the help of borax, into a mafs. Ibid.

AMALGAMATION *of tin* is made in the fame way with that of lead. This is ufed for ftaining looking-glaffes, and for making mercury-balls, ufed in purifying waters. Mr. Cannon firft obferved, that a fmall quantity of this *amalgam*, with a very little chalk or whiting, being rubbed on the cufhion of a glafs globe, or on the oiled filk-rubber of a tube, would contribute to increafe the power of electricity; fo that they might be excited by this means to a very great degree with very little friction, efpecially if the rubbers be made more damp or dry, as occafion may require. Phil. Tranf. vol. li. p. 461. *See Experiments, &c. in* ELECTRICITY.

AMALGAMATION is alfo applied, in a lefs proper fenfe, to a folution of fulphur with mercury.

In this fenfe *amalgamation* amounts to the fame with mollification, or foftening; in which fenfe the word is ufed by fome ancient chemifts.

AMALOZOUE, in *Ornithology*, a name under which Nieremberg defcribes a Mexican bird. The neck of this is red; it is of the fize of the turtle, and lives about the lakes and rivers, but has not webbed feet; the breaft, belly, and under-part of the wings are white; the tail is variegated with black and yellow, and it has two black circles, a finger's fpace afunder, round the neck and breaft. It has a very long and ftender neck, and feeds on the infects common in watery places. Ray.

AMAN, a fort of blue cotton cloth, which comes from the Levant by the way of Aleppo.

AMANDAVAS, in *Ornithology*, a fpecies of the FRINGILLA, common in the Eaft Indies.

AMANITA; fee AGARICUS.

AMARACUS, among *Ancient Naturalifts*; fee SAMYDUCHUS.

AMARACUS, in *Botany*; fee *Baftard* PENNYROYAL.

AMARADULUS, in *Botany*, a name fometimes given to the woody NIGHTSHADE.

AMARANTH, an order of knighthood, inftituted in Sweden by queen Chriftina in 1645, at the clofe of an annual feaft, celebrated in that country, and called *Wittefeaft*.

This feaft was folemnized with entertainments, balls, mafquerades, and the like diverfions, and held from evening till the next morning. That princefs, thinking the name too vulgar, changed it into that of the *feaft of the gods*, becaufe each perfon here reprefented fome deity, according as it fell to his lot. The queen affumed the name of *Amarante*, that is *unfading*, or *immortal*. The young nobility, dreffed in the habit of nymphs and fhepherds, ferved the gods at the table. At the end of the feaft, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the mafquers; and, in memory of fo gallant a feaft, founded a military order, called, in Swedifh, *fatzihoffs*, into which all that had been prefent at the feaft were admitted, including fixteen lords, and as many ladies, befides the queen. Their device was the cypher of *Amarante*, compofed of two A's, the one erect, the other inverted, and interwoven together; the whole inclofed by a laurel crown, with this motto, *Live with immortals*. Bulftrode Whitlock, the Engliih ambaffador from Charles II. to the court of Sweden, was made a knight of the order of *Amarante*. On which account it feems to be, that we fometimes find him ftyled Sir Bulftrode Whitlock.

AMARANTH, AMARANTHUS, *flower gentle*, or *prince's feather*, in *Botany*, a genus of the *monœcia pentandria* claſs. The characters are theſe: it hath male and female flow-

flowers on the same plant. The flower hath no petals, but the empalement consists of three or five leaves, which is common to both sexes. The male flowers have in some species three, in others five slender stamina. The female flowers have three short styles; the seed-vessel hath one cell, in which is lodged a single globular seed. There are annual species.

The species of this plant cultivated in gardens for their beauty, are raised on hot-beds; and in June or July may be planted into the borders of the pleasure garden, shading them until they have taken new root; and in dry weather they should be well watered.

All the species of this plant are drying and astringent, but heat not in a violent degree. Schroder recommends the flowers of the common large garden-kind dried and powdered, as good in diarrhœas, dysenteries, hæmorrhages of all kinds, and incontinence of urine; but they are very little used in the present practice.

AMARANTH expresses a colour inclining to purple. The name is derived from the flower.

AMARANTHOIDES, in *Botany*, *lithe amaranth*, or GOMPHRENA of Linnæus.

The culture and propagation of these plants are, in all respects, the same with that of the AMARANTH: only that they must have a greater share of heat, and must be forwarded more in the spring.

The flowers of this plant are commonly known by the name of *everlasting flowers*; and, if kept in a dry place, after having been gathered in their full perfection, and before they begin to decay on the plant, they will retain their full beauty many years.

AMARYLLIS, in the Linnæan system of *Botany*, the name of a genus of plants of the *hexandria monogynia* class, called in English *daffadillies*, and by other botanical writers *lilionarcissus*: the corolla is bell-shaped, with six petals; the stigma is divided into three segments.

AMATIDES, in *Natural History*, a name given by Bartholomæus Anglus, and other writers of his time, to a stone, of which they recorded a wonderful virtue in resisting the fire.

AMATORII *musculi*, in *Anatomy*, an appellation sometimes given to those muscles of the eyes which give them a call sideways, and assist in that particular look by some called *ogling*.

When the *abductor* and *humilis* act together, they give this oblique motion.

AMAUROSIS, in *Surgery*, a deprivation of sight; the eye remaining fair, and seemingly unaffected.

The word is formed of *αμαυρωω*, *I darken*.

Amaurosis is the same with what the Latins more usually call GUTTA *serena*.

A *perfect amaurosis* is when the blindness is total; when there is still a power of distinguishing light from darkness, the disease is called by M. de St. Ives an *imperfect amaurosis*. There is a periodical sort which comes on instantaneously, continues for hours, or days, and then disappears. The *mythiasis* is considered by some as a species of this disease. This disorder must be carefully distinguished from the *glaucoma*, or CATARACT; and a vertigo, which require different methods of treatment. If the *amaurosis* succeeds a fever, or comes upon the aged, or very infirm, a cure is not to be expected; if one eye fails, the other usually soon follows. But if the case be slight, and the habit of the body robust, if it happens after the measles, or small-pox, or in pubertine virgins, it is sometimes cured.

Mr. Hey, surgeon at Leeds, mentions several cases of patients afflicted with the *amaurosis*, who were relieved by being electrified. Med. Obf. and Inq. vol. v.

This distemper is sometimes denominated *scotoma nigra*, the black cataract.

The *amaurosis* differs from the AMBLYOPIA, this being in an inferior degree. For methods of cure, &c. see Heister, Hoffman, St. Ives, &c.

AMAUSA, a name by which the chemists have called the PASTES made of lead and cryftal with various admixtures, for imitating gems.

AMAXOBII, see HAMAXOBII.

AMAZON, in *Antiquity*, denotes a bold, courageous woman, capable of doing hardy atchievements.

AMAZONS, in a more peculiar sense, denote an ancient nation of warlike women, who founded an empire in Asia Minor, upon the river Thermodoon, along the coasts of the Black Sea.

The *Amazons* are said to have formed a state out of which men were excluded. What commerce they had with that sex, was only with strangers; they killed all their male children, and cut off the right breasts of their females, to make them more fit for the combat.—From which last circumstance it is, that they are supposed to take their name, viz. from the privative α, and μαζος, *mamma*, *breast*.

It is a point controverted, even among ancient writers, whether ever there really were such a nation of *Amazons*?—Strabo, Palæphatus, and others, absolutely deny it: on the contrary, Herodotus, Pausanias, Diodorus Siculus, Trogus Pompeius, Justin, Pliny, Mela, Plutarch, &c. expressly assert it.

Hippocrates mentions a law among the *Amazons*, whereby they were doomed to remain virgins, till such time as they had slain three men of their enemies.—He adds, that the reason of their cutting off the right breast was, to make the right arm the stronger; as supposing this would now receive the whole nutriment, which would otherwise have been divided between both.

Some authors relate, that, instead of killing, they only twisted the legs of their male children, to prevent their being able to contend with them for the mastery.

Dr. Bryant, in his Analysis of Ancient Mythology, explodes the above account of the etymology and establishment of the *Amazons* as fabulous; and observes, that they were, in general, Cushite colonies from Egypt and Syria, who formed settlements in different countries, and that they derived their name from *ase*, the *sun*, which was the national object of worship. Vol. iii. p. 463.

M. Petit, a French physician, published a Latin dissertation, in 1685, to prove, that there was really a nation of *Amazons*; it contains abundance of curious inquiries, relating to their habit, their arms, the cities built by them, &c.—On medals, the *Amazons* bust is usually armed with a little ax, called *bipennis*, or *securis*, borne on the shoulder, and a buckler, in form of a half-moon, by the Latins called *pelta*, on the left arm.—Hence that of the poet:

Non tibia Amazonia aft gre ut fumenda fecuris,
Aut exsita levi pelta gerenda manu.

Ov. ex Pont.

We read of Scythian *Amazons* in Herodotus; of Lybian *Amazons*, in Diodorus Siculus; and of German *Amazons* in Lucius Florus. Later geographers and travellers also speak of Mingrelian, and Georgian *Amazons*; *Amazons* in America, in Monomotopa, in the Philippine islands, in Denmark, &c.

The *Amazons* of South America, living on the banks of the great river which bears their name, make the greatest figure in modern story. They are represented as governed and led to war only by their queen. No men are suffered to live among them; though those of some neighbouring nations are suffered to visit them, at a certain season, for the sake of procreation. The females issuing from this commerce are bred up with care, and instructed in what relates to war and government; as to the males, they are sent away into the country of their fathers.

Some modern geographers and travellers mention *Amazons* still in being.—John de los Sanctos, a Portuguese Capuchin, in his description of Æthiopia, speaks of a race of *Amazons* in Africa; and Æneas Sylvius gives us a very precise account of a republic of real *Amazons*, in Bohemia, which lasted nine years; founded by the courage of a maid named Valasca.

AMAZON is also applied, in a figurative sense, to bees, because among these insects the females alone are commonly supposed to bear sway.

Aristotle, treating of the breeding of bees, professes himself ignorant of their sex; and therefore, willing to keep up the prerogative of the males, calls their governor ΒΑΣΙΛΕΥΣ, *rex*, in which he has been followed by the generality of authors.

An ingenious writer of our own country, takes the liberty to strain the ordinary signification of the word *rex*, and in such places translates it *queen*, this being an *Amazonian*, or female kingdom.

Mr. Warder has published a work under the title of the True *Amazons*, or Commonwealth of BEES.

AMAZONIAN, something relating to, or resembling AMAZONS.

AMAZONIAN *kingdom*, is particularly used for a feminine one, or that wherein the females alone bear rule.

AMAZONIAN *habit*, in *Antiquity*, denotes a dress formed in imitation of the *Amazons*.

Martia, the famous concubine of the emperor Commodus, had the appellation *Amazonian*, because she charmed him most in a habit of this kind.—Hence also that prince himself engaged in combat, in the amphitheatre, in an *Amazonian* habit; and of all titles the *Amazonius* was one of those he most delighted in.—In honour either of the gallant, or his mistress, the month December was also denominated *Amazonius*.

Some also apply *Amazonian habit* to the hunting dress worn by many ladies among us.

AMAZONIUS is an appellation given to a kind of pastil or *troche*, anciently used against risings of the stomach, and vomitings.—The ingredients of which it is com-

posed

posed, are smallage, anise-seed, worm-wood, myrrh, pepper, *castoreum*, *opium*, and cinnamon.

AMBA, in *Botany*, a name by which some authors have called the *mango Indica*, or MANGO-*tree*, called also *ambolans*, and *ambe*.

AMBACHT, in *Topography*, denotes a kind of jurisdiction, or territory, the palatine whereof has the administration of justice, both in *alta* and *basa*; or of what is called in the Scotch law a power of pit and gallows, i. e. a power of drowning and hanging.

In some ancient writers *ambacht* is particularly used for the jurisdiction, government, or chief magistracy of a city. The word is very ancient, though used originally in a sense some what different. Ennius calls a mercenary, or slave hired for money, *ambactus*; and Cæsar gives the same appellation to a kind of dependents among the Gauls, who, without being slaves, were attached to the service of great lords.

AMBAGES, *circumlocution*; an indirect discourse, or phrase, tending to express or shew something by a Compass of words or sentiments fetched from afar.

AMBAIBA, the name of a tree in Brasil, called by the Indians, *tipinon*. Ray's Hist. of Plants.

AMBAITINGA, the name of a tree whose leaves are so rough, that they may be used to polish hard wood. Ray's Hist. of Plants.

AMBAR-*seed*, in the *Materia Medica*, a name by which some have called musk-seed.

AMBARVALIA, in *Antiquity*, a feast, or ceremony, among the Romans, celebrated annually, in honour of the goddess Ceres, in order to procure a happy harvest.

At these feasts they sacrificed a bull, a sow, and a sheep; which, before the sacrifice, were led in procession thrice around the fields; whence the feast is supposed to have taken its name; from the Greek *amfis*, *around*; or the Latin *ambio*, *I go round*; and *arvum*, *field*. Though others write it *amburbalia*, and *amburbia*, and deduce it from *ambire urbem*, *to go round the city*.

From the beasts offered in sacrifice, the ceremony was also called SUOVETAURILIA.

Some will have the *amburbalia* to have been held twice a year; the first time towards the end of January, or, as others think, in April; and the second time in July, or, as Rosinus imagines, in August; at the time when the harvest was ripe, *maturis frugibus*. Which opinion is the more probable, because Ovid, who, in his Fasti, describes the feasts in the first six months of the year, from January to June inclusive, says nothing of the *amburbalia*.

The sacrifice offered on this occasion was hence called *amburbiale sacrum*, and *hostia amburbialis*.

The *amburbalia* were of two kinds, *public* and *private*.

The *private* were those solemnized by the masters of families, accompanied with their children and servants, in the villages and farms out of Rome. They walked three times round the grounds, every one being crowned with leaves of oak, and singing hymns in honour of Ceres. After the procession, they went to sacrifice.

The *amburvale carmen* was a prayer preferred on this occasion; wherein we have the *formula* preferred in Cato.

The *public amburbalia* were those celebrated in the boundaries of the city; and in which the twelve *fratres arvales* officiated pontifically, walking, at the head of a procession of the citizens, who had lands and vineyards at Rome.

The prayer, or *formula*, here used, was *averrua morbum, vortere, taben, pedum, impetigenem, pestilatem*.

Some make a quinquennial as well as an annual *amburbalia*, the one performed once every *lustrum*, the other once a year.

The priests who chiefly officiated at the solemnity, were called *fratres* ARVALES.

AMBARVALIS *fos*, in *Botany*, a name given, by some authors, to the *polygala*, or milkwort.

AMBASSADOR. See EMBASSADOR.

AMBE, in *Anatomy*, a superficial jutting out of a BONE.

AMBE, in *Surgery*, is also used as the name of an ancient instrument, with which they reduced dislocated bones. The *ambe*, or *ancumandre*, is mentioned by Hippocrates, and has its partisans among the moderns, especially for replacing the arm.

It consists of an horizontal lever, and a fixed point made of a piece of wood standing vertically, to the extremity of which the lever is jointed by a hinge. The patient sitting, and his arm that is hurt being raised, the machine is pushed forward under the arm-pit, as far as can be: *curandum*, says Hippocrates, *ut quam penitissimè alam subeat*. The arm is tied to this horizontal piece, and then an assistant bears upon the scapula and the clavicula, whilst another presses down the lever, and thus makes the bone come into its place again. See *Tab.* III. *Surgery fig.* 32.

The capital defect of the *ambe* is, that it pushes the head the bone into its cavity, before the extension and counter extension are made; the dangerous consequences of which are, first, that the reduction is very difficult, because the bone is not conducted by the same [illegible] took in hunting itself, and that one meets with o[illegible] from the parts that surround it, even the *scapula* on which it articulates. Secondly, in making effort surmounting those obstacles, one runs the risque o[illegible] ing inwards the cartilaginous edge of the cavity *fossula*, or the *capsula ligamentosa*. The third d[illegible] the *ambe* of Hippocrates is, that it cannot move the luxated bone, but from below upwards; consequently the machine is only proper in luxations directly downwards; and yet it is certain, that the arm luxates itself both outwards and inwards, and sometimes forward are very frequent. In those cases, the *ambe* is useless, and being dangerous in luxations downwards, it follows, that this machine (shown by Hippocrates very near the clavicle, Mr. le Cat, in the Phil. Trans. N° 469, has endeavoured to remedy these defects, by giving the description and use of a new *ambe*, not subject to the inconveniencies of the old one.

AMBER, *succinum*, or *lacabe*, in *Natural History*, &c. a yellow, transparent fossil juice, of a gummous or bituminous form or consistence, of a resinous taste, and a smell like oil of turpentine; chiefly found in the Baltic sea, along the coasts of Prussia, &c. of use in medicine, and in divers arts.

The word is originally Arabic, *ambar*, or *anbar*, which signifies the same.

This substance has been in great repute in the world from the very earliest times we have any knowledge of; many years before Christ it was in esteem as a medicine; and Plato, Aristotle, and Herodotus, and among the poets, Æschylus, and others, have commended its virtues. In the times of the Romans it became in high esteem as a gem; and in the luxurious reign of Nero, immense quantities of it were brought to Rome, and used for ornamenting works of various kinds. Long after this, Theodoric king of the Goths shewed a high esteem for it. However well known, and however highly esteemed this substance was in these ages, its nature and origin yet remained unknown through a long series of time, and various conjectures were made about it in the different places where people were pussified of it among their gems.

The generality of the false accounts of *amber* have been owing to the ignorance of the persons who have taken upon them to give the history of it: they have, in general, taken upon hearsay what they have related, or borrowed it from books they were not able to understand. Thus we find the many places in Asia and Africa celebrated for producing large stones of *amber*, are taken upon credit from the old authors, who have mentioned *ambra* as being found there; these copiers not distinguishing, that *ambra* in those places is not given as the name of *succinum*, or *amber*, but that of the rich perfume called *ambergris*, which is found there, though the real *amber* never was.

The name of *oriental amber*, so common with some, seems to have been also owing to a mistake, but of another kind; the gum COPAL, brought from the East Indies, is very like *amber*, and some of the fantastic writers in chemistry have called this by the forced name of *oriental amber*. Hence those who read their works, without perfectly understanding them, have supposed that *amber* was common in the East Indies; and as all the gems of that part of the world are superior to those of other places, they began to call all the fine pieces of this fossil, by the pompous name of *oriental amber*. But it is certain, that we have no authentic account of its ever having been found in any of those regions. All the intelligent persons who have resided in the East Indies, say, that they never saw or heard of *amber* being found there. And, upon the whole, it seems very rational to conclude, that our *oriental amber* never existed, other wise than in the error before mentioned, of calling COPAL by that name. This we are very well assured of, that the Chinese, who are so cunning a people as any in the world, expend annually with us vast sums of money in buying European *amber*, and have done so at all times since we have traded with them; and it is by no means to be supposed that they would purchase it at us, if they had it nearer home. Europe seems the only region of the world where *amber* is produced: it seems also to be produced almost all over Europe, but not in equal plenty, nor perfection; the German dominions, and the country about the Baltic, claim the prerogative above all other places. Hartman, who has given the above mentioned account of the errors of the ancients, &c. in regard to the places of its origin, has been too free in censuring the moderns for giving it, to some parts even of Europe, he scruples to believe that *Italy*, Spain, and even England, produce *amber*; but

but in this he errs: he supposes that *ist*, which is called by some *black amber*, being found in these places, has imposed upon the authors of these accounts, and made them say *amber* was found there; but nothing is more certain, than that *amber*, and that of the finest kind in the world, is found in England at least, if not in the other places where he doubts of its production.

Amber is at this time thrown on the shores of Yorkshire, and many other places; and found even in our clay-pits; the pits dug for tile-clay, between Tyburn and Kensington Gravel-pits, have afforded many specimens; and those behind St. George's Hospital, at Hyde-park Corner, has afforded fine specimens, one of which has been wrought into a beautiful cane-head of three inches long; and if we mention Dr. Woodward, and the other authors, who have themselves taken it up, we shall have no room to doubt of its being real *amber*, not *jet*, as Hartman supposes.

Poland, Silesia, and Bohemia, are famous for the *amber* dug up there at this time. Germany affords great quantities of *amber*, as well dug up from the bowels of the earth, as tossed about on the shores of the sea and rivers there. Saxony, Misnia, and Sweden, and many other places in the tract of Europe, abound with it. Denmark has affirmed, as different times, several quantities of fossile *amber*, and the shores of the Baltic abound with it. But these countries lying on the Baltic afford it in the greatest abundance of all: and of these the most plentiful country is Prussia, and the next is Pomerania. Prussia was, as early as the times of Theodoric the Goth, famous for *amber*; for this substance coming into great repute with this prince, some natives of Prussia, who were about this court, offered their service to go to their own country, where that substance, they said, was produced, and bring back great stores of it. They accordingly did so; and from this time Prussia had the honour to be called the *Country of Amber*, instead of Italy, which had before so deservedly that title.

This *amber* of Prussia is not only found on the sea coasts, but in digging; and though that of Pomerania is generally brought from the shores, yet people, who dig on different occasions in the very heart of the country, at times find *amber*. Phil. Trans. N° 248. p. 5. See MATRIX *Succini*.

Junker describes, after Neumann, the Prussian *amber-mines*, which are the richest known.

First, at the surface of the earth, is found a *stratum* of sand. Immediately under this sand is a bed of clay, filled with small lumps of about an inch diameter each. Under this clay lies a *stratum* of black earth, or turf, filled with fossile wood, half decomposed, and bituminous; this stratum is extended upon a bank of minerals, containing little metal, except iron, which are consequently pyrites. Lastly, under this bed the *amber* is found, scattered about in pieces, or sometimes accumulated in heaps.

Naturalists are greatly divided as to the origin of *amber*, and what class of bodies it belongs to; some referring it to the vegetable, others to the mineral, and some even to the animal kingdom. Its natural history, and its chemical analysis, afford something in favour of each opinion.

Pliny describes it as, 'a reluctant juice, oozing from 'pines and firs (others say from poplars), whereof there 'are whole forests on the coasts of Sweden), and discharged thence into the sea, where, undergoing some 'alterations, it is thrown, in the form upon the shores 'of Prussia; which he says low: he adds that it was 'hence the ancients gave it the denomination *succinum*, 'from *succus*, *juice*.'

This opinion of the ancient naturalists seem confirmed by observations of many of the modern ones; particularly of the learned father Camelli. Phil. Trans. N° 290.

Some suppose it a BITUMEN, trickling into the sea from subterraneous sources; and those concreted into this form, and thrown ashore by the waves. But a good *amber* has been found in digging at a considerable distance from the sea, as that gathered on the coast.

Others suppose *amber* a compound substance—Prussia, say they, and the other countries which produce *amber*, are mentioned with a bituminous juice, which mixing with the vitriolic salts abounding in those places, the points of those salts fix its fluidity, whence it congeals, and the result of that congelation makes what we call *amber*; which is more or less pure, transparent and firm, as those parts of salt and bitumen are more or less pure, and are mixed in this or that proportion.

Mr. Brydone, in his Tour to Sicily and Malta, says, that the river Gearretta, formerly celebrated by the poets under the name of Simetus, throws up near its mouth great quantities of *amber*. Vol. I. Lett. 22. p. 282.

He mentions also a kind of artificial *amber*, not uncommon there, made, as he was told, from COPAL, but very different from the natural. Ib. p. 284.

If the people, who collect *amber* on the shores of the Baltic, were more curious and particular in their observations of the masses they find, we should doubtless have much more light into its true history and nature. There is no question but that some pieces of it are tossed up there in imperfectly formed, that the process of nature may be seen in its different stages. Pieces have been sometimes found to soft, as to receive the impression of a seal; these are always not only perfect *amber* in other respects, but they are observed to have a smell stronger than the common *amber* has. These pieces sometimes harden immediately on being exposed to the air, but sometimes they remain this softness many months. We have an account of such as piece, which had remained this softness a whole year, in which time it had lain among other pieces of *amber*, and of another mark received on one side, and hard on the other, and containing in the soft part a fly buried. Phil. Trans. N° 57.

Hartman has undertaken to prove, that *amber* is formed of a BITUMEN, mixed with vitriol and other salts; and though this is allowed him in regard to the fossile *amber*, many dispute whether the sea or *beautiful amber*, as they express it, be so produced. It is, however, very evident, that all *amber* is of the same origin; and probably all the *beautiful amber* is first washed into the sea out of the cliffs; though Hartman thinks it very possible, that some of it may be formed in the earth under the sea, and be washed up thence. The *beautiful*, or *fine amber*, is usually finer to the eye than the *coarse*; but the reason is, that it is divested of that coarse coat with which the other is covered within in the earth. Hartman's Hist. Succini.

The chemists are as much divided on this head as the naturalists. *Amber* being found by distillation to yield an acid spirit, which precipitates into salt, is inferred, by some to be of a mineral nature; this being a circumstance peculiar to this kingdom, and never found in the distillation of vegetables; to which may be added, that *amber* dissolves in *alcohol*, not in water; and melts at the fire, and is inflammable; which are characters that seem to refer it to the class of sulphurs, or bitumens.

Others, on the contrary, argue it to be of the vegetable kind, from its resolving into the same principles with vegetables, viz. water, spirit, salts, and oil. See MATRIX *Succini*. Boerhaave reconciles it to camphor, which is a concrete oil of the aromatic plants of hot countries, elaborated by heat into a crystalline form.

Amber, though fusible with a small fire, and concreting again when cold, yet differs from the metals, and other fusible bodies of that kind, in this, that as soon as cold they are the same as before melting; but *amber*, when it has once been melted, is no longer *amber*, it loses its beauty and hardness; and the true reason of this is said to be, that being compoled of an UNCTUOUS and fat, the fat flies off in the heating, and leaves the remainder little better than the simple resinous or any exported *gummous*, or any other liquid bitumen. There have been people, at different times, who have pretended to have an art of melting small pieces of *amber* into a mass, and constituting large ones of them; but this seems such another undertaking as the making of gold; all the trials that have yet been made by the most curious experimenters, proving, that the heat which is necessary to melt *amber*, is sufficient to destroy it. Phil. Trans. N° 248. p. 25.

Hartman indeed mentions an accident, which shews a possibility of many pieces of *amber* being combined into one by an operation of nature, though it never could be effected by art. A sheep was once killed in Prussia, in whose stomach a large piece of *amber* was found, which was composed of several other smaller pieces, the joinings of all which might be seen, though as firm as the pieces themselves. This is a proof that the creature had swallowed the whole in small pieces with its food, and that nature, by the heat and juices of its stomach, had softened these pieces without melting them, so as to make them unite firmly, though not so as to be thoroughly blended with each other. Could art arrive at this, whether it is not probable it ever will, even this is far short of what is pretended of melting *amber*, and calling it into what form is defired.

There are several indications which discover where *amber* is to be found.—The surface of the earth is there covered with a soft scaly stone; and vitriol in particular always abounds there, which is sometimes found white, sometimes reduced into a matter like melted glass, and sometimes figured like petrified wood.

Amber assumes all figures in the ground; that of a pear, an almond, a pea, &c. In *amber* there have been faid to be letters found very well formed; and even Hebrew and Arabic characters.—Within fome pieces of *amber* have likewife been found leaves, infects, &c. included; which feems to indicate, either that the *amber* was originally in a fluid ſtate, or that having been expoſed to the ſun, it was once ſoftened, and rendered ſuſceptible of the leaves, infects, &c. which came in its way. The latter of theſe ſuppoſitions ſeems the more agreeable to the phenomenon, becauſe theſe infects, &c. are never found in the centre of the pieces of *amber*, but always near the ſurface.

It is obſerved by the inhabitants of the places where *amber* is produced, that all animals, whether terreſtrial, aerial, or aquatic, are extremely fond of it; and that they frequently find pieces of it in their excrements, and in their bodies when opened.

The bodies of inſects, found buried in *amber*, are viewed with admiration by all the world; but of the moſt remarkable of theſe, many are to be ſuſpected as counterfeit; the great price, beautiful ſpecimens of this kind fell at, having tempted ingenious cheats to introduce animal bodies in ſuch artful manners into ſeemingly whole pieces of *amber*, that it is not eaſy to detect the fraud. The factitious curioſities in *amber*, which are pretended to be pieces of this foſſil, with inſects embedded in it, are uſually no other than a hardened varniſh, not having the hardneſs or other qualities of *amber*. Some few of them are *amber mollet*, into which the inſects have been put in that ſtate, but theſe are very coarſe and brittle. Theſe two kinds of cheat are diſcovered by their want of hardneſs, or by obſerving the ſides of the piece, to find the joining where it had been ſplit.

Many ſpecies of the fly kind, however, are obviouſly and indiſputably lodged by nature there. Among this tribe of animals, the ſeveral ſpecies of the *tipula* fly are found the moſt numerous; the common houſe and flieſh flies are alſo frequently found thus preſerved; and it is remarkable, that of thoſe ſome have preſerved, and others have wholly loſt their natural colours. Theſe are ſometimes found in cloudy pieces of *amber*, but much more frequently in the perfectly clear and fine ones; and in theſe many are ſeen plainly to be encruſted with a thin coat of the matter of the *amber*, ſeparate from the maſs.

Some of theſe, which are incloſed in it, are plainly ſeen to have ſtruggled hard for their liberty, and even to have left their limbs behind them in the attempt; it being no unuſual thing to ſee in a maſs of *amber* that contains a ſtout beetle, the animal wanting one, or perhaps two of its legs; and thoſe legs left in different places, nearer that part of the maſs from which it has travelled. This alſo may account for the common accident of finding legs, or wings of flies, without the reſt of their bodies, in pieces of *amber*; the inſects, to which theſe have belonged, having, when entangled in the yet ſoft and viſcid matter of the *amber*, eſcaped, at the expence of leaving theſe limbs behind them. Drops of clear water are ſometimes alſo preſerved in *amber*. Theſe have doubtleſs been received into it while ſoft, and preſerved by its hardening round them. They are uſually contained in cavities too large for them, though ſometimes the holes are filled up. In ſome ſpecimens, the holes alone remain without any moiſture. Naturaliſts, who have been ſo curious as to examine this liquor contained in the *amber*, have found it to be of an auſtere taſte, like that in which vitriol had been diſſolved; others mention the having met with it wholly inſipid, and ſome taſting of ſea-ſalt. It is eaſy to account for a drop of water, of any of the three kinds, being found in *amber*, but the vitriolic water is the moſt natural there, as there is always great plenty of vitriol where the *amber* is found.

Beautiful leaves of a pinnated ſtructure, reſembling ſome of the ferns, or maidenhairs, have been found in ſome pieces; but theſe are rare, and the ſpecimens of great value.

Mineral ſubſtances are alſo found at times lodged in maſſes of *amber*. Some of the pompous collections of the German princes conſiſt of ſpecimens of native gold and ſilver in maſſes of *amber*; but as there are many ſubſtances of the marcaſites, and other kinds, that have all the glittering appearance of gold and ſilver, it is not to be too haſtily concluded that thoſe metals are really lodged in theſe maſſes of *amber*. Iron is found in various ſhapes intermixed in *amber*, and as it is often ſeen eroded, and ſometimes in the ſtate of vitriol, it is not impoſſible but that copper, and the other metals, may be alſo ſometimes immerſed in it in the ſame ſtate: and that the bluiſh and greeniſh colours, ſometimes found in the recent pieces of *amber*, may be owing, like the particles of the gem colours, to thoſe metals; but as the gems, by their denſe texture, always retain their colours, this lighter and more lax bitumen uſually loſes what it gets of this kind, by keeping ſome time. Small pebbles, grains of ſand, and fragments of other ſtones, are alſo unfrequently alſo found immerſed in *amber*.

There is one very eaſy way of diſtinguiſhing alſo whether theſe are real and natural curioſities, or whether it has been concerned in them; which is by examining what depth in the maſs the creature lies. Insects naturally embodied in *amber* are always found near its ſurface, or, at leaſt, there are few found otherwiſe. Artificially buried creatures are always lodged in or near the centre. The reaſon of this is plain; for the artiſt knows the deeper the creature lies, the better his art will be concealed; and that if he had lodged it near the ſurface, the natural tranſparence of the thin plate of *amber* which lay over it, would have ſhewn the fallacy, by bringing the artificial hollow too near the eye. Phil. Tranſ. N° 248. p. 81.

The moſt remarkable property of *amber* is, that, when rubbed, it draws or attracts other bodies to it; and this, it is obſerved, is does even to thoſe bodies which the ancients thought it had an antipathy to; as oily bodies, drops of watery ſweat of human bodies, &c.

Add, that by the friction it is brought to yield light pretty copiouſly in the dark; whence it is reckoned among the native *phoſphori*.

This property which *amber* poſſeſſes of attracting light bodies was very anciently obſerved. Thales of Miletus, ſix hundred years before Chriſt, concluded from hence that it was animated. But the firſt perſon, who expreſly mentions this ſubſtance, is Theophraſtus, about the year 300, before Chriſt. The attractive property of *amber* is likewiſe occaſionally taken notice of by Pliny and other later naturaliſts, particularly by Gaſſendus, Kenelm Digby, and ſir Thomas Brown; but it was generally apprehended that this quality was peculiar to *amber* and jet, and perhaps agate, till Gilbert publiſhed his treatiſe De Magnete, in the year 1600. From καϰτρον, the Greek name for *amber*, is derived the term ELECTRICITY, which is now very extenſively applied not only to the power of attracting light bodies inherent in *amber*, but to other ſimilar powers, and their various effects, in whatever bodies they reſide, or to whatever bodies they may be communicated.

Some diſtinguiſh *amber* with regard to its colours, into *yellow*, *white*, *grey*, and *black*. But the two latter are properly of a different nature and denomination; the one called JET, the other AMBERGRIS.

The *white* is moſt valued for medicinal uſes, as being beſt digeſted, of the moſt odoriferous ſmell, and containing the greateſt quantity of volatile ſalt. The *yellow* is moſt prized by thoſe who work it into beads, and other toys, by reaſon of its tranſparency.

There are two methods of rendering *amber* tranſparent; either by cementing lumps of it with heat, during forty hours, in an iron pot; or by digeſting them, during twenty-four hours, in boiling rape-ſeed oil.

AMBER is the baſis of all varniſhes. For the method of diſſolving this ſubſtance into varniſh, ſee VARNISH.

But *amber* could be diſſolved without impairing its tranſparency, or one large maſs be made of it by uniting ſeveral ſmall ones, it is eaſy to ſee what would be the advantages of ſuch a proceſs. The art of embalming might poſſibly be alſo carried to a great height by this. If we could preſerve the human corpſe in a tranſparent caſe of *amber*, as the bodies of flies, ſpiders, grathoppers, &c. are, to a great perfection. Something of a ſubſtitute of this kind we have in fine roſin, boiled to a great hardneſs, and perfect tranſparence; this being diſſolved by heat, and the bodies of ſmall animals ſeveral times dipped in it, they are thus coated with colophony, that in ſome degree reſembles *amber*; but this muſt be kept from duſt. Shaw's Lectures, p. 425.

For the methods of diſſolving *amber* in oils, the advantages of ſuch ſolutions, and a farther account of its preparation for varniſhes, the curious may conſult Dr. Lewis's Commerc. Phil. Tech. p. 366, &c ſeq.

AMBER is reputed of ſome medicinal efficacy; being uſed in fumigations, to remove defluxions; and in powder, as an alterant, abſorbent, ſweetener, and aſtringent.

In times of the plague, thoſe who work in *amber* at Koningſberg, are ſaid to be never infected; whence it is held a preſervative. It is alſo eſteemed a lithontriptic, diuretic, and promoter of the *menſes*.

It is preſcribed in the *fluor albus*, in convulſions, and in all diſorders of the nerves. It is alſo given in coughs, and diſeaſes of the lungs; and is by ſome greatly recommended in inveterate head-ache. Its dote is from one ſcruple to two.

In

Its preparations are as follow:

AMBER, *spirit of*, is an acid liquor, procured from amber by putrefying and diſtilling it with a ſand heat, with or without the addition of tobacco-pipes, bricks, ſand, &c.

It is chiefly uſed externally in rheumatic pains and aches; and internally, in inveterate gleets, &c.

AMBER, *oil of*, is a fine, tranſparent, ponderous, yellow oil, procured after the ſpirit, by increaſing the degree of fire. This, by rectification, becomes a good antihyſteric, and emmenagogue; being very ſubtile and penetrative.

To purify the dark muddy *oil of amber* drawn *per ſe*, take two pounds of good brandy, one of ſea-ſalt, half a pound of the oil; mix them, and diſtil them together, and a large proportion will come over very tranſparent, and finely coloured.

AMBER, *volatile ſalt of*.—The principal chemical production of *amber*, is a peculiar acid ſalt; which riſes after the oil, and fixes in the neck of the retort, &c. Mr. Potts concludes from ſeveral experiments, that the acid of this *ſalt* is eſſentially diſſerent from the three mineral acids, and approaches neareſt to thoſe of the vegetable kingdom. See ACID of *Amber*.

It is a good cephalic, and detergent; and Quincy ſays, it extremely attenuates, and cuts, and penetrates, the moſt remote and minute recrifes; and thus ſcours, as it were, the whole nervous ſyſtem. Its chief tendency, he adds, is to ſecretion, and what it carries along with it, is by urine. It alſo contributes, with alexipharmics, to promote a *diaphoreſis*; and is *ſcarce* ever omitted in preſcription for chronic caſes, as epilepſies, palſies, &c. The great conſumption of this medicine, and the ſmall proportion that *amber* yields of it, occaſions it to be frequently adulterated with ſal ammoniac, nitre, cream of tartar, ſalt of coral, &c.

AMBER, *ſtrong*, is procured by digeſtion in ſpirit of wine with a ſand heat. It is prefended with the ſame intentions as the oil of *amber*.

AMBER, *black*, *gagate*. See JET.

AMBER, *liquid*, and *odoriferous*. See BALSAM.

AMBER-GRIS, or AMBRE GRIS, is a fatty ſubſtance, of an aſh-colour, ſometimes variegated with white, yellow, and blackiſh ſtreaks, and brought dry to us from Mauritius and Egypt. The Egyptians uſe it attenuated, as a cordial, to fortify the heart, ſtomach, and head, and to provoke luſt.—It gives a grateful ſcent to the breath, after eating; but it is not proper for thoſe who are inclinable to vapours.

AMBER-TREE, *ambrifermum*, in *Botany*, a genus of the *polygamia dioecia* claſs. Its characters are theſe: it is male and female in different plants, and the male flowers have no petals. The female flowers have the ſame ſtructure as the male, but have no ſtamina: an oval germen is ſituated in the bottom, which becomes a roundiſh capſule having four cells, and containing ſeveral angular ſeeds. There is but one ſpecies.

The beauty of this ſhrub is its ſmall evergreen leaves, which grow in cloſe ſet heads, and being bruiſed between the fingers emit a very fragrant odour.

It is but of late years, that this plant could be propagated by ſeeds, as female plants being in our gardens; they were, therefore, continued from cuttings, until ſeeds were procured from the Cape of Good Hope, from which both kinds were raiſed.

AMBERBEL, in *Botany*. See CENTAURY.

AMBERGRIS, from *amber* and *gris*, *gry*, AMBER GREASE, AMBRA GRISEA, a fragrant drug, that melts almoſt like wax; and is commonly of a greyiſh or aſh-colour, and is uſed both as a perfume, and a cordial.

It is found on the ſea-coaſts, in ſeveral countries; as, along the ſouthern and eaſtern parts of Africa, Madagaſcar, the Maldives, ſome parts of the Mediterranean, and in the Weſt Indies, about the iſlands of Bermudas and Jamaica; alſo on the coaſts of Carolina, and the weſtern coaſts of Ireland. It is likewiſe ſaid to be found on the coaſts of Norfolk, and in the iſlands of Orkney.

It is ſometimes whitiſh, browniſh, and ſtreaked with yellowiſh, blackiſh, &c.

There is a great variety of opinions among naturaliſts with regard to its origin and production: to rehearſe them all, would make a volume. Kiobius recites eighteen, to which we could add half as many more. The principal may be reduced to thoſe which follow.

1. Some take it for the excrement of a bird, called in the Madagaſcar language *ofeibibanch*; which being melted by the heat of the ſun, and waſhed off the ſhore by the waves, they ſay is ſwallowed up by whales, who return it back in the condition we find it.

2. Others ſpeak of it as the excrement of a cetaceous fiſh: becauſe ſometimes found in the inteſtines, and ſometimes in the *feces* themſelves, of ſuch animals.

But to both theſe hypotheſes it is objected, that we have no inſtance of any excrement capable of melting like wax. Beſides, the *error* of theſe opinions may be detected by chemical experiments; the dung of all animals admitting of a ſolution in aqueous menſtrua, but ultimately refuſing the moſt highly rectified ſpirit of wine. Add, that if it were the excrement of a whale, it ſhould rather be found in ſuch places where thoſe animals abound, as about Greenland, &c. than about the Maldive iſlands, Soffala, Malinda, Cape Comorin, &c. where no whales are found.

3. Others take it for a kind of wax, or gum, which diſtils from trees, and drops into the ſea, where it congeals, and becomes *ambergris*.

4. Others, and particularly many of the oilemals, imagine it ſprings out of the bottom of the ſea, as naphtha does out of ſome fountains.—They add, that the only ſprings hereof are in the ſea of Ormus, between the Arabian and Perſian Gulfs. Edriſi, who is of this opinion, in the firſt climate of his Geography, mentions pieces of *ambergris* on thoſe coaſts, weighing a full quintal. Pabidanus and Linſchoitan alſo ſpeak of it as a ſort of bitumen, gradually working up from the bottom of the ſea and hardening in the ſun.

5. Others take it for a ſea muſhroom, torn up from the bottom by the violence of tempeſts; it being obſerved, that *ambergris* is never found but during the ſouth-weſt monſoons, after ſtorms.

6. Others aſſert that it is a vegetable production, iſſuing out of the root of a tree, whoſe roots always ſhoot toward the ſea, and diſcharge themſelves into the ſame. This account we have in the Philoſophical Tranſactions, from one of the Dutch factors at Batavia; and the ſame is confirmed by Mr. Boyle.

7. Others ſuppoſe it a ſpongious kind of earth, which the working of the ſea waſhes from off the rocks, where, being lighter than water, it floats. Others are of opinion, that it is a bituminous matter; that it is at firſt liquid, and runs into the ſea; and that it is there conſtrued, and reduced into a maſs.

8. Others maintain, that *ambergris* is made from the honey combs which fall into the ſea from the rocks, where the bees have formed their neſts. This opinion ſeems to have ſomething of exiſtence on its ſide; ſeveral perſons having from pieces that were half *ambergris*, and half plain honey-comb; and others, again, having found large pieces of *ambergris*, in the middle of which, when broken, they diſcovered both honey-comb and honey. But the error of this hypotheſis may be detected by chemical experiments; as honey likewiſe admits of a ſolution in aqueous *menſtrua*, but refuſes the moſt highly rectified ſpirit of wine.

9. Dr. Boylſton, and Mr. Dudley, in the Philoſophical Tranſactions, aſſert, that the *ambergris* is a true, animal concrete, formed in balls, in the body of the male ſpermaceti whale, and lodged in a large oval bag, over the teſticles, at the root of the penis. Phil. Tranſ. N° 385. and 387.

It is certain the whale-catchers have divers times found *ambergris* in their ſpermaceti whales, and that chiefly in the large and older ſort; and it is from the information of Mr. Atkins, and other whale-catchers, that Mr. Dudley chiefly drew his account. But it is added, that it is not one ſpermaceti whale in a hundred that is found to have *ambergris*. Mr. Neumann abſolutely denies it to be an animal ſubſtance, as not yielding, in the analyſis, any one animal principle. It may indeed, he ſays, be found in whales; but it muſt have been ſwallowed by them.

Mr. Neumann, chemiſt to the king of Pruſſia, after an ample recital of all the different opinions advanced by others, gives us his own; which is, that *ambergris* is a BITUMEN, iſſuing out of the earth into the ſea; at firſt of a viſcous conſiſtence, but hardening, by its mixture with ſome liquid *nitrum*, into the form wherein we find it. Phil. Tranſ. N° 434. N° 434. N° 435. Mr. Cartheuſer is of the ſame opinion.

This opinion ſeems to be the beſt founded, and is ſtrengthened by this circumſtance, that *ambergris* is found in the greateſt quantities in the ſea, about the iſland of Madagaſcar, where the ſubterraneous parts are ſuppoſed to be impregnated with bituminous matter.

The pieces are frequently ſeen compoſed of divers ſtrata, laid one over another, with ſtones and other bodies incloſed therein, and the ſtrata are ſometimes full of little holes, which ſeem a ſpecies of *concha anatifera*; whence it may be conjectured, that the *ambergris* has originally been in a fluid ſtate, or, at leaſt, that it has been diſſolved and in that ſtate has formed itſelf afreſh, and inveloped ſuch bodies as happened to be in its way. Dr. Swediar has lately proved *ambergris* to be of animal origin. Kirwan's Elem. Miner. p. 221.

Ambergris is of conſiderable uſe among perfumers, who melt

melt it over a gentle fire, and make extracts, essence, and tinctures of it. It would be of more use in physic too, were not its smell apt to occasion vapours.

There is a preparation, however, recommended by Hoffman, which is said not to be attended with these ill consequences. The preparation is made in the following manner.

Let the spirit of roses, perfectly dephlegmated, be, not only once, but twice, at least, drawn off from the salt of tartar, which is burnt, or calcined, into a vehement fire. By this means there is produced a spirit, which, by its penetrating quality, enters into the inmost substance of the *ambergris*, and so separates and resolves its oleous concretion.

This, we are assured, will not excite commotions and agitations in a weak body, as does the common preparation of *ambergris*, which is made with a mixture of musk or civet. Hoffm. Observ. Physic. Chem. lib. 1. cap. 18.

It enters into the composition of many cordial, sudorific, and alexiterial waters. But its chief virtue consists in its antispasmodic and sedative qualities, similar to those of musk and castor, and its power of relieving certain hysterical, convulsive, and other nervous affections. It may be taken inwardly from half a grain to ten or twelve grains, or more; for as to doses, there can be no fixed rules about remedies and diseases of these kinds.

Ambergris is very commonly counterfeited and adulterated. The bill generally consists of musk, civet, storax, laudanum, and aloes wood, mixed together; the latter of a large quantity of bullock's blood, duly flavoured with musk and civet. It is one of the most agreeable perfumes; but must be proportioned so sparingly, as that while it improves the smell of what it is added to, its own may not be felt.

Neumann gives the chemical characters of this bitumen, and its analysis, by distillation. He distinguishes the sophistications of *ambergris*, and observes, that it is totally soluble in oils and vinous spirits, and that it yields the same products as AMBER. See the particulars and the proofs of this in Newmann's Works, p. 239, & seq.

We have various instances in authors of vast pieces of this matter: one of the largest that has been known in Europe was brought by the Dutch East India company, toward the close of the last century, and kept in their house for some years. It was almost round; measured two feet in diameter, and weighed a hundred and eighty-two pounds. The great duke of Tuscany offered fifty thousand crowns for it. We are told, however, that one was taken up near the Cape of Good Hope, which weighed three hundred pounds; and another, if we may credit the relation, fifteen thousand pounds. Phil. Trans. N° 263, N° 232.

AMBERGRIS, may be known to be genuine by its fragrant scent, when a hot needle or pin is thrust into it, and its melting like fat, of an uniform consistence. Whereas the counterfeit will not yield such a smell, nor prove of such a fat texture.

One thing, however, is very remarkable, that this drug, which is the most sweet of all the perfumes, should be capable of being resembled in smell, by the preparation of one of the most odious of all stinks. Mr. Homberg found that a vessel in which he had made a long digestion of the human *faces*, acquired a very strong and perfect smell of *ambergris*, insomuch that any one would have thought a great quantity of essence of *ambergris* had been made in it. The perfume was so strong and offensive, that the vessel was forced to be removed out of the elaboratory. Mem. Acad. Roy. 1700.

AMBERING is used, by some writers, to denote the giving a scent, or perfume of *amber* to any thing.

This is otherwise called *incensering*. Hooke, Phil. Collect. N° 4.

Dr. Hooke mentions an extraordinary method of *ambering in profusum*, i. e. with a small quantity of *amber*, and other requisites, *incensering* a hundred or a thousand pounds of sugar, or the like, so as the first matter shall remain undecayed, to be used again. Ibid.

AMBIDEXTER, one who uses both hands alike, the left as well as right, or in cases where only the use of one is necessary.

The word is compounded of *ambo*, *both*, and *dexter*, *right hand*, by analogy to the Greek, ἀμφιδέξιος, which signifies the same.

Women, according to the observation of Hippocrates, are never *ambidextrous*. But this is denied by some moderns, who give instances of the contrary; though it is owned, they are but few in comparison of those that are found in the other sex.

It may be imputed to education and habit, that men as well as brutes are not all *ambidexters*, there being no difference of right and left in the nature of things. Nurses are even forced to be at some pains to ensure the infants under their care to forego the use of their left hand. How far it may be our advantage to be deprived of half our natural dexterity, may be doubted. It is certain, there are infinite occasions in life, when it would be better to have the equal use of both hands. Surgeons and oculists are of necessity obliged to be *ambidexters*; bleeding, &c. in the left-arm or left-ankle, and operations on the left-eyes, cannot be well performed but with the left-hand. Divers inflances occur in battery, where the use of the left hand has been cultivated preferably to the right. But by the laws of the ancient Scythians, people were enjoined to exercise both hands alike, without partiality either for the right or left; and Plato enjoins *ambidexterity* to be observed and encouraged in his republic.

In the Grecian armies, their more distinguished soldiers, their pikemen and halberdeers, as those who formed the first line of their battalions, were to be able to fight indifferently with left hand or right. We find it mentioned in Scripture, that, on an extraordinary occasion, the single tribe of Gad produced 300 brave men, who fought with the left-hand as well as the right. And the Roman historians allure us, that they had gladiators who were trained up to the same exercise. An ingenious French writer is surprised, that among all the modern refinements in the art of war, none have thought of restoring the ancient practice of forming *ambidexters*, which, it is certain, might be of considerable service in the way of stratagem.

AMBIDEXTER, in a legal sense, denotes a person who takes money from both of the contending parties to father them in their cause. In this sense the word may be applied to a judge, juror, a solicitor, or the like. The penalty on a juror, in such a case, is to forfeit DECEM TANTUM, ten times as much as he received.

AMBIGNA, in *antiquity*, an appellation given to a victim, which was surrounded, or attended at the time of offering it with other lesser ones.

In this sense the word is also written *ambigna*. We read of *ambignæ oves* used in sacrificing to Juno, which were sheep, having brought forth twins, and offered up with two lambs fattened on either side.

AMBIENT, a term applied to such things as encompass others round about.

The word is formed of *ambire*, *to encompass*.

Thus the bodies situate around another body, are called *ambient*, and often the CIRCUM-AMBIENT bodies. The whole body of air, because it encompasses all things on the face of the earth, is often by physical writers called, by way of eminence, the *ambient*, or *ambiant* air.

AMBIGENAL, *hyperbola*. See HYPERBOLA.

AMBIGU denotes a kind of mixed entertainment, wherein both flesh and fruit are served together; so that it seems doubtful whether to denominate it a mere collation, or a meal.

AMBIGUOUS, something dubious, obscure, or which may be taken in different senses. See EQUIVOCAL.

The word is formed of *ambo*, *both*, and *ago*, *I drive*; q. d. that which keeps the mind wavering, or in suspence; not knowing which side to choose.

The answers of the ancient oracles were always *ambiguous*.

An anonymous writer has published a dictionary of *ambiguous* words, Lexicon Philosophicum de *Ambiguitate* Vocabulorum, Francof. 1597, 8vo.

Ambiguity is occasioned either by a wrong choice of words, and the use of equivocal terms, or by an improper arrangement of them. *Ambiguities* of the first kind are either where the arrangement leads to a wrong sense, or where the sense is left doubtful. Dr. Campbell expresses the former by the term equivocation, and appropriates that of *ambiguity* to the latter. See Elem. of Criticism, vol. ii. p. 20, 34, and Campbell's Philosophy of Rhetoric, vol. ii. p. 28, 32.

AMBIT, AMBITUS, of a figure in *Geometry*, denotes the *perimeter*; or the sum of all the lines, that constitute, or include it.

Isaac Vossius has a particular inquiry concerning the *ambit*, or circumference of ancient Rome. That of the city he makes to be 60 miles, or *mille passus*, and that of the city and suburbs together 72 miles; exceeding ancient Babylon, whose *ambit* was only 60 miles.

AMBIT, *ambitus*, was particularly used, in *Antiquity*, to denote a space of ground to be left vacant between one building and another. By the laws of the Twelve Tables, houses were not to be built contiguous, but an *ambit*, or space of 2½ feet, was to be left about each, for fear of fire.

The *ambitus* of a tomb, or monument, denoted a certain number of feet, in length and breadth around the same, within which the sanctuary assigned to it was limited. The whole ground, wherein a tomb was erected, was not to be separated from the common uses; for this reason, it was frequent to inscribe the *ambitus* on it, that it might be known how far its sanctuary extended: thus, *in fronte pedes tot, in agrum pedes tot.*

AMBITUS, among the ancient Romans, the act of soliciting or making interest for offices, or honours.

The candidates, in this case, were about the city, and into all public places and assemblies, in long robes; which was called *ambire toga*, in the ancient Latin, signifying *circumdare, abire*, and *ire, to go*.

Among the Romans, it differed from *ambition*, as the former lies in the act, the latter in the mind.

Ambitus was of two kinds, one lawful, and even laudable; the other infamous.

The first, called also *ambitus popularis*, was when a person offered his service to the republic frankly, leaving it to every body to judge of his pretensions as they found reasonable.

This kind was not prohibited by any law, but always approved and practised by the best and greatest men.

The means and instruments here made use of were various: 1. *Amici*, or friends, under divers relations, including *cognati, affines, necessarii, familiares, socii, tribules, clientes, municipes, subditi, exercitus*. 2. *Nomenclatores*, or the calling and saluting every person by his name; to which purpose, the candidates were attended with an officer, under the denomination of *interpres*, or *nomenclator*. 3. *Blanditia*, or obliging persons by serving them, or their friends, patrons, or the like, with their vote and interest on other occasions. 4. *Promissa*, the shaking every person by the hand, offering him his service, friendship, &c. 5. *Assectatio*. 6. The *toga candida*, were loose. 7. *Benignitas*, the distributing largesses, *congiaria*, &c.

The second kind was that wherein force, caioling, money, or other extraordinary influence was made use of. This was held infamous, and severely punished, as a source of corruption and other mischiefs.

This kind of *ambitus* was at one time the great trade of Rome, and demanded a constant supply of great sums of money. Tully alleges this as the cause of the high rate of interest, and tells us it had risen from 4 to 8 per cent. Bribery was come to the pitch of 80,750*l.* per tribe; and there being no less than thirty-five tribes, it is obvious how expensive this corruption was grown. It is also well known where it ended.

Several laws were made against it, as the *Lex Acilia, Calpurnia, Aufidia, Baebia, Cornelia, Fabia, Fabia, Julia Augusti, Julia Cæsaris, Licinia, Maria, Pactia, Pompeia, Tullia Petri*.

In the year of Rome 321, the use of the *toga candida* was prohibited. In the year 398, the candidates were forbid to go to the markets and meetings in the neighbouring towns. In 571, severe penalties were laid on the givers of largesses. In 594 this was made punishable by banishment. In 697, heavy fines were imposed. By the *Lex Tullia*, made in the consulship of Cicero, the candidates were forbidden to bestow any combats of gladiators on the people, to make any public feasts, or to cause themselves to be followed by a crowd of clients, for two years before they put in for any place.

A senator, who was guilty of a breach of this law, was punished with ten years banishment; others were fined, and rendered incapable of any dignity for ever.

Ambitus was not only practised at Rome and in the forum, but in the meetings and assemblies of other towns in Italy, where numbers of citizens were usually found, on account of trade and business.

The practice ceased in the city from the time of the emperors, because posts were not then to be had by courting the people, but by favour from the prince.

Persons who had causes depending, practised the same, going about among the judges to implore their favour and mercy.

They who practised this were called *ambitiosi*. Hence we also meet with *ambitiosæ decreta*, and *ambitiosa judicia*, used for such sentences and decrees as were thus procured from the judges, contrary to reason and equity, either gratuitously, or for money.

AMBITUS, in *Music*, a name sometimes appropriated to signify the particular extent of each tone, or modification of grave and sharp.

AMBIX, in *Ancient Writers*, denotes a vessel of glass, or flint.

Hence the origin of the word *alembic*, which we sometimes also find denoted by the word *ambix*.

AMBLE, AMBLING, in *Horsemanship*, a peculiar kind of pace, wherein a horse's two legs of the same side, move at the same time.

The *ambling* horse changes sides at each remove; two legs of a side being always in the air, and two on the ground, at the same time: an *amble* is usually the first natural pace of young colts; which, as soon as they have strength enough to trot, they quit. There is no such thing as an *amble* in the manage; the riding-masters allowing of no other paces besides walk, trot, and gallop: their reason is, that a horse may be put from a trot to a gallop, without stopping him; but not from an *amble* to a gallop without stopping: which loses time, and interrupts the juliness and cadence of the manage.

There are various practices and methods of discipline, for bringing a young horse to *amble*; some choose to tie him in his foot-pace through new-coupled hads; which naturally inures him to the trade required in the *amble*. But its inconveniences are, the weakness and lameness that such disorderly gait may bring on a young horse.

Others attempt it by sudden flopping, or checking him in the cheeks when in a gallop; and thus putting him into an amazedness, between gallop and trot; to that losing both, he necessarily stumbles upon an *amble*. But this is apt to spoil a good mouth and rein, and expose the horse to the danger of a hoof-reach, or knee-strain, by over-reaching, &c.

Others prefer *ambling* by weights, as the best way; and to this end, some overload the horse with excessive heavy shoes, which are apt to make him interfere, or strike short, with his hind feet. Others fold tenden weights about the fetlock pasterns; which are not only liable to the inconveniences of the former, but put the horse in danger of incurable strains, crushing of the coronet, and breeding of ring-bones, &c. Others load the horse's back with earth, lead, or the like massy substance; but this may occasion a swaying of the back, overstraining the reins, &c.

Some endeavour to make him *amble* in hand, before they mount his back, by means of some wall, smooth pale or rail, and by checking him in the mouth with the bridle-hand, and correcting him with a rod on the hinder hoofs, and under the belly, when he treads false. But this is apt to drive the horse to a desperate phrensy, before he can be made to understand what they would have of him; and to tear, (spawl out his legs, and to make other antic postures, which are not easily quitted again. Others think to effect it by a pair of hind shoes, with long spurns or plates before the toes; and of such length, that if the horse offers to tread the hind-foot before the fore-foot. But this occasions wounds of the back-sinews, which often bring on an incurable lameness.

Some attempt to procure an *amble*, by folding fine, soft till, flrait about his gambrels, in the place where he is gartered for a fistle-drain; and turn him thus to grass for two or three weeks, and afterwards take away the Eft. This is a Spanish method, but disapproved; for though a horse cannot then trot but with pain, yet the members must be sufferers; and though the *amble* be gained, it must be slow and unsightly; because attended with a cringing in the hind-parts. In effect, *ambling* by the tramel, as practised by us, appears the nearest to nature, and the best and most allured way.

There are divers errors, however, usually practised in this method: as, that the tramel is often made too long, and so gives no stroke, but makes a horse hackle and shuffle his feet confusedly; or too short, which makes him volt and switch up his hind-feet so suddenly, that by cushion it brings him to a string-halt, from which he will scarce ever be recovered. Sometimes the tramel is misplaced, and to prevent falling put about the knee, and the hind hoof. In which case, the best cannot give any true stroke, nor can the fore-leg compel the hind to follow it: or if, to create this, the tramel be made short and strait, it will press the main bone of the hind-leg, and the fleshy part of the fore-thigh; so that the horse cannot go without halting before, and cringing behind.

As to the matter of the tramel; some make it all of leather, which is inconvenient; in that it will either stretch or break, and thus confound the certainty of the operation. In a true tramel, the side ropes are to be so firm, as not to yield a hair's breadth: the horse soft; and to tie so close, as not to move from its first place: and the back-band flat, no matter how light, and to descend from the fillet so as not to gall.

When the horse, by being tramelled on one side, has attained to *amble* perfectly in the hand, it is to be changed to the other side, and that is to be likewise brought to rule.

When by this changing from one side to another, with a half-tramel, the horse will run and *amble* in the hand readily and swiftly, without stoppering and stumbling; which is ordinarily done by two or three hours labour; the whole tramel is to be put on, with a broad, flat, back-band, and both sides tramelled alike. See TRAMEL.

AMBLYGON, or AMBLYGONIUM, in *Geometry*, denotes a triangle, one of whose angles is obtuse, or consisting of more than ninety degrees.

The word is compounded of ἀμβλὺς, *obtusus*, and γωνία, *angle*.

AMBLYOPY, AMBLYOPIA, in *Medicine*, a disease of the eyes, otherwise called CAUTA *ferens*, and *amaurosis*.

The word comes from ἀμβλὺς, *dull*; and ὄψις, *I see*.

AMBO, or AMBON, a kind of pulpit, or desk, in the ancient churches, where the priest and deacons stood to read or sing part of the service, and preach to the people; called also *analogium*.

The term is derived from ἀναβαίνω, *to mount*. The *ambo* was mounted upon two steps; whence some also derive the appellation from *ambo*, *both*.

The *ambo* was ascended by steps; which occasioned that part of the office performed there to be called the *gradual*. The Gospel was read at the top of the *ambo*; the Epistle a step lower.

The *modern* reading desks and pulpits have been generally substituted instead of the ancient *ambo*, though in some churches, remains of the *ambo* are still seen. In that of St. John de Lateran at Rome, there are two miserable *ambo*s. M. Thiers inveighs against the disuse of the ancient *ambo*. Those by whom this innovation has been effected, he calls by a new word *ambonoclastes*. It was in the *ambo* that publication was made of feasts, fasts, processions, &c. Here were read the acts of the martyrs, the *sancta sanctis*, the diptychs, or commemoration of the dead; the letters of peace and communion, which one church sent to another. Here new converts made their public confession of faith, and bishops their defence against accusations brought against them. Here treaties of peace were sometimes also concluded, and coronations of kings and emperors performed, &c.

Divers antiquaries hold, that the *ambo* was anciently the place from whence the bishops and presbyters made their sermons; pulpits for that purpose having only been introduced by the mendicants at the beginning of the last tenth century.

A late writer combats this opinion, and shews, that the usual place from whence the ancients preached, was the steps of the altar; not but St. Chrysostom and St. Augustine both appear to have preached from the *ambo*; but this was looked on as a thing somewhat extraordinary.

AMBONOCLASTES, a name given, by a late writer, to the demolishers of the *ambo*s used in the primitive church.

AMBONUM, in *Natural History*, a term used, by some of the old writers, to express the prominent tubercles on certain stones.

AMBRELDA, thus they call the false or factitious amber, which the Europeans vile in their trade with the negroes on the coast of Africa, and particularly on the river Senegal. There are some large and red pieces of it, a thousand of which making twenty ropes of strings, weigh three pounds. There are others small, and also red, which weigh but two pounds and a half.

AMBROSE, *St. Ambrose in the wood*, by the Italians called *al vano*, is an order of religious, confirmed in 1431, under the rule of St. Augustine.

The monks of *St. Ambrose al vano* wear the image of the saint engraven on a little plate, and make use of the Ambrosian office.

In the province of Berry in France, the title *fathers of St. Ambrose* is also given to the canons regular of St. Augustine, because their abbey at Bourges is dedicated to St. Ambrose de Cahors.

AMBROSIA, in the *Heathen Theology*, &c. a delicious kind of food, wherein the gods were supposed to feed.

The word is compounded of the privative particle α, and βροτὸς, *mortal*; because it rendered those who fed to excess immortal, or because it was the food of the immortals.

Lucian, ridiculing the poetical gods, tells us, that *ambrosia* and *nectar*, of which one is the meat, and the other the drink of the gods, were not so excellent as the pores between them; since their deities would leave them for blood and fat, which they come to suck from the altars like flies.

But though the *ambrosia* is commonly represented as the solid food of the gods, by way of contradistinction from the fluid, which was called *nectar*; yet the appellations are sometimes inverted, and the name *ambrosia* given to the drink of the deities, as that of nectar to the meat.

Wedelius has a dissertation on *ambrosia* and nectar, wherein he shews, that the terms are sometimes used to denote honey, sometimes wine, sometimes perfumes, and particularly ambergris; besides this, their method and ingredients for embalming or preserving dead bodies from putrefaction, and sometimes also for a state of exchange from a state of immortality.

AMBROSIA is also a splendid kind of title, given, by some physicians, to certain alexipharmic compositions, of extraordinary virtue.

In this sense, *ambrosia*, ἀμβροσία, amounts to much the same with *athanasia*, *athanasie*, as being supposed to connote immortality.

This name was particularly given to a famous antidote of Philip of Macedon, against all poisons, bites, and stings of venomous creatures, as well as many internal diseases.

AMBROSIA is also used for a pure spirituous kind of medicine, artfully extracted from the grosa elementary parts of a body, and which being administered in the smallest dose is of considerable virtue, and may be taken without disgust, or inconvenience.

In this sense, *ambrosia* amounts to much the same with what we otherwise call QUINTESSENCE.

Nic. Abr. Framboisa has a treatise on the preparation of these *ambrosiæ*. Ambrosiopœa, Lugd. Bat. 1028. 12mo. Francof. 1629. 4to.

AMBROSIA, in *Botany*, the name of a genus of plants belonging to the *monœcia pentandria* class; the characters of which are these: it hath male and female flowers on the same plant; the male flowers are of one leaf, funnel-shaped, and cut into five parts at the brim; the female flowers are placed under the male in the same spike; they have no petals, but an oval pericarpium placed in the bottom of the empalement; the germen afterward becomes an oval capsule with one cell, including one roundish seed. There are according to Linnæus four, and according to Miller five species of this plant, which is perennial, and may be propagated by cuttings, or by seeds; if by the former, they should be planted in a shady border, in either of the summer months. In a month or five weeks they will have good roots, and therefore should be then taken up and potted; for when they are left longer in the full ground, they will grow very luxuriant, and will not so soon recover their removal as those which are transplanted earlier. The plants are hardy, so may be exposed to the open air in the summer; and in winter, if they are sheltered in a common green-house with myrtles, and other hardy exotic plants, they will live several years.

The seeds of this sort seldom come up the same year when they are sown in the spring; but those which have fallen in autumn, have grown in the following year as well as those sown at the same season.

It revives the heart and brain; it stops fluxes; it resolves and fortifies; and is prescribed both internally and externally.

AMBROSIA is also used, by some of the *Ancient Writers*, to express what they judged to be the food of the BEES.

This substance is, by some, taken to be a gross or solid honey; and is contradistinguished from the liquid or purer sort, which is denominated *nectar*.

The *ambrosia* will not keep, and if not speedily spent, corrupts and turns sour, making what is sometimes called, *esses*, or *foppings*, or, after the Greeks, *sandyx*; highly offensive and pernicious to the hive. See PAPE *des Abeilles*.

AMBROSIA, in *Antiquity*, denotes a feast celebrated by the Accuians, in honour of Bacchus.

The *ambrosia* were also denominated *Choa* and *Lenæa*. They were held in the month called Lenæon.

AMBROSIAN *rite*, or office, denotes a particular office or formula of worship, used in the church of Milan, which is sometimes also called the *Ambrosian* church.

The denomination takes its rise from St. Ambrose, archbishop of Milan, in the fourth century, who is usually supposed to have been the author of this office. Yet some are of opinion the church of Milan had an office different from that of the Roman, and other churches of Italy, before the time of that father. In effect, till the time of Charlemagne, each church had its several office; and when in 1080 the pope took on him to impose the Roman office on all the other churches of the West, that of Milan sheltered itself from the imposition, under the name and authority of St. Ambrose; from which time, the phrase *Ambrosian rite* has obtained, in contradistinction to the Roman rite.

We also meet with the *Ambrosian chant*, or song, which was distinguished from the Roman, in that it was stronger and higher. See *Choral* SERVICE.

The public library of Milan is called the *Ambrosian Library*.

AMBROGIN, in *Middle Age Writers*, denotes a coin struck by the lords or dukes of Milan, wherein was represented St. Ambrose on horse-back, with a whip in his right-hand. The occasion of this coinage is said to have been a vision of that saint, who appeared to the Milanese general, in 1339, during the time of a battle.

AMBROSINIA, in *Botany*, a genus of the *gynandria polyandria* class of plants, with a single-leaved and divided *spatha*. There is only one species.

AMBRY: the place where the arms, plate, veſſels, and every thing belonging to houſe-keeping, were formerly kept.

Hence, probably, the *Ambry* at Weſtminſter was ſo called, becauſe formerly ſet apart for that uſe: or rather, from *aumonery*, a houſe adjoining to an abbey, in which the charities were laid up and diſtributed to the poor. The word is ſtill uſed in Scotland, in the ſame ſenſe.

AMBUBAJÆ, in *Antiquity*, a kind of wanton miniſtrels about Rome, who lived by playing and dancing in places of reſort, and proſtituting their bodies for hire.

Authors ſpeak as if there had been a regular college, or community of *ambubajæ*, and that theſe were the ſame with what were otherwiſe called *citharistæ*. Some ſuggeſt that the *ambubajæ* were of the male kind, only dreſſed in the habit of women.

Antiquaries have been greatly divided about the *ambubajæ*; ſome will have them to have come to Rome out of Syria; others ſuppoſe them to have been Roman women, though called by a name of Syriac origin.

Torrentius, Turnebus, and Salmaſius, derive the name from *ambo*, or *am*, an old Latin prepoſition, denoting *circum*, *about*, and *Baiæ*, a delicious place near Naples; and maintain, that the *ambubajæ* were a kind of courtezans, who frequented the baths of that city. Cruquius is of a different opinion, taking the word *ambubajæ* to have been uſed for *ambubeja*, and primarily to denote a ſeller of *ambubeja*, an herb mentioned by ancient naturaliſts. Theſe ſellers of *ambubeja* being a kind of empirics, their name became afterwards applied to all charlatans and quacks.

Hoffman has a diſcourſe on the *ambubajæ*.

AMBUBEIA, in *Botany*, a name given, by ſome authors, to wild ſuccory.

AMBULANT, or AMBULATORY: they give in *France* the name of *ambulant* commiſſioners to thoſe commiſſioners, or clerks of the king's farms, who have no fixed office, but viſit all the offices within a certain diſtrict, to ſee that nothing be done in them againſt the king's right, and the intereſt of the farm.

AMBULANT is alſo uſed to denote thoſe brokers at Amſterdam, or exchange-agents, who have not been ſworn before the magiſtrates. They tranſact brokerage buſineſs, but their teſtimony is not received in the courts of juſtice.

AMBULATION, or walking. See EXERCISE.

AMBULATION, in *Phyſic*, is uſed by ſome for the ſpreading of a gangrene or mortification.

AMBULATORY, a term anciently applied to ſuch courts, &c. as were not fixed to any certain place; but held ſometimes in one place, and ſometimes at another.—In oppoſition to ſtationary courts.

The word is formed from *ambulare*, to walk.

The court of parliament was anciently *ambulatory*; ſo alſo were the courts of king's bench, &c.

We ſometimes alſo ſay, in a legal ſenſe, a man's will is *ambulatory*, to the time of his death; meaning, that he has it always in his power to revoke it.

AMBULON, in *Botany*. See *Sweet* WILLOW.

AMBURBIUM, or AMBURBIALE *Sacrum*, in *Antiquity*, a religious feaſt, or ceremony, practiſed among the Romans, wherein they made proceſſions around their city. Hence alſo we have *amburbiales victimæ*, the victims carried along in the proceſſion, and afterward ſacrificed.

The word is compounded of *ambo*, *I go round*; or of *amb*, or *ambo*, an ancient prepoſition, ſignifying *around*, and *urbs a city*.

Scaliger, in his notes on Feſtus, followed by many others, maintains the *amburbia* to be the ſame with *ambarvalia*. Servius, however, expreſly diſtinguiſhes between the *amburbia* and *ambarvalia*, and ſays, the one was performed in the city, and the other in the country.

AMBURY, or AMBURY, a name given, by our farriers, to a kind of ſoft and ſpungy ſwelling growing on the bodies of horſes, ſomewhat ſore to the touch, and full of blood. The method of curing it is, to tie a horſe-hair very hard round it, at the root: in about a week after this it will fall off, and the part is then to have ſome powder of verdigris ſtrewed upon it, to prevent the return of the complaint, and finally to be healed up with the common green ointment.

This is the common method when the *ambury* is high and prominent; but ſometimes it is flat and low, with a broad baſe: in this caſe, it is impoſſible to take it off by ligature, and there is a neceſſity of having recourſe to a ſeverer operation. It muſt in this circumſtance be taken away either by the knife or fire; if the former way be agreed on, the method is this: the ſkin is to be drawn back tight, and then the whole ſwelling cut off cloſe to the common level of the reſt of the fleſh: if in the other way, an iron is to be heated red-hot, and applied to it, continuing it on till the whole is burnt down to the even fleſh. In both caſes, care muſt be taken not to ſpare in the cutting or burning, ſo as to leave any root behind, for then the complaint will be renewed. When it is taken off, the common ointment of hog's-lard, and turpentine, will complete a cure. There are ſome circumſtances, however, in which the knife and cautery may be both unneceſſary, as, if it grows in a downy part, or the like: in this caſe, the proper method is, to cut out the core with oil of vitriol, or white arſenic, and then ſtop the hole with flax dipped in honey, and time will do the reſt. Some for the firſt day or two dip it only in the white of an egg, and after that, in the mixture of quick-lime and honey; and this ſeems the better way.

Many of our farriers boaſt of a ſecret, which infallibly cures all kinds of protuberances of this kind, the preparation of which is this: take three ounces of green vitriol, and one ounce of white arſenic; beat them to a coarſe powder, and put them into a crucible; place the crucible in the midſt of a charcoal-fire, ſtirring the inſtance, but carefully avoiding the poiſonous fumes; when the whole grows reddiſh, take the crucible out of the fire, and when cool, break it and take out the matter at the bottom; beat this to powder in a mortar, and add to four ounces of this powder five ounces of *album rhaſis*; make the whole into an ointment, and let it be applied cold to warts, rubbing them with it every day: they will, by this means, fall off gently and eaſily, without leaving any ſwellings. It is beſt to keep the horſe quiet, and without working during the cure. What horſe remain on the parts which the ſwellings fall off from, may be cured with the common application, called the *countryman's* ointment.

AMBUSCADE, AMBUSH, AMBUSHMENT, a body of men who lie in a wood, &c. in readineſs to ruſh out upon, or incloſe an enemy unawares.—Or, the place wherein ſuch a corps hide themſelves.

AMBUSTIO, in *Medicine*, a BURN.

AMBUTUA. See PAREIRA *Brava*.

AMEA, in *Botany*, a name given, by the natives of Guinea, to a plant which they uſe in bleedings at the noſe, drying and powdering the leaves, and ſnuffing up the powder. It ſeems to be of the family of the plant called *peponoides*, by Sir Hans Sloane, in his Jamaica Catalogue. Its leaves are large and ſhated, and of a beautiful green, even when dried. Phil. Tranſ. N° 232.

AMEDEI, *Amedæi*, a congregation of religious in Italy, inſtituted in 1465.

Their name is formed of the Latin *amans Deum*, q. d. *lover of God*, or rather of *amatus Deo*, *beloved of God*.

The *Amedei* wore a grey habit, and wooden ſhoes: had no breeches, and girt themſelves with a cord. They had twenty-eight convents, and were united by pope Pius V. partly with the Ciſtercian order, and partly with that of the Servantini, or wooden-ſhoe wearers.

AMEIVA, in *Zoology*, the name of a Braſilian ſpecies of lizard, reſembling the *teguixin* in figure, but having a bifid tail. This is Margrave's account of it; but Mr. Ray very judiciouſly queſtions the fact, not believing that there is in nature any ſuch ſpecies. Probably indeed it is only an accidental variety of the TARAGUIRA, or ſome other common lizard, perhaps from a wound, or other accident; perhaps from the egg, as we have lately ſeen from Barbadoes a ſnake with two heads, taken out of an egg of ſome common kind; for aſſuredly there never was any ſuch ſpecies as a two-headed ſerpent.

AMEL. See EMMER.

AMELLUS, in *Botany*, a name uſed, by ſome authors, to expreſs the CALTHA *paluſtris*, or *marſh*-MARYGOLD; and by Virgil, for the ASTER *atticus*.

AMELLUS is uſed by Linnæus to denote a genus of plants of the *ſyngeneſia polygamia ſuperflua* claſs: with a chaffy receptacle, ſimple flower, imbricated calyx, and undivided ſeminal.

Of this genus there are two ſpecies.

AMEN, a church-term, uſed at the concluſion of all ſolemn prayers, &c. and ſignifying, *ſo be it, or ſo.*

The Hebrews had four kinds of *amen*. That moſt mentioned they called *amen pauli*, which was accompanied with the greateſt attention and devotion: to this ſenſe the word has paſſed in almoſt all languages, without any alteration.

Some authors are of opinion, that the word *amen* is formed of the initial letters of theſe words, *Adonai*, *Melech*, *Neeman*, *Dominus Rex Fidelis*; an uſual expreſſion among the Jews, when they would give weight or attention to any thing they ſaid. In effect, it is known, that to expreſs the words אדני מלך נאמן *Adonai Melech Neeman*, in the ordinary way of abbreviature, the rabbins only take the initial letters, which, joined together, are really the letters of the word אמן *amen*.

On the other hand, there are ſome of the Cabbaliſts, who, according to their uſual manner of finding a myſterious meaning in words, which they call *notaricon*, out of the letters of the word *amen* form the whole phraſe, *Adonai Melech Neeman*.

Yet

Yet it is certain also, that the word *amen* was in the Hebrew tongue before ever there were any such things as cabbala or cabbalists in the world; as appears from Deuteronomy, chap. xxvii. *ver.* 15.

The primitive of the word *amen* is the verb *aman*, which, in the paſſive voice, ſignifies to be true, faithful, conſtant, &c.—Hence came the noun ⁊ⁿ *amen*, which ſignifies *truth*. And, laſtly, of this noun *amen* they make a kind of affirmative adverb, which, when placed at the end of any phraſe, or propoſition, ſignifies, *it is it, be it true, I acquieſce in it*, &c. Thus, in the paſſage above cited from Deuteronomy, Moſes ordered the Levites to cry aloud to the people, *Curſed is he that makes any graven or molten image, &c. and all the people ſhall ſay amen*, i. e. yes, may he be curſed, we deteſt, we agree to it.—But at the beginning of a phraſe, as in ſeveral paſſages of the New Teſtament, it ſignifies, truly, verily.—When it is redoubled, or repeated twice together, as is always done by St. John, it has the effect of a ſuperlative; agreeably to the genius of the Hebrew tongue, and her two daughters, the Chaldee and Syriac.—To this ſenſe we are to underſtand *amen, amen, dico vobis*. The Evangeliſts uſually preſerve the Hebrew word *amen*, in their Greek ἀμὴν, though St. Luke ſometimes renders it by ναὶ, *truly*, or ναὶ, *certainly*.

AMENABLE, or AMENABLE, is applied in our law-books to a woman, who is ſuppoſed to be governable by her huſband.

It is likewiſe uſed to ſignify a right or power of bringing perſons before a particular juriſdiction: thus, we ſay, a perſon is *amenable* before ſuch a court, or magiſtrate.

AMEND, or AMENDE, in the French *Coſtume*, a mulct, or pecuniary puniſhment, impoſed by a ſentence of the judge; for any crime, falſe proſecution, or groundleſs appeal.

AMENDE HONORABLE denotes an infamous kind of puniſhment, uſed in France, &c. on traitors, on parricides, ſacrilegious perſons, and other heinous criminals.

It conſiſts in this, that the offender is delivered up to the common hangman, who having ſtript him to his ſhirt, and put a rope about his neck, and a wax taper in his hand, leads him to the court, where he is to beg pardon of God, the king, the court, and his country.

Sometimes the puniſhment ends here; and ſometimes death, or the galleys, are added.

The phraſe *amende honorable* is alſo uſed by way of alluſion, where a perſon is condemned to come into court, or into the preſence of ſome perſon injured, and make an open recantation, aſk pardon, &c.

AMENDMENT, in a general ſenſe, a change made in a thing for the better.

Amendment amounts to much the ſame with melioration, reformation, correction, &c.

AMENDMENT, more particularly uſed for a MANURE laid on the ground, to fatten or enrich it.

AMENDMENT, in a literal ſenſe, is uſed to denote the corrections and other alterations made in the paſſtive editions of books.

In this ſenſe, *amendments* are alſo denominated emendations.

AMENDMENT, in *Law*, the correction of an error committed in a proceſs, and diſcovered before judgment.

If the error be committed in giving judgment, viz. if a wrong judgment be given, there they cannot amend it; but the party aggrieved muſt bring his writ of error.—However, where the fault appears to be in the clerk who writ the record, it may be amended; chiefly if it be in matter of *fact*, not in point of *law*.

Original writs are not amendable at common law, for if the writ be not good, the party may have another: judicial writs may and have been often amended. Indictments of treaſon and felony, writs of appeal, &c. are excepted out of the ſtatutes of *amendment*, though ſome things in them are *amendable* at common law. *Amendments* are uſually made in affirmance of judgments; and ſeldom or never to deſtroy them: and where *amendments* were at common law, the party was to pay a fine for leave to amend. Terms de Ley, 39. 8 Rep. 157. Palmer, 232. Mod. Caſ. 269. 3 Salk. 269.

AMENDMENT *of bills in Parliament*, means ſome alteration, made in the original draught; and we read of *amendments* of *amendments*, *amendments* or returns of repreſentatives, &c.

In caſes of wrong returns, ſo reported by the committee of privileges and elections, and voted by the houſe of commons, it is uſually ordered, that the returns be *amended* by the returning officer, according to the directions of the houſe, without iſſuing a new writ.

Amendments ought always to be in that houſe from whence the thing to be *amended* originally proceeded, though the directions for the *amendments* came from the other houſe. Hakew. Manu. of Paſſing Bills, p. 167.

AMENTACEOUS, in *Botany*, a term applied to the flowers of certain trees and plants, which are compoſed of vaſt number of *ſpices* or *anthers*, hanging down in form of a rope, ſuch as the hazel, &c.

AMENTUM, among *Alchemiſts*, denotes *alembic faſſion*.

AMENTUM, in *Antiquity*, a leathern thong faſtened about the middle of a dart, or javelin, whereby, after caſting it at the enemy, it might be drawn back again to the owner. The *amentum* ſerved alſo to increaſe the force of the ſtroke; for which reaſon, ſome of their great men refuſed to uſe it, as confiding wholly in the natural ſtrength of their own arms.

AMENTUM, in *Botany*. See CATKIN.

AMERADE, a kind of officers among the Saracens, anſwering to the governors of provinces among the Europeans.

The name is originally the ſame with that of *emir*.

AMERCEMENT, or AMERCIAMENT, in *Law*, a pecuniary puniſhment impoſed upon offenders, at the diſcretion of the court; frequently alſo called *miſeria arbitr.*

There is this ſtated difference between fines and *amercements*; that fines are puniſhments certain, and determined by ſome ſtatutes; but *amercements* are arbitrary impoſitions, proportioned to the fault and wholly at the mercy of the court.—Manwood, in his *Foreſt Laws*, makes another diſtinction; as if an *amercement* were a more eaſy and merciful penalty, and a fine a more ſharp and grievous one.

If *amercements* were too grievous, releaſe may be ſued by an ancient writ called *moderata miſericordia*.

Fines are alſo impoſed and aſſeſſed by the court; *amercements*, by the country: and no court can impoſe a fine, but a court of record; other courts can only *amerce*. 8 Rep. 39. 41. A town ſhall be *amerced* for the eſcape of a murderer in the day time; and if the town be walled, it is ſaid it ſhall be ſubject to *amercement* whether by day or night. 3 Inſt. 53.

By the ſtatute of *Magna Charta*, a freeman is not to be *amerced* for a ſmall fault, but proportionable to the offence, and that by his peers. 9 Hen. III. c. 4.

In the New Terms of the Law, *amercement* is ſaid to be properly a penalty aſſeſſed by the peers or equals of the party *amerced*, for an offence done; for which he puts himſelf upon the mercy of the lord.

Amercement tryal is uſed by ſome to denote a pecuniary puniſhment laid upon a ſheriff, coroner, or ſuch like officer of the king, by juſtices, for ſome offence or abuſe in his office.

AMERICAN *ſea-ſun-ſtone*, CORONA *ſolis marina Americana*, a name given by John Andrew Peyſonnel, M. D. F. R. S. to a marine inſect, becauſe of the reſemblance it bears to the flower called *corona ſolis*. The curious may ſee a very particular deſcription of it in the Philoſ. Tranſ. vol. 50. part II. N° 11. anno 1758. The gentleman who deſcribes it could not tell how it lived, or what its mechaniſm was, not being able, as he ſays, to diſtinguiſh either a mouth, or any *viſcera*, nor any other organ neceſſary to its nouriſhment.

AMERICIMA, in *Zoology*, the name of a Braſilian ſpecies of lizard, very ſmall, being not above three fingers breadth long, and of the thickneſs of a ſwan's quill. Its body appears ſquare; its whole back is covered with deep grey ſcales, and its head, legs, and ſides, with brown ones, and its tail with blue. All of them are very ſlothful, and extremely ſmooth to the touch. Its feet are ſcarce thicker than hogs briſtles. It is generally eſteemed a poiſonous animal. See *Tab. of Serpents* N° 35.

AMETHYST, in *Natural Hiſtory*, a precious ſtone of a violet colour, bordering on purple, frequently yellowiſh or reddiſh.

Plutarch ſays the *amethyſt* takes its name from its colour; which, according to him, reſembles that of wine mixed with water; and not from its preventing drunkenneſs, which, however, was a common opinion, and gave occaſion to its being hung about the neck of great drinkers.—Thoſe who aſcribe this virtue to the *amethyſt*, derive its name from the privative α, and μεθύω, *to inebriate*. See GEM.

There are divers ſorts of *amethyſts*.—The oriental, which is the hardeſt, the ſcarceſt, and moſt valuable, and which is of a deep purple colour; the German, which is of a violet colour; and the Spaniſh, which has the colour of a *pale*.

This *gem* is pellucid, the ſecond in degree of hardneſs from diamonds, fuſible by fire, which alſo deſtroys its colour. It is found among *quartz*, and is probably only a coloured quartz cryſtal. This ſtone may be imitated by adding to a frit of cryſtal glaſs eight parts of magneſia, and one part of zaffre. The purple of the *amethyſt* as well as the blue of the ſapphire, and the green of the emerald, are very periſhable, being all totally deſtroyed by a moderate degree of heat. Lewis. "The ſpecific gravity of *amethyſt* is between 2,6 and 2,7.

There are ſome oriental ſorts of a paler colour and others white,

white, and like the diamond. There are also beautiful ones found in the Pyrenean mountains, and in those of Auvergne.

Amethysts are dug in a hill named St. Sigmimont, two leagues from Vich, in Catalonia. They find the stones by following a vein of reddish or black earth, or a rein in the rock to coloured. They are all hexangular, and pointed like crystal. There are three sorts: the best are the blackish, or deepest violet; others are almost quite white; and some few are tinctured with yellow. Sometimes there is a great number found sticking together, like the Bristol diamonds; but these are never good: the best are found loose in the chinks of the rock, in a fatty reddish or yellowish earth. They take out this earth with long narrow knives, which enter the chinks; and then crumble it with their fingers to feel for the stones. Ray's Trav. p. 402.

The occidental *amethyst* is not extremely hard, but may be cut with a leaden wheel, smeared with emery moistened with water. It is polished on a pewter wheel with *tripoli*. It is easily engraven on, either in CREUX or RELIEVO.

Mr. Morin shewed Dr. Lister a huge block of French *amethyst*, two or three hundred pounds weight. Ray speaks of a mountain of *amethysts*. Spars and crystals tinged red and yellow, &c. are sold for *amethysts*. The false ones come from Germany, are tinged by vapours in the mines, and contain some lead.

Amethysts may be counterfeited by glass, to which the proper colour or stain is given. There were fine ones made in France, about the year 1690, which may even impose on connoisseurs, unless the stone be taken out of the collet.

The method of giving this colour to glass is as follows: take crystal-flint, made with the most perfect and fine tartar; then prepare a mixture of manganese in powder, one pound; zaffer prepared, one ounce and a half; mix these powders well together, and add to every pound of the frit, an ounce of this powder. Let it be put into the pots with the frit, not into the already made metal. When the whole has stood long enough in fusion to be perfectly pure, work it into vessels, and they will resemble the colour of the *amethyst*.

Some physicians distinguish a particular class of medicines, under the denomination of *amethystine, amethystina*, under which they comprehend all preservatives from drunkenness.

Among the medicinal qualities attributed to this stone, it is said to be good to stop a looseness, and to absorb the acid particles, when too much abounding in the stomach; which virtue it has in common with other alkaline substances.

AMETHYST, in *Heraldry*, signifies the purple colour in the coat of a nobleman, which in gentlemen's escutcheons below that degree, is called *purpure*; and in those of sovereign princes, *Mercury*.

AMETHYSTEA, *amethyst*, in *Botany*, a genus of the *diandria monogynia* class. The characters are: the flower has one leaf, which is cut into five equal pointed segments at the brim; it hath two slender stamens, which stand under the upper lip. After the flower is past, the germen becomes four naked seeds, shut up in the empalement.

We know but one species of the genus, viz. *amethystea*, Hort. Upsal. 9. Mountain upright *amethyst*. This plant is a native of the mountains in Siberia, from whence the seeds were sent to the imperial garden at Petersburgh.

It is annual, and hath an upright stalk, which rises about a foot high, and towards the top puts out two or three small lateral branches; these are garnished with small trifid leaves, sawed on their edges, and of a very dark green colour; at the extremity of the branches the flowers are produced in small umbels; these are of a fine blue colour, as are also the upper part of the branches, and the leaves immediately under the umbel; so that though the flowers are small, yet from their colour with those of the upper part of the stalk, the plants make a pretty appearance, during their continuance in flower. If the seeds of this plant are sown in the autumn, or are permitted to scatter, the plants will come up early in the following spring, and these will flower the beginning of June; but those sown in the spring will not flower until July.

When the plants come up, they will require no other care than to keep them clean from weeds, and where they are too close, to thin them, for they do not thrive when transplanted; the seeds, therefore, should be sown where they are to remain.

AMETHYSTINE is applied, in *Antiquity*, to a kind of purple garment dyed of the hue of *amethyst*.

In this sense *amethystine* differed from *Tyrian*, as well as from *hyacinthine* purple, being a kind of medium between both.

AMGAILA, or AMGAILAM, in the *Materia Medica of the Ancients*, a name given by Avicenna, and others, to a plant sometimes called ACANTHA *Arabica*, and *leucacantha* by the Greeks; the roots of which were called *hauban*, and much used in medicine by the Arabian physicians.

The *amgailia*, called also *furaha*, or *anuthai*, is described as a prickly herb, having roots like those of the cyprus, formed of several joints, or knots. They were used in stomachic and cardiac compositions, and were chosen by their lightness and good smell.

AMIA, in *Ichthyology*, the name of a very large sea-fish, called by some also *glaucus*, and by others *lucius*. It grows to a vast size, and in figure resembles the salmon. It is very common in the Mediterranean, and grows to four or five feet long.

AMIA is also the name of a fish called, by some authors, *pelamys*, but different both from the *pelamys sarda*, more usually called simply *pelamys*, and from the *pelamys* of the ancients, which was no other than the *thynnus*, or runny-fish, at a certain time of its growth.

This is, in shape and figure, very like the mackrel; it is common in the Mediterranean, and is brought to the markets of Italy, &c.

The *amia* is a species of the SCOMBER, in the Linnæan arrangement, and also the name of a genus of *abdominal* fishes.

AMIABLE *numbers*, denote numbers which are mutually equal to the whole sum of each others aliquot parts.—Such are the numbers 284 and 220. See NUMBERS.

AMIANTHUS, in *Natural History*, the name of a genus of fossils, of the class of the STEATITÆ; the characters of which are, that the bodies of it are flexile and elastic, and composed of short and abrupt filaments. See *Nat. of Fossils, Class* 1.

It has been a common error to confound the species of this genus one with another, and all with the several species of the *asbestus*, the consequence of which has been the loss of the art of spinning, and working the STEATITÆ into incombustible cloth.

Dr. Grew, in his Cosmologia Sacra, printed at London, in English, in the year 1701, observes, that the *amianthus* is full of parallel threads like silk hairs; and that it forms that diamonds, *amianthus*, and talc, both on account of their hardness, and because fire cannot spoil them, are composed of earthy and stony particles properly so called; and that it may be inferred from hence, that these bodies being of regular figures, are composed of regular atoms.

With regard to its medicinal virtues, not to speak of the fabulous properties attributed to it by Pliny, and others, it is said to resist poison, and to cure the itch.

It is the lightest and softest of all stones; its fibres are so flexible, that cloth has been made of them. It is indissoluble by acids, and was long thought unfusible by fire, till Mouf. d'Arcet discovered, that by violent and long continued heat it is fusible, and forms a black glass. By strong heat it is whitened and hardened so as to strike fire with steel, and become brittle. This stony concrete is of the talcky kind, though differing from talc in its external appearance. The shorter filaments that separate in the walking of the flour, may be made into paper in the common manner. For the method of its preparation for manufacture into cloth, see Phil. Trans. N° 277, and Dr. Lewis, in his edition of Neumann, p. 30.

The species of this genus, at present known in the world, are four, two of which are composed of larger, and two of finer or smaller filaments.

AMICABLE *lawyers, fauna amicabilia*, in *Antiquity*, are generally supposed to denote the seats in the Roman courts, wherein the advocates were placed. Some think that these had but little title to the denomination of *amicable*, and therefore will have the word to be here used for the benches wherein the *assessors*, or those called *judices pedanei*, were placed.

AMICABLE *compounder, amicabilis compositor*, is used by some ancient LAW-writers, for an ARBITRATOR.

AMICABLE, or *amiable compounder*, among the French, is a person who acts the part of a common friend, to reconcile two merchants or traders who have disputes, or are at law together. He differs from the *arbiter*, in that, in order to make the two disputants agree, he often prevails upon both to give up some part of their right or claim which an *arbiter* who performs the functions of a judge, is not, it seems, at liberty to do.

AMICABLE *society*. See ASSURANCE.

AMICIA. See AMELLUM.

AMICITIA.—*Tenure in* AMICITIA, is applied in *Ancient Writers*, to land granted freely, and of mere good will, to be enjoyed at the discretion of the donor.

AMICTUS, in our *Ancient Writers*, the uppermost of the

six garments, worn by priests; the others are *alba*, *cingulum*, *stola*, *manipulus*, and *planeta*. It was first found the neck, *Ne inde ad linguam transeat manducatum*; and covered the breast and heart, *Ne vanitates cogitet*.

This garment is otherwise called *amboligium*; sometimes *ambolagium*, *anagolagium*, and *humerale*. In ancient English writers it is called *amice*.

The *amict* is also worn by deacons, sub-deacons, and *acolouths*, when they officiate at the altar.

The priest and deacons in some dioceses, wear *amicts* on their heads from All-saints to Easter; though by the canons, they be expressly forbid to wear the *amict* without some considerable occasion.

Mr. Thiers asserts, that the use of *amicts* was introduced into the Latin church before the twelfth century. Dom. de Vert. maintains the contrary, chiefly from a figure of St. Fermin, first bishop of Amiens, supposed to have suffered martyrdom towards the beginning of the seventh century, whereon he is represented in his pontifical habit, with the *amict* on his head.

AMICTUS, in Roman *Antiquity*, denotes any upper garment worn over the tunica.

AMICULUM, in *Antiquity*, denoted an upper garment worn by the women. The *amiculum* is said to have differed from the *palla*; but wherein the precise difference lay does not appear. An *amiculum* was also in use among the men. This seems to have been the same with the *chlamys*, or *paludamentum*.

AMIDA, a god worshipped by the Japanese, who has many temples erected to him in the island of Japan, of which the principal is at Jedo. The Japanese have such a confidence in their idol *Amida*, that they hope to obtain eternal felicity by the frequent invocation of his name. One of the figures of this idol is represented at Rome.

AMID-SHIPS, a nautical term, denoting the middle of a ship, either with regard to her length or breadth.

AMIETES, cotton cloths which come from the East-Indies.

AMIGETI, in the Christian *Theology*, denote a kind of intellectual powers, or persons in the divine hierarchy.

The *amigeti* are represented as three in number, and constitute one of the triads, in the third order of the hierarchy.

AMINEUM *wine*, a name by which some of the medical writers have called white-wine vinegar, to distinguish it from other kinds. See AMINEA *Uva*.

AMIRANTE, a great officer in Spain, answering to the lord high-admiral in England.

AMISS *drawing*. See DRAWING.

AMISSA, *in*. See LEX.

AMITTERE *legem terræ*, a law-phrase, signifying the forfeiture of the right of swearing in any court or cause; or the becoming infamous.

This is the punishment of a champion overcome, or yielding in the combat; of jurors found guilty in a writ of attaint; and of perfons outlawed. Vide Glanvil. lib. ii. and fee the ftat. 5 Eliz. cap. 9. against *perjury*.

AM-KAS, in *Hiftory*, a name given to a fpacious falloon in the palace of the great Mogul, where he gives audience to his fubjects; and where he appears on folemn feftivals with extraordinary magnificence. His throne is fupported by fix large fteps of maffy gold, fet with rubies, emeralds, and diamonds; and eftimated at 60,000,000*l*.

AMMA, or HAMMA, from *amao*, to mow, a girdle or truls ufed in ruptures, to hinder the inteftines from bearing down into the fcrotum.

AMMA, in *Ecclefiaftical Writers*, denotes a fpiritual mother. In this fenfe, the word was chiefly underftood of an abbefs, or fuperior of a nunnery.

AMMAN, in the German and Belgic *Polity*, denotes a judge who has the cognizance of civil caufes.

The word is alfo written *amant*. Thus it occurs in writers on the French officers, where it ftands for a notary, or parochial officer, who draws acts or inftruments.

AMMANNIA, in *Botany*, a genus of the *tetrandria monogynia claſs*, in the Linnæan fyftem; the characters of which are thefe: it has a bell-fhaped empalement, divided at the brim into four fmaller parts; the flower hath no petals; it has four fmaller ftamina, which are inferted in the empalement; the empalement afterward becomes a round capfule with four cells, which are filled with fmall feeds. Linnæus mentions three and Miller two fpecies of it; the firft grows naturally in moift places in Jamaica, from whence Dr. Houftan fent the feeds to England. It grows about a foot high, with an upright fquare ftalk, and long narrow leaves, in form of a triangle, whofe bafe half furrounds it. The fecond fort grows naturally in Virginia and Carolina; this is an annual plant, which rifes about a foot high, with red fucculent ftalks, putting out fide-branches, which grow oppofite: the flowers are produced fingle from the wings, on the lower part of the branches.

AMMI, in *Botany*, called *ammoides*, by Boerhaave. See Ellior's *Bot.*

AMMI, or *Semen* AMMEOS, a kind of aromatic feed, of fome ufe in medicine; the produce of the plant above mentioned.

This feed is brought from the Levant: it is found to contain a great deal of eſſential oil, and volatile fal[illegible] to be attenuating, aperitive, hyſteric, carminative, [illegible]phalic, and alexipharmic; being one of the four hot feeds. It expels wind, provokes the menſes, [illegible]. It is alſo thought to have the property of reſiſting poiſon, and to be good againſt the bites of ſerpents. According to Lemery, the plant takes its name *ammeos*, from *ammos*, *arena*; its ſeeds being very like grains of ſand.

AMMINEA *uva*, in *Botany*, a name given by the old writers, to the grapes of a wild vine, common in the hedges of Italy, and ſome other places. They uſed to make wine of theſe grapes, which they mixed with other richer wines, and had in common uſe.

Some write the word *tamines*, inſtead of *amminea*.

AMMITES, in *Mineralogy*, a kind of figured ſtone, of a looſe open contexture, formed of a number of ſmall globular ſtones.

Ammites is the ſame with what is otherwiſe called *ammonites*. The word is derived from *ammos*, *ſand*; becauſe the *animales* appear to the eye as a compoſition of large ſand. The *ammites* is found in divers countries of Germany, &c. of different colours, as well as different degrees of hardneſs. It bears a near reſemblance to the cochlea.

AMMOCETUS, in *Ichthyology*, a name given by Gesner, and ſome others, to the AMMODYTES, or ſand-eel; called alſo *tobianus*, by Schonevelde and others.

AMMOCHOSIA, from *ammos*, *ſand*, and *χεω*, *I lay along*, in the *Materia Medica*, a kind of remedy, or operation for drying the body, by lying along on warm ſand, and having the body covered with it. Some prefer fait for this purpoſe to ſand.

AMMOCHRYSOS, from *ammos*, *ſand*, and *χρυσος*, *gold*, a name given by authors to a ſtone very common in Germany, and forming to be compoſed of a golden ſand. It is of a yellow gold-like colour, and its particles are all very glofſy, being all fragments of a coloured cube. It is eaſily to ſoft as to be eaſily rubbed to a powder in the hand; ſometimes it requires grinding to powder in a mortar, or otherwiſe. It is alſo uſed as ſand to ſtrew over writings. The Germans call it *bartzgold*; and there is another kind of it leſs common, but much more beautiful, conſiſting of the ſame ſort of glofſy ſpangles, but thoſe not of a gold colour, but of a bright red, like vermillion.

AMMOCHYSUS, in *Natural Hiſtory*, a kind of gem, ſuppoſed to be the ſame with the *coralloides*.

AMMODYTES, in *Zoology*, the name of a ſpecies of ſerpent, called alſo *ſerpens cornutus* by ſome, from certain protuberances in the head. It is about the ſize of the viper, and is of a yellowiſh or ſand colour. Its head is ſhaped like that of the viper, but its jaws are wider; and, in the upper part of its head, it has a ſort of wart-like excreſcence, which is ſuppoſed to reſemble a horn; and thence its name of *ſerpens cornutus*, as it has in other of *ammodytes*, or ſand-ſnake, from its ſand-like colour, or from its quality of ſometimes running under the ſands. It is found in Lybia, and in ſome parts of Italy.

AMMODYTES, in *Ichthyology*, the name of a genus of fiſh, characterized of which, according to Artedi, are theſe: the *branchioſtege* membrane contains on each ſide ſeven bones, but theſe are, in great part, hid by the *lamina* of the *operculum*. The head is compreſſed, the body oblong and ſlender, nearly cylindrical, but a little compreſſed, and it has no belly-fins. The fiſh is of the *malacopterygious*, or ſoft-finned kind; and the characters of the ſpecies, enumerated by Artedi, are theſe: The lower jaw is the longeſt; the lateral lines are double, or two on each ſide: the pectoral fins have each twelve rays; the back-fin five fifty-four; that of the anus twenty-eight: the tail is bifid, and has fifteen long rays: the mouth is toothleſs; the anus is nearer to the tail than the head. We call the fifth the *ſand-eel*. Schonevelde, the *ichneumon*. The fiſh is commonly found at about half a foot deep under the ſand, when the tide has run out, and caught there with iron hooks, with which the fiſhermen pull them out.

The name is formed of *ammos*, *ſand*, and *δυνω*, *a diver*, expreſſing the quality of this creature, to dive into, or bury itſelf under the ſand.

This genus belongs to the order of *apodes*, in the Linnæan ſyſtem.

AMMON, or HAMMON, in *Antiquity*, an epithet given to Jupiter in Lybia: where was a celebrated temple of that deity under the denomination of Jupiter *Ammon*.

There has been a great diſpute about the origin of this name.—Some derive it from *ammos*, *ſand*; becauſe the temple was ſituate in the burning ſands of Lybia; others borrow it from the Egyptian *Amun*, a ram; as having been firſt diſcovered by that animal.—Others will have

Ammon

Ammon to fignify the fun, originally derived from *Ham*; and the horns wherewith he is repreſented, the ſun-beams. Plutarch ſays, that of all the Egyptian names which ſeemed to have any correſpondence with the Zeus of Greece, *Ammon*, or *Amun*, was the moſt peculiar and adequate. Bryant's Mythol. vol. I. p. 5.

However this be, Jupiter *Ammon* was uſually repreſented under the figure of a ram; though in ſome medals he appears of a human ſhape, having only two ram's horns growing out beneath his ears.

AMMONIAC. *Gum* AMMONIAC, or as it is ſometimes, though improperly, called ARMONIAC, is a kind of gum, brought from the Eaſt Indies, and is ſaid to oozе from an umbelliferous plant.

Dioſcorides ſays, it is the juice of a kind of *ferula*, growing in Barbary; and that the plant which produces it was called *afaſtilis*.

Pliny calls the plant whence it flows, *metopion*; and ſays the gum takes its name from the temple of Jupiter *Ammon*, nigh which it grows. But it is much to be queſtioned whether we have at preſent the *gum ammoniacum* deſcribed by the ancients; and indeed their deſcriptions of that drug ſeem to evince that we have not.

The good *ammoniac* ought to be in dry drops, white within, yellowiſh without, eaſily ſuſible, reſinous, ſomewhat bitter, and of a very ſharp taſte and ſmell, ſomewhat like garlick. It ſhould alſo be of a pale colour, and not mixed with any ſcrapings of wood, ſtone, or ſand; this by the Greeks was called *commun. fragment.* The other, which is full of ſtone or ſand, was called *commun.* that is, *mixture.*

Some ſay, this gum ſerved the ancients for incenſe in their ſacrifices. It is a *gum reſin*, from an ounce of which ſix drams may be diſſolved by ſpirit of wine, or ſix drams two ſcruples and a half may be diſſolved by water. Neumann.

It enters ſeveral medicinal compoſitions, as an attenuant and detergent, againſt diſorders ariſing from viſcidities and grumes. Outwardly applied, it is reſolutive and ſuppurative; and, as ſome ſay, will of itſelf draw out ſplinters, &c. This gum contains plenty of eſſential, or volatile oil, ſome phlegm, and earth.

Some diſſolve the gum in vinegar, and other liquors, and call theſe *ſal ammoniacs*; much uſed in aſthmas, and obſtructions of the lungs. It is frequently alſo given in pills. It is often adulterated with common roſin.

AMMONIAC, *ſal*, is *natural* and *artificial*.

AMMONIAC, *ſal, natural*, is a neutral ſalt, compoſed of marine acid, and of volatile alkali; combinations of other ſalts with volatile alkalies are alſo called, from the name of this ſalt, *ſal ammoniac*, more uſually written *ammoniac*.

AMMONIAC, *ſal, mineral*, uſed by the ancients, was found in the ſands of Lybia, near the temple of Jupiter Ammun, from whence it derives its name. It was ſuppoſed to be generated in thoſe ſands from the urine of camels. Nor will this appear ſtrange, if we ſuppoſe thoſe ſands to be naturally impregnated with common ſalt; for then the urine of thoſe animals, by the intenſe heat of the ſun, muſt cauſe a fermentation, which will unite the acid of the common ſalt with the urinous ſalt, and conſequently produce *ſal ammoniac*. What the ancients called by this name is ſuppoſed to be a ſpecies of *ſal gem.* M. Lemery had a ſalt taken from mount Veſuvius, which they call *mineral ſal ammoniac*. It was of a compoſed ſubſtance, pretty tranſparent, very white, and the inſide cryſtalline; it would not attract much humidity from the air, but no ſmell, was of an acid ſaline taſte, and very much like that of *ſal ammoniac*. Hiſt. de l'Acad. Roy. des Scien. 1703.

The true *modern ſal ammoniac* is never found native, at leaſt in any tolerable pure ſtate, or in ſuch quantities as to anſwer the demands of arts.

AMMONIAC, *ſal, artificial*, or common *ſal ammoniac*, is chiefly brought from Egypt; and though there is hardly a more common drug, it is but very lately we have known in what manner it is made. M. Lemery, who was reſident at Grand Cairo, in the year 1720, has given us the following account of the method uſed by the Egyptians, in making *ſal ammoniac*.

'Concerning *ſal ammoniac* (ſays he), I ſhall obſerve, 1. the matter. 2. The veſſels that contain it. 3. The diſpoſition of the furnaces. 4. The manner of working. 5. The quantity and uſe of that ſalt.

'1. The *matter* is pure ſoot, and nothing elſe; but ſuch as is ſwept from chimneys, where they burn tufts of the dung of animals fed with ſtraw, which is the common fuel of the country. Theſe tufts, which are impregnated with alkaline and urinous ſalts, communicate to the ſoot certain properties, which it could not be expected to receive from the ſmoak of wood or coal, and yet are abſolutely neceſſary for the production of *ſal ammoniac*.

'2. The veſſels which contain the matter, are exactly of the figure of bombs. They are large round glaſs bottles, a foot and a half in diameter, with a neck two fingers in height. They cauſe over their bottles with a fat earth, and all theſe with ſhot to four fingers ſhort of their neck, which continues void and open. They contain each about ſixty pounds of ſoot, which at the end of the operation, yield ſix pounds or more of *ſal ammoniac*, according to the goodneſs of the ſoot.

'3. The furnaces are built like our common ovens, excepting that their vaults are perforated with ſeveral longitudinal clefts; upon each cleft are four bottles, placed in ſuch a manner, that the bottom of the bottle being funk in, and expoſed to the action of the flame, only the neck of the bottle continues expoſed to the air, the parts of the cleft contained between the bottles being ſtrongly cloſed with cement. Every furnace has four clefts, and conſequently contains fifteen bottles, and a very great laboratory conſiſts of eight furnaces, diſpoſed in two rooms; ſo that there are at once an hundred and twenty-eight bottles employed.

'4. In each furnace, for three days and eight ſucceſſively, there is kept up a conſtant fire, made of the dung of animals, mixed with ſtraw. The firſt day the thick phlegm of the ſoot exhales in a thick fume through the neck of the bottle. On the ſecond, the acid and alkaline ſalts being ſublimed, coaleſce and harden near the necks of the bottles. The third day the coagulation continues, depurates, and is finiſhed. In the mean time, they make a ſmall hole in the fire, a little below the neck of each bottle, to ſee if the matter be ſufficiently baked, and all the ſalt ſublimed. After making theſe obſervations, they carefully ſtop the hole with lute, and open it from time to time as they ſee occaſion. When the operation is finiſhed, they take out the fire, break the bottles, and ſeparate the aſhes from the ſublimed ſalts, or *ſal ammoniac*, which is a round, white, tranſparent ſubſtance, three or four fingers thick.

'5. In two towns of the Delta, near each other, a league from the city of Munſoure, there are twenty-five large laboratories, and ſome ſmall ones, which make every year fifteen hundred, or two thouſand quintals, of *ſal ammoniac*. In all Egypt beſide there are but theſe laboratories more, two of which are alſo in the Delta, and the other at Grand Cairo, which do not produce above twenty or thirty quintals of this ſalt.' Idem. de l'Acad. Roy. des Scienc. 1720.

Some, however, doubt whether ſo prodigious a quantity of ſoot can be furniſhed by ſuch a country as Egypt, whoſe climate is ſo warm, that fires are only uſed for culinary purpoſes, and for baginios; and therefore conclude, that the Egyptians have had the addreſs to keep the proceſs a ſecret from the Europeans, and that they uſe ſome other materials than ſoot; and it is ſaid that very good *ſal ammoniac* may be made without any ſoot at all.

Ammoniac ſalt is principally uſed by whitners of copper-veſſels, and goldſmiths; and is a noted drug with chymiſts and phyſicians. F. Sicard, a miſſionary, and an eye-witneſs, ſays they add a little ſea ſalt and urine of beaſts. Mem. de l'Acad. Roy. des Scienc. 1720.

See the method of making *ſal ammoniac* in Egypt, as communicated by Dr. Libanius, from his pupil Dr. Haſſelquiſt. His account does not eſſentially differ from that above recited. Phil. Tranſ. vol. ix. N° 48. an. 1760.

AMMONIAC is ſometimes made by the chemiſts of urine, ſea-ſalt, and wood-ſoot, boiled into a maſs, and then ſublimed.

We are told, that at the works carried on lately at Newcaſtle, *ſal ammoniac* was made from *urine* and *brine*; and it is further ſaid, that from one hundred weight of ſalt made from *brine*, ſold under the name of Epſom ſalt, and three boſtheads of urine, fifty-ſix pounds of *ſal ammoniac* may be procured.

AMMONIAC, *ſal, properties of*. It is ſoluble in four times its quantity of water; and if the ſolution be duly evaporated, it ſhoots into thin oblong ſublimates, reſembling feathers. *Sal ammoniac* neither coagulates milk, nor changes the colour of a ſolution of ſublimate; it makes a conſiderable efferveſcence with the vitriolic acid, attended with a great degree of cold. Expoſed to a conſiderable heat, it totally ſublimes; and if previouſly ground with metallic, and certain other powderous ſubſtances, elevates ſome part of them along with itſelf, and concretes with the reſt into a maſs, which expoſed as a moiſt air, readily flows into a liquor. Mixed with a due quantity of alkaline ſalts, it yields, by a ſmall degree of heat, two-thirds its weight of pure volatile alkali; what remains in the ſubliming veſſel, being diſſolved in water, and cryſtallized, readily aſſumes the form of cubical cryſtals, like thoſe of common ſalt, the properties of which it likewiſe poſſeſſes. *Sal ammoniac*, mixed

mixed with nitre, and injected into a red-hot crucible, boils up, and emits flashes of light, and thus betrays its animal origin. Sublimed in a retort, with double its weight of chalk, it is said to be increased in its weight. See Mem. de l'Acad. des Scienc. 1735.

In this operation, as M. Duhamel has observed, a true decomposition of the *sal ammoniac* takes place by the intervention of the chalk; which combining with the acid of the salt, discharges its *fixable air*. This again combines with the volatile alkali of the *sal ammoniac*, and occasions that increase of weight, which Duhamel, and other chemists, erroneously ascribed to a part of the calcareous earth carried off during the operation.

A mixture of quick-lime and *sal ammoniac* set to sublime, affords an exceeding penetrating spirit, but gives nothing in the form of a solid salt: if the quantity of lime be considerable, a volatile alkaline part of the *sal ammoniac* will be almost totally absorbed by it.

The volatile alkali obtained by this process is called *volatile spirit of sal ammoniac*; as it is caustic, or uncombined with *fixable air*, it is always in a liquid state. Moreover, fixed alkali, either vegetable or mineral, and most metallic substances, are capable of decomposing *sal ammoniac*.

Lastly, of all salts, *sal ammoniac* most intensely cools the water, in which it is dissolved, whose coldness in hot weather equals that of water ready to freeze.

From what has been said, it appears that *sal ammoniac* is a neutral salt, compounded of a volatile alkaline salt, and an acid.

The *sal ammoniac* derives its name from the various kinds of acid forming the composition. And accordingly we have *sal ammoniac animal, nitrous, vitriolic*, and *vegetable*, denoting the different combinations of volatile alkali with these acids respectively. That formed by volatile alkali and vinegar, is called *spirit of Mindererus*.

But it must be observed, that *sal ammoniac* is a very different substance from most of the preparations made from it; for when alkaline salts are mixed with the crude *sal ammoniac*, they absorb the acid, which renders the *sal ammoniac* neutral; and then the volatile urinous salts, being freed from the acid, rise in distillation.

Boerhaave says, that *sal ammoniac* preserves all animal substances from putrefaction; that its brine penetrates into the most minute parts; and that it is the noblest aperient, attenuant, resolvent, stimulant, errhine, alexipharmatory, diaphoretic, sudorific, antiseptic, and diuretic. It is made use of in sundry mechanic businesses, by the dyers and glass-makers, but especially by those who work on metals, for the purpose of soldering.

There are several preparations of this salt made use of in the present practice of physic, as

AMMONIAC, *flos*, volatile, made by sublimating *sal ammoniac*, mixed with salt of tartar. It is used for pocket-smelling bottles; but Boerhaave, with the greatest appearance of reason, condemns the custom of smelling to these salts as highly pernicious. Some put aromatics into the retort, which give it a more agreeable smell. It is prescribed in malignant fevers as a sudorific.

AMMONIAC, *spiritus salis, spirit of sal ammoniac*. This is a spirit distilled from *sal ammoniac*, mixed with salt of tartar, or pot-ash, and diffolved in a proper quantity of water. Some use lime instead of salt of tartar, in order to increase its volatility; but this should never be used internally.

The *aqua regia*, with which so many experiments are made, particularly in diffolving gold, is made from *sal ammoniac* and nitre. But the most celebrated medicine now in the shops from this substance, is the

Spiritus salis ammoniaci anisatus, generally called *sal volatile*, the oily spirit of volatile salt. This is a spirit distilled from *sal ammoniac*, salt of tartar, and spirit of wine, impregnated with aromatic oil. There is also the

AMMONIAC, *spiritus salis, succinatus*, spirit of *sal ammoniac* with amber; which is reckoned to be cephalic, and exceedingly well suited to all nervous indispositions; its dose is from ten drops to forty.

AMMONIAC, *flores*, is a name given to the *sublimate* formed by decomposing *sal ammoniac*, with a calcareous earth. It is a salt compofed of that earth, and marine acid.

AMMONIACUM *regeneratum*, in *Chymistry*, the name given to a sort of *sal ammoniac*, procured by chemistry from its principles.

The method of preparing it is this: take four ounces of alkaline spirit of *sal ammoniac*, dilute it with three times its weight of water, in a tall glass, and drop in spirit of sea-salt, till the alkali is saturated, and no more effervescence happens. The saturation being nicely hit, the liquor will be scentless, and of the taste of *sal ammoniac*; let it be filtrated and evaporated, and it will shoot out a fine woolly salt; or if it be evaporated to a dryness, a white salt will remain, and either one or the other of these will be found to be true genuine *sal ammoniac*, capable of rising in flowers, and standing all the tests of the common *sal ammoniac*.

The volatile alkali of animal and vegetable substances, which of itself indifferently recovers all acids, is here determined, by the acid of sea-salt, into a semi-volatile sea-salt; hence the chemical rule, that acids are capable of determining alkalies into their own nature, seems to receive confirmation, while the alkali either gives [illegible] neals, or volatility, as itself is fixed, or volatile. [illegible] therefore, as a large quantity of volatile alkali is continually generated from putrified animals and vegetables, if there was in nature a spirit of sea-salt floating about in several places, *sal ammoniac* would, in these places, be continually produced; and the same spirit meeting with a fixed alkali, produced from the ashes of vegetables, would immediately produce a true fixed sea-salt, as appears by the process of the regenerated sea-salt.

But though it is easy to manifest these fixed alkalies by experiments, yet it is very difficult to shew the existence of such acids in nature, unless we had the secret of Mr. Boyle, who, in his treatise of Mechanical Experiments, declares, that by a secret and long continued digestion, sea-salt may be so disposed as to part with its acid, by a gentle heat, and that before its water, and without any addition of any other substance. Boerh. Chem. part ii. p. 261.

For the chemical history of this substance, see Neumann's Works, p. 312.

AMMONIS, *cornu*, in *Natural History*. See CORNU *Ammonis*.

AMMONITÆ, in *Natural History*. See SNAKE-*stone*, and Phil. Trans. abr. vol. 2. part ii. p. 644.

AMMOSCHISTA, in *Natural History*, a genus of stones of a laminated structure, and splitting only horizontally, or into flat plates.

The *ammoschista* are coarse, harsh, and rough stones, of a very loose texture, and appearing something porous. They are considerably heavy, and composed of a large, coarse, and obtusely angular GRIT, surrounded, and in part held together, by a loose earthy spar. They are very soft and friable in the mass, but much more so when reduced to small pieces. They make a violent effervescence with aqua fortis, and will not easily strike fire with steel.

The species of *ammoschista* are six.

AMMUNITION, in general, signifies all sorts of warlike stores and provisions, more especially powder and ball.

The word is *ammunire*, which, according to Du-Cange, was used in the corrupt state of that language for *fortification*.

Ammunition or gun-powder, may be prohibited to be exported at the king's pleasure, by 12 Car. II. cap. 4. sect. 13.

By 1 Jac. II. cap. 8. sect. 2. *ammunition*, arms, utensils of war, or gun-powder, imported without license from his majesty, are to be forfeited with treble the value. Such license obtained, except for the furnishing his majesty's public stores, is to be void, and the officer to incur a premunire, and be disabled to hold any office from the crown.

Whoever is curious to know the quantity of *ammunition* necessary for the siege of a place, may consult the chevalier de St. Julien's treatise De la Forge de Vulcain; and the quantity requisite for the defence of a place, will be found in Surrey de St. Remy's Memoires d'Artillerie.

AMMUNITION-*bread*, flour, &c. what is provided for, and distributed to, the soldiers of an army or garrison.

Such an officer has so many rations of *ammunition-bread*, &c.

AMNA, in *Physical Writers*, denotes the water found in tiny soils, and which is consequently tinged with a whitish colour, as in many places of England.

In this sense, Paracelsus speaks of the medical virtues and uses of *amna*.

AMNESTY, or AMNESTIA, from *a*, *not*, and *memini*, *I remember*, a kind of general pardon, which a prince grants to his subjects, by a treaty or edict, wherein he declares, that he forgets and annuls all that is past, and promises not to make any farther enquiry into the same.

The word is *amnestia*, *amnestie*, which was the name of an ancient law of this kind, passed by Thrasybulus upon the expulsion of the thirty tyrants out of Athens. Andocides, an Athenian orator, whose life is written by Plutarch, and of whom we have an edition of the year 1575, gives us, in his Oration upon Mysteries, a *formula* of the *amnesty*, and the oaths taken thereupon.

Amnesties are usually practised upon reconciliations of the sovereign with his people, after rebellions, general defections, &c.

Amnesty is either general and unlimited, or particular and restrained, though most commonly universal, without condition or exception: such as that which passed in Germany,

Germany, at the peace of Osnabrug, in the year 1648.

Amnesty, in a more limited sense, denotes a pardon granted by a prince to his rebellious subjects, usually with some exceptions: such was that granted by king Charles II. at his restoration.

Amnesty also, in a military sense, signifies the pardon granted by a sovereign to deserters, on condition of their rejoining their regiments.

AMNIMODAR, in *Astrology*, the planet that rectifies a genniture, or rather a method of rectifying a nativity, and finding the precise degree in the horoscope at the time of an infant's birth, from the condition of the planet, which had the rule in the last preceding conjunction, or opposition of the luminaries. Vital. Lex. Math.

AMNIOS, or AMNION, in *Anatomy*, the innermost membrane wherewith the *fœtus* in the womb is immediately invested.

The word seems to be derived from ἀμνὸς, *a lamb*; q. d. *pelis agnina, lamb's skin*.

The *amnios* is a white, soft, thin, transparent membrane; making part of the secundine, and lying under the *chorion*. The existence of the *amnios* in human subjects is questioned; but the *amnios* is found in all animals both viviparous and oviparous. Dr. Hunter says, that the *amnion*, viewed in the microscope, appears to have blood-vessels, but that they are really lymphatics.

It contains a limpid liquor, like a thin jelly-broth; which, because the stomach of the *fœtus* is always found full of it, is supposed to be the matter of its nourishment.

But authors differ widely as to the quantity and quality of the liquor of the *amnios*.

The liquor of the *amnios*, according to Mr. Monro, serves to keep the *fœtus* and its membranes soft and extensible, hinders them from cohering, and defends the *fœtus* from pressure and other violence, which it needs most to be protected from, while its parts are very tender.

It is a question, however, whether the liquor of the *amnios* be a proper food for the *fœtus*. Mr. Monro is of opinion, that whether the liquor of the *amnios* be in a sound or in a morbid state, it appears to be very ill calculated for serving as food to be taken into the stomach of a *fœtus*.

It is also controverted, whether the liquor of the *amnios* passes into the stomach of the *fœtus*. Mr. Monro asserts, that the liquor of the *amnios* does not pass into the stomach of the *fœtus*; and answers the arguments brought by several learned men for the contrary opinion. Medic. Ess. Edinb. vol. i. and ii.

On its outside lies the *allantois*, or urinary membrane. In some subjects, the urinary membrane and *chorion* flick so close to one another, that they appear to be but one. The *amnios* hath all its vessels from the same origin as the *chorion*.

See some observations, proving that the *fœtus* is in part nourished by the liquor *amnii*, by Malcolm Fleming, M. D. Philof. Transact. vol. xlix. part i. N° 42. an. 1755.

AMNIS *alkalifatus*, among *Chemists*, denotes water impregnated with an alkalious quality, by passing through a lime or other alkaline substance under ground.

This amounts to much the same with what Paracelsus calls AMSA.

AMNITES, in *Natural History*, a name used by some for the *hamatites*, or spaw-stone, a stone supposed to be composed of the petrified spawn of fishes; but they are, in reality, a *congeries* of small STALAGMITÆ, or drop-stones.

AMŒBÆUM, in the *Ancient Poetry*, denotes a kind of poem, or composition, wherein two parties speak alternately in the same number of verses, but so as that he who answers, either goes beyond or contradicts the other.

The word is *amœbæus*, signifying *mutual* or *alternate*. Hence also we meet with *tripodes amœbæi*. Such, e. g. are those of Pliny and Dares.

AMOGABARI, a kind of ancient Spanish soldiers, in great repute for their bravery.—These are otherwise denominated, by some writers, *almogavares*.

AMOGLOSSUS, in *Ichthyology*, a name of a peculiar kind of flat fish, somewhat resembling the sole, and called in some parts of England, the *smear*. It is of a very slender, pellucid, and white body, never exceeds three inches in length, and is exceedingly smooth to the touch, being covered only with a number of very thin scales, which fall off on touching it. Its flesh is very finely tasted, and requires very little dressing.

AMOMI is used, by the Dutch traders, for what we otherwise call Jamaica pepper.

AMOMUM, in *Botany*. See GINGER.

AMOMUM *of Pliny*. See SOLANUM.

AMOMUM, in the *Materia Medica*, a small and rich aromatic fruit, growing in bunches like grapes, valued highly for its medicinal virtues. It is commonly chused among the *feeds*.

The commentators on Pliny and Dioscorides, have never been able to agree upon the ancient *amomum*; the generality of them seek it in fruits different from one's. Some will have the rose of Jericho pass for it.—F. Camelli is positive he has discovered the real *amomum* of Dioscorides, and that it is the *tapos* or *tiras*, or *zarapi*, growing in the Philippine islands; the grains or berries whereof are worn by the natives about their necks; both on account of their agreeable odour, and of their supposed virtue in preserving from infection, during the rising of the scolopendra, &c. Phil. Trans. N° 248.

Scaliger is confident, that the *amomum* of the ancients was not a fruit, but the wood itself, which bore some resemblance to a bunch of grapes, and was particularly used in embalming of bodies; and hence, says he, the term MUMMY was given to the bodies of Egyptians, embalmed with it. On this account, likewise, all medicines and unguents used in the embalming and preserving of dead bodies, were called *amomia*.

The ancient *amomum* was of divers kinds; but the Armenian was most esteemed. It was a heater, dryer, and astringent; used as a cardiac, to appease pain, cure poisonous bites, inflammation of the eyes, &c.

The true *amomum* of the ancients resembles the muscat grape, and grows like it, in clusters; it is about the bigness of a large chich-pea, round, membranous, and divided into three cells, which contain several brown angular grains; of a very strong aromatic taste and smell; and is of the cardamum kind.

This fruit is brought from the East Indies; and makes part of the composition of Venice treacle.—It is of a hot, spicy taste and smell.

Besides this, there is likewise another paler sort, which bears the name *amomum*; but neither this nor the former are much used in physic.

The modern *amomum*, used in the shops, under the denomination of *amomum vulgare*, or *amomum officinarum*, appears to be the seed of the *siser* or *sium* of the ancients, answering to what in English we call *hollow-stone* PARSLEY.

It is esteemed a powerful diuretic, and is good in all nephritic cases. It is also commended as an aperient in general, and prescribed in obstructions of the liver and spleen, and in suppressions of the menses. The people in some parts of England bruise the seeds, and give them in warm ale, in colics; but those of caraway, or anise, are better. See SKIRRET.

AMORÆANS, from "ΧΝ, *Amri*, a self or order of *gamaliel* doctors or commentators on the Jerusalem Talmud.

The word is otherwise written *amorai*, and *amoraim*, *amoraim*.—The *amoræans* are also called, by Scaliger, *sophifæ*; by Alting, *sematores*, or, *fpectores of sentences*; by Bartolocius, *doctores*, or *disputantes*, because they conferred and disputed together in a scholastic manner. The *amoræans* succeeded the *mishnic* doctors. They subsisted 250 years; and were succeeded by the *sabureans*.

AMORE, in *Ichthyology*, the name of a genus of fishes, of which there are three species. 1. The *amore plumieri*. 2. The *amore grace*. And, 3. The *amore thuja*.

The *amore plumieri* has a very broad head, and a very large mouth, but has no teeth. Its body is oblong, and its back and sides are of a dusky iron colour. Its belly, which is protuberant, is white. Its fins is soft; and it has seven fins, besides the tail, which is rounded at the end. Its flesh is firm, and well-tasted.

The *amore grace* is, like the former, of an oblong figure; but it grows to six inches in length. Its head is thick, its gills large, and its mouth is furnished with small teeth. Its eyes are small, their pupil black, and the iris yellow. It has seven fins besides the tail, which is long, and rounded at the end. This species is covered with somewhat large scales, and is of a ruby iron colour, but somewhat paler on the belly than on any other parts.

The *amore thuja* is of the same shape with the former, but is much smaller, and is covered with whitish scales all over, but painted with brown spots. Its tail is brown, and waved with different degrees of that colour. All the three species are eaten, but the first is esteemed the best. They are caught about the American shores. Meregrave's Hist. Brasil.

AMOMPHA, *bastard indigo*, in the Linnæan system of *Botany*, a genus of plants belonging to the *decandria diandria* class, of which the characters are: the flowers are of the butterfly kind, having an oval concave standard, but no wings, or keel; this is inserted between the two upper segments of the cemplement; the germen afterword becomes a reflexed, moon-shaped pod, having one cell, in which are lodged two kidney-shaped seeds. We know but one species of this genus.

This shrub grows naturally in Carolina, where formerly the inhabitants made a coarse sort of *paper* from the

young ſhoots, which occaſioned their giving it the title of *baſtard acacia*.

It riſes with many irregular ſtems to the height of twelve or fourteen feet, with very long winged leaves, in ſhape like thoſe of the common ACACIA. At the extremity of the ſame year's ſhoots, the flowers are produced in long ſlender ſpikes, which are very ſmall, and of a deep purple colour. After the flowers are paſt, the germen turns to a ſharp pod, having two kidney-ſhaped ſeeds; but theſe do not ripen in England.

This ſhrub is become very common in all the gardens and nurſeries near London, where it is propagated as a flowering ſhrub, for the ornament of the ſhrubbery. It is generally propagated by laying down the young branches, which in one year will make good roots, and may then be taken off and planted, either in the nurſery, or the places where they are deſigned to remain.

AMORTIZATION, or AMORTISEMENT, in *Law*, the act of turning lands into mortmain, i. e. of alienating or transferring them to ſome corporation, guild, or fraternity, and their ſucceſſors.

The word is formed of the French *amortir*, *to extinguiſh*. See EXTINGUISHMENT.

The term is alſo uſed for the licence or privilege which the king or ſuperior lord grants, to enable ſuch a corporation, &c. thus to receive lands in MORTMAIN; which otherwiſe they cannot do.—There is always ſuppoſed to be ſome fine or acknowledgment paid to the king, or the lord, in conſideration hereof; to make them ſatisfaction for ſeveral incidental duties and profits, which would have fallen to them in the common way; which are hereby cut off.

This practice was borrowed from the ancient *Lex Papiria*, whereby it was forbidden to conſecrate any land to religious uſes without the conſent of the people.

AMOS, or the *Prophecy of Amos*, a canonical book of the Old Teſtament. This prophet boldly remonſtrates againſt the crying ſins that prevailed among the Iſraelites; and reproves the people of Judah for their ſecuſality and injuſtice. He terrifies them both with frequent threatnings, and denunciations that their ſins will at laſt end in the ruin of Judah and Iſrael. He begins with denunciations of judgment and deſtruction againſt the enemies of the Jews, and concludes with promiſes of reſtoring the tabernacle of David, and of erecting the kingdom of Chriſt.

AMOVING, the act of removing or expelling another from his place, office, or the like. We have ſtatutes for *amoving* papiſts out of London and Weſtminſter, and ten miles round the ſame. 1 W. and M. cap. 9.

AMOVING *a guardian, amovendo cuſtode*. See CUSTODE.

AMPANA, in *Botany*, a name given, in the Hortus Malabaricus, to a genus of plants, ſince deſtroyed by LINNÆUS, under the name of ROSSÆUS.

AMPELIS, in *Botany*, the *vine*. See VINE.

AMPELIS, in the *Linnæan* ſyſtem of *Ornithology*, the name of a genus of birds of the order of the *paſſeres*; the diſtinguiſhing characters of which are, that the tongue is furniſhed with a *rim*, or margin, all round; the beak is of a convex form, and ſtraight. There are ſeven ſpecies.

AMPELIS is alſo the name of a bird, of the magpye-kind, called by ſome GARRULUS *Bohemicus*. See ROLLIER.

AMPELITES, canal-coal, in *Natural Hiſtory*, a black *bituminous* ſubſtance, called alſo PHARMACITIS, and nearly reſembling pit-coal, inſomuch, that the difference between them is ſcarce ſenſible. Accordingly, Theophraſtus gives its deſcription under the claſs of thoſe coals; and Dr. Woodward ſeems of the ſame opinion. The *ampelites* of the ſhops, according to him, is the ſame with our canal-coal found in Lincolnſhire.

It differs from the common pit-coal, in that it is more friable and fat; and alſo leſs compact and ſolid; which, it muſt be owned, does not agree with Woodward's deſcription of canal-coal, which he repreſents as very fine and hard, ſo as to take a pretty good poliſh.

The beſt, according to Dioſcorides, is that of a black colour, reſembling ſmall pieces of the *lapis piceus*, or pit-coal; equally gloſſy on all ſides, though when kneaded up with a little oil, it readily melts.

It is found in many parts of England, in the ſame places with pit-coal. It is alſo to be met with in a quarry near Abergavenny, in France. It is uſed by huſbandmen, &c. to ſmear their wives with, againſt vermin, and is endued with a drying diſcuſſive power; on which account it is alſo uſed for the dying of hair.

It makes no efferveſcence with *aqua fortis*. Being applied to the belly, it is reputed good for killing worms. It is capable of a fine poliſh, and for that reaſon is turned into vaſt number of toys, as ſnuff-boxes, and the like.

Ampelites is by ſome called vine-earth, becauſe it kills the worms that creep upon vines.

Libavius has treated at large of the *terra ampelites*.

AMPELOGRAPHIA, the natural hiſtory, or deſcription of the VINE.

The word is originally compounded of ἀμπελος, *a vine*, and γραφω, *deſcription*.

Phil. James Sachs has publiſhed an *Ampelographia, ſeu Vitis vinifera ejuſque partium conſideratio phyſica, &c.* Uratiſlav, 1661, 8vo.

AMPER, a local term uſed in Eſſex for a *tumor* or *phlegmon*. In this ſenſe, the word is alſo written *amper*.

AMPHERES, from ἀμφι, *on both ſides*, in *Antiquity*, a kind of veſſels, wherein each mariner wrought two oars at the ſame time, one with the right-hand, and the other with his left, anſwering to our *ſculler*s. This is alſo called *amphoricum*.

AMPHIARTHROSIS, in *Anatomy*, a neutral or dubious kind of articulation; diſtinguiſhed from the *diarthroſis*, in that it has no conſpicuous motion; and from the *ſynarthroſis*, in its not being without ſenſible motion.

The word is derived from ἀμφι, *both*, and ἀρθρωσις, *articulation*, the *amphiarthroſis* being compounded of both the other ſorts. Whence ſome alſo call it *diarthroſis ſynarthrodialis*.

Of this kind is the articulation of the ribs with the *vertebræ*; and that of the *carpus* with the *metacarpus*.

AMPHIBALUM, among *Middle Age Writers*. See AMPHIMALLUM.

AMPHIBIA, in *Natural Hiſtory*, the third claſs of animals, whoſe eſſential characters are, according to Linnæus, that they have either a naked, or elſe a ſcaly body, with no grinders, or *dentes molares*, their teeth all ſharp and pointed, and without radiated fins; or, their heart has but one ventricle, and they reſpire through their lungs.

This claſs is divided into three orders, viz. *reptiles, ſerpentes*, and the ſwimming *amphibia*, comprehending 24 genera, and 289 ſpecies.

AMPHIBIOUS, in *Natural Hiſtory*, a term applied to a ſort of animals which live both on land and in the water; that is, which breathe the air, but paſs part of their time in the water, as affording them their chief food.

The word comes from ἀμφι, *utrumque, both ways*, and βιος, *vita, life*; as living in either place.

Such are the *frog, caſtor, otter, tortoiſe, ſea-calf, crocodile*, &c.—Moſt of the *amphibious* kind, the *caſtor* and *otter* excepted, have peculiar proviſions in their ſtructure, to fit them for ſo various a way of living; particularly in the heart, lungs, *foramen ovale*, &c.

In ſome of theſe animals, as the *frog, tortoiſe*, &c. the heart has but one cavity, with an artery to receive the blood coming out of it, and a vein to convey it thither. In others, the *foramen ovale* appears to be ſtill open for the paſſage of the blood from the vena cava to the *arteria venoſa*, without the help of breathing.

In the *caſtor* diſſected by the academiſts of Paris, though the *foramen* was not found actually open, yet the marks of it appeared; and the cauſe of its cloſure might well enough be accounted for, from the animal's having been detained a good while from the water, by which the part having been in diſuſe cloſed up. In the OTTER the caſe is different; there is no appearance of any thing like a *foramen*, and hence the neceſſity the creature is under of riſing, from time to time above water, to take in air. Phil. Tranſ. N° 124.

The ſtructure of the feet of the CASTOR pronounces it *amphibious* at firſt ſight, the fore-feet being formed like thoſe of terreſtrial animals, who hold their food in their feet, e. gr. ſquirrels, while the hind-feet are faſhioned after the manner of river fowl, with webs or membranes between the toes, as the gooſe, duck, &c.

A great part of the fly-kind may be ſaid, in one ſenſe, to be *amphibious*. Gnats drop their eggs in water, where hatching, the young live and breathe after the manner of fiſhes, till at length undergoing a metamorphoſis, they take wing, quit their native element, and become inhabitants of the air. May not ſwallows alſo be ranged under this claſs, which have been ſometimes found to paſs their winter aſleep under water, from which the warmth of the ſpring awakes, and calls them forth?

Elias Geiſsler has written expreſly concerning *amphibious* animals. M. Ottwald of Dantzick has left behind him anatomical obſervations on *amphibious* animals.

Dr. Hunter obſerves that, properly ſpeaking, there are no *amphibious* animals; for that fiſh cannot live long without air, though much longer than men. See two ingenious diſſertations on this ſubject by Dr. Parſoes, in the Phil. Tranſ. vol. lxi. 1766.

The term *amphibious* is ſometimes alſo extended to men, who have the faculty of living a long time under water.

We have divers inſtances of ſuch *amphibious* men; the moſt remarkable is of a Sicilian named the *Fiſh-Cola*. Kircher relates, that by a long habitude from his youth, he had ſo accuſtomed himſelf to live in water, that his nature ſeemed to be quite altered; ſo that he lived rather

after

after the manner of a fish than a man. See Brydone's Tour, vol. I. p. 77.—The PEARL-*fisher*, also arrive at a surprising art of this kind.

AMPHIBIOUS *Plants*. See PLANTS.

AMPHIBIOUS *birds*. See SIREN.

AMPHIBLESTRODES, in *Anatomy*, a tunic, or coat of the eye, more usually called *retina*.

The word is compounded of ἀμφὶ, *about*, βλῆστρον, net, and εἶδος, *form*; on account of its net-like texture; whence the Latins also call it *reticformis*.

AMPHIBOLOGY, or AMPHIBOLIA, in *Grammar*, a fault in language, whereby it is rendered obscure, and liable to be understood in a double sense.

The word comes from ἀμφίβολος, *ambiguous*, and λόγος, *discourse*.

Amphibology is chiefly used in respect of a phrase, as equivocal is in respect of a word.

Of this kind was that answer which Pyrrhus received from the oracle: *Aio te, Æacida, Romanos vincere posse*; where the *amphibology* consists in this, that the words *te* and *Romanos*, may either of them precede, or either of them follow, the words *posse vincere*, indifferently. See ORACLE.

The English language usually speaks in a more natural manner, and is not capable of any *amphibologies* of this kind: nor is it so liable to *amphibologies* in the articles, as the French, and most other modern tongues.

AMPHIBRACHYS, the name of a foot in the Latin and Greek poetry; consisting of three syllables, the first and last whereof are short, and that in the middle long.

The word comes from ἀμφὶ, *circum*, and βραχὺς, *brevis*, q. d. a foot short at both ends, and long in the middle.—Among the ancients it is also called *jonius*, and *ecdicus*. Diom. iii. p. 475.

Such are the words *amāvī*, *ămārī*, *patĕrnūs*, Ὁμήρου, &c.

AMPHICOME, in *Natural History*, a kind of figured stone, of a round shape, but rugged, and beset with eminences, celebrated on account of its use in divination. The word is originally ἀμφίκομα, q. d. *utrinque comata*, or *hairy on all sides*.

AMPHICTYONS, AMPHICTYONES, in *Antiquity*, the deputies of the cities and people of Greece, who represented their respective nations in a general assembly; having a full power to concert, resolve, and appoint, what they should think fit, for the service of the common cause.

Some suppose the word ἀμφικτύονες, to be formed of ἀμφὶ, *about*, and κτίσις, or κτίσμα, because the inhabitants of the country round about met here in council. Others, with more probability, derive it from *Amphictyon*, son of Deucalion, whom they suppose to have been the founder of this assembly; though others will have Acrisius, king of the Argives, to have been the first who gave a form and laws to this body.

The *amphictyones* very much resembled the states-general of the United Provinces; or rather, what in Germany they call the DIET of the empire.

Authors give different accounts of the number of the *amphictyons*, as well as the states who were entitled to have their representatives in this council; according to Strabo, Harpocration, and Suidas, they were twelve from their first institution, sent by the following cities and states; the Ionians, Dorians, Perrhæbians, Bœotians, Magnesians, Achæans, Phthians, Melians, Dolopians, Ænianians, Delphians, and Phocæans. Æschines only reckons eleven, instead of the Achæans, Ænianians, Delphians, and Dolopians, he only gives these three, the Thessalians, Œtæans, and Locrians. Lastly, Pausanias's list only contains ten *amphictyons*; namely, the Ionians, Dolopians, Thessalians, Ænianians, Magnesians, Melians, Phthians, Dorians, Phocians, and Locrians.

In the time of Philip of Macedon, the Phocians were excluded the alliance, for having plundered the Delphian temple, and the Lacedæmonians were admitted into their place; but the Phocæans, sixty years after having behaved gallantly against Brennus and his Gauls, were restored to their seat in the *amphictyonic* council. Under Augustus, the city Nicopolis was admitted into the body; and to make room for it, the Magnesians, Melians, Phthians, and Ænianians, who till then had distinct voices, were ordered to be numbered with the Thessalians, and to have only one common representative. Strabo speaks as if this council were extinct in the times of Augustus and Tiberius; but Pausanias, who lived many years after, under Antoninus Pius, assures us it remained entire in his time, and that the number of *amphictyons* was then thirty.

The members were of two kinds: each city sending two deputies, under different denominations, one called πυλαγόραι, whose business seems to have been more immediately to inspect what related to sacrifices and ceremonies of religion; the other σύνεδροι, charged with hearing and deciding causes and differences between private persons. Both had an equal right to deliberate and vote, in all that related to the common interests of Greece. The *hieromnemon* was elected by lot; the *pylagorat*, by plurality of voices.

Though the *amphictyons* were first instituted at Thermopylæ, M. de Valois maintains that their first place of residence was at Delphi, where, for some ages, the tranquillity of the times found them no other employment than that of being, if we may so call it, church-wardens of the temple of Apollo. In after-times the approach of armies frequently drove them to Thermopylæ, where they took their station, to be nearer at hand to oppose the enemies progress, and order timely succour to the cities in danger. Their ordinary residence, however, was at Delphi.

Here they decided all public differences and disputes between any of the cities of Greece; but before they entered on business, they jointly sacrificed an ox, cut into small pieces, as a symbol of their union. Their determinations were received with the greatest veneration, and even held sacred and inviolable.

The *amphictyons*, at their admittance, took a solemn oath never to divert any city of their right of deputation, never to avert its running waters; and if any attempt of this kind were made by others, to make mortal war against him; more particularly, in case of any attempt to rob the temple of any of its ornaments, that they would employ hands, feet, tongue, their whole power, to revenge it. This oath was backed with terrible imprecations against such as should violate it; as eg. May they meet all the vengeance of Apollo, Diana, Minerva, &c. their soil produce no fruit, their wives bring forth nothing but monsters, &c.

The stated terms of their meeting were spring and autumn; the spring meeting was called Ἐαρινὰ Πύλαια, that in autumn Μετοπωρινὰ. On extraordinary occasions, however, they met at any time of the year, or even continued sitting all the year round.

Philip of Macedon survived the right of presiding in the assembly of the *amphictyons*, and of first consulting the oracle which was called Προμαντεία.

The Romans never thought fit to suppress the meeting of the *amphictyons*. Strabo informs us that they subsisted in his time. Potter's Arch. Græc. Meib. Acad. Inscr. tom. iv. and vii. Æschin. Orat.

AMPHIDROMIA, from ἀμφὶ, and δρόμος, a *course*, in *Antiquity*, a feast celebrated the fifth day after the birth of a child, called *dies lustricus*, or LUSTRAL *day*.

AMPHIDRYON, in *Ecclesiastical Writers*, a veil or curtain usually drawn before the door of the BEMA in ancient churches.

APHIMACER, a foot in the *Ancient Poetry*, consisting of three syllables; the first and last whereof are long, and that in the middle short.

The word is derived from the Greek ἀμφὶ, *circum*, and μακρὸς, *longus*, by reason both extremes are long.

Such are the words *lunārĭum*, *cāpĭtāle*, *γεραιτάτων*, &c.

This foot is also called *creticus*, and sometimes *felecmnius*.

AMPHIMALLUM, from ἀμφὶ, and μαλλὸς, a *fleece of wool*, whence *covering*, or *garment*, in *Ecclesiastical Writers*, is otherwise called *amphibalum*, and *amphibalum*, from ἀμφὶ, and βάλλω.

Magri suggests the *amphimallum*, spoken of by ecclesiastical writers, to have been a garment peculiar to bishops.

AMPHIPNEUMA, ἀμφίπνευμα, among *ancient Physicians*, a great degree or species of difficult respiration.

AMPHIPOLES, from ἀμφὶ and πωλέω, *sell*, in *Antiquity*, archons, or chief magistrates of the city of Syracuse.

They were first established by Timoleon, after the expulsion of Dionysius the Tyrant. They governed Syracuse for the space of three hundred years; and Diodorus Siculus assures us, they subsisted even in his time.

AMPHIPPI, in *Antiquity*, those who practised riding on two horses, by jumping from one to the other.

The word is Greek, ἀμφίπποι; they are sometimes also called ἐφαμιππιοι, and sometimes by corruption, ἀμφιππι.

The appellation was given to a sort of cavalry in the Grecian armies, who, for their convenience, had two horses a-piece, on which they rode by turns, leading the other.

AMPHIPRORÆ, from ἀμφὶ, and πρῶρα, *prow*, in *Antiquity*, were ships which had prows at both ends, that no time might be lost in turning them, and also on account of the rapidity of streams, and narrowness of channels.

AMPHIPROSTYLE, in the *Ancient Architecture*, a kind of temple, which had four columns in front, and as many behind.

The word is derived from ἀμφὶ, *about*, πρὸ, *before*, and στύλος, *column*.

AMPHISBÆNA, from ἀμφὶ and βαίνω, *I go*, in *Zoology*, the name of a genus of serpents in the Linnæan system. It goes with equal ease, as its name imports, either forward or backward.

Linnæus

Linnæus enumerates two species, viz. the fulfiginous, and white. They are both found in America.

AMPHISBÆNA *aquatica*, a name given, by Bertrutius, Albertus, and several other authors, to that long and slender insect, called by others the *scta aquatica*, and *vermis fetorius*. It has the name *amphisbæna* from its going backwards or forwards with equal ease or celerity. The usual size is four or five inches long, and the thickness of a large hair.

Dr. Lister accidentally found out the origin of this worm, in his researches into the history of a very different sort of insect. Dissecting one of the common black beetles dug up in a garden, he found in its belly two of these hair-worms, or *amphisbænæ*; and renewing the experiment on other beetles of the same species, he found that they usually contained one, two, or three of these worms. As soon as the body of the beetle is opened, they always crawl out. When put into water, they will live a considerable time, and swim nimbly about; but often put up their heads above water, as if endeavouring to make their escape, and sometimes fastening themselves by the mouth to the sides of the vessel, and drawing their whole bodies after them.

These creatures are not only found in the waters, but buried in earth, and sometimes on the leaves of trees, in our gardens and hedges. Phil. Trans. N° 83.

AMPHISCII, in *Geography* and *Astronomy*, the people who inhabit the torrid zone.

The word comes from ἀμφὶ, *about*, and σκιὰ, *shadow*. They are thus denominated, as having their SHADOW turned sometimes one way and sometimes another, i. e. at one time of the year to the north, and at another to the south.

The *amphiscii* are called also SCII.

AMPHISMILA, or AMPHISMELA, an anatomical knife, edged on both sides.

The word is formed from ἀμφὶ, *utrinque*, *on both sides*, and σμὴ, *knife*.

AMPHITANE, ἀμφίτανις, in *Natural History*, a name of a stone described by the ancients, and said to have the power of the magnet, or load-stone: but with this remarkable difference, that as that stone attracts only iron, to this is supposed to exert its influence only on gold. For this fabulous property, however, there does not appear to be the least foundation.

AMPHITAPA, in *Antiquity*, a kind of carpets, or clothing, having a soft warm nap on each side.

AMPHITHEATRE, a spacious building of an oval figure, having its *area* or *arena* encompassed with several rows of seats, rising gradually one over another: with portico both within and without-side.

The word is derived from ἀμφὶ, *about*, and θεατρον, *theatre*, from θεασθαι, *contemplari*; in that an *amphitheatre*, strictly speaking, is a place whence a person may see all around him.

Among the ancients, the *amphitheatre* was appointed for the exhibiting of spectacles or shews to the people; as the combats of gladiators, those of wild beasts, and the *naumachiæ*, or *sea-fights*.

Amphitheatres were at first only of wood; and it was not until the reign of Augustus, that Statilius Taurus built one for the first time of stone. The lowest part was of an oval figure, and called *arena*, because for the convenience of the combatants, it was usually strewed with sand; and round the *arena* were vaults, styled *cuneæ*, in which were confined the wild beasts appointed for the shews.

Above the *cuneæ* was erected a large circular peristyle *podium*, adorned with columns. This was the place of the emperors, senators, and other persons of distinction. The rows of benches were above the *podium*. Their figure was circular, and they were entered by avenues, at the end of which were gates called *vomitoria*.

Their theatre was built in form of a semicircle, only exceeding a full semicircle by one fourth part of the diameter; and the *amphitheatre* was nothing else but a double theatre, or two theatres joined together; in that the longest diameter of the amphitheatre was to the shortest, as 15 to 8.

There are *amphitheatres* still standing at Rome, at Pola, at Nismes, &c. The *amphitheatre* of Vespasian, called the Coliseum, and that at Verona in Italy, are the most celebrated now remaining in all antiquity. Remains of *amphitheatres* are there also at Arles, Bourdeaux, &c.

The *amphitheatre* at Pola, an ancient republic of Istria, is very entire; it consists of two orders of Tuscan pillars, one over the other. The lower have pedestals, which is extraordinary; this order having scarce ever more than *bases* to support them.

The *amphitheatre* of Titus is computed to have been capable of holding 85,000 spectators. That of Verona is the best preserved: for, though most of the great and best stones of the outside are picked out, yet the great vault, on which the rows of the seats are laid, is entire; the rows also (which are 44 in number) are entire. Every row is a foot and a half high, and as much in breadth; so that a man fits conveniently in them; and allowing for a seat a foot and a half, the whole will hold 23,000 persons.

Pliny mentions an *amphitheatre* built by Curio, which turned on large iron pivots; so that of the same *materials* two several theatres were occasionally made, where different entertainments were sometimes presented at the same time.

Mr. Brydone mentions an *amphitheatre* at Syracuse, the theatre of which is so entire, that the *gradini* for seats still remain; but it is a small theatre, he says, in comparison of that at Taurominum. Tour to Sicily, vol. I. p. 295.

AMPHITHEATRE is also used for a room formed with circular seats above one another, for the convenience of those who attend chirurgical experiments and operations.

AMPHITHEATRE, in *Gardening*, certain dispositions of trees and shrubs on the sides of hilly places, which, if the hill or rising be naturally of a circular figure, always have the best effect. They are to be formed of evergreens, such as hollies, phillereys, laurustines, bays, and such plants, observing to plant the shortest growing trees in the front, and those which will be the tallest behind, such as pines, firs, cedars of Lebanon, &c.

Amphitheatres are also sometimes formed of slopes on the sides of hills covered only with turf, and, when well kept, they are a great ornament to large gardens.

AMPHITHURA, in *Ecclesiastical Antiquity*, a name given to the veil, or curtain, which attended the chancel from the rest of the church.

The word is ἀμφίθυρα, thus called, on account of its opening in the middle, after the manner of folding doors.

AMPHITRITE, ἀμφίτριτη, from ἀμφὶ and τρίζω, *fono*, in the *Heathen Mythology*, the wife of Neptune, daughter of Nereus, and goddess of the sea, sometimes taken for the *sea*.

AMPHITRITE, in *Zoology*, the name of a small naked sea insect, of an oblong figure, with only one *tentaculum*, resembling a piece of thread. There are several species of this animal, some of which are margmated, and variously furrowed, so as to bear some resemblance to a quill.

AMPHODONTA, in *Zoology*, a denomination given to animals which have teeth in both jaws, the upper as well as under.

The word is compounded of ἀμφὶ and ὀδους, *tooth*.

AMPHORA, in *Antiquity*, an earthen vessel, which served as a kind of liquid measure, among the ancient Greeks and Romans.

It is called in Homer ἀμφιφορευς, from ἀμφὶ and φερω, and by Suidas, ἀμφωτις, on account of its two *ansæ*, or *handles*, for carriage. It is the same with the quadrantale. But we meet with two kinds of *amphoræ* in ancient writers, the Italic and Attic.

AMPHORA, *Italica*, was that used by the Romans, and which is therefore sometimes called the Roman *amphora*. The Italian *amphora* was also called *quadrantal*, and sometimes *cadus*. It contained 72 pounds of wine or water, 80 of oil, and 180 of honey.

The *amphora* was equal to 2 *urnæ*, or 3 *modii*, 6 *semodii*, 8 *congii*, 48 *sextarii*, 96 *cyathi*, 192 *quartarii*, and 576 *acetabula*, amounting to about 7 gallons one pint, English wine measure. Arbuthnot.

The ancient *amphoræ* were either *fossiles*, i. e. such as would stand, or *non fossiles*, terminating in a sharp bottom. Of both which kinds, we meet with figures on ancient medals.

The *amphora capitolina* was the standard of this measure, which was kept in the Capitol, to adjust others by.

Suetonius tells us of a man, who stood for the quæstorship, and who drank an *amphora* of wine at one meal, with the emperor Tiberius.

Supposing the *amphora* to have been a cube of four feet each side, as Politian asserts it to have been, we may venture to say, that ten of the greatest drinkers on earth could not have emptied it. Buddæus's computation is much more reasonable: he makes the *amphora* of wine amount to about 4½ gallons Paris measure.

AMPHORA, *Attica*, was that used by the Greeks, and therefore sometimes also called the Grecian *amphora*.

The Attic *amphora* was one-third part bigger than the Italic; so that as the latter contained 2 *urnæ*, or 48 *sextarii*, the former contained 3 *urnæ*, or 72 *sextarii*, amounting to about 10 gallons 5½ pints, English wine measure. This was called *amphora*, sometimes also κεραμιον, and, by way of distinction from the Roman kind, *petrinum*.

AMPHORA was sometimes also used as a dry measure, containing three bushels; the standard whereof was kept at Rome in the Capitol, to prevent false measures.

AMPHORA is also used to denote the largest liquid measure in use among the Venetians. The *amphora* contained

talis four *bigæ*, seventy-six *amphoræ*, or two boats, or *naides*.

AMPHORA, in *Astronomy*, a name given to the sign more usually called AQUARIUS.

AMPHORARIUM *vinum*, in *Antiquity*, denotes that which is drawn or poured into *amphoræ*, or pitchers, by way of distinction from *vinum doliare*, or cask wine.

The Romans had a method of keeping wine in *amphoræ* for many years, to ripen, by fastening the lids tight down with pitch or GYPSUM, and placing them either in a place where the smoak came, or under-ground. Columm. Re Rust. lib. 1. cap. 6. Plin. Nat. Hist. tom. ii. lib. 23. cap. 1.

AMPHOTEROPLON, among *Civilians*, denotes a kind of naval insurance, where the insurers run the risque both of the going out and return of a vessel.

In this sense, the word stands opposed to *Hateroplon*, where only the voyage outwards is insured.

AMPHOTIDES, in *Antiquity*, a kind of defence, or armour for the ears, worn by the ancient Pugiles, to prevent giving their adversaries a handle by that part.

Authors have been in the dark as to the nature and office of the *amphotides*. Some explain them as a sort of helmet for covering the nose and ears.

Fabretti first ascertained their real use, from the figure of a Pugil, which had *amphotides* over its ears, joined by a piece coming over the forehead, and tied with strings under the chin.

AMPLEXATIO, or *Basiatio*, among *Alchemists*, denotes a kind of union betwixt their *philosophical mercury*, which they call the white female, by which they mean *regulus* of antimony, and the red husband, by which they mean *gold*. This embracing, some of them express in terms not very decent.

AMPLIATION, is used, by some writers, for the act of enlarging the compass or extent of a thing.

On a medal of the emperor Antoninus Pius, we find the title *amplitator civium* given him, on account of his having extended the *jus civitatis*, or right of citizenship, to many states and people, before excluded from that privilege. In effect, this prince is generally supposed to have made the famous constitution, whereby all the subjects of the empire were made citizens of Rome. M. Spanheim refutes this notion, and makes the emperor Caracalla to have been the author of that constitution.

AMPLIATION, in the Roman *Law*, denotes the act of deferring a judicial sentence, either as the cause is not clear, or in favour of him against whom it is to pass.

Ampliation differed from *comprobation*, as the former was granted on the mere motion or pleasure of the judge, the latter as the petition of one or both the parties. Besides, the former was not limited to any certain time, whereas the latter could not be extended beyond the third day. Besides, *ampliation* might be repealed, which *comprobation* might not.

The first introduction of *ampliation* was in favour of the *reis*, or persons accused. But it was afterwards used on other occasions; e. gr. when certain witnesses were wanting, or the crime or the fact had not been sufficiently proved for a final decision, or the kind or measure of punishment was not agreed on, &c.

In these cases, the prætor signified his intention, by pronouncing the word *ampliat*, or the letters *N. L.* for *non liquet*, by which he denoted that the cause was not clear, but that the second action must be brought.

The person whose sentence, whether of condemnation or absolution, was thus deferred, was said to be *ampliatus*.

Hence the phrases, *bis ampliatus, tertiò absolutus est reus*.

AMPLIATION is also used, among *Scholmen*, to denote the acceptation of a term for a different time from that signified by the verb in the proposition, e. gr. *justus peccavit*, i. e. *before he was but now just*.

AMPLIFICATION, in *Rhetoric*, part of a discourse or speech, wherein a crime is aggravated, a praise or commendation heightened, or a narration enlarged, by an enumeration of circumstances; so as to excite the proper emotions in the souls of the auditors.

Such is the passage in Virgil, where instead of saying merely that Turnus died, he *amplifies* the circumstances of his death.

——*Ast illi solvuntur frigore membra,*
Vitaque cum gemitu fugit indignata sub umbras.

The masters of eloquence make *amplification* to be the soul of discourse. Longinus speaks of it as one of the principal means which contribute to the sublime: but he censures those who define it a discourse which magnifies things; this equally agreeing to the sublime, the pathetic, &c. The same author distinguishes *amplification* from the sublime by this, that the latter consists wholly in the elevation of words and sentiments, whereas the former consists also in their multitude: the sublime is sometimes found in a single thought; but *amplification* cannot subsist, excepting in abundance.

There is likewise a difference between the *amplification*, and the proof; because the one serves to clear the point, and the other to heighten and exaggerate it.

There are two general kinds of *amplification*; the one of *things*, the other of *words*. The first is produced in divers manners; as, 1. By a multitude of definitions: thus it is Cicero *amplifies* on history: *Historia est testis temporum, lux veritatis, vita memoriæ, magistra vitæ, nuntia vetustatis*. 2. By a multitude of adjuncts; of which we have a fine instance in Virgil's lamentation for Cæsar's death, by enumerating the many prodigies and monsters that either preceded or succeeded it. *Tum quoque per tacras vulgo exaudita silentes ingens, & simulacra modis pallentia miris visa sub obscurum noctis; pecudesque locutæ, infandum! sistunt amnes terramque dehiscunt, & mœstum illacrymat templis ebur, æraque sudant.* 3. By a detail of causes and effects. 4. By an enumeration of consequences. 5. By comparisons, similitudes, and examples, &c. 6. By the contrast of antithets, and by rational inference.

Amplification by words is effected six ways. 1. By using metaphors. 2. By hyperboles. 3. By *synonyma*. 4. By splendid and magnificent terms; as that of Horace, *Scandit æratas vitiosa naves cura, nec turmas equitum relinquit, neque cervi, & agente nimbos ocyor cervo.* 5. By *periphrases*, or circumlocutions. 6. By repetition. To which may be added, by gradation.

AMPLITUDE *of the range of a* PROJECTILE, denotes the horizontal line subtending the path in which it moved.

AMPLITUDE, in *Astronomy*, an arch of the horizon, intercepted between the true east or west point, and the centre of the sun, or a star, at its rising or setting; so that the *amplitude* is of two kinds; *ortive*, or *vesper*; and *occasive*, or *occiduous*.

The eastern and western *amplitudes* are also called *northern* and *southern*, as they fall in the northern and southern quarters of the horizon.

The complement of the eastern or western *amplitude* to a quadrant, is called the *ascensio*.

To find the sun's or star's *amplitude*, either rising or setting, by the globe. See GLOBE.

To find the sun's *amplitude* trigonometrically; having the latitude and the sun's declination, given. Say, as the cosine of the latitude is to the radius, so is the sine of the present declination to the sine of the *amplitude*. Suppose, e. gr. the latitude 15° 30', and the declination 11° 50';

Sine comp.	15° 30' subtr. from radius,	0,0160805
Sine of declin.	11° 50'.	+ 9,3112920
		9,3273821

Amplitude required 12° 15'.

AMPLITUDE, *magnetical*, is an arch of the horizon, contained between the sun at its rising, and the east or west point of the compass; or it is the difference of the rising or setting of the sun, from the east or west points of the compass.

It is found by observing the sun, at its rising or setting, by an azimuth compass. If the compass had no variation, the *magnetical amplitude* would be the same as the true one.

AMPOTIS, *motuum*, signifies properly the recess or ebb of the tide. But Hippocrates, who was of Cos, one of the Grecian isles, and must have had many opportunities of observing the tides, very elegantly applies this word to the recess of humours, from the circumference of the body to the internal parts.

AMPULLARE, in *Antiquity*, denoted a kind of dancing performed by the chief of the *salii*, and answered with a correspondent motion by others in the *armati*.

This is sometimes also called *ambervare*; the answer of the *chorus* was particularly called *redambvare*.

AMPULLA, in *Antiquity*, an oil-vial with a large belly, used for unction at the baths.

The word *ampulla* was also used for a drinking vessel used at table.

AMPULLA, among *Ecclesiastical Writers*, denotes one of the sacred vessels used at the altars.

The word is sometimes also written in English *ampul*.

Ampullæ were also used for holding the oil used in christmation, confecration, coronation, &c.

Among the ornaments of churches, we find frequent mention made of *ampullæ*, or *vialæ*. In the inventory of the cathedral of Lincoln, we meet with *ampullæ* of crystal, variously enriched with silver-feet and covers; one containing a tooth of St. Christopher, another a tooth of St. Cecily, another a bone of the head of St. John Baptist. Dugdale Mon. tom. iii. p. 272.

AMPULLA, *Knights of St. Ampulla*, belong to an order instituted by Clovis I. king of France; at the coronation

they bear up the canopy, under which the *ampulla* is carried in proceſſion.

AMPULLA, a ſpecies of *bulla*, in the Linnæan arrangement of *worms*.

AMPULLACEÆ *concha*, in *Natural Hiſtory*, a name by which ſome authors have called a genus of ſhells, named by others *conchæ globoſæ* and *bullæ*, and by the French naturaliſts *tonnes*. See DOLIUM.

AMPUTATION, in *Surgery*, the operation of cutting off a limb, or other part of the body with an inſtrument.

The uſual method of performing it, in the inſtance of a leg, is as follows.—The proper part for the operation being four or five inches below the knee, the ſkin and fleſh are firſt to be drawn very tight upwards, and ſecured from returning by a ligature two or three fingers broad; above this ligature another looſe one is paſſed, for the gripe; which being twiſted by means of a ſtick, may be ſtraightened to any degree of pleaſure.

Then, the patient being conveniently ſituated, and the operator placed on the inſide of the limb, which is to be held by one aſſiſtant above, and another below the part deſigned for the operation, and the gripe being ſufficiently twiſted, to prevent too large an hæmorrhage, the fleſh is with a ſtroke or two to be ſeparated from the bone with the diſmembering knife. Then the *periofteum* being alſo divided from the bone with an inſtrument called a *catalin*, ſaw the bone aſunder with as few ſtrokes as poſſible. When two parallel bones are concerned, the fleſh that grows between them muſt likewiſe be ſeparated before the uſe of the ſaw.

This being done, the gripe may be ſlackened, to give an opportunity for ſearching for the large blood-veſſels, and ſecuring the hæmorrhage at their mouths, either by the actual cautery, the ligature, ſtitching them up, applying vitriol buttons, or the like. After this a dry pledget of lint, or one dipped in ſpirit of wine, and ſprinkled with *diapente*, may be applied to the ſtump: then looſen the firſt ligature, and pull both the ſkin and fleſh as far as conveniently may be, over the ſtump, to cover it; and ſecure them with the croſs-ſtitch, made at the depth of half or three quarters of an inch in the ſkin.

It remains to apply over the whole ſtump two large pledgets, dipped in oxycrate, dried, and afterwards charged with aſtringents; over theſe to apply a plaiſter of the de minio, or ſimple diachylon; over all theſe, an ox-bladder, wetted in oxycrate; and finally over all a croſs-cloth pretty tight, ſecured with rollers.

After all this, the gripe may be ſlackened, ſo as to be made eaſy to the patient; or even entirely taken away, after he is put to bed; in which he muſt lie with the ſtump ſomewhat raiſed; an aſſiſtant for twelve or fourteen hours keeping faſt the dreſſing with his hand, to prevent any violent hæmorrhage.—In three or four days the dreſſing may be removed; and proper digeſtives mixed with aſtringents, applied; having an actual cautery, or ſome powerful ſtyptic, in readineſs, in caſe of a violent hæmorrhage at the firſt opening. M. Sabourin, ſurgeon of Geneva, is recorded in the hiſtory of the Royal Academy of Sciences, an. 1702, for an improvement in the method of *amputation*, propoſed to that academy; the whole ſecret conſiſts in ſaving a piece of fleſh and ſkin, a little lower than the place where the ſection is to be, wherewith the ſtump is to be afterwards covered. The advantages hereof are, that in leſs than two days time, this fleſh unites with the extremes of the divided veſſels, and ſo ſaves the neceſſity either of binding the ends of thoſe veſſels with thread, or of applying cauſtics or aſtringents; which are methods very dangerous, or at leaſt very incommodious: and, that the bone thus covered up, does not exfoliate. This method of Meſſrs. Sabourin and Verduin, is called *l'operation de l'amputation à lambeau*.

Dr. Motherby, in his Medical Dictionary, ſays, that in the year 1674, Mr. Morrel, a French ſurgeon, introduced the *tourniquet*, as it is now uſed; but the firſt mention of the inſtrument is in the Currus Triumphalis e Terebintho, Lond. an. 1679, from which book it alſo appears, that the operation *de l'amputation à lambeau*, was then the practice of the Engliſh ſurgeon, who publiſhed it.

In the year 1713, it is ſaid in the Collect. Acad. tom. iii. p. 517, that M. Sabourin, a ſurgeon of Geneva, had diſcovered the method of what is called *amputation à lambeau*; and that he came that year to Paris, to propoſe it to the academy, with a view of introducing it into practice in the courſe of a war that was then beginning. It is added, that he diſcloſed it without reſerve or preſumption, and in a manner that did him great honour; but that the academy declined adopting the practice, ſuſpended its judgment, and waited for the additional recommendation of experience.

Many and important improvements on the methods of *amputation* have been made in this century, in the courſe of which the crooked needle, and moſt other parts of the *apparatus* in this branch of ſurgery, have either been introduced or improved. The double-edged knife, called the *catalin*, formerly uſed to clear away the *periofteum*, is now laid aſide, as unneceſſary or hurtful; it having been diſcovered, that in conſequence of ſtripping off the *periofteum*, an exfoliation ſometimes follows from the adjacent bone.

In moſt *amputations* the operation ſhould be performed the breadth of a finger or more, above the ſphacelus or otherwiſe injured part. The *tourniquet* ſhould be ſo applied, as that it may preſs upon the chief artery of the limb to be taken off. The practice of making a ſhort ſtump is moſt general; but others prefer amputating between the calf of the leg and the ankle, in caſes that will admit of ſaving ſo much of the leg: and are confident that the motion of the long ſtump is more eaſy than that of a ſhort one. Mr. White and Mr. Bromfield are entirely of this opinion.

The uſe of ſponge as a part of the dreſſing, as ſoon after the *amputation* as the digeſtion is begun in the ſtump, is recommended by Mr. Kirkland, to prevent the ill and ſometimes fatal conſequences of an abſorption of the matter from the wound, after the inflammation is gone off, particularly when the digeſtion does not proceed kindly. See Lond. Med. Obſ. & Inq. vol. ii. art. 23. p. 278.

According to his method, ſo ſoon as the digeſtion is complete, the wound is firſt covered with thin layers of dry lint, over them pieces of fine ſponge are applied, which imbibe the thinneſt part of the matter from the lint, and that which remains becomes too thick to be abſorbed. Vide Eſſays Phyſic. and Liter. Edinb. vol. iii. art. 22. See a general account of the caſes that are ordinarily ſuppoſed to indicate and require *amputation*, and the various methods of amputating particular parts, &c. Med. Dict. Sharp's Operations of Surgery, and Crit. Inq. Heiſter's Surgery; Bilguer's Diſſert. on Amputation; Le Dran's Operations, &c.

AMSDORFIANS, in *Church Hiſtory*, a ſect of proteſtants, in the ſixteenth century; ſo denominated from their leader *Amſdorf*.

Saunders repreſents them as maintaining, that good works were not only unprofitable, but even oppoſite and pernicious to ſalvation.

AMSEGETES, in *Antiquity*, thoſe whoſe grounds abutted on the highway. Vide Feſt. de Verb. Signif. in voc.

The laws of the Twelve Tables decree, *amſegetes viam munianto*.

AMTRUSTIO, in *Ancient Charters*, denotes a ſworn or liege tenant, or vaſſal, of the ancient French or German kings.

The word is alſo written *antruſtis*. Spelman derives it from the German *amps*, *office*, *beſingſ*, and the Engliſh *truſter*.

AMULET, AMULETUM, a kind of external medicament, to be worn about the neck, or other part of the body, to prevent, or remove diſeaſes.

The word *amulet* is formed from *amoliri, to remove*.

Such are quills of quickſilver, or arſenic, which ſome hang on the neck, or wear under the ſhirt, againſt the plague, and other contagious diſeaſes; as alſo the bloodſtones worn by others againſt hæmorrhages; and that worn by the women of the Eaſt Indies to bring the *menſes*.

Amulets are alſo frequently no other than a ſort of ſpells, or charms, conſiſting of quaint words and characters, ſuppoſed to have the virtue of warding off ill. Pliny makes frequent mention of them.

The Greeks called this kind of remedies φυλακτηρια, *phylacteries*; περιαπτα, *periapta*; περιτετμημενα, περιαμματα, βριθια, and ενσημα. The Latins call them *amulata*, *appenſa*, *pentacula*, &c.

Some think this word derived from *amolo*, a ſmall veſſel with luſtral water in it, anciently carried in the pocket by the Romans, for the uſe of purification and expiation. This laſt opinion appears the more probable, in that ſome *amulets* were made in the ſhape of little veſſels, as appears from the teſtimony of Pliny, who obſerves, that pieces of amber, cut in form of little veſſels, were hung about children's necks for *amulets*.

Amulets are by ſome conſidered as a natural ſpecies of *teſtimonia*. Others rather make *teſtimonia* a ſpecies of *amulets*. The *bulla*, worn by the ancients; the *abraxas* of the Baſilidians, &c. were alſo *amulets*.

The ancients made great uſe of gems for *amulets*: the whole Eaſt, according to Chiflet, wore a kind of jaſper for this purpoſe.

That ſpecies of *amulets* compounded of poiſons, uſed as preſervatives from the plague, are more particularly denominated *zenexta*.

Under *amulets*, ſome alſo include medical or other ſubſtances

ſtances fixed to brutes, or even plants, to preſerve them from certain diſeaſes and dangers.

Charms, words, ſcrolls, magic figures and numbers, make a large claſs of *amulets*, to which the Turks are ſtill greatly devoted. Their *amulets*, called *chaimaïls*, are little bits of paper of two or three fingers breadth, rolled up in pieces of ſilk, containing ſhort prayers or ſentences out of the Alcoran, with circles and other figures, in which they inſcribe the name of Jeſus, the figure of the ſun, &c. They hang them about their necks, or place them under their arm-pits, or in their boſom near their hearts, and eſpecially when they go to war, as a preſervative againſt the dangers of it.

The pope is ſuppoſed to have the virtue of making *amulets*, which he exerciſes in the conſecrating of *Agnus Dei's*, &c.

Amulets are now much fallen from the repute they were anciently in; yet the great Mr. Boyle alledges them as an inſtance of the ingreſs of external effluvia into the habit; in order to ſhew the great poroſity of the human body.—He adds, that he is perſuaded ſome of theſe external medicines do anſwer; for that he himſelf, having once been ſubject to bleed at the noſe, and reduced to uſe ſeveral remedies to check it, found the moſs of a dead man's ſkull, though only applied ſo as to touch the ſkin till the moſs was warm thereby, the moſt effectual of any. The ſame Mr. Boyle ſhews how the effluvia, even of cold *amulets*, may, in tract of time, pervade the pores of a living animal; by ſuppoſing an agreement between the pores of the ſkin, and the figure of the corpuſcles. Beſides has demonſtrated the poſſibility of the thing in his laſt propoſitions, De Febribus; and the like is done by Dr. Wainwright, Dr. Keill, &c. However, theſe are principally uſed at preſent by empirics, women, and credulous, ſuperſtitious perſons.

AMULET, in a more particular ſenſe, is reſtrained to ſuch medicines, as do not operate by any phyſical virtue, or to thoſe wherein there is no proportion between the cauſe and effect.

In this ſenſe medicines, which operate by effluvia, odours, and the like, do not belong to the claſs of *amulets*.

In this ſenſe, alſo, thoſe eſſence-veſſels worn by hyſterical women on their breaſts, called by the Greeks ἀνθίσματα, and by the Latins *dentes pellicii*, were not properly *amulets*.

AMULET is ſometimes alſo applied, in a more extenſive ſenſe, to all medicines, whether internal or external, whoſe virtue, or manner of operation is *occult*.

AMULET, in *Cookery*. See OMELET.

AMULETIC, in *Medicine*, is uſed by ſome writers for what is more frequently called an *amulet*.

Amuletic amounts to the ſame with what are otherwiſe called *ſympathetics*, and are chiefly uſed of late times to ſtop bleeding; ſuch are the *perſicaria*, *lapis hæmatites*, dried toads, &c. alſo againſt warts, *furcomas*, &c.

Sir Kenelm Digby's ſympathetic powder is one of the principal *amuletics* in caſes of hæmorrhages; and with many the *cruces ſacra*.

AMUND, in *Ancient Writers*, denotes a perſon free or diſcharged from tuition or wardſhip.

The word is alſo written *aumund*, *amond*, and *amont*; and is compounded of the privative *a*, and the Saxon *mund*, *defence, tuition*.

AMURACORY, in ſome *Writers of the Middle Age*, denotes a kind of Turkiſh ſoldiery belonging to the corps or order of Janizaries.

They ſeem to be the ſame with thoſe otherwiſe called *Sacraptæ* and *Peſſilatores*.

AMURCA, in *Pharmacy*, a medicine made of the refuſe or recrement of expreſſed OLIVES.

Amurca being boiled in a copper veſſel to the conſiſtence of honey becomes a drug of ſome uſe in medicine, being reputed an aſtringent and drier; and as ſuch ſometimes preſcribed in ulcers, as well as againſt diſeaſes of the teeth, eyes, &c.

Hippocrates applies the term *amurca* to a crude, immature, putrid ſtate of the liver.

Some authors have alſo given the name *amurca* to the juice or fluid found in the RENES *ſuccenturiati*.

AMY, in *Law*, the perſon next of kin to an orphan, or infant, who is to be intruſted for him; properly called PROCHEIN *amy*.

The word in French literally ſignifies *friend*.

AMY, *whom*, is a foreigner here, ſubject to ſome prince, in friendſhip with us.

AMYGDALA, in *Natural Hiſtory*, the name of a ſpecies of ECHINUS *marinus*, of the genus of the BRISSOIDES.

AMYGDALE, in *Surgery*, denotes ſuperfluous fleſh growing at the root of the tongue.

AMYGDALÆ, in *Anatomy*. See ALMONDS.

AMYGDALE. See ALMOND.

AMYGDALATE, an artificial milk, or emulſion made of blanched almonds, &c.

AMYGDALOIDES *lapis*, in *Natural Hiſtory*, the name given by authors to a ſtone which reſembles the kernel of an almond in figure. It is no natural foſſil, but the petrified ſpine of an ECHINUS *marinus* or ſea urchin, of the nature of the LAPIS *Judaicus*, but wanting the pedicle or ſtalk of that ſpine.

AMYGDALUS, in *Botany*, the ALMOND-*tree*.

AMYLON, in *Ancient Writers*, a kind of aliment anſwering, as ſome apprehend, to our furmity.

The word is Greek ἄμυλον, thus called, becauſe made *ſine mola*.

AMYLUM. See STARCH.

AMYNTA, in *Literary Hiſtory*, a beautiful paſtoral comedy, compoſed by Taſſo; the model of all dramatic pieces, wherein ſhepherds are actors. The *Paſtor Fido*, and *Filli di Sciro*, are only copies of this excellent piece.

AMYNTICA *emplaſtra*, in *Pharmacy*, defenſative, or ſtrengthening plaiſters.

AMYNTOR properly denotes a perſon who defends or vindicates a *cauſe*. The word is ἀμύντωρ, formed of the verb ἀμύνω, *I defend*, or *avenge*.

In this ſenſe, Mr. Toland entitles his defence of Milton's life, *Amyntor*, as being a vindication of that work againſt Mr. Blackall, and others, who had charged him with queſtioning the authority of ſome of the books of the New Teſtament, and declaring his doubt that ſeveral pieces under the name of Chriſt and his Apoſtles, received now by the whole Chriſtian church, were ſuppoſititious.

AMYRALDISM, a name given by ſome writers to the doctrine of univerſal grace, as explained and aſſerted by Amyraldus, or Moſes Amyraut, and others his followers, among the reformed in France, towards the middle of the ſeventeenth century.

This doctrine principally conſiſted of the following particulars, viz. that God *deſires* the happineſs of all men, and none are excluded by a divine decree; that none can obtain ſalvation without faith in Chriſt; that God refuſes to none the *power of believing*, though he does not grant to *all* his aſſiſtance, that they may improve this power to ſaving purpoſes; and that many periſh through their own fault. Thoſe who embraced this doctrine were called UNIVERSALISTS, though, it is evident they rendered grace univerſal in words, but *partial* in reality, and are chargeable with greater inconſiſtencies than the SUPRALAPSARIANS.

Amyraldiſm is ſaid to have been a ſyſtem worked up, to bring on a reconciliation with the Lutherans.

AMYRRERIS, in *Botany*, a name uſed by ſome authors, to expreſs the BARBARY-*tree*.

AMYRIS, in *Botany*, a genus of the *octandria monogynia* claſs, with a four-toothed calyx, four oblong petals, a four-cornered ſtigma, and a pulpy berry.

AMZEL, in *Ornithology*, the name of a bird of the *merula* or black-bird kind, of which there are two ſpecies. The *ring-ouzel*, or *merula torquata*, and the *merula montana*, called ſimply the *ouzel*.

The ring-*ouzel* is a little larger than the common black-bird. Its back is of a duſky blackiſh brown, and its throat and breaſt are beautifully variegated with ſpots and ſtreaks of white, and the lower part of the throat is adorned with a fine broad white ring, whence the bird has its name: this ring is of a lunated ſhape, the points ending at the ſides of the neck. The wings and tail are blackiſh, but are ſome what variegated with white in the females; the white looks greyiſh. The female is ſaid alſo by ſome not to have the ring round its neck, and has by that means been miſtaken for the *merula montana*, or common *ouzel*. This feeds on inſects and on berries. It is common about the Peak in Derbyſhire, and is there called the rock-*ouzel*.

The common *ouzel*, or *merula montana*, differs from this, in that it has no ring round the throat, which is variegated with a brownith red, and with ſpots of black, and the belly with grey and black ſpots. It ſeems, however, not determined certainly, whether this is any other than the female of the *ring-ouzel*. Ray. See OUZEL.

ANA, æ, in *Medicine*, denotes an equal quantity of any things, whether in liquid or in dry meaſure.

Hence *ana libra ſeptem* is uſed by ſome writers to ſignify the *ratio*, or *proportion of equality*.

ANA, in *Matters of Literature*, a Latin termination, adopted into the titles of ſeveral books in other languages. *Anas*, or *books in ana*, are collections of the memorable ſayings of perſons of learning and wit; much the ſame with what we otherwiſe call TABLE-*talk*.

Weſſius has given the hiſtory of books in *ana*, in the preface to the Caſauboniana. He there obſerves, that though ſuch titles be new, the thing itſelf is very old; that Xenophon's books of the deeds and ſayings of Socrates, as well as the dialogues of Plato, are *Socratiana*; that the apophthegms of the philoſophers, collected by Diogenes Laertius; the ſentences of Pythagoras, and thoſe of Epictetus; the works of Athenæus, Stobæus, and divers others, are ſo many *anas*. Even the *Gemara*

of

of the Jews, with several other oriental writings, according to Wolfius, properly belong to the fame claſs. To this head of *ana* may likewiſe be referred the *Orphica*, the *Pythagorana*, *Æſopica*, *Pyrrhonia*, &c.

Scaligerana was the firſt piece that appeared with a title in *ana*. It was compoſed by Ifan de Vaſſan, a young Champanois, recommended to Joſ. Scaliger, by Caſaubon.—Being much with Scaliger, who was daily viſited by the men of learning at Leyden, De Vaſſan wrote down whatever things of any moment he heard Scaliger ſay. —And thus arroſe the *Scaligerana*, which was not printed till many years after, at Geneva, in 1666. Patin. Let. 431.—Soon after came the *Perroniana*, *Thuana*, *Naudæana*, *Patiniana*, *Sorberiana*, *Menagiana*, *Anti-Menagiana*, *Fortiana*, *Chevræana*, *Leibnitiana*, *Arquiniana*, *Poggiana*, &c.

ANA is uſed among ſome occult philoſophers to denote the human mind. Hence, according to ſome, is derived the word *anapaſta*, a dæmon invoked to the aſſiſtance of a ſick perſon.

ANABAPTISM, ſee ANABAPTISTS, *infra*.

ANABAPTISTON. See ANABAPTISTON.

ANABAPTISTS, a name given to Chriſtians who maintain that *baptiſm* ought always to be performed by immerſion; that it ought not to be adminiſtered to children before the age of diſcretion, or that at this age it ought to be re-adminiſtered to thoſe who have been baptized in their infancy, becauſe, they ſay, the adminiſtration of this ſacrament is neither valid nor uſeful, *if* it be done by ſprinkling only, and not by immerſion; or if the perſons who received it, be not in a condition to give the reaſons of their belief.

The word *Anabaptiſt* is compounded of *ava*, *new*, and *βαπτιζω*, *I baptize*; and this general denomination has been indiſcriminately applied to people of very different principles and practices; though many of them object to the name, and hold nothing in common, excepting ſome one or other of the above mentioned opinions concerning BAPTISM.

The NOVATIANS, the CATAPHRYGIANS, and the DONATISTS, may be conſidered as a kind of *Anabaptiſts*, in the earlier ages, though not then denoted by this name; for they contended that thoſe Chriſtians of the catholic church who joined themſelves to their reſpective parties, ſhould be re-baptized. But we muſt not claſs under the ſame denomination thoſe biſhops of Aſia and Africa, who, in the third century, maintained, that *baptiſm*, adminiſtered by thoſe whom they called heretics, was not valid; and therefore that ſuch of them as returned into their churches ought to be re-baptized. Nor does it appear that there is ſufficient authority to affirm, that the *Vaudois* and the *Albigenſes* were predeceſſors of the modern *Anabaptiſts*, though ſome of them adopted the practice of adult *baptiſm*.

It was not till a little after the time when the Lutherans ſeparated from communion with the Romiſh Church, that the *Anabaptiſts* began to make a noiſe in Germany. Storck, Stubner, and Munzer, were the firſt diſciples of Luther, who, about the year 1521, were ſtyled *Anabaptiſts*. But well knowing that their opinions were very different from Luther's doctrine, they availed themſelves of his abſence to diſſeminate them in Wittemburgh, and had the addreſs to over-reach the piety of Melancthon. Their principal purpoſe, was to gain over the populace, and to form a conſiderable party. To effect this, ſays Bayle, they were induſtrious and active, each in his own way. Storck wanting knowledge, boaſted of inſpiration; and Stubner, who had both genius and erudition, labboured at commonious explications of ſcripture. Not contented with diſcrediting the court of Rome, and decrying the authority of conſiſtories, they taught, that men being entitled under the Goſpel to equal liberty, could not be juſtly ſubjected to any civil power, nor erect ſuperiorities over each other: that, as all magiſtracy was an uſurpation on Chriſtian freedom, no true Chriſtian could be either magiſtrate, or ſubject, nor conſequently pay any impoſt, give any oath, or bear arms; that violence or arms ought never to be made uſe of, excepting againſt princes, and people in power, from whom they were permitted to revolt, as from ſo many uſurpers, who were to be pulled down, in order to erect the kingdom of God. They pretended that Chriſtians, being all free, equal, and independent, there ought to be no tribunal among them, nor laws, nor any diſtinction of property, but that every thing ſhould be in common, nor any reſtraints with regard to the number of wives which they might marry. In other reſpects they affected ſingular auſterity, recommending macerations, faſtings, and the utmoſt ſimplicity of apparel. Their ſermons were, for the moſt part, declamations againſt the communion of the reformed; and they were inceſſantly exhorting every body to join with them, who, as they ſaid, were ſent of God, to re-eſtabliſh the kingdom of his Son. They made high promiſes to all who would unite with them to exterminate the impious, if this maſſacre proved the epocha, for the commencement of Chriſt's reign upon earth, when the juſt, meaning themſelves, were to reign alſo, inſtead of the unrighteous uſurpers of authority. They moreover affected to ſpeak with a kind of contempt concerning external worſhip, the ſacraments, the miniſtry, and even the word of God, with a view to enhance the merit of the extacies, viſions, and inſpiration, to which they pretended, and on which they valued themſelves. They dealt much in predictions, eſpecially concerning the nearneſs of the laſt judgment; and finally, to give a greater eclat to their party, they re-baptized all thoſe who joined them; and to make their practice ſucceed, they taught that baptiſm adminiſtered to infants was void.

Munzer took the lead of this party; and, in 1525, aſſembled a numerous army of aſſociates; but this inſurrection was ſoon ſuppreſſed, and Munzer put to an ignominious death. Many of his followers, however, ſurvived, and propagated their opinions through Germany, Switzerland, and Holland. In the year 1533, they formed a new community at Munſter, under the direction of two *Anabaptiſt* prophets, John Matthias, a baker of Haerlem, and John Bleckholdt, a journeyman taylor of Leyden. Having made themſelves maſters of the city, they depoſed the magiſtrates, confiſcated the eſtates of ſuch as had eſcaped, and depoſited the wealth they amaſſed together in a public treaſury, for common uſe. They made preparations of every kind for the defence of the city, and ſent out emiſſaries to the *Anabaptiſts* in the Low Countries, inviting them to aſſemble at Munſter, which was now dignified with the name of Mount Sion, that from hence they might be deputed to reduce all the nations of the earth under their dominion. Matthias, who was the firſt in command, was ſoon cut off, in an act of phrenſy, by the biſhop of Munſter's army; and was ſucceeded by Bleckholdt, who was proclaimed, by a ſpecial deſignation of heaven, as he pretended, king of Sion, and inveſted with legiſlative powers, like thoſe of Moſes. The extravagancies of Bleckholdt were too numerous to be recited; it will be ſufficient to add, that the city of Munſter was taken, after a long ſiege, and an obſtinate reſiſtance; and Bleckholdt, the mock monarch, was puniſhed with a moſt painful and ignominious death. The *Baptiſts* in England, and Holland, or, as they are there called the *Mennonites*, are very different from thoſe who firſt gave riſe and name to the ſect.

It muſt be acknowledged, that the firſt inſurgents in Germany had been grievouſly oppreſſed; and that they took up arms principally in defence of their civil liberties; nor ſhould ſubſequent extravagancies of violence be attributed to their religious principles, much leſs charged on their ſucceſſors.

The ſequel of their hiſtory, and diſtinguiſhing tenets, may be ſeen under the article ANTI-PÆDO-BAPTISTS, BAPTISTS, MENNONITES, WALDENSIANS, &c.

ANABASII, in *Antiquity*, the couriers who travelled on horſe-back, or in chariots, for the greater expedition.

The word comes from the Greek *αναβασις*, *mounting*.

ANABASIS, *αναβασις*, *aſcenſion*, derived from *αναβαινω*, *to aſcend*.

ANABASIS, *in Medicine*, the ſtate of a diſeaſe in its growth.

ANABASIUS, a name given by Pliny to a plant, which he calls alſo *aphedro*, and deſcribes as hanging down from the branches of large trees, in form of tufts of hair. The plant deſcribed by Pliny, and others of the ancients, under this name is the USNEA, or long hairy tree-moſs.

ANABATA, in *Ancient Cuſtoms*, a cope, or ſacerdotal veſt, to cover the back and ſhoulders of the prieſt.

It is otherwiſe called *anabolium*, formed of *αναβαλλω*, *to caſt over*, or *throw*.

The word *anabata* ſeems to be uſed in the ſame ſenſe.

ANABATERA, from *αναβαινω*, *I aſcend*, in *Ancient Writers*, denote a kind of ſteps or ladder, whereby to aſcend to ſome eminence. In this ſenſe we read of the *anabathra* of theatres, pulpits, &c.

Anabathra appears to have been ſometimes alſo applied to ranges of ſeats riſing gradually over each other.

ANABATHRA is more particularly applied to a kind of ſtone-blocks raiſed by the highway ſides, to aſſiſt travellers in mounting or alighting, before the uſe of ſtirrups was invented.

The firſt author of this contrivance, among the Romans, was C. Gracchus, brother of Tiberius.

ANABIRAZON, in *Aſtronomy*, the DRAGON'S *tail*.

ANABLATUM, in *Botany*, a name uſed by ſome authors for the *ſyngonanthe*, or tooth-wort, called *dentaria* by others.

ANABLEPS, in the *Artificial Syſtem of Ichthyology*, the name of a new genus of fiſh, of the *malacopterygious* kind, the characters of which are theſe: the *branchioſtege* membrane contains ſix bones, and there is only one ſmall fin at the extremity of the back. There is a ſpecimen of this fiſh, in the great collection of Alberms

Sebs in Holland. The *anoblepsis* is a species of the *colitis*, in the Linnæan ſyſtem.

ANABOLÆUM, in *Antiquity*, denotes any kind of upper garment worn over the coat or tunic.

This is otherwiſe called *anabole*, from ἀνα and βαλλω.

ANABOLEUS, among the *Ancients*, a ſervant whoſe office was to aſſiſt in mounting on horſeback. Theſe were in uſe before the invention of ſtirrups, or of thoſe ſtones called *anabathra*.

ANABOLEUS is alſo uſed by Euſtathius, to denote a ſmall piece of iron, whereon the foot was ſet, in order to mount; from which Buddæus infers, that the ancients had ſtirrups or foot-boards; to which Lipſius objects, that it does not appear this *anabolæus* was any pendent part fixed to the ſaddle, after the manner of our ſtirrups, but rather a portable engine brought by a ſervant, and placed by the horſe's ſide.

ANABROCHISMUS, from ἀνα, *upwards*, and βρεχω, a *loop*, in the *Ancient Phyſic*, the operation of taking away offenſive hairs in the eye-lids.

The manner of performing the *anabrochiſmus* is deſcribed by Gorræus.

ANABROSIS, in *Medicine*, otherwiſe called *diabrosis*, the iſſuing of blood at a hole worn in a vein by corroſion.

The word is ἀναβρωσις, q. d. *eroſio*.

ANACA, in *Ornithology*, the name of a Braſilian ſpecies of PARROQUET. It is of the ſize of a lark; its beak is brown and crooked; the crown of its head is covered with feathers of a liver-colour, and there are circles of brown once near its eyes. Its throat is grey; the upper part of its neck and ſides are green; its belly is of a reddiſh brown; its back green, with a pale brown ſpot, and its tail a pale brown. There it a deep blood-red mark at the top of each wing, the reſt of the wings is green, except their extremities, which are bluiſh. Its thighs are covered with green feathers, and its legs and feet are grey.

ANACALYPTERIA, in *Antiquity*, feaſts celebrated among the heathens on the day that the bride was permitted to lay aſide her veil, and to be ſeen in public.

They were thus called from ἀνακαλυπτω, *to uncover*.

According to Suidas, it alſo means the preſents which were made to the bride by her huſband's relations and friends on that day.

ANACAMPSEROS. See PORTULACA.

ANACAMPTERIA, in *Eccleſiaſtical Antiquity*, denote little hoſpitals, or inns, for the entertainment of the poor and ſtrangers, built adjoining to the ancient churches.

ANACAMPTIC, from ἀνα and καμπτω, *flecto, I bend*, ſignifies as much as *reflecting*; and is frequently uſed in reference to echoes, which are ſaid to be ſounds produced *anacampticallly* or by reflection.

Hence, alſo, *anacamptics* is by ſome uſed for the ſcience of reflecting rays; otherwiſe called CATOPTRICS.

ANACANDAIA, in *Zoology*, the name of a ſpecies of ſerpent found in the iſland of Ceylon, and very miſchievous among the cattle, whence it is called BUBALINUS.

ANACARDIUM, in *Botany*, the caſhew-nut, or *acajou*, a genus of the *ennandria monogynia* claſs. For the characters, ſee ACAJOU.

We have but one ſpecies of this genus, viz.

ANACARDIUM, Hort. Cliff. 161. This tree grows to a conſiderable height in its native country, which is the Weſt Indies. But in England the plants are with great difficulty preſerved; though by their firſt ſhoots from the ſeeds they appear ſo ſtrong and vigorous, as to promiſe a much greater progreſs than they are ever ſeen to make here.

The milky juice of this tree will ſtain linen of a deep black, which cannot be waſhed out again; but whether this has the ſame property with that of the eaſtern *anacardium*, has not yet been fully experimented; for the inſpiſſated juice of that tree is the beſt ſort of lack which is uſed for ſtaining of black in China or Japan. Phil. Trand. vol. xlix. part ii. p. 872, and Dr. Lewis's Commercium, Phil. Techn. p. 309, &c.

ANACARDIUM, in *Medicine*, the fruit of the above mentioned tree, brought from the Eaſt Indies, anciently in great eſteem as a cephalic.

The word is formed of ἀνα and καρδια, *heart*, on account of the figure of this fruit, which bears ſome reſemblance to a heart.

The pith or medullary part of the *anacardium* is extremely pungent and acrimonious; whence the ancients made great uſe of it in cold diſeaſes of the head, particularly to ſtrengthen the memory; but the abuſe of it ſometimes making them ſtupid, delirious, or even mad, the moderns rarely venture on the uſe of it, at leaſt not without great correctives.

ANACARDIUM *antarcticum* is alſo uſed by ſome for the *cajou-fruit*. This is alſo called by others *anacardium occidentale*, and is ordinarily uſed for the true, or eaſtern kind.

ANACATHARSIS, in *Medicine*, properly denotes a purgation by ſpitting; in which ſenſe, it ſtands contradiſtinguiſhed from *catharſis*, or evacuation downward.

In this ſenſe is the word uſed by Hippocrates and Galen; agreeably to this Blaſius reſtrains *anacatharſis* to expectoration. Only Blancard, on what authority does not appear, extends *anacathartic* medicines to all thoſe which work upwards, by the glands of the head, whether vomitories, ſternutatories, or maſticatories.

ANACATHARSIS is alſo a name given by civil lawyers to the *Baſilicon reputitæ Prælectionis* made by order of the emperor Conſtantine Porphyrogenitus.

It was thus called as being a review or correction of the Baſilicon.

ANACATHARSIS, among *Divines*, denotes the clearing up ſome obſcure paſſage, by a ſpiritual, or anagogical interpretation.

ANACATHARTIC, is uſually underſtood of a vomit, or a purging medicine that works upwards.

The word comes from ἀνα, *upwards*, and καθαιρω, *I purge*.

ANACEIA, an Athenian feſtival in honour of the Dioſcuri. It took its name from thoſe deities, who were alſo called Ἀνακες and honoured with a temple called Ἀνακειον, *Anaceum*.

The ſacrifices offered at that time were named Ξενικια because thoſe deities were ξενοι, or *ſtrangers*; and conſiſted of three offerings, which were called Τριτυα. Athenæus mentions plays acted in honour of theſe deities.

ANACEPHALÆOSIS, in *Rhetoric*, a recapitulation, or a ſhort and ſummary repetition of the heads of a diſcourſe.

The word comes from ἀνα, which in compoſition ſignifies *again*; and κεφαλη, *head*.

ANACHIS, in *Mythology*, one of the four deities, to whom the Egyptians imagined the peculiar care of each perſon was committed at his birth: the other three were *Dymen*, *Tychen*, and *Hercle*. They are alſo called *Dymonia*, *Tyche*, *Eros*, and *Ananche*; i. e. Power, Fortune, Charity, and Neceſſity.

ANACHORESIS, denotes a withdrawing from ſociety, or retiring into ſolitude.

The *anachoreſis* was not allowed to perſons, before they had ſpent thirty years in the community.

ANACHORET, a hermit or devout perſon, living alone in ſome deſert, to be farther out of the reach of the temptations of the world, and more at leiſure for meditation.

The word comes from ἀναχωρεω, *I retire into a ſolitary place*.

Such were St. Anthony, St. Hilarion, &c. Paul the Hermit was the firſt of the tribe of *anachorets*.

When many of the habitations of *anachorets* were placed together in the ſame wilderneſs, at ſome diſtance from one another, they were all called by one common name *lauræ*, which, as Evagrius informs us, differed from a *cœnobium*, or *convent*, in that a *laura* conſiſted of many cells divided from each other, where every monk provided for himſelf; but a *cœnobium* was one habitation, where the monks lived in ſociety, and had all things in common. *Anachorets*, popularly *anchorets*, were very numerous among the Greeks, conſiſting principally of monks; who not caring for the fatigues and offices of the monaſtery, purchaſed a little ſpot of ground, with a cell, whither they retreat, and never appear in the monaſtery again, excepting on ſolemn days. Theſe are ſometimes alſo called *aſcetæ* and *ſolitaries*.

They have their chapel, and after prayers apply themſelves to the culture of their vineyards, olives, fig-trees, and the like, which afford them proviſion for the year.

Theſe *anchorets* only differ from the conventual monks, in that they have leſs intercourſe with the world, and live but in ſmall bodies.

The *anchorets* of Syria and Paleſtine retire into the moſt obſcure and unfrequented places; hiding themſelves under rocks and mountains, and living on the ſpontaneous productions of the earth.

There have alſo been *anchorets* in the Weſt. Peter Damian, who was of the order of *hermits*, frequently ſpeaks of them with great praiſe. He repreſents them as by far the moſt perfect ſort of monks; holding them in much higher eſtimation and veneration than the *cœnobites*, or monks reſiding in monaſteries.

Many of theſe retire, with the leave of their abbots, and have an allowance from the monaſtery. The people, on account of their piety, preſent them with good ſums of money, which they carefully hoard up, and at their death bequeath to the monaſtery they had belonged to.

ANACHORITA, in *Eccleſiaſtical writers*, a name ſometimes given to the cells of recluſes.

By the ancient canons, no *anachorita* could be erected without conſent of the biſhop.

ANACHRONISM, in *Chronology*, an error in computation of time; whereby an event is placed earlier than it really happened.

The word is compounded of ἀνα, *higher*, and χρονος, *time*.

Such is that of Virgil, who placed Dido in Africa, at the time of Æneas; though, in reality, ſhe did not come there till 300 years after the taking of Troy. An error

on the other side, whereby a fact is placed later or lower than it should be, is called a *parecrasis*; though this distinction is not commonly observed.

ANACLASTIC *glasses, vitra anaclastica*, a kind of sonorous phials, or glasses, chiefly made in Germany, which have the property of being flexible, and emitting a vehement noise by the human breath. They are also called vexing glasses, by the Germans *vexier glaser*, on account of the slight and disturbance they occasion by their resilition.

The *anaclastic* glasses are a low kind of phials with flat bellies, resembling inverted funnels, whose bottoms are very thin, scarce surpassing the thickness of an onion-peel: this bottom is not quite flat, but a little convex. But upon applying the mouth to the orifice, and gently inspiring, or as it were sucking out the air, the bottom gives way with a horrible crack, and from being convex becomes concave. On the contrary, upon expiring or breathing gently into the orifice of the same glass, the bottom with no less noise bounds back on its former place, and becomes gibbous as before.

The *anaclastic* glasses first taken notice of were in the castle of Goldbach; where one of the academists *Naturæ Curiosorum*, having seen and made experiments on them, published a piece expressly on their history and phænomena. Rossii Lentilii Oribasii Sched. de Vitris Anaclasticis. Vid. Ephem. Acad. N. C. Dec. 2. Ann. 3. p. 489. seq. Their figure may be seen in the book above cited.

They are all made of a fine white glass. It is to be observed in these, 1. That if the bottom be concave at the time of inspiration, it will burst, and the like will happen if it be convex at the time of expiration. 2. A strong breath will have the same effect even under the contrary circumstances.

ANACLASTICS, or ANACLASTICS, that part of OPTICS which considers refracted light. The term is derived from ἀνὰ, and κλάω, *I break*.

Anaclastics is the same with what we more usually call *dioptrics*.

ANACLETERIA, in *Antiquity*, solemn feasts celebrated in honour of kings and princes when they came of age, and took upon them the administration of the state, and made a solemn declaration thereof to the people.

The word is formed of ἀνὰ, and καλέω, καω, *I call*.

ANACLETICUM, in the *Ancient Art of War*, a particular blast of the trumpet, whereby the fearful, and flying soldiers were rallied, and recalled to the combat.

ANACLINOPALE, from ἀνὰ, κλίνω, *I recline*, and πάλη, *wrestling*, in *Antiquity*, a kind of wrestling, wherein the champions threw themselves voluntarily on the ground, and continued the combat by punching, biting, scratching, and other methods of offence.

The *anaclinopale* stood contradistinguished from the *orthopale*, wherein the champions were erect. In the *anaclinopale*, the weaker combatant sometimes gained the victory.

ANACLINTERIA, in *Antiquity*, a kind of pillows on the eating-bed, whereon the guests used to lean.

The ancient triclinary beds had four ἀναπαῆται, one at the head, another at the feet, a third at the back, and a fourth at the breast. That on which the head lay, was properly called by the Greeks, ἀναπαυτήριον, or ἀναπαυτὴρ; by the Romans *fulcrum*, sometimes *pulvinus*.

According to other writers, *anaclinteria* is more properly understood of the backs of chairs whereon we lean.

ANACOINOSIS, from ἀνὰ and κοινὸς, *I communicate, communicatio*, a figure in *Rhetoric*, when we consult the adversary, or appeal to the judges what ought, or could have been done on such an occasion.

Such as that of Cicero, *Quæro, fi te hodie domum tuam redeuntem, cœtûs hominum et armati, non modo linguæ tectique omnium tuorum, sed privatæ etiam vestibulique prohibuerint, quid alluris fit?* Cicero pro Cœcin.

ANACOLLEMA, in *Physic*, denotes a liniment or other medicine applied to the forehead, to stop or prevent defluxions of the eyes.

The word is formed of ἀναλλάω, *conglutino*.

Anacollemata make a species of medicines called *frontalia*.

The qualities required are, to be dryings, cooling, thickening, astringent, conglutinant, &c.

To the class of *anacollema* belong bean, manna, myrrh, *terra sanda, oxalis*, &c.

Junker describes an *anacollema frontale* for stopping hæmorrhages at the nose.

ANACOLUTHON, from ἀνακόλουθος, *incoherent*, among *Ancient Grammarians*, denotes an incoherence, or a construction which does not hang together. This is usually signified by the appellation of a figure which ought rather to be nominated an inaccuracy.

ANACONDO, in *Zoology*, is a name given, in the isle of Ceylon, to a very large and terrible RATTLE-SNAKE, which *alive* devours the unfortunate traveller alive, who is itself accounted excellent and delicious fare.

ANACREONTIC, in the Greek and Latin *Poetry*, something invented by Anacreon; or in the manner and taste of Anacreon, a poet of Teios, who lived upwards of 400 years before Christ, famous for the delicacy of his wit, and the exquisite, yet easy and natural, turn of his poesy.—We have several of his odes still extant; and there are few of the modern poets who have not written *Anacreontics* in imitation of them. They are mostly composed in verses of seven syllables; or rather of three feet and a half; spondees and iambics, though sometimes anapæsts. Hence verses in that measure are sometimes called *Anacreontics*, or *Anacreontic verses*.

ANACRISIS, from ἀνὰ and κρίνω, *I judge*, among the *Ancient Greeks*, is used for a kind of trial, or examination, which the *archons*, or chief magistrates of Athens, were to undergo, before their admission into that office.

The *anacrisis* stands distinguished from the *dokimasia*, which was a second examination in the *senate*.

The *anacrisis* was performed in the senate house. The questions here proposed to them were concerning their family, kindred, behaviour, estate, &c.

Some maintain that all magistrates underwent the *anacrisis*.

ANACRISIS, in the *Civil Laws*, denotes a search or inquiry into the truth by examination of witnesses.

ANACROSIS, in *Antiquity*, denotes a part of the Pythian song, wherein the combat of Apollo and Python are described.

The *anacrosis* was the first part, and contained the preparation to the fight.

ANACTON *festum*, in *Antiquity*, a festival held at Amphyssa, the capital of Locris, in honour either of the Dioscori, or of the Curetes, or Cabiri, about which authors are not agreed.

ANACYCLUS, in *Botany*, a genus of plants of the *syngenesia polygamia superflua* class of Linnæus, being the same with the *santolinoides* of other authors. It is a sort of camomile of little beauty, and of no known use.

ANADAVADEA, in *Ornithology*, the name of a small bird of the East Indies, which has the look of a chaffinch, and the feet of the lark. It is sometimes brought over to England alive in cages, and will live here very comfortably.

ANADEMA, among the *Ancients*, denotes an ornament of the head, wherewith victors at the sacred games had their temples bound.

The word is formed of ἀναδέω, *to tie bound round*.

Some confound the *anadema* with the *diadema*, worn by the ancient Persian kings.

Anademata are also mentioned by ancient writers among the ornaments of the heads of women.

According to some, ἀναδέσια answers to what the Latins call *redimiculum*.

ANADIPLOSIS, ἀναδίπλωσις, from ἀνὰ, *again*, and διπλόω, *I double*, denote a repetition of the last word of the former verse or member in the beginning of the next; e. g.

Addite si quam timidi pavi superavit Achilles,
Achilles Maladum pulchrior ille fuit,
Æquitat ille fuis hortatus Achivis,
Æquus equo fidens.

If children, then heirs, heirs of God, and joint heirs with Christ.

ANADIPLOSIS, in *Medicine*, denotes the redoubling or return of the paroxysm of a fever, chiefly of a remittention.

This is otherwise called *epanalepsis* and *epanadiplosis*.

ANADOSIS, from ἀνὰ and δίδωμι, *I give*, in the *Ancient Medicine*, denotes the distribution of the aliment by the vessels of the body.

In this sense, *anadosis* makes a part of nutrition or DIGESTION.

ANADROMOUS, in *Ichthyography*, a term of distinction among fishes, denoting such as have their times of going from the fresh water to the salt, and afterwards returning back to the fresh water again.

The word is derived from ἀνὰ, *again*, and δρόμος, a *course*. The *anadromous* fishes are many of them of this kind, and the method nature has appointed for their course of changes seems to be this: they are first produced from the spawn in fresh water rivers; they live there till they acquire some strength and size, and then seek the salt water to feed more at large in, and grow to their full extent: at which period they return into the freshes again to lay their spawn, that their young brood may have the same advantages which they had before, of being placed first in fresh water. Some use the word *catanadromi* in the same sense.

ANADUOMENE *Venus*, in the Grecian *Mythology*, answered to the *Sea-Venus* in the Roman, and was the appellation

pellation given to one of the chief deities of the sea. The most celebrated picture in all antiquity was that of this goddess by Apelles; and the famous Venus of Medici is a *Sea-Venus*.

ANADYSIS, among *Ancient Divines*, denotes the ceremony of the emersion in BAPTISM.

In which sense *anabora* stands contradistinguished from *katabora*, or *immersion*.

ANÆDEIA, in *Antiquity*, a denomination given to a silver stool placed in the *areopagus*, on which the defendant, or person accused, was seated for examination.

The word is *anadeia*, which imports *impudence*; but according to Junius's correction, it should rather be *anaideia*, q. d. *unmodesty*.

The plaintiff, or accuser, was placed on an opposite stool, called *hybris*, or *injury*: here he proposed three questions to the party accused; to which positive answers were to be given. The first, are you guilty of this fact? The second, how did you commit the fact? The third, who were your accomplices?

ANAIRETA, in *Astrology*, a place in the heavens, at which the *apheta* arriving, an infant born at that time, is pronounced by astrologers in danger of death.

The word is Greek, and literally imports a *cutter off*. In this sense, *anaireta* stands opposed to *apheta*.

ANAIRETA, among the Greek *Astrologers*, amounts to the same with what the Arabs call *alcubaren*.

ANAESTHESIA, *anæsthesia*, in *Medicine*, a privation of sense, or of the faculty of perceiving external objects.

The species or degrees of this are, *stupor*, *hebetudo*, *deprivatio*, &c.

ANAGALLIDASTRUM. See CENTUNCULUS.

ANAGALLIS, in *Botany*. See PIMPERNEL.

ANAGALLIS *Aquatica* is called by *Botanists*, *veronica aquatica*, or *becca bunga*; in English, BROOKLIME.

ANAGLYPHA, in *Ancient Writers*, denote vessels, or other things, adorned with sculpture in *basso relievo*; and hence the *anaglyphic* art is the art of carving, chasing, engraving, or imboſſing plate.

ANAGLYPHICE, or ANAGLYPTICE, denotes that species of sculpture wherein the ſtrokes or figures are prominent, or imboſſed; and is contradiſtinguiſhed from *diaglyphice*, where the ſtrokes are indented.

The word comes from the Greek *anaglyphw*, *exſculpo*.

ANAGNOSES, or ANAGNOMATA, from *ana* and *ginomai*, *I know*, in the Greek *Church*, denotes an eccleſiaſtical book, containing the leſſons read at divine ſervice, in the ſeveral feaſts, &c. of the year.

ANAGNOSTA, or ANAGNOSTES, among the *Ancients*, denotes a kind of ſervant reſident in the families of perſons of rank, to read to them at meals.

Theſe are called by the Greeks *anagnostai*, and by the Romans *lectores*; ſometimes alſo *a ſtudiis*.

Even private families, who lived in any degree politely, were not without this kind of literary ſervants. Servius makes mention of a female *anagnoſte*, under the denomination of *lectrix*. Sometimes the maſter himſelf performed the office of reader. The emperor Severus read himſelf at table. Martial mentions one Liguſinus, who read his own poems at dinner, to the great diſguſt of the gueſts.

Among the Greeks there were alſo *anagnoſtæ* in their theatres for public reading of the poets.

Some ſpeak of the *anagnoſtæ*, as a ſpecies of *acroamata*, from which, however, in propriety they differed.

Cornelius Nepos relates of Atticus, that no *acroama* was ever heard at his meals, but an *anagnoſtes*. He never ſupped without reading, ſo that the minds of his gueſts were no leſs agreeably entertained than their appetites. The ſame cuſtom Eginhard obſerves was kept up by Charlemagne, who at table had the hiſtories and acts of ancient kings read to him. This cuſtom ſeems to have been a reliqué of that of the ancient Greeks, who had the praiſes of great men and heroes ſung to them, while at table. The ancient monks and clergy kept up the like uſage, as we are informed by St. Auguſtin. Sidonius praiſes a man of quality in his time, who, in this reſpect, lived a clerical life, though he was no prieſt.

Bilbergius, and Th. Raynaud, have diſſertations expreſs on *anagnoſtæ*.

ANAGNOSTIC, in *Middle Age Writers*, is ſometimes uſed for an epiſtle, or other writing.

ANAGOGIA, in *Antiquity*, ſolemn ſacrifices to Venus at Eryx, in Sicily, where ſhe was honoured with a magnificent temple.

The name of this ſolemnity was derived, *apo tu anayein*, i. e. *from returning*; becauſe the goddeſs was ſaid to leave Sicily, and return to Africa, at that time.

ANAGOGICAL, *tranſporting*, ſomething that raiſes the mind to things eternal and divine; the great objects of the next life.

The word is derived from *anagoge*, *carrying away*, which is formed of the preposition *ana*, *upwards*, and *agoge*, *leading*.

The term is principally uſed in ſpeaking of the diverſ ſenſes of Scripture.—The *literal* ſenſe is the firſt, and natural ſenſe; the *myſtical* ſenſe is founded on the natural ſenſe, from whence it is taken by analogy or compariſon, by ſimilitude or reſemblance of one thing to another; and is diviſible into ſeveral kinds.

Where it regards the church, and matters of religion, it is called the *allegorical* ſenſe.

Where it regards our morals, it is called the *tropological* ſenſe. And where it regards eternity, or the life to come, it is called the *anagogical* ſenſe.

ANAGOGY, ANAGOGE, a rapture or elevation of the ſoul, to things celeſtial and eternal.

Anagogy, in a more particular ſenſe, denotes the application of types and allegories of the Old Teſtament to ſubjects of the New; thus called becauſe the veil being here drawn, what before was hidden is expoſed to open light. Some of the fathers place *anagoge* in oppoſition to *ecpaſis*, *baſtos*.

ANAGOGY, in *Medicine*, denotes a return of humours, or the rejection of a matter upwards, or by the mouth.

Anagogy amounts to the ſame with what is otherwiſe called *anabaſis*.

ANAGOGY, *exagoge*, in *Ancient Hiſtory*, denotes a looſe education or diſcipline.

ANAGRAM, ANAGRAMMA, a tranſpoſition of the letters of a name, with a combination thereof in ſome new manner, ſo as to exhibit one or more words, either to the advantage or diſadvantage of the perſon to whom it belongs.

The word is formed from *ana*, *backwards*, and *graphw*, *letter*.

Thus the *anagram* of Galenus is *angelus*; that of Logica, *caligo*; that of Aſtronus, *ſedronus*; that of Archimundury Godfry, *I find murdered by regret*; or, *by Rene's knife ſlayer die*, that of Loraine, *in odorem*, on which account it was, that the family of Loraine took *odorem* for their armoury.—Calvin, in the title of his Inſtitutions, printed at Strafburgh in 1550, calls himſelf *Alcuinus*, which is the *anagram* of Calvinus, and the name of an eminently learned perſon in the time of Charlemagne, who contributed greatly to the reſtoration of learning in that age. Baillet, in his Argenis, *anagrammatiſes* Calvinus by a leſs creditable name, *Upnedo*; and Rabelais, to be revenged of the ſame Calvin, who had made an *anagram* of his name, found in that of Calvin, *Jan. Cule*.

Such as keep cloſe to the definition of *anagram*, take the liberty to omit or retain the letter H, and that letter only; but ſuch as ſtand up for the poetical licence, make bold ſometimes to uſe E for B, V for W, S for Z, and C for K, and *vice verſa*.

This way of writing was ſcarce known among the ancients: Dauriat, a French poet in the reign of Charles IX. is uſually ſaid to be the firſt that practiſed it; yet Lycophron, who wrote under Ptolemy Philadelphus, about 280 years before Chriſt, appears to have been no ſtranger to the art of making *anagrams*. Canterus, in his *Prolegomena* to Lycophron, gives us two of the pieces in this kind; the firſt on the name of king Ptolemy, Πτολεμαιος, in which he found *meli thras*, *of honey*; to inſinuate the ſweetneſs and mildneſs of that prince: the ſecond was on queen Virginia, Αρσινοη, of whom he made *ios Heas*, *Juno's violet*.

There are two ways of making *anagrams*, for, 1. Some only conſiſt in dividing a ſingle word into ſeveral: thus the anigma of the god Terminus, mentioned by Aulus Gellius, lib. xii. cap. 6. is founded on the *anagram* TER MINUS; and thus *ſeptimontium* yields *ſex timet mus*. This kind alone ſeems to have been uſed among the Romans.

The ſecond is, where the order and poſition of the letters is changed: ſuch are thoſe above mentioned; and alſo theſe, *Roma*, *Amor*, *Amor*, *Jeſus*, *Lisus*, *Caſpari Peucer*, *Precus*, *Spurca*.

To find all the *anagrams* any name will admit of, *algebraically*. See COMBINATION.

The fineſt and happieſt of all the *anagrams* extant, is that on the queſtion put by Pilate to Jeſus Chriſt; *Quid eſt veritas?* which *anagrammatically* makes *Eſt vir qui adeſt*: the *anagram*, here, is the beſt and fulleſt anſwer that could poſſibly be given.

Beſides the ancient kind of *anagrams*, there have been new ones invented: as, the mathematical *anagram*, invented in 1680, by which the abbot Catelan found, that the letters of the name Lewis XIV. made *vrai heros*, i. e. *true hero*.

We are now likewiſe furniſhed with the numerical *anagram*, more properly called *chronogram*; where the numerical letters (i. e. ſuch as in the Roman cypherings ſtood for numbers) taken together, according to their numerical value, expreſs ſome epocha: of which kind is that diſtich of Godart on the birth of Lewis XIV. in the

year

year 1638, on a day wherein there was a conjunction of the eagle with the lion's heart:

eXsVLeonIsDeLphIn eqVILoCVDIssVeLeonIs
CongressVsgaLLasseLatIsIaqVeresCIt.

ANAGRAMMATIST, a maker or compoſer of *anagrams*; Thomas Billon, a Provençal, was a celebrated *anagrammatiſt*, and retained by Lewis XIII. with a penſion of 1200 livres, in quality of *anagrammatiſt* to the king. Lipenius gives a long liſt of *anagrammatiſts*.

Thomas Billon has given a ſet of propheſies in *anagrams*; Gul. Blancus, the art of compoſing *anagrams*.

ANAGROS, a meaſure for corn, uſed in ſome cities in Spain containing ſomewhat more than the Paris *mine*.

This is otherwiſe called *anegros*.

Four *anegros* make a *cabi*, four *cabis* a *tunega*.

ANAGYRIS, in *Botany*, ſtinking bean TREFOIL, a genus of the *decandria monogynia* claſs. The characters are: the flower is of the butterfly kind; the ſtandard is heart-ſhaped, and much longer than the empalement; the wings are oblong, plain, and longer than the ſtandard, as is alſo the keel; the germen afterward becomes a large oblong pod, in which are lodged ſeveral kidney-ſhaped ſeeds. We have but one ſpecies in England, viz.

Anagyris ſtipis ramis floribus lateralibus: ſtinking bean *trefoil*, with oval leaves, and flowers proceeding from the wings of the ſtalks. This ſort grows wild in the ſouth of France, as alſo in Spain and Italy. It is a ſhrub which uſually riſes to the height of eight or ten feet, and produces its flowers in April and May, which are of a bright yellow colour, growing in ſpikes, ſomewhat like thoſe of the LABURNUM.

Tournefort, however, enumerates two ſpecies. Tourn. Inſt. p. 647.

The leaves of the *anagyris* are reſolutive, and its ſeed emetic.

ANALECTA, the fragments, or offals of meat, which dropped from the table on the ground.

Analecta was alſo uſed for a ſervant appointed to gather up the offals of the tables.

In this ſenſe, the word is ſometimes alſo written *analectes*. Sateliius Quadratus, in the way of deriſion, adviſed Calviſius Sabinus, a man of great wealth, and much affectation of learning, but with little memory, and leſs genius, to keep *analectas*, *ut grammaticus haberet analectas*; a phraſe which has occaſioned much diſpute among critics and antiquaries.

ANALECTA is likewiſe, in a literary ſenſe, uſed for a collection of ſmall pieces or compoſitions.

The word is formed of *ανα*, *λεγω*, *I gather*.

ANALEMMA, a planiſphere, or projection of the SPHERE, on the plane of the meridian, orthographically made, by ſtraight lines and ellipſes; the eye being ſuppoſed to be at an infinite diſtance, and in the eaſt or weſt points of the horizon.

The word is derived from *ανα*, of *αναλαμβανω*, *reſumo*, *I take backwards*.

The *analemma* was invented by John de Royas, a Spaniard. The advantages of this above the *aſtrolabe* of Ptolemy and Gemma Friſius, are, that all the lines proceeding from the eye are parallel to each other, and perpendicular to the plane of projection; conſequently not only the equator is a right line, as in the *aſtrolabe* of Gemma Friſius, but all the parallels to the equator are ſo too; ſince, in virtue of the infinite diſtance of the eye, they are all in the ſame caſe, as if their plane paſſed through the eye: for the like reaſon, the horizon, and its parallels, are alſo right lines. On the other hand, whereas in the two former *aſtrolabes* the degrees of circles converted into right lines become very ſmall towards the centre, and large towards the circumference, they become here ſmall towards the circumference, and large towards the centre: ſo that their figures will be no leſs altered in this than in the others. Add, that moſt of the circles here degenerate into ellipſes, which are often difficult to deſcribe.

ANALEMMA is alſo uſed for a *gnomon* or *aſtrolabe*, conſiſting of the furniture of the ſame projection, drawn on a plate of braſs, or wood; with an horizon, or *curſor* fitted to it.

Its uſe is for finding the time of the ſun's riſing and ſetting, the length of the longeſt day in any latitude, and the hour of the day.

The *analemma* is alſo of conſiderable uſe among *Dialiſts*, for laying down the ſigns of the zodiac, with the length of days, and other matters or furniture, upon dials.

ANALEPSIS, the reſtoration of a body waſted by diſeaſe, by the uſe of a nutritious diet.

ANALEPSIS is alſo uſed for the method of hanging a broken or diſlocated member, eſpecially the hand, in a ſling. This operation to the arm is called *analeptis*; to the foot, *thyſis*.

ANALEPTICS, in *Medicine*, reſtoratives; or remedies proper to reſtore the body, when waſted or emaciated, either by the countenance of a diſeaſe, or by want of food.

The word is derived of *ανα*, *λαμβανω*, *I re-aſſabiſh*.

ANALOGICAL *ſyllogiſm*. See SYLLOGISM.

ANALOGISM, in *Medicine*. See ANALOGY.

ANALOGISM, among *Logicians*, the arguing from the cauſe to the effect.

ANALOGISTA, among *Civil Law Writers*, a tutor who is not obliged to give an account of his conduct.

Perſons dying ſometimes appointed friends to be tutors to their children, with this clauſe, that they ſhould be *analogiſtæ*.

Some lawyers hold, that this did not exempt a tutor guilty of glaring miſmanagement, from being called to account, and puniſhed accordingly.

ANALOGIUM, in *Eccleſiaſtical Writers*, denotes an *ambo*, or reading-deſk.

ANALOGIUM is ſometimes alſo uſed for a *martyrology*, or *obituary* of a monaſtery.

ANALOGY, in *Philoſophy*, a term denoting a certain relation, proportion, or agreement, which ſeveral things bear to each other in ſome reſpects, though different in others.

The word is Greek, which the Latins uſually render by *comparatio*, and *proportionalitas*.

The ſchoolmen define *analogy* to be a reſemblance, joined with ſome diverſity: its foundation, according to them, is laid in the proportion of ſeveral things, conſidered as that proportion proceeds upon different conſiderations.

Thus, a ſound animal, a ſound food, and a ſound propoſition, agreeing in this, that they have a common denomination, but the reaſon or quality whereon the denomination is founded, different, are ſaid to have an *analogy*, or to be *analogous*. Accordingly, *analogous* things are defined to be ſuch as have a common name, but the thing immediately ſignified by that common name different; yet with ſome correſpondence or relation diſcernible therein.

Philoſophers uſually diſtinguiſh three kinds of *analogy*, viz. of *inequality*, where the reaſon of the common denomination is the ſame in nature, but not in degree or order: in which ſenſe, animal is *analogous* to man and brute.—Of *attribution*; where, though the reaſon of the common name be the ſame, there is a difference in its habitude or reſpect thereto: in which ſenſe, healthy is *analogous* both to a man, and an exerciſe.—Of *proportionality*; where, though the reaſons of the common name do really differ, yet they bear ſome proportion to each other. In this ſenſe, the gills of fiſhes are ſaid to be *analogous* to the lungs in terreſtrial animals; and thus, the eye and the underſtanding are ſaid to bear an *analogy* to each other.

Reaſonings by *analogy* may ſerve to explain and illuſtrate, but not to prove any thing; yet is a great deal of our philoſophizing no better founded.

From a few *data*, a few points known and allowed, we reaſon by *analogy*, and deduce a number of others. It is thus that moſt branches of knowledge are extended to their preſent dimenſions. There are but few things actually obſerved, few experiments made; and all the obſervations and experiments we have are only ſingular. Such an effect was found from ſuch an individual body, under ſuch and ſuch circumſtances. We infer, that what has been obſerved of one body under ſuch circumſtances, will, from the *analogy* and uniformity in the works of the Creator, equally hold in all other bodies of the ſame ſpecies under the like circumſtances. Thus, without having recourſe to experiment, we never heſitate to conclude, that the fruit of trees of the ſame ſpecies will have the ſame taſte and properties. This has many times drawn us into great errors; it continues every day to lead us into new ones, and may be ſaid to be the ſource of moſt of the miſtakes committed in purſuit of ſcience. But nevertheleſs, while mankind extend their thoughts toward unknown and inacceſſible *objects*, they have no other guide to direct their reſearches but the ſuppoſed correſpondence between the objects they are acquainted with, and thoſe which are the ſubjects of their inveſtigation.

The *analogy* between the three kingdoms of plants, animals and minerals, has been the ſource of a variety of diſcoveries, either real or imaginary: hence it is we have learnt, that ſtones vegetate; that plants breathe: that the ſap circulates in them; that generation is performed by eggs in the human kind; that the planets have their atmoſpheres, their inhabitants, their trees, their ſeas, &c. Indeed, if we will follow whither *analogy*, real or imaginary, will lead us, there is no end of ſcience.

As to divine and ſupernatural matters, it is aſſerted we know nothing of them, but by *analogy*; that is, by the mediation and ſubſtitution of thoſe ideas we have of ourſelves and other natural beings. Our ideas of God himſelf ariſe from this ſpring; we have no direct and immediate perception of him. The knowledge we have of

the Supreme Being, is only an observation of his works, and a reflection of the mind, which shews what power, wisdom, &c. appear necessary to enable him to produce them. Having no proper ideas of his perfections, we give them the names of those faculties of men, which we judge necessary. See an excellent treatise on the *Analogy* of Religion, natural and revealed, to the Constitution and Course of Nature, by bishop Butler: in which, by evincing the *analogy* or likeness that subsists between the system of things and dispensation of providence, which revelation informs us of, and that system of things and dispensation of providence, which experience and reason inform us of, i. e. the known course of nature, he is led to ascribe both to the same author and cause.

ANALOGY, in *Grammar*, denotes the subsistence, or agreeableness of a word or phrase to the common rules, or forms of language.

In this sense, *analogy* stands opposed to ANOMALY.

ANALOGY, in respect to language, denotes a conformity with other points already established, serving as a rule, or model, for the making of new words and phrases similar to those already in use.

Or, *analogy* may be considered as a general or established usage, applied in similar cases, to certain words, phrases, or constructions not yet established. Or, *analogy* is only a particular usage which, in certain cases, is inferred from a general usage already established.

Grammarians are divided into two parties. Some, with Sanctius, contend, that the *analogy*, or reason, reigns through all the parts, all the phrases and dictions of the Latin tongue. On the contrary, others, with Perizonius, assert, that there are many phrases, contrary to *analogy* and reason, derived all originally from the populace. Such, e. g. are, *Nemo bona, dicerium, eversum*, &c.

Varro and Cæsar wrote expressly on the *analogy* of Latin words, but their works are now lost. Jac. Operarius has endeavoured to supply that loss, by tracing the *analogy* of 30,000 Latin words. Vid. Bib. Lat. lib. 1. cap. 10.

ANALOGY of *conjugation*, *analogia conjugationis*, is not only when a verb is conjugated like another, but agrees with it in the quantity of the syllables.

Thus *clamo* is conjugated like *amo*, and *clamabam* pronounced like *amabam*.

ANALOGY *of declension*, *analogia declinationis*, is not only when a noun, pronoun, or participle, is declined like another, but agrees with it in respect of the quantities of the syllables.

Thus, e. g. *mater* is declined like *pater*, *faltans* as *amans*, *suus* as *tuus*. So *pennarum* is pronounced as *monjarum*, and *fumeris* as *meneris*.

ANALOGY *of doctrine*, among *Critics*, is one of the great rules to which regard is to be had in the interpretation of authors.

We are first to learn from the author himself, the general system which he follows; and as no writer is to be easily supposed to contradict himself, our interpretation is to be so conducted, as that nothing be admitted which is contrary to, or tends to overthrow this system.

Thus, in interpreting an author who follows the Platonic scheme, we are to prefer a sense which is consistent with the Platonic doctrine, to another which is contrary to it, unless there be some evident proof, that the author contradicts himself, or asserts things which are inconsistent.

ANALOGY, in *Rhetoric*. See COMPARISON.

ANALOGY, in *Geometry*, denotes a similitude of ratios, or proportions.

ANALOGY *of faith*, among *Divines*, denotes that relation which the several articles of faith bear to each other.

Analogy of faith stands opposed to tradition and authority, which is the great rule of interpretation among catholics. By this it is required, that whether we interpret Scripture, or explain the doctrines of Christianity, all our positions and explanations be consistent with the *analogy* of our faith, and those evident propositions deduced from Scripture.

Tottschius, Antonius, Franckius, &c. have written expressly on the *analogy of faith*.

ANALOGY, in *Medicine*, is a certain relation or resemblance between diseases, in virtue whereof, we may reason and conclude from one to another, and treat them all much in the same manner; e. gr. a pleurisy, being a species of inflammation, produced like inflammations of other parts, is to be treated like them, relaxing the solids, which are too much stretched, and giving free passage for the humours.

This method of deduction was called, by the ancients, *medicina rationalis*, or *dogmatica*, in opposition to the *empirica*, called also *epilogismi*, which was conducted by appearances only, without theory.

ANALYSIS, in a general sense, is the resolution of something compounded into its constituent parts.

ANALYSIS, in *Logic*, is a method of applying the rules of reasoning, to resolve a discourse into its principles, in order to a discovery of its truth, or falsehood. Or it is an examination of some discourse, proposition, or other matter, by searching into its principles, and separating and opening its parts; in order to consider them more distinctly, and arrive at the more precise knowledge of the whole.

The word is ἀνάλυσις, which literally signifies *resolution*; formed of ἀνα and λυω, *solvo*, *I solve*.

Analysis makes one great branch or species of method; called also RESOLUTION.

It is particularly used for the reduction of an imperfect syllogism to a perfect one. This is otherwise called REDUCTION.

The order of the *synthesis* is contrary to that of the *analysis*, one beginning where the other ends. The two methods cannot always be used indifferently; the *analysis* is most proper for the discovery of truth, and SYNTHESIS for teaching and explaining it in a systematical way. Hence some call *analysis* the method of invention.

ANALYSIS, in *Mathematics*, may be divided into *ancient* and *modern*.

The modern *analysis* is what is often called *algebra*; but they ought to be distinguished, algebra being only a part of the *analytic* art.

The moderns are at some loss concerning the *ancient analysis*, i. e. concerning the art and method whereby the ancients resolved problems, and invented theorems. Some traces of their method are extant in Pappus, Apollonius, and Euclid; and Dr. Hook suspects, that their *analysis* went backwards through almost all the same steps by which their demonstrations went forwards.

That this might often be the case, seems evident to any one who has studied Euclid with care. They have indeed left us no precepts of their art. This, like almost all others, must be acquired by imitation, and the excellent examples left us by the Greeks. Men of genius among the moderns, who had studied the works of the ancient geometers, have been thereby enabled to imitate them, and penetrate into their methods: the works of Huygens and Newton, and of late the treatise of Conic Sections by Mr. Simpson, professor of mathematics in the university of Glasgow; as also several parts of Mr. Maclaurin's Treatise on Fluxions, are evident proofs of this.

Weigelius has endeavoured to retrieve the ancient *analysis* of Aristotle, from Euclid and other ancient geometricians.

ANALYSIS is divided by some authors into *simple* and *compound*.

ANALYSIS, *simple*, is that employed in solving problems reducible to simple EQUATIONS.

ANALYSIS, *compound* or *complex*, that which gives the expressions or solutions of problems in compounded EQUATIONS.

ANALYSIS is further divided, with regard to its object, into that of *finites*, and that of *infinites*.

ANALYSIS *of finite quantities*, is what we otherwise call *species arithmetic*, or ALGEBRA.

ANALYSIS *of infinites*, called also the new ANALYSIS, is particularly used for the *method of* FLUXIONS, or the *differential calculus*.

ANALYSIS *of powers*, denotes the resolving them into their ROOTS.

In this sense *analysis* amounts to the same with what we otherwise call EVOLUTION.

We find divers other kinds of *analysis* treated of by mathematical writers, as the *analysis* of *indivisibles*, &c. M. Leibnitz spoke of an *analysis situs*, different from the *analysis* of magnitudes.

The *analysis* of geometrical curves shews their properties and internal constitution, their curvature, points of inflexion, station, retrogradation, variation, &c. In this *analysis*, curves are usually considered as polygons composed of an infinite number of infinitely little sides; but this supposition is neither accurate nor necessary, though it sometimes affords convenient hints for invention.

F. Renau of the Oratory has given a large system of algebra under the title of *analysis*. F. Calsel censures it as not sufficiently methodical or systematical. The great divisions and members are lost in the multitude of particular rules and methods.

ANALYSIS *of ideas*, that whereby an idea is resolved into the ideas of its ingredients, and the ideas of these again into simple ones, till at length we arrive at the most simple.

ANALYSIS, *grammatical*, is that employed about words, their etymons, homonymas, or various acceptations, synonymas, constructions, rules, and the like.

Pasor has given a grammatical *analysis* of the difficult words in Hesiod, &c. Starmius has published a method of making the *analysis* of Latin words.

ANALYSIS, *rhetorical*, is that which examines the connections, tropes, figures, and the like, inquiring into the proposition, division, passions, arguments, and other apparatus of rhetoric.

Several authors, as Freigius and others, have given *analyses* of Cicero's Orations, wherein they reduce them to

their grammatical and logical principles; strip them of all the ornaments, and additions of rhetoric, which otherwise disguise their true form, and conceal the connection between one part and another. The design of these authors is to have those admired harangues, just such as the judgment disposed them, without the help of imagination; so that here we may coolly view the force of each proof; and admire the use Cicero made of rhetorical figures, to conceal the weak part of a cause.

A collection has been made of the *analyses* formed by the most celebrated authors of the fixteenth century, in three volumes folio.

ANALYSIS is alſo uſed, in *Chemiſtry*, for the decompounding of a mixed body; or the ſeparation of the principles and conſtituent parts of the compounded ſubſtance.

To *analyſe* bodies, or reſolve them into their component parts, is indeed the chief object of the art of chemiſtry. Chemiſtry furniſhes ſeveral means for the decompoſition of bodies, which are all founded on the differences of the properties belonging to the different principles of which the body to be analyſed is compoſed. If, for example, a body be compoſed of ſeveral principles, ſome of which have a great, and others a moderate degree of volatility, and, laſtly, others are fixed, its moſt volatile parts may be firſt ſeparated by a gradual heat, in diſtilling veſſels, and then the parts which are next in volatility will paſs over in diſtillation, and laſtly, thoſe parts which are fixed, and capable of reſiſting the action of fire, will remain at the bottom of the veſſel.

There are two methods of *analyſis* which chemiſts make uſe of; *analyſis by fire*, and *analyſis by menſtrua*. The laſt is at leaſt of as extenſive utility as the firſt, ſince it takes place in almoſt all the operations of chemiſtry. The operations called by chemiſts PARTING, ought to be conſidered as the true *analyſis by menſtrua*. It is true, that in many caſes, the *analyſis by menſtrua*, as well as the *analyſis by fire*, is incomplete. Frequently it is neceſſary, in order to make a perfect *analyſis* of bodies, to unite theſe two methods, by *fire* and by *menſtrua*, ſo that the one can be made to aſſiſt the other; and from theſe combined means a decompoſition reſults much more perfect and more accurate than could have been obtained by either of them ſeparately. Nothing more need be ſaid here on *analyſis* in general; the ſubject is ſo extenſive, that to make particular applications of it, we ſhould be obliged to conſider all the objects in chemiſtry. Thoſe who know the uſe of general principles, will apply theſe to particular operations, and longer details would be fatiguing and uſeleſs to others. It is, nevertheleſs, proper to mention the general articles which relate to this. See therefore EXTRACTION, DECOMPOSITION, DISTILLATION, CALCINATION, PRECIPITATION, and SOLUTION.

All bodies by a chemical *analyſis* reſolve into water, earth, ſalt, ſulphur, and mercury, though every body does not afford all theſe parts; but ſome more, ſome fewer, of them, according to the kingdom they belong to. The *analyſis* of vegetables is eaſy; that of foſſils, particularly of metals, and ſemi-metals, difficult.

The many *analyſes* that have been made of plants by Bourdelin, and others, have generally proved uſeleſs with regard to any diſcoveries of the properties and virtues of the plants analyſed. The moſt ſalutary plants, in this way of treatment, yield much the ſame principles as the moſt poiſonous. The reaſon apparently is, that the too great action of the fire, in diſtillation, changes the plants, and their principles: on this account, inſtead of diſtillation, M. Bouldue has made his *analyſes* by decoction only. Vide Mem. Acad. R. Sciences an. 1734. p. 139. Hiſt. 63.

Some bodies of the foſſil tribe conſiſt of particles ſo very minute, and ſo firmly united, that the corpuſcles thereof need leſs heat to carry them off than to ſeparate them into their principles: ſo that the *analyſis* is impracticable in ſuch bodies. Hence ariſes the difficulty of *analyſing* ſulphur.

Analyſis of metals, and metallic minerals, conſiſts in what they call the MERCURIFICATION of them: the *analyſis* of other bodies is performed by *diſtillation*, *ſublimation*, &c.

The order of matters which ariſe in analyſing vegetable and animal bodies in different, according as thoſe bodies have been fermented or not; if they have, the ſpirits and volatile ſalts ariſe firſt, then aqueous liquors, then fœtid oil, after which a *caput mortuum*, which by *calcination* and *lixiviation*, is reduced to a fixed ſalt, and inſipid earth. In bodies unfermented, the aqueous parts riſe firſt, afterwards the reſt ſucceed in the ſame order as above.

The anatomical diſſection of an animal, is alſo a kind of *analyſis*.

ANALYSIS is alſo uſed for a kind of ſyllabus, or table of the principal heads or articles of a continued diſcourſe; diſpoſed in their natural order and dependency.

Analyſes are more ſcientifical than alphabetical indexes; but they are leſs uſed, as being more intricate.

Analyſis is likewiſe uſed for a brief, but methodical illuſtration of the principles of a *ſcience*; in which ſenſe it is nearly ſynonymous with what we otherwiſe call a *ſyngeſis*.

ANALYST, a perſon who analyſes a thing, or makes uſe of the *analytical* method.

Some reſtrain the word more peculiarly to denote a mathematician, who makes a great uſe of the algebraic method or *calculus* in geometry, in excluſion of the *ſynthetic*, or ſtrict geometrical method.

In which ſenſe *analyſt* amounts to much the ſame with *algebraiſt* or *calculator*.

In a ſenſe not unlike this, Dr. Berkeley, an ingenious writer, gives the title *analyſt* to a book againſt the modern *geometry*, or doctrine of FLUXIONS.

ANALYTIC, ANALYTICAL, ſomething that belongs to, or partakes of, the nature of analyſis.

Thus we ſay, an *analytical* demonſtration; *analytical* inquiry; *analytical* table or ſcheme; *analytical* method, &c.

The *analytic* method ſtands oppoſite to the *ſynthetic*.

ANALYTICS, ANALYTICA, the ſcience, or doctrine, and uſe of *analyſis*.

The great advantage of the modern mathematicians above the ancient, is in point of *analytics*.

The authors on the ancient *analytics* are enumerated by Pappus, in the preface of his fifth book of his mathematical collections; being, Euclid, in his *Data*, and *Porifmata*; Apollonius, *De Sectione Rationis*; Apollonius in his *Canon*, *Inclinationes*, and *Tactiones*; Ariſtæus *De Locis Solidis*; and Eratoſthenes, *De Mediis Proportionalibus*. But the ancient *analytics* were very different from the modern.

To the modern *analytics* principally belongs *algebra*; the hiſtory of which, with the ſeveral authors thereof, ſee under ALGEBRA.

The chief writers upon the analyſis of infinites are, its inventor, Sir Iſaac Newton, in his *Analyſis per Quantitatem Seriei, Fluxiones, & Differentias, cum Enumeratione Linearum tertii Ordinis* 1702. *De Quadratura Curvarum*; and M. Leibnitz, in *Act. Eruditor.* an. 1684. The Marquis De l'Hôpital, in his *Analyſe des Infiniments petites*, 1696. Carre, in his *Methode pour la Meſure des Surfaces, la Dimenſion des Solides, &c. par l'Application du Calcul integral*. 1700. G. Manfredi, in a poſthumous piece, *De Conſtructione Æquationum differentialium primi gradus*, 1707. Nic. Mercator, in *Logarithmotechnica*, 1668. Cheyne, in *Methodus Fluxionum inverſa*, 1703. Craig, in *Methodus Figurarum lineis rectis & curvis comprehenſarum Quadraturas determinandi*, 1685; and *De Quadraturis Figurarum curvilinearum & inclt*, &c. 1693. Dav. Gregory, in *Exercitatio Geometrica de Dimenſione Figurarum*, 1684; and Nieuwentit, in *Conſiderationes circa Analyſeos ad Quantitates infinite parvas applicatæ principia*, 1695. The ſum of what is found in l'Hôpital, Carre, Cheyne, Gregory, and Craig, is collected into one volume, and very well explained, by C. Hayes, under the title of a Treatiſe of Fluxions, &c. 1704. And the ſubſtance of moſt of the reſt in Pere Reyneau's *Analyſe Demontrée*, 2 vols 4to. 1708. De Moivre alſo, Maclaurin, and Mr. T. Simpſon, may be added to the number.

ANALYTICS, in *Literary Hiſtory*, is particularly uſed to denote certain writings of Ariſtotle under this title.

Ariſtotle's *Analytics* conſiſt of four books, run under the denomination of *former*, ANALYTICA *poſteriora*, and as many under that of *latter*, *priora*. They belong to the claſs of his *acroamatic* works. Fabr. Bibl. Græc. lib. iii. cap. 6.

ANALYTICS is alſo uſed by ſome for a part of LOGIC, which teaches to decline and conſtrue reaſon, as grammar does words.

ANAMNESIS, from ἀνὰ and μνήσομαι, *I remember*, in *Ancient Writers*, denote encomiums of perſons who had behaved well in war, or on other occaſions, rehearſed before the emperors of Conſtantinople, to put them in mind of beſtowing ſuitable rewards.

ANAMNESTICS, in *Medicine*, are uſed by ſome writers, to denote thoſe ſigns which help to diſcover the paſt ſtate of a patient's body: in which ſenſe it ſtands oppoſed to PROGNOSTICS.

Theſe are otherwiſe called *commemoratives*.

ANAMNESTIC is alſo applied by Blancard to remedies proper for reſtoring or ſtrengthening the memory.

Such, according to this author, are all ſpirituous things.

ANAMORPHOSIS, in *Perſpective* and *Painting*, a monſtrous projection; or a repreſentation of ſome image, either on a plane or curve ſurface, deformed and diſtorted: which at a certain diſtance ſhall appear regular, and in proportion.

The word is compounded of ἀνὰ and μορφὴ, *form*.

To make an *anamorphoſis*, or monſtrous projection on a plane. Draw the ſquare ABCD (*Tab. Perſpective, fig.* 10. N° 1.) of a bigneſs at pleaſure, and ſubdivide it

into

into a number of areolas, or lesser squares. In this square, or reticle, called the *cruticular prototype*, let the image to be distorted be drawn. Then draw the line *a b* (*fig.* 19. N° 2.) equal to A B; and divide it into the same number of equal parts, as the side of the prototype A B; and in E, the middle thereof, erect the perpendicular E V, so much the longer; draw V S perpendicular to E V, so much the shorter, as the image is defired to be more distorted. From each point of division draw right lines to V, and join the points *a* and S, by the right line *a* S. Through the points *d e f g* draw lines parallel to *a b*; then will *a b d* be the space which the monstrous projection is to be delineated in; called the *cruticular eclype*.

Lastly, in every *areola*, or small *trapezium* of the space *a b d*, draw what appears delineated in the correspondent *areola* of the square ABCD: by this means you will obtain a deformed image, which yet will appear in just proportion to an eye distant from it the length EV, and raised above the height VS.

It will be diverting to manage it so, that the deformed image may not represent a mere chaos, but some other image: thus, we have seen a river with soldiers, waggons, &c. marching along the side of it, so drawn, that when viewed by an eye in the point S, it appears to be the farrical face of a man.

An image also may be distorted mechanically, by perforating it here and there with a needle, and placing it against a candle or lamp; and observing where the rays, which pass through these little holes, fall on a plane, or curve superficies; for they will give the correspondent points of the image deformed; by means whereof, the deformation may be completed.

ANAMORPHOSIS, *to draw the, or deformation of an image, upon the convex surface of a cone.*—It is manifeft from the former cafe, that all here required is, to make a *cruticular eclype* on the fuperficies of the cone, which fhall appear to an eye duly placed over its vertex, equal to the cruticular prototype.

Let the bafe, or periphery, ABCD, therefore, of the cone (*fig.* 20.) be divided by diameters into any number of equal parts; and let fome one radius be likewife divided into equal parts; and through each point of divifion draw concentric circles: thus will the cruticular prototype be made. With double the diameter AB, as a radius, defcribe the quadrant EFG (*fig.* 21.) fo as the arch EG be equal to the whole periphery: then this quadrant, folded duly up, will form the fuperficies of a cone, whofe bafe is the circle ABCD. Divide the arch E G into the fame number of equal parts as the cruticular prototype is divided into; and draw radii from each of the points of divifion. Produce GF to I, fo that FI = EG: and from the centre I, with the radius IF, draw the quadrant FKH; and from I to E draw the right line IE. Divide the arch KF into the fame number of equal parts as the radius of the cruticular prototype is divided into; and draw radii through each of the points of divifion, from the centre I, meeting EF, in 1, 2, 3, &c. Laftly, from the centre F, with the radii, F 1, F 2, F 3, &c. defcribe the concentric arches. Thus will the cruticular eclype be formed, the *areolæ* whereof will appear equal to each other.

Hence what is delineated in every *areola* of the cruticular prototype, being tranfferred into the *areolæ* of the cruticular eclype, the images will be diftorted or deformed: yet an eye being duly raifed over the vertex of the cone, will perceive it in juft proportion.

If the chords of the quadrants be drawn in the cruticular prototype, and chords of the fourth part in the cruticular eclype, all things elfe remaining the fame, you will have the cruticular eclype in a quadrangular pyramid.

And hence it will be eafy to deform any image, in any other pyramid, whofe bafe is any regular polygon.

Becaufe the eye will be more deceived, if from contiguous objects it cannot judge of the diftance of the parts of the deformed image; therefore, thefe kinds of deformed images are to be viewed through a fmall hole; and when they are made to appear like the objects which they are intended to repreſent, by means of a mirror of any particular conftruction, thefe *anamorphoſes* are faid to be *performed*. See MIRROR.

ANANAS, in *Natural Hiſtory*, by fome called *nanas*, by others *ananas*, and by us popularly the *pine-apple*, on account of the refemblance it bears to the cones of pines and firs, is a fine Indian fruit, which grows on an herbaceous plant, with leaves like thofe of the aloe. See PINE-APPLE.

ANAPÆST, *Anapæstus*, a foot in the Greek and Latin poetry, conſiſting of two fhort, and one long fyllable, being the reverſe of the dactyl.

The word is derived from ἀνάπαιστος, *contra ferio*, becauſe, in dancing this meaſure, the ground was ſtruck in a contrary order from what it was in the dactyl. Whence the Greeks called it *ἀντιδάκτυλος*. Diom. lib. iii. p. 74.

Such are the words *ſupervĕnit*, *ſuperĕmi*, *reſiſtĕre*.

ANAPÆSTIC, or ANAPÆST, is ſometimes uſed in a ſubſtantive ſenſe.

Such is the *anapæſtus Ariſtophaneus*, in Cicero, which is a verſe conſiſting of eight feet, as

Arena ponit pro ſcriba denique dictata adhæſit.

Vide Cic. in Orat. cap. 56. Fabr. Theſ. in voc. *Anapæſtus*.

This is otherwiſe called *anapæſtus octonarius*.

ANAPÆSTIC, in an adjective ſenſe, ſomething relating to, or compoſed of *anapæſts*.

ANAPÆSTIC *kind*, *genus anapæſticum*, is a ſort of verſe compoſed of pure Ariſtophanic or Parthenaic *anapæſts*.

Anapæſtic verſes are either Ariſtophanic or Pindaric.

Anapæſtici Ariſtophanei, called alſo *Parthenaici*, conſiſts of three *anapæſts*, and one long ſyllable, but in ſtead inſtead of the firſt two *anapæſts* as many ſpondees may be uſed.

Its type ſtands thus:

Venient ætis ſæcula quæ non
Socius naſcet naſſa recluſit
Animantique ſalmarius ævo
Habitacula priſſima pandet
Laxymas ſolſandite cauſſi
Mors nec reparabilis vincet te. Boeth.

Pindaric anapæſt admits, in the firſt place, either of an *anapæſt* or a ſpondee; in the ſecond, only of an *anapæſt*; in the third, of an *anapæſt* or a ſpondee in the ſixth, either of a ſpondee or a trochee.

As in the following type:

In ſummo perſcula textuit
Malum timor ipſe mali mittit.

ANAPHORA, in *Rhetoric*, a figure whereby one or more words are repeated in the beginning of ſeveral ſentences or verſes.

The word is ἀναφορὰ, ſignifying *repetition*.

Such, e. gr. is that of the Pſalmiſt: *The voice of the Lord is powerful: the voice of the Lord is full of majeſty: the voice of the Lord ſhaketh the wilderneſs.*

ANAPHORA is uſed in the *Ancient Medicine*, for the rejection of matter by the mouth.

Hence alſo we meet with the term *anaphoricis*, *anaphoricum*, uſed for thoſe labouring under an *anapatos*, who bring up blood from the lower part by the mouth.

ANAPHORA, among *Eccleſiaſtical Writers*, denotes the hoſt or ſacrifice offered in the *euchariſt*.

ANAPHORA is alſo uſed to denote the rehearſing a perſon's name from the DIPTYCHS in the liturgy.

ANAPHORA is alſo a title given to thoſe little Syriac liturgies, wherein are contained the prayers after the *ſanctus* paris. Ignatius, patriarch of the Maronites, enumerates forty of theſe *anaphoræ*.

ANAPHORA, in *Aſtrology*, denotes the ſecond houſe, or that part of heaven which is thirty degrees diſtant from the HORIZON.

The term *anaphora* is ſometimes alſo promiſcuouſly applied to ſome of the ſucceeding houſes; as the ſecond, fifth, eighth, and eleventh. In this ſenſe *anaphora* amounts to the ſame with *epanaphora*, and ſtands oppoſed to CATAPHORA.

ANAPHORA is alſo applied by ſome to the oblique aſcenſions of the ſtars.

ANAPHRODISIA, from ἀν and Ἀφροδίτη, *Venus*, denotes impotency in reſpect of venery. Some alſo uſe it for a want of deſire or inclination to the ſex.

In this ſenſe, the academiſts *Naturæ Curioſæ* give an extraordinary inſtance of this kind, in a perſon otherwiſe healthy and robuſt. Eph. Acad. N. C. Dec. 1. ann. 8. Obſ. 134.

ANAPHYSEMATA, from ἀνα and φυω, *I ſend forth*, in ſome *Ancient Writers*, denote winds iſſuing from under ground, at the clefts or apertures thereof.

Theſe are ſometimes called by latter writers *apopnoi*.

ANAPLASIS, from ἀνα and πλάσσω, *I form*, in *Medicine*, the complete reſtitution of a broken bone, ſo that the two ends meet and cloſe exactly together. This is the ſame with what is otherwiſe called *anaſtaſis*.

ANAPLASIS alſo ſignifies a renutrition of the exhauſted fleſh.

ANAPLEROSIS, in the general ſenſe, denotes REPLETION. *Anaplerotics* in more particularly uſed to denote that part of ſurgery whereby things wanting are ſupplied.

In which ſenſe, *anapleroſis* amounts to the ſame with what we otherwiſe call apposition, or PROTHESIS.

ANAPLEROTES, in the *Greek Laws*, is a name which ſome give to the four laſt books of Juſtinian's Code.

ANAPLEROTICS, in *Medicine*, ſuch remedies as incarnate, and fill up ulcers and wounds with new fleſh.

The word comes from *αναπληρω*, *I fill up*.

Anapleroties are the ſame with what we otherwiſe call INCARNATIVES.

ANAPODOPHYLLON, in *Botany*. See DUCK'S-*foot*.

ANARCHI, in *Antiquity*, a name given by the Athenians to four ſupernumerary days in the year, during which they had no magiſtrates.

The Attic year was divided into ten parts, according to the number of tribes, to whom the preſidency in the ſenate fell by turns.

Each diviſion conſiſted of thirty-five days; what remained after the expiration of theſe, to make the lunar year complete, which, according to their computation, conſiſted of three hundred and fifty-four days, were employed in the creation of magiſtrates, and called *αναρχοι ημεραι*. and *αρχαιρεσιαι*.

ANARCHY, the want of government in a nation, where no ſupreme authority is lodged, either in the prince, or other rulers; but the people live at large, and all things are in confuſion.

The word is derived from the Greek privative *a*, and *αρχη*, *principality*.

All kinds of ſtates are ſubject to *anarchies*. We read of civil *anarchies*, eccleſiaſtical or ſpiritual *anarchies*, and even *anarchies* in the republic of letters.

Anarchy is ſuppoſed to have reigned after the deluge, before the foundation of monarchies. We ſtill find it obtain in divers parts, eſpecially of Africa and America; e. gr. among the Iſlands, who are obſerved by travellers to live in a perfect independency of any ſuperior; among the Californians, where every family makes its own laws, as well as religion; in Chili, where every maſter of a family is a king; in the Marian iſlands, where neither prince nor law is known, but every perſon governs himſelf according to his own will; and to mention no more, among the Hottentots, where the only reſemblance of government is, that in each neighbourhood, the eldeſt is the firſt in honour, and his advice chiefly followed, not from any civil authority he is veſted with, but on account of his ſuperior experience.

Some extend the idea of *anarchy* farther, ſo as to make it comprehend all the more popular governments.

In this ſenſe, *anarchy* amounts to much the ſame with DEMOCRACY.

Hobbes, in this ſenſe, calls the Roman commonwealth an *anarchy*.

It has been ſometimes controverted which of the two is beſt, a ſtate of *anarchy*, or of tyranny and arbitrary power. This controverſy, however, does not appear to be of any great uſe; it is of little purpoſe to determine which is beſt, ſince a ſtate of *anarchy* naturally, nay neceſſarily, paves the way for deſpotiſm; and confuſion is always the parent of oppreſſion.

ANARCHY is alſo applied to certain troubleſome and diſorderly periods, even in governments otherwiſe regular. —In Germany, the ſpace from the election of Richard duke of Cornwall, to that of duke Rud. of Hapſburg, is commonly called the *anarchy*, or *interregnum*.

In England, the period between the death of Cromwell and king Charles's Reſtoration, is commonly repreſented as an *anarchy*. Every month produced a new ſcheme or form of government. Enthuſiaſts talked of nothing but annulling all the laws, aboliſhing all writings, records, and regiſters, and bringing all men to the primitive level. No modern nation is more ſubject to *anarchies* than Poland: where every interval between the death of one king, and the election of another, is a perfect picture of confuſion, inſomuch that it is a proverb among that people, Poland is governed by confuſion.

The Jewiſh hiſtory preſents numerous inſtances of *anarchies* in that ſtate, uſually denoted by this phraſe, *that in thoſe days there was no king in Iſrael, but every man did that which was right in his own eyes*; which is a juſt picture of an *anarchy*. The firſt *anarchy* we read of in that commonwealth, is that which enſued on the death of Joſhua, who leaving no ſucceſſor, the government devolved to the elders of the tribes, who ruled each according to his own will. After the death of theſe elders, the *anarchy* became complete.

ANARGYRUS, from *α* and *αργυρος*, *money*, in *Ancient Writers*, denotes a perſon without money, though otherwiſe ſufficiently accommodated with land, and other effects.

In a like ſenſe, we ſometimes alſo meet with the word *anargyria*, uſed by lawyers for the condition of a perſon without ready money.

Mart. Phil. Fabricius has a diſſertation expreſs *De Exceptione Anargyriæ*.

ANARGYRI, in *Eccleſiaſtical Hiſtory*, is an appellation given to certain ſaints in the Greek church, who having been phyſicians, gave not only their advice, but their remedies, *gratis*. They are alſo called *argentinopoi*.

ANARRHAPHE, from *ανα* and *ραφη*, *ſuture*, in *Surgery*, denotes a kind of future or retraction of the upper eye-lid, when relaxed and hanging over the eye.

This is by ſome alſo called *ſutura blepharica*, by others *adverſalis*, *contractio*, *colliſio*, or *ſuſpenſio ſuperioris palpebræ*. It is uſed in the *phalangoſis*, *ptoſis*, or *chalaſis*; where the ſight is obſtructed, by a *prolapſus* of the part, or the eye-lid itſelf is too thick beſet with briſtly hairs both within and without.

ANARRHICAS, in *Ichthyology*, the name given by Artedi to the fiſh called by others the LUPUS *marinus*. It is a genus of the order of *apodes*, in the Linnæan ſyſtem.

ANARRHINON, in *Botany*, a name given by ſome of the ancients to the plant called by others LYCHNIS *agria*, and by others *antirrhinum*. Pliny tells us, that this plant reſembled flax; that it had ſcarce any root; that its flower was the colour of the hyacinth, and its fruit reſembled the noſe of a calf. It is from this reſemblance that we at this time call the plant *calve's ſnout*. Dioſcorides ſays, that it was like the *anagallis*.

ANARTHRA, from *α* and *αρθρον*, *joint*, a claſs of naked inſects, diſtinguiſhed from all others, by having neither wings nor limbs. To this claſs belong all kinds of worms and leeches.

ANAS, *duck*, in the Linnæan ſyſtem of *Zoology*, the name of a large genus of birds, of the general order of ANSERES. The diſtinguiſhing characters of this genus are, that the beak is convex, and ends in an obtuſe point. The birds of this genus are the ſwan, goote, widgeon, &c. See DUCK.

ANAS *ſaraſſa*, in *Ornithology*, the name of a bird common in France, and uſually called TETRAX, and *canus perdicis*. It is of the ſize of a pheaſant, and of the nature of the *buſtard*, having no hinder toe; it runs very ſwiftly, and ſits on the ground as the duck does in the water, whence it has its name.

ANASARCA, from *ανα* and *σαρξ*, *fleſh*, in *Medicine*, a ſort of univerſal dropſy, wherein the whole ſubſtance of the body is ſtuffed or bloated with pituitous humours.

This diſtemper is ſometimes alſo called *cataſarca*, ſometimes *hypoſarcidium*, ſometimes *epiſarcidium*, ſometimes *aqua inter cutem*, or *interosa*, becauſe the pituitous humour ſpreads itſelf through the fleſh. Sereanus Samonicus elegantly calls it *ſympathicus error*; Alhucaſis calls it a dropſy by inſiltration.

Anaſarca is a peculiar ſpecies of univerſal dropſy, differing from both the *aſcites* and *tympanites*. It differs from the *aſcites* in that, though it uſually ariſes from the ſame cauſes, the waters in an *aſcites* do not poſſeſs the upper parts of the body, at leaſt while the patient keeps in an erect poſture, which they do in the *anaſarca*.

Some diſtinguiſh between the *anaſarca* and the *leucophlegmatia*, in that the latter comes from the *pituita*, the former from an ichorous ſerosity diſcharged in the very habit of the body; apparently through the fault of the lymphatic veſſels.

The *anaſarca* ſometimes ſtops at half its growth; in which caſe it is called by the ancients *phlegmatia*, where the bloating is conſpicuous, yet ſoft and looſe.

In an *anaſarca*, the legs ſwell at firſt, eſpecially towards night, and then pit remarkably; the urine is pale, the appetite decays; at length the ſwelling riſes higher, and appears in the thighs, belly, breaſt, and arms. The face becomes pale and cadaverous; the fleſh loſt and lax; and a difficult reſpiration comes on, attended with a ſlow fever.

The uſual method of cure among us is much the ſame as that of the *aſcites*. The ancients had a peculiar method adapted to it.

Actius relates from Aſclepiades, the manner of curing an *anaſarca*. This is by making inciſions on the inſide of the leg, about four fingers breadth above the ankle, as deep as generally thoſe in bleeding are made. At firſt a little blood iſſues out, afterwards there is a continual diſcharge of water, without any inflammation, ſo that the aperture cannot be cloſed, till the humour is ſpent, and the ſwelling gone down; and this drain cures the diſtemper, without any internal medicine.

Leonides ſays farther, that if the inciſions in the legs do not make a diſcharge quick enough, ſome ought to be made in other parts of the body; in the thighs, in the arms, or in the *ſcrotum*, if ſwelled, by which means a great quantity of watery matter may be evacuated.

The operation itſelf is mentioned by Hippocrates, and had been practiſed from his time down to our days, with ſucceſs; though ſometimes mortifications have been known to enſue.

In ſome caſes the *anaſarca* appears to have been advantageous, inſomuch that the cure of it has killed the patient.

Dr.

Dr. Dover's cure for an *anaſarca* is an electuary compoſed of ſteel prepared with ſulphur and crude antimony, each an ounce; *diapridium*, four ounces; make a fine powder of theſe; then add as much of any ſyrup as will make a ſoft electuary.

ANASSAS, in *Natural Hiſtory*, the name of a fruit very common in Guinea, and in ſome other parts of Africa. It is very beautiful to the eye, and not leſs agreeable both to the taſte and ſmell, and is by ſome accounted the fineſt fruit in the world. The deſcriptions we meet with of it are very imperfect; but as there is nothing in them that contradicts its being the PINE-APPLE, it may be that fruit, and if ſo, it deſerves all the praiſe that is given it.

ANASTASIS, a Greek word adopted into the Engliſh language, which denotes a reſurrection.

Chiflet has given us a diſſertation on Childeric's tomb, under the title of *Anaſtaſis Childerici*. Trucr has publiſhed the figure of a man and woman in the ancient German habit, as found in an ancient urn, under the title of *Anaſtaſis veteris Germani Germanaque Faminæ*.

ANASTASIS, among *Ancient Phyſicians*, denotes a riſing up to go to ſtool. It likewiſe ſignifies a migration of humours, when expelled from one place and obliged to remove to another.

ANASTATICA, ROSE *of Jericho*, in *Botany*, a genus of the *tetradynamia ſiliculoſa* claſs. *Anaſtatica*, *Hort. Cliff.* 328. The characters are: the flower hath four roundiſh petals, placed in form of a croſs; the ſeed-veſſel in this is blunt-pointed, bordered, and crowned, and the valves open oblique to the ſtyle.

This plant grows naturally on the ſands, near the borders of the Red Sea, and in many parts of Syria.

It hath had the epithet of *roſa Mariæ* given to it by the monks, who have ſuperſtitiouſly ſuppoſed that the flowers open on the night that our Saviour was born. But the truth is, that the dry woody plant being ſet for ſome time in water, will diſtend and open, ſo as to diſcloſe the ſeed veſſels and ſeed. This has been done when the plants have been many years gathered; ſo that ſome curious perſons preſerve them in their repoſitories of curioſities, for the ſingularity of this property.

This plant is propagated by ſeeds, which ſhould be ſown the beginning of April, on a border of light ſandy earth, where it is deſigned to remain; for it will not bear tranſplanting. If the ſeaſon proves favourable the plants will flower in Auguſt; but unleſs the autumn proves warm and dry, they will not ripen their ſeeds in England.

ANASTOMASIS, or ANASTOMOSIS, in *Anatomy*, is ſometimes uſed to expreſs ſuch aperture of the mouths of the veſſels as lets out their contents.

The word is formed of *ava*, *through*, and *ςομα*, *mouth*.

ANASTOMASIS is more frequently uſed to denote the opening of two veſſels into one another; or the union and junCture of the mouths of two veſſels, whereby they come to communicate with one another.

There are various *anaſtomoſes* of this kind, e. gr. of an artery with an artery, a vein with a VEIN, and of a vein with an ARTERY.

This circulation of the blood in the *fœtus* is effected by means of the *anaſtomoſes*, or inoſculations of the *vena cava* with the pulmonary vein; and of the pulmonary artery with the *aorta*.

The circulation is alſo performed in adults by the *anaſtomoſes*, or continuation of the capillary arteries with the veins.

After the circulation of the blood through the heart, lungs, and large blood-veſſels, was demonſtrated by Harvey, it was only gueſſed how the extremities of the arteries tranſmitted the blood to the veins; till Leewenhoeck's microſcopes had diſcovered the continuations of the extremities of thoſe veſſels, in fiſh, frogs, &c.—However, there were not wanting thoſe who doubted of the like continuations of the extremities of the arteries and veins in human bodies, and quadrupeds; ſince thoſe animals it had hitherto been chiefly ſeen in ſatisfactorily, were either ſuch fiſh or amphibious kinds, as have but one ventricle in their hearts, and whoſe blood is actually cold; beſide that in them it does not circulate with ſuch rapidity as in animals whoſe hearts have two ventricles. This difference in the principal organs of circulation moved Mr. Cowper to make experiments on animals whoſe organs differ only from the human in their groſs figure, and not in their intimate ſtructure.—The reſult was a plain diſcovery of the like inoſculations of the arteries and veins in the *omentum* of a cat.

George Frederic Francus, of Frankenau, a phyſician of Copenhagen, publiſhed in the year 1705, a learned and copious work, intituled, *Anaſtomaſis Reſtella*.

It is a queſtion among *anatomiſts*, whether the uterine arteries and veins *anaſtomoſe* with the veins and arteries of the fecundines. Mr. Alex. Monro holds the negative, and he thinks that ſeveral inconveniencies are avoided by the want of this *anaſtomoſis*. Med. Eſſ. Edinb. vol. ii. p. 133, &c.

ANASTOMATICS, or ANASTOMATIC *medicines*, are ſuch as have a faculty of opening and dilating the cavities of the veſſels: and by that means of making the blood circulate the more freely.

The word comes from *ανακτομοω*, *I unſtop*.

ANASTROUS *ſigns*, in *Aſtronomy*, an appellation given to the *duodecatimoria*, or the twelve portions of the ecliptic which the ſigns poſſeſſed anciently, but have deſerted by the preceſſion of the *equinox*.

ANASTROPHE, from *ava* and *ςρεφω*, *I turn*, in the *Ancient Military Art*, denotes the turn of a battalion to its former ſtation, after a turn or evolution either to the right or left.

The *anaſtrophe* ſtands oppoſed to the *epiſtrophe*.

ANASTROPHE alſo denotes a grammatical figure, whereby a prepoſition, which regularly ought to precede, is placed after its caſe, e. gr. *Saxa per et ſcopulos*.

ANASTROPHE, in *Rhetoric*, denotes a quaint inverſion of the order of the words in a ſentence, e. gr. *ut ſcire poſſis ad quos te expediat loqui*, for *quo ad expediat te loqui*.

ANATHEMA, from *ava* and *τιθημι*, *I lay up*, in *Antiquity*, denotes a preſent offered to ſome god, and hung up in his temple.

Making preſents to the gods was a cuſtom even from the earlieſt times, either to pacify them when angry, or to obtain ſome future benefit, or as a grateful acknowledgment of ſome paſt favour. They conſiſted of crowns and garlands, garments, cups of gold, and other valuable metals, and any other things which conduced to the ornament, or the enriching of the temples.

Theſe were commonly termed *αναθηματα*, and ſometimes *αναϑεματα*; from their being depoſited in the temple, where they ſometimes were laid on the floor, ſometimes hung upon the walls, doors, pillars, or the roof, or any other conſpicuous place. Sometimes the occaſion of the dedication was inſcribed either upon the thing itſelf, or when the matter of that could not bear an inſcription, upon a tablet hung up with it.

When any perſon left his employment, or way of life, it was cuſtomary to dedicate the inſtruments belonging to it, as a grateful commemoration of the divine favour and protection. Thus in an ancient Greek epigram we find a fiſherman makes a preſent of his nets to the Nymphs of the ſea. Shepherds hung up their pipe to Pan, or ſome of the country deities, as we find done by one in Tibullus. So Lais, decayed with age, dedicates her mirror to Venus. Pauſanias has left us a particular deſcription of the *anathemata*, in the Delphian temple, which was the richeſt of any in Greece.

The term *anathema* alſo occurs in a like ſenſe, applied to Chriſtian offerings.

The *anathemata* or ornaments of the ancient churches, are otherwiſe called in eccleſiaſtical writers *donaria*.

Such in particular were thoſe called *ευχτηριακα*, conſiſting of the votive tablets of the heathens. Alſo pictures, moſaics, inſcriptions, and at length images, ſtatues, crucifixes, &c.

Cebes's beautiful Tablature of Human Life, is ſaid, in the introduction to it, to have been among the *αναϑηματα*, in the temple of Saturn.

ANATHEMA, in an eccleſiaſtical ſenſe, denotes an EXCOMMUNICATION, attended with execrations and curſes. In this ſenſe, the word is uſually written in Greek *anathema*, to diſtinguiſh it from an offering to the gods, called *anathema*: though it is certain ſeveral of the Greek fathers do not obſerve this diſtinction; but uſe *anathema* indifferently for either.

There are two kinds of *anathemas*; the one *judiciary*, the other *abjuratory*.

The former can only be pronounced by a council, a pope, biſhop, or other qualified perſon; and differs from a ſimple excommunication in this, that an excommunication only prohibits the criminal from entering within the church, or from holding communion with the faithful; whereas an *anathema* cuts him off from the body, the ſociety, and even the commerce of the faithful, and delivers him over to the *Devil*.

The latter kind of *anathema* uſually makes a part of the ceremony of ABJURATION; the convert being obliged to *anathematize the hereſy* he abjures.

The critics and commentators are divided about the manner wherein St. Paul wiſhes to be *anathema* for his brethren. Romans, ch. ix. 3. See ACCURSED.

In ancient cenſures we meet with an extraordinary *formula*, called *maranatha*; and authors are divided concerning its import and uſe.

St. Chryſoſtom ſays it is a Hebrew word, ſignifying *the Lord is come*; and he particularly applies it to the confuſion of thoſe who ſtill abuſe the privilege of the Goſpel, notwithſtanding that the Lord was come among them.

St. Jerom says it was more a Syriac than an Hebrew word, though it had something in it of both languages, signifying *our Lord is come*. But he applies it against the perverseness of the Jews and others who denied the coming of Christ, making this the sense of the apostle; *if any man love not the Lord Jesus Christ, let him be anathema, the Lord is come.*

According to this sense, *maranatha* could not be any part of the form of *excommunication*, but only a reason for pronouncing the *anathema* against those who expressed their hatred against Christ, by denying his coming, either in words, as the Jews did who blasphemed him, and called Jesus *anathema* or accursed; or else by wicked works, as those who lived profanely under the name of Christians. Others of the ancients interpret the word of the future coming of Christ, particularly St. Austin, who says, *maranatha* is a Syriac word, signifying *the Lord will come*. And he particularly applies it against the Arians, who could not be said, as he unchristianly thought, to love the Lord, because they denied his divine nature. Dr. Hammond and others will have *anathema maranatha* to have answered to the third and highest degree of excommunication among the Jews, called *shammatha*.

Baldunus, Deutrohmannus, Durrius, Stewartius, and others, have written expressly concerning *anathemas*. Hen. Laberus, a German writer, has given an *Anathematologia*, or a discourse on the church curses. See a form of the *anathema* denounced against robbers in the middle ages, in Bouquet's Recueil des Hist. tom. x. p. 527. The English reader may see it in An. Regist. vol. xii an. 1769. p. 147.

ANATHEMATIZING, the act of pronouncing an *anathema*. In which sense it amounts to the same with *excommunicating*. The term is not only applied in speaking of persons, but of doctrines and opinions.

ANATHEMATISM denotes the same with *anathema*, or imprecation.

ANATHREPSIS, in *Medicine*, amounts to much the same with ANALEPSIS.

ANATICULA, a diminutive of *anas*, and used by the old Roman *authors*, as a term of fondness, to express the passion of love. There is another of the same kind from a different bird, *palumbula*.

My little duck my little dove, were the most endearing terms the lovers of those times could use; nor was this the custom of the Romans only, but the Greeks, as far back as Anstophanes, have it.

ANATIFERA *concha*, in *Natural History*, the name of a genus of shells, the characters of which are these; it is a shell-fish of the multivalve kind, being of a triangular figure, flat, and composed of five shells fastened to a long pedicle, and furnished with fourteen hairs. Of this genus of shell-fish, the cabinets of the curious afford us four species.

This genus of shells obtained this strange name from an erroneous opinion, that they produced ducks, or a species of wild-fowl of that kind, the name signifying a shell producing *ducks*.

ANATOCISM, ANATOCISMUS, an usurious contract, wherein the interest is arising from the principal sum are added to the principal itself, and interest exacted upon the whole.

The word is originally Greek, but used by Cicero in Latin; whence it is descended into most other languages. It comes from the preposition ανα, which in composition signifies *repetition* or *duplication*, and τοκος, *usury*.

Anatocism is what we properly call *interest upon interest*, or *compound interest*.

This is the worst kind of usury, and has been severely condemned by the Roman law, as well as by the common laws of most other countries.

ANATOMY, the art of dissecting, or artificially taking to pieces the solid parts of animal bodies; in order to an exact discovery of their structure and œconomy.

The word is ανατομη, q. d. *section* or *cutting*; formed of ανατεμνω, *I cut asunder*.

Anatomy makes a great branch of that division of medicine called *physiology*.

It is sometimes divided, with regard to its end, into *speculative* and *practical*; a division of very little moment.—It is also divided, with regard to its subject, into *human* and *comparative*.

ANATOMY, *comparative*, is that which considers brutes, and other animals, and even vegetables; chiefly with a view to illustrate the human structure.

There is some dispute among physicians and naturalists concerning the usefulness of comparative *anatomy*. On the one hand it is urged, that the parts less apparent in one animal, are found more distinct and conspicuous in another; so that the knowledge of the structure of the former, may be improved by analogy, from that of the latter. On the other hand it is objected, that the diversity is so great between one animal and another, according to the different manners of life they are intended for, that it is never safe concluding by mere analogy, from the structure of one to that of the other. Malpighi has been very large in the refutation of this objection.

ANATOMY, *human*, which is absolutely and properly denominated ANATOMY, is that employed on the human body; by some called also *anthropotomy*.

The subject of *anatomy*, viz. the body, is variously divided into parts, *organical*, and *inorganical*; *similar*, and *dissimilar*, *normal*, &c.

Its more obvious division is into *solids* and *fluids*, or into the containing and contained parts.

Under the solids come the bones, muscles, nerves, arteries, veins, cartilages, ligaments, membranes, &c.—Under the fluids come chyle, blood, milk, fat, lymph, &c. See each under its proper article.

But some divide *anatomy*, with regard to its objects, into OSTEOLOGY and SARCOLOGY.

The first treats of the bones and cartilages: the second is subdivided into *splanchnology*, which comprehends the history of the internal parts, and more particularly of the viscera; *myology*, or the doctrine of the muscles; and *angiology*, which treats of the vessels, viz. the nerves, arteries, veins, and lymphatic vessels.

Others divide *anatomy*, with regard to its objects, into that of living bodies, and that of dead carcases.

Herophilus and Erasistratus, we are told by Celsus, dissected living persons; condemned criminals were sent to the former by princes, on purpose that they might have an opportunity of seeing the parts in their natural state, before any alterations induced in them by diseases or death.

The bodies of persons who have suffered a violent death, among which those who have been hanged, or lost their lives by strangulation with a cord, are the most proper, and to be preferred before the rest. It is for that reason that Riolan rejects those dead carcases which have been suffocated in the water, as improper for *anatomy*; though Galen used most frequently to drown such of his living creatures, as he had chosen for his anatomical operations.

Anatomy is by others divided into *medicinal* and *physical*.

ANATOMY *physical*, *anatomia physica*, is that employed in enumerating and describing the several solid parts of the body, as bones, cartilages, membranes, muscles, tendons, nerves, ligaments, arteries, veins, lymphæducts, &c. describing their figure, situation, connection, &c.

ANATOMY, *medicinal*, *anatomia medica*, is that which, to the former inquiries, adds that of the office and use of the several parts, and their concern in health or diseases. Some give a particular species of this under the denomination of chirurgical *anatomy*.

Some considerable physicians have endeavoured to check a minute study of *anatomy*, as of no use in physic. It is in reality but a small part of the science, as it now stands, that falls under immediate consideration in the medicinal practice. It seems enough for a physician to know the number, situation, communication, and use of the parts, without losing time in a minute investigation of their intimate structure, not excepting the smallest fibres, of which they are composed.

Others again recommend an exact and curious knowledge of *anatomy*, which does not barely include the situation of one or other of the viscera, or the magnitude, colour, figure, and order of the internal parts, but is of very wide extent. For, *by* they, it is necessary to inspect, with all our curiosity, the peculiar structure of each part, which we see to be formed with the highest art and skill; to find out its use, what function it performs in the body, what connection it has with the other members, and to comprehend what influence it has, after a wonderful manner, on different and remote parts. Such a knowledge of *anatomy* they esteem as a most firm foundation, on which the whole body of medicine may securely rest. If this be removed, all rational explications in medicinal matters must fail, practice is in danger, and even *medicine* itself fails to ruin. The use of *anatomy*, in *surgery*, they add, is so undoubted, that none but such as are little versed in the *medicinal* art, will have the rashness to deny it.

Anatomy is not only of use in *medicine*, but also in *painting*, *designing*, *statuary*, &c. Leonardo da Vinci, and all the great masters, studied it with particular application. Titian took so much delight in it, that he designed the figures for Vesalius's *Anatomy*. M. de Piles, under the fictitious name of Tortebat, and the Rolli at Rome, have published books of *anatomy* particularly accommodated to this use. A translation of this has been given in England, under the title of *Anatomy* improved and illustrated, with regard to the Use thereof in Designing.

ANATOMY, *its history*.—With respect to the antiquity of *anatomy*, it seems scarcely possible, but that the slaughter of beasts for the use of man, casualties, murders, and the accidents

accidents of war, muſt have furniſhed mankind with a general knowledge of the ſtructure of the parts, in very early ages of the world. But it is not very certain at what period it began to be cultivated as a *ſcience*. This however muſt have been very early, eſpecially if we pay any regard to Manetho, the famous Egyptian writer, who, according to the report of Euſebius, relates that Athotis, an Egyptian king, wrote ſome treatiſes of *anatomy*. This king, if the Egyptian chronology was to be depended on, lived many ages before Adam. This, however falſe with reſpect to time, amounts to a ſort of proof of the antiquity of this *ſcience*. It is inferred that Solomon was no ſtranger to the ſtructure of the human body, from ſome paſſages in the twelfth chapter of the book of Eccleſiaſtes.

It is very certain however that before, or at leaſt in the days of Homer, *anatomy* was much cultivated; ſince this author appears to have had a competent knowledge of the parts, and to have been very well verſed in the enumeration of wounds, as the moderns call it, ſo as to give an accurate account of their effects in almoſt all the parts of the body.

But Hippocrates is the firſt author, at leaſt extant, who treated of *anatomy* ſcientifically. This writer, conſcious of his noble and exalted genius, publiſhed many *anatomical* obſervations, which, though diſjoined and ſcattered here and there in his works, yet make up an entire body of *anatomy*, when taken together: but that he made it his principal buſineſs to underſtand and explain the parts of the human body, is plain from thoſe valuable books upon Fractures, and the Joints, which evidently diſcover his perfect knowledge of, and intimate acquaintance with, the bones; and that his diligence, his induſtry, and ſkill in this way, might the more effectually be tranſmitted to future ages, he conſecrated, if we may believe Pauſanias, a brazen ſkeleton to the Delphian Apollo.

The writings of this great man are interſperſed with many things relating to the blood, which ſeem to ſhew ſome knowledge of the circulation, and alſo of the ſecretion of the various humours. Dr. Douglas has pointed out ſuch of them as ſeem to be the moſt glaring and unexceptionable proofs of this.

Galen, by general conſent of writers, is the prince of *anatomiſts*. By his early application, his unwearied aſſiduity, great ſagacity, and penetration of mind, as well as dexterity of hand, he not only carried the art infinitely beyond what had been done by thoſe before him, but even to that perfection wherein we find it at this day, ſharing only ſome few diſcoveries made by modern anatomiſts. In reality, many of the diſcoveries with which late writers plume themſelves, are due to him. Dr. Douglas enumerates ſeveral of the diſcoveries made by Galen in the ſtructure and uſe of the parts of the human body.

Anatomy ſuffered with the other *ſciences* by the invaſions of the Goths and Vandals, and at length ſunk into total barbariſm; from which it was reſtored in the fourteenth century by Mundinus, a Milaneſe, who compoſed an inſtrument of that art in the year 1315, which, notwithſtanding the barbarous ſtyle wherein they were written, remain ſtill in eſteem, and are the only ſyſtem now taught in ſome of the principal ſchools in Italy. The ſtatutes of the univerſity of Padua expreſly enjoin the profeſſors to follow the text of Mundinus in their lectures and expoſitions.

Some, with Fallopius, rather aſcribe the honour of the reſtoration of *anatomy* to Jac. Bercengarius, called alſo Carpus or Carpenſis, who lived two hundred years after Mundinus. He ſet out with commenting on that author, but afterwards wrote a much better book on the ſubject, of his own; in order to which he diſſected above one hundred bodies. Some have even charged him with the crime of Herophilus. It is alledged that he bore an implacable hatred to the Spaniards; and that, having got ſome of them into his cuſtody, he intended to have proceeded to diſſection, but his deſign being diſcovered, he was baniſhed. Others deny the charge, and give other reaſons for his exile.

The honour of reforming *anatomy*, and bringing it to its preſent perfection, is commonly aſcribed to Veſalius, whoſe inclination to this ſcience was ſo great, that, when a boy, he could not forbear diſſecting moles, dormice, cats, and the like. As he grew up, his paſſion increaſed; when bodies were wanting for ſkeletons, he would ſteal them from the gibbets; for which he was expelled Louvain, as he himſelf informs us. Bodies which he dug out of their graves, he would keep ſeveral weeks in his bed-chamber. He publiſhed his famous work on the ſtructure of the human body at twenty-eight years of age. He was chief phyſician to the emperor Charles V. and Philip II. of Spain; but growing weary of a court-life, he undertook a pilgrimage to Jeruſalem, and died in his return. The motive of this expedition is attributed to his opening the body of a young Spaniard of quality, ſuppoſing him dead, whereas, when he came to the heart, he found it ſtill beating. Others give a different account of his misfortunes.

The writers of *anatomy* may be divided into ſuch as either treat on the ſubject *profeſſedly*, or *occaſionally*.

Under the latter are comprehended *phyſicians*, *natural hiſtorians*, thoſe who treat of human nature, and of brutes. Among the *profeſſed* writers on *anatomy*, ſome treat of the whole ſubject, others only of a part.

The ancient writers in *anatomy*, Hippocrates, Democritus, Ariſtotle, Galen, and others, looked upon this as the moſt important part of phyſic, and that, without which the uſes of the parts of a human fabric, and conſequently the cauſes of diſeaſes incident to it, could no way be diſcovered. And yet this art, uſeful as it is, was entirely diſcontinued for ſeveral ages; till in the fifteenth century it began to flouriſh afreſh.—The diſſection of a human body was looked upon as ſacrilege before that time; and we have ſeen a conſultation which the emperor Charles V. appointed to be held by the divines of Salamanca, in order to be ſatisfied, whether or no it were lawful, in point of conſcience, to diſſect a dead carcaſe?—We may add, that to this day the uſe of *anatomy* and ſkeletons is forbid in Muſcovy: the firſt as inhuman, the latter as ſubſervient to witchcraft: and Olearius aſſures us, that one Quirin, a German ſurgeon, being found there with a ſkeleton, hardly eſcaped with life; and the ſkeleton, after being ſolemnly dragged about the ſtreets, was burnt in form. Boyle's Uſefulneſs of Philoſophy.

After Veſalius, a Flemiſh phyſician, who died in 1562, ſucceeded Carpus, Sylvius, Fernelius, Fallopius, Euſtachius, Fabricius, Parens, Bauhinus, Hoffman, Riolanus, &c.

Theſe were followed by others, to whom ſome of the fineſt diſcoveries in *anatomy* are owing.—Aſellius, in the year 1622, diſcovered the lacteal veins, though he modeſtly declines the honour of this *diſcovery*, and ſays they were known to Hippocrates, Praxiſtratus, and Galen; and in 1628, the immortal Harvey publiſhed his admirable diſcovery of the circulation of the blood.—Pecquet diſcovered the reſervoir of the chyle, and the thoracic duct, in 1651.—Rudbeck, a Swede, and Bartholine, a Dane, found out the lymphatic veſſels, in 1650, and 1651. Wharton, in 1655, diſcovered the lower ſalival ducts; and Steno the upper ſalival ducts, thoſe of the palate, the noſtrils, and eyes, in 1661. Wirſungus, in 1642, diſcovered the pancreatic duct.—Willis, who came after him, publiſhed an anatomy of the brain, and nerves, in a manner much more exact than had been done before him; yet he had omitted ſome conſiderable things, which were afterwards obſerved by Vieuſſens.—In ſhort, Gliſſon treated particularly of the liver; Wharton, of the glands; Havers, of the bones; Graaf, of the pancreatic juice, and the parts of generation; Lower, of the motion of the heart; Thurlton, of the reſpiration; Peyer, of the glands of the inteſtines; Brown, of nutrition, and Douglas, of the muſcles; and Drelincourt, of the conception of the ova in women, the placenta, and the membranes of the *fœtus*; Dryander, of the head; Hoffman and Rudius, of the uſe of the parts; Rufus, Epheſius, and Cumeratius, of the names of the parts; Galen, Cappivaccius, Hippolitus, Boſcus, and Lacuna, of the art of diſſecting; Horſtius, on the art of preſerving carcaſes; and Monro of *ofteology*, and *comparative anatomy*. Malpighi, who died in 1694, is one of thoſe to whom *anatomy* owes the moſt: he made a great number of diſcoveries in the lungs, brain, liver, ſpleen, glands, and lymphatics, by the help of the microſcope, &c. Nor muſt it be omitted, that Ruyſch, who died in 1727, has let great light into many of the finer and more intricate parts of the human frame, particularly the glands, by means of his injections.

An account of the later diſcoveries controverted between Monro, Hunter, and Hewſon, who all claim the merit of firſt making them, ſhall be given under the articles LYMPHATICS and LACTEALS. The reader may find a particular information about them, and the pretenſions of the different claimants, in Monro's Inaugural Diſſertation.

Among thoſe who treat of the whole ſubject of *anatomy*, Winſlow is moſt deſervedly eſteemed. This author's works have been tranſlated into Engliſh by Dr. George Douglas. We have alſo an excellent compendium of *anatomy* by Heiſter. The merits of Albinus's Tables, and of his writings, is well known; as is that of Mr. Cheſelden; ſo that after reading Heiſter, Winſlow, Monro, and Cheſelden, conſulting the Tables of Veſalius and Albinus, a ſtudent may, we believe, conſider other books rather curious than neceſſary.

Manget and Le Clerc, two phyſicians of Geneva, have given us a *Bibliotheca Anatomica*, containing all the new diſco-

discoveries that have been made in this art, but with many miſtakes, the detecting of which has been undertaken by Morgagni, who has publiſhed ſeveral volumes with that view, under the title of *Adverſaria Anatomica*.

ANATOMY is alſo uſed for an artificial repreſentation of the ſtructure and parts of the human body in metal, plaiſter, wax, or the like.—In this ſenſe, we ſay, the wax-work *anatomy*. R. Dickenſon, Eſquire, ſtuffed an human *anatomy* in plaiſter of Paris, repreſenting a man ſtanding upright, with his ſkin flayed off.

There is likewiſe a wax-work *anatomy*, ſaid to have been invented by Gaetano Giulio Zumbo, a Sicilian of Syracuſe. Yet M. des Noues, who learnt it of him, and probably made ſome improvements in it, bringing it to Paris, arrogated the chief honour of it to himſelf. Some prefer before all the reſt, for public lectures and courſes, the uſe of real parts of dead bodies, prepared by injection. *Anatomical* injections are either of mercury, or mixtures of equal parts of bitumith, lead, and tin. Neumann. The inconveniencies that attend the diſſecting of dead carcaſes, have occaſioned the invention of another elean-lier and more durable kind of ſubjects. Reiſeiſius contrived a human ſtatue, wherein the circulation of the blood was repreſented to the ſight, and ſomething of the like kind was ſhewn by M. Chovet; and more lately ſtill by Madam Bacheroo, who has brought this art to great perfection. See her obſervations on the artificial *anatomy*, in the Memoirs of the Acad. des Scienc. an. 1759. Hiſt. 94.

ANATOMY is ſometimes uſed to denote the ſubject to be anatomized. Thus (by 32 H. VIII. cap. 22.) the company of barbers and ſurgeons may have and take yearly four perſons condemned, adjudged, and put to death for felony, for *anatomies*; and to make inciſion of the ſame dead bodies.

And by 25 Geo. II. cap. 37. the bodies of felons convicted of murder, in the county of Middleſex, or city of London, are, after execution, to be delivered to the hall of the ſurgeons' company, to be diſſected and anatomized; and in caſe ſuch conviction and execution ſhall happen to be in any other county, or places, in Great Britain, then the body of ſuch murderer ſhall be delivered by the ſheriff, &c. to ſuch ſurgeon as the judge ſhall direct.

ANATOMY is alſo uſed, in an improper ſenſe, for the ANALYSIS of mixt bodies.

In this ſenſe the chemiſts ſometimes call their art *ſpagyrical anatomy*, *anatomia ſpagyrica*.

In which ſenſe we ſometimes ſay the *anatomy* of vitriol, the *anatomy* of ſulphur, the *anatomy* of Rhenith wine, &c.

ANATOMY is alſo uſed, in a leſs proper ſenſe, to denote the art of reſolving compound bodies into ſimple ones.

In this ſenſe any kind of compound body may be conſidered as the object of *anatomy*; that is, any body wherein there are divers parts joined together; even the taking aſunder an artificial, political, or moral being, may, in this ſenſe, come under *anatomy*.

ANATOMY is alſo uſed, *figuratively*, for an exact ſearch or examination of the parts of a diſcourſe, buſineſs, or the like: in which ſenſe we ſay the *anatomy* of a book, a doctrine, or the like.

ANATOMY *of plants* may be conſidered as a branch of comparative *anatomy*, otherwiſe called *phytotomy*.

The parts of PLANTS which come under anatomical conſideration are, the root, wood, bark, pith, fruit, leaves, flowers, &c.

The *anatomy* of vegetables is chiefly owing to the induſtry of Malpighi, and Dr. Grew, though conſiderably promoted alſo by Ruyſch, who by a peculiar method of injection has produced divers ſkeletons or ſyſtems of veſſels of fruit, leaves, and the like. Something of the ſame kind has alſo been done by Thummigius.

Some pretend to make F. Fabri the father of this *ſcience*; and allege that Malpighi took many of his diſcoveries from him. Dr. Highmore in his book of Generation, Dr. Sharrock on the propagation of plants, and Dr. Hook in his *Micrographia*, have alſo given ſome obſervations tending this way, though only collaterally.

ANATRIPSIS, from ἀνὰ and τρῖβω, *I tear*, in the *Ancient Medicine*, denotes friction.

The word is ſometimes alſo written ſimply TRIPSIS.

ANATRON, or NATRON, a kind of native ſalt-petre, or nitre, found in Egypt. It is of a cineritious colour, and bitter taſte, approaching to ſal ammoniac.

It is the produce of a hoge lake, on the ſurface of which it is gathered, in form of a ſcum.

ANATRON is alſo uſed for the ſalt and ſcum of the compoſition of glaſs, when in fuſion.

When pounded it yields a kind of powder; which being diſſolved in the air, or in a proper liquor, becomes common ſalt, after congelation.

The *anatron* ſkimmed from glaſs fuſion is the ſame with what others call *ſal vitri*, or *gall of glaſs*.

ANATRON is likewiſe the name of a nitrous juice, which condenſes in vaults, arches, and other ſubterraneous places.

ANATRON is alſo uſed by ſome writers, for a compound ſalt, made of quicklime, alum, vitriol, common ſalt, and nitre; uſed as a flux to promote the fuſion and purification of metals.

ANATRON, laſtly, is uſed for the TERRA *Saxonica*; of which there are ſeveral kinds, black, red, and blue.

ANATROPE, ἀνατροπὴ, from ἀνατρέπω, *to ſubvert*; a ſubverſion literally, or relaxation of the ſtomach, attended with the loſs of appetite, vomiting, and nauſea.

ANAUDIA, among *Naturaliſts*, denotes dumbneſs, or a want of the uſe of ſpeech.

Anaudia is, by ſome, made to differ from *aphonia*, as the former is owing to a defect of the nerves of the tongue, the latter to that of the nerves of the *larynx*.

Infants and mutes are *anaudi*, *aphoni*, not *aphoni*, *aphones*.

ANAVINGA, in *Botany*, a tree of middle ſize, that grows in Malabar, in the Eaſt Indies, eſpecially about Cochin. It is an evergreen, and its fruits or berries are ripe in Auguſt.

The juice of the berries drunk, excites ſweat, cures malignant diſtempers, and keeps the body ſoluble. A decoction of the leaves in water makes a fit bath for ſuch as are afflicted with pains in the joints.

ANAUMACHION, from ἀ, *non*, *ſhip*, and μάχομαι, *I fight*, in *Antiquity*, the crime of refuſing to ſerve in the fleet. The puniſhment aſſigned for this offence was infamy.

ANAX, in *Ancient Writers*, denotes a hero, or a god.

The word ſeems formed of the Hebrew *anakim*, or *enacim*, which ſignifies the ſame.

Some will have it originally to import giants, called alſo *terrigenæ*, *earth-born*. Cicero aſſures us, that the three eldeſt ſons of Jupiter, called *Dactyli*, were alſo denominated *anaces*.

ANAXAGORIA, in *Antiquity*, a feſtival obſerved in honour of Anaxagoras.

The occaſion of its being inſtituted was this: Anaxagoras dying at Lampſacus, the magiſtrates of that city aſked him, whether he deſired any thing to be done for him? He replied, that on the anniverſary of his death the boys ſhould have leave to play.

ANAXIMANDRIANS, a name given by ſome writers to the followers of Anaximander. Theſe are otherwiſe denominated *hylopathi*; and ſtand oppoſed to the *atomiſts*.

The *Anaximandrians* make the moſt ancient ſect of *philoſophical atheiſts*; they allow of nothing in nature but bodies. Theſe bodies, they aſſert, admit of qualities which produce and deſtroy each other, in a circle without beginning or end.

ANBERTKEND, in the *Eaſtern Languages*, a celebrated book of the Brachmans, wherein the Indian *philoſophy* and *religion* are contained.

The word in its literal ſenſe denotes the ciſtern, wherein is the water of life.

The *anbertkend* is divided into fifty *baths*, or diſcourſes, each of which conſiſts of ten chapters.

It has been tranſlated from the original Indian into Arabic, under the title of *Morat el Moumi*, q. d. *the marrow of intelligence*.

ANBLATUM, in *Botany*. See APHYLLON.

It is alſo named by Linnæus LATHRÆA, &c.

ANBURY, in *Farriery*. See AMBURY.

ANCA, in *Middle Age Writers*, denotes the thigh or hind-leg.

In which ſenſe, the word is alſo written ANCUS.

ANCESTORS, *progenitori*, are thoſe from whom a perſon is deſcended; excluſive of his immediate parents.

The word is derived from the Latin *anceſſor*, written, by contraction, *for anteceſſor*, q. d. *goer before*.

Moſt nations have paid honours to their *anceſtors*.

It was properly the departed ſouls of their fore-fathers that the Romans worſhipped under the denominations of *lares*, *lemures*, and houſhold gods.

Hence the ancient tombs were a kind of temples, or rather altars, wherein oblations were made by the kindred of the deceaſed.

The Ruſſians have ſtill their anniverſary feaſts in memory of their *anceſtors*, which they call *radituli ſobot*, q. d. *himſelf's ſabbath*, wherein they make formal viſits to the dead in their graves, and carry them proviſions, eatables, and preſents of divers other kinds. They interrogate them, with loud lamentable cries, What they are doing? how they ſpend their time? what it is they want? and the like.

The Quojas, a people of Africa, offer ſacrifices of rice and wine to their *anceſtors*, before ever they undertake any conſiderable action. The anniverſaries of their deaths are always kept by their families with great ſolemnity. The king invokes the ſoul of his father and mother to make trade flouriſh, and the chace ſucceed.

The Chineſe ſeem to have diſtinguiſhed themſelves above all

all other nations in the veneration they bear their *ancestors*. By the laws of Confucius, part of the duty which children owe their parents, consists in worshipping them when dead. This service, which makes a considerable part of the natural religion of the Chinese, is said to have been instituted by the emperor Kaie, the fifth in order from the foundation of that ancient empire.

The Chinese have both a solemn and ordinary worship which they pay their *ancestors*. The former is held regularly twice a year, viz. in spring and autumn, with much pomp. A person who was present at it gives the following account of the ceremonies on that occasion.

The functions were made in a chapel well adorned, where there were six altars furnished with censers, tapers, and flowers. There were three ministers, and behind them two young acolytes; he that officiated was an aged man, and a new Christian. The three former went within a profound distance, and frequent genuflexions towards the five altars, pouring out wine: afterwards they drew near the fifth, and when they came to the foot of the altar, half bowed down, they said their prayers with a low voice. That being finished, the three ministers went to the altar, the priest took up a vessel full of wine, and drank; then he lifted up the heart of a deer or goat; after which taking fire from the altar, they lighted a bit of paper, and the minister of the ceremonies turning towards the people, said with a high voice, that he gave them thanks in the name of their *ancestors* for having so well honoured them; and in recompence he promised them, on their part, a plentiful harvest, a fruitful issue, good health and long life, and all those advantages that are most pleasing to men.

All the Chinese, pagans as well as Christians, give their *ancestors* another simpler and more private worship. To this end they have in their houses a nich or hollow place, where they put the names of their deceased fathers, and make prayers and offerings of perfumes and spices to them at certain times, with bowing, &c. They do the like at their tombs.

It has been a question warmly agitated of late years, whether the worship which the Chinese pay their *ancestors* be religious, or only of a civil nature. The Jesuits, who not only allow their neophytes, or new converts, to join in it, but even assist in it themselves, are necessitated to maintain the latter, to screen themselves from the charge of idolatry; the Dominicans, and other missionaries, maintain the former, and prohibit the service as absolutely unlawful.

The Jesuits argue, that with relation to the first institution, those honours might be given to our *ancestors*, since at first they appear to have been only civil; even though they should since, through the superstitious disposition of the people, have degenerated into idolatry. But it is answered, that by this argument the most gross worship of idols might be authorised, because all idolatry appears at first only to have been civil worship, as is maintained in the book of *Wisdom*, chap. xiv. ver. 15.

The Jews settled in China are said to worship their *ancestors* like the heathens, and with the same ceremonies, except that they offer not swine's flesh. Near their synagogue they have a hall, or court of *ancestors*, wherein are niches for Abraham, Isaac, &c.—The Jesuits also conformed, and were permitted by their general to conform to this, and many other superstitious usages of the Chinese. See the proof of this in Patchal's Provincial Letters, *passim*.

There is one peculiarity of another kind, wherein the Chinese shew their regard for their *ancestors*; in proportion as any of their descendants are preferred to a higher degree of dignity, their dead *ancestors* are at the same time preferred and ennobled with them. The kings Ven, Vou, Vou, Vang, Cheng, and Cum, who were descended from vassal kings, when they mounted the imperial throne, raised their *ancestors* from the vassal or depending state wherein these had lived, to the dignity of emperors; so that the same honours were for the future rendered them as if they had been emperors of China. The same example was followed by the subsequent kings, and now obtains among the grandees and literati; all now worship their *ancestors*, according to the rank which they themselves hold in the world. If the son be a mandarin, and the father only a doctor, the latter is buried as a doctor, but sacrificed to as a mandarin. The like holds in degradations, where the condition of the fathers is that of their sons.

The law distinguishes between *ancestor*, and *predecessor*: the former being applied to a natural person, as such an one, and his *ancestor*; and the latter to a body politic or corporate, as a bishop, and his *predecessors*.

ANCESTOR, *disability by the act of*. See DISABILITY.

ANCESTREL, in *Law*, something relating to a man's ancestors.—Thus,

ANCESTRAL *homage*, signifies homage that hath been done or performed by one's ancestors.

ANCESTRAL, *action*. See ACTION.

ANCHILOPS, in *Medicine*, denotes an abscess, or collection of matter between the great angle of the eye, and the nose.

The same abscess when broken is no longer denominated *anchilops*, but ÆGILOPS.

Strictly speaking, the *anchilops* is only a tumor not yet exulcerated; not is the tumor always within the *great lacrymale*, but sometimes only near it.

If the *anchilops* be suffered to remain too long, or be unskilfully managed, it degenerates, the stagnating humours corrupt, and an ulcer is produced.

It makes a species, or rather a degree, of the FISTULA *lacrymalis*.

Care must be had to examine strictly, whether the abscess opens into the lacrymal bag, or whether it be only superficial, between the skin and the orbicular muscle. In the latter case, there is no occasion to fear its changing to a *fistula*, if the matter be not lodged between the bag and the muscle.

When the tumor is broke, and the tears flow involuntarily, whilst the *os lacrymale* is not carious, it is an *egagropyle*; but when the ulcer is of a long standing, deep, fetid, and the *os lacrymale* becomes carious, it is a FISTULA.

The *anchilops* is sometimes attended with an inflammation, and then resembles a PHLEGMON; but when not inflamed, it approaches nearer to those tumors called *atheromata*, *steatomata*, and *meliceridæ*.

Its cure is by cutting and caution; tying it at the root on the *glandula lacrymalis*, and, when ready, cutting it off.

ANCHIROMAGUS, in *Middle Age Writers*, denotes a kind of vessel, which, on account of its middle sailing, was used for the conveyance of anchors, and other necessary utensils of ships.

In this sense, the word is also written *anceromagus*, *anceiromachus*, *ancyromani*, *angromagus*, *anguromagus*, and *anguromagus*.

ANCHOR, ANCHORA, an instrument used at sea, and in rivers, to retain and fasten a vessel by.

The word comes from the Latin *uncus*, or *uncinus*, of the Greek ἄγκυρα, which comes from ἀγκος, *incurvus*, *crooked*.

An *anchor* is a large, strong piece of iron, crooked at one end, and formed into two barbs, resembling a double hook; and fastened at the other end by a cable.

The goodness of the *anchor* is a point of great importance; the safety and conservation of the vessel depending principally upon it.—Great care is to be taken, that the metal it is made of be neither too soft, nor too brittle: the latter rendering it liable to break, and the former to straiten.

ANCHORS, *method of making*. The shank, arms, and flukes, are first forged separately: then the hole is made at one end of the shank for the ring, which being also previously forged, is put into the hole of the shank, and the two ends shut together. After which the arms are shut to the shank, one after the other, and the *anchor* is finished.

Proof is made of *anchors*, by raising them to a great height, and then letting them fall again on a kind of long block placed across for the purpose.—To try whether the flukes will turn to the bottom, and take hold of the ground, they place the *anchor* on an even surface, with the end of one of the flukes, and one of the ends of the shank resting on the surface; in case the *anchor* turns, and the point of the fluke rises upwards, the *anchor* is good.

Travellers tell us of people in the Indies who make use of wooden *anchors* in their navigation.—The inhabitants of the island of Ceylon, in lieu of *anchors*, use huge round stones; and, in other places, their *anchors* are a kind of machines of wood, loaden with stones. Sometimes bags of sand have been made use of, but these chiefly obtain in rocky places, where *anchors* would not take hold.

In England, France, and Holland, *anchors* are made of forged iron; but in Spain they are sometimes made of copper, and likewise in several parts of the South Sea.

The parts of an *anchor* are, 1. The *ring*, into which the cable is fastened. 2. The *arm*, or *shank*, which is the longest part of the *anchor*. 3. The *arms*, which is that which runs down into the ground: at the end of which is, 4. The *flukes*, or *flues*, by some called the *paws*; being that broad and picked part, with its barbs, like an arrow-head, which fastens into the ground. 5. The *stock*, a piece of wood fastened to the beam, near the ring, serving to guide the flukes, so that it may fall right, and fix in the ground.

The first *anchors* of iron had only a fluke on one side.

The contrivance was completed by Eupalinus, who made them fluked both ways; though some ascribe the honour of this to Anacharsis the Scythian.

All *anchors* have now two arms; not but they might still be used with only one arm, which structure would have this advantage, that they would be lighter, and yet in fine weather would hold equally firm with the double kind. The reason of having two arms is, that the *anchor* may always take, in order to which it is necessary that it be very heavy; besides, that *anchors* with a single arm would require more preparation for service.

For the proportions of *anchors* according to Manwaring, the shank is to be thrice the length of one of the flukes, and half the length of the beam. According to Aubin, the length of the *anchor* is to be four-sevenths of the greatest breadth of the ship; to that the shank; so are of an *anchor* in a vessel three feet wide is to be twelve feet long. When the shank is, for instance, eight feet long, the two arms are to be seven feet long, measuring them according to their curvity. As to the degree of curvity given the arms, there is no rule for it; the workmen are here left to their own discretion.

Aubin, in his Marine Dictionary, gives a table from a Flemish writer, wherein the lengths of the shanks of *anchors*, for vessels of all widths, is computed, as well as the weights of the *anchors* from a vessel eight feet wide within, which requires an *anchor* 3½ feet long, weighing thirty-three pounds; to a vessel forty-five feet wide, which demands an *anchor* eighteen feet long, and weighing 5832 pounds.

He likewise observes, that the *anchor* of a large heavy vessel is smaller, in proportion, than that of a lesser and lighter one. The reason he gives is, that though the sea employs an equal force against a small vessel as against a great one, supposing the extent of wood upon which the water acts to be equal in both, yet the little vessel, by reason of its superior lightness, does not make so much resistance as the greater; the defect whereof must be supplied by the weight of the *anchor*.

From these and other hydrostatic principles, the following table has been formed; wherein is shewn, by means of the ship's breadth within, how many feet the beam or shank ought to be long, giving it ⅓ or ½ of the ship's breadth within; by which proportion may be regulated the length of the other parts of the *anchor*. In this table is represented likewise the weight an *anchor* ought to be for a ship from 8 feet broad to 45, increasing by 1 foot's breadth; supposing that all *anchors* are similar, or that their weights are as the cubes of the lengths of the shanks.

Feet.	Feet.	Pounds
8	3⅓	33
9	3¾	48
10	4	64
11	4⅓	84
12	4½	110

Breadth of the Vessel. Length of the Anchor. Weight.

N. Bouguer directs to take the length of the shank in inches, and to divide the cube of it by 180 for the weight. The reason is obvious; because the moment of the cube of 201 inches, which is the length of an *anchor* weighing 1000lb. divided by the weight is 1180, and therefore by the rule of three, this will be a common divisor for the cube of any length, and a single operation will suffice.

M. Bouguer, in his *Traité de Navire*, gives the following dimensions of the several parts of an *anchor*. The two arms generally form the arch of a circle, whose centre is three eighths of the shank from the vertex, or point where it is fixed, to the shank; and each arm is equal to the same length of the radius; so that the two arms together make an arch of 120 degrees: the flukes are half the length of the arms, and their breadth two fifths of the fluke length. With respect to the thickness, the circumference at the throat, or vertex of the shank, is generally made about the fifth part of its length, and the small end two thirds of the throat; the small end of the arms of the flukes, three fourths of the circumference of the shank at the throat. These dimensions should be larger, when the iron is of a bad quality, especially if cast iron is used instead of forged iron.

Vessels that sail on rivers have at least one *anchor*; those which sail in the canals of Zealand, have two *anchors*; but those which go to sea have always three, four, or more.

There are three kinds of *anchors* commonly used, the *lesser*, the *greater*, and the *stream-anchor*.

The distinctions of *anchors* are taken from their use, and the proportion they bear in the ship, where they are employed; for that which in one ship would be called but a *lesser*, or *bower*-ANCHOR, in a lesser would be a *sheet*-ANCHOR.

ANCHOR, *lesser*, is the smallest, which, by reason of its slightness, is first to stop the ship in *looking* a river.

This is what the Dutch sailors call *sterp*-ANCHOR, the French *un petit ancre*. It ought to weigh 250 pounds.

The *grapnel* is an *anchor* for a small ship or boat.

ANCHOR, *stream*, is a small *anchor* fastened to a stream-cable, wherewith to ride in rivers, and gentle streams, and to stop a tide without in fair weather.

ANCHOR, *sheet* or *sheet*, is the biggest and strongest, being that which the seamen call their last hope, never to be used but in great extremity.

This is what the Romans call *anchora sacra*; the Dutch *sheep-anker*, and *stop-anker*; the French *maistresse-ancre*, or *grande-ancre*.

The other *anchors* are called by the name of the first, second, and third *anchor*; by any of which the ship may ride in any seasonable weather, sea-gate, or tide.— These are something bigger one than another, and usually when they sail in any freighters, or are near a port, they carry two of these at the bow, in which respect they are also called by the name of first and second bowers.

ANCHOR, *second*, called by the Dutch *boey-anker*, or *danger-fast anker*, is that ordinarily made use of.

ANCHOR, *creuk*, called by the Dutch *cruy-anker*, or *cruy-under*, and by the French *ancre d'affourche*, is a middling *anchor* thrown across or opposite to another.—This ought to weigh 1500 pounds, or near as much as the second *anchor*.

ANCHOR, *riding at*, in the *Sea Language*, the state of a vessel moored and fixed by her *anchors* at some proper Station.

Where a great number of vessels are moored in the same port, care is to be taken by the pilots, or those who have the command, that each ship be at a due distance from the rest, to prevent their running foul of each other: also that they be neither too near, nor too far from land. The proper space betwixt vessels is, from two to three cables length.

ANCHOR, *stopping*, or *let fall the*, otherwise called *casting anchor*, is quite the letting it down into the sea.

In some cases it is necessary to drop two *anchors* opposite to each other, one of them to keep the ship firm against the tide, or flow, the other against the ebb.

ANCHOR, *weighing*, imports the act of withdrawing, or recovering the *anchor* into the vessel, in order for sailing. The *anchor* is ordinarily weighed, or recovered, by means of a CAPSTAN, or WINDLASS.

ANCHOR, *dragging*, is when the *anchor* gives way, or loses its hold in the ground by the force of the wind, or sea, and the vessel drives from the place.

ANCHOR, *clearing the*, signifies the getting the cable off the fluke.

Generally also, when they let fall the *anchor*, they use this term, to see that the buoy-rope, nor any other ropes, hang about it.

ANCHOR, *fishing*, or *bringing home the*, denotes the weighing it in the bow, and bringing it aboard the ship.

The *anchor* is said to come home, when the ship drives away with the tide or sea.—This may happen either because the *anchor* is too small for the burden of the ship, or because the ground is soft, and ozzy; in such places flooring is used.

ANCHOR, *flooring the*, denotes putting boards on the flukes, in the form of flukes themselves, to make it broader than before,

before, used when they are obliged to *anchor* in bad ground, to prevent the ship from driving.

This is what the French mariners call *broder l'ancre*, and the Dutch *t'anker leckadee*.

In some cases, they have been known to fallow the *anchors*, where the ground being soft, the ordinary would not hinder them from coming home. Mauwaring saw an instance of fallowing the anchor in Porto Farein by Tunis.

The reason of the advantage is hard to assign; he supposes it to be that the fallow sinks deeper into the ooze, and finds some harder ground at the bottom, than the other.

Other terms and words of command relating to the *anchor* are, *the anchor is a pike*, that is, when heaving up the *anchor*, the cable is right perpendicular between the hawse and the *anchor*: *the anchor is cock-bill*, when the *anchor* hangs right down by the ship's side: this word is given by the mariners, when they are ready to bring the ship to an *anchor*: *the anchor is foul*, that is when the cable by the turning of the ship, is hitched, or got about the fluke; which will not only cut the cable asunder, but hinder the *anchor* from holding.

On this account, when they come to an *anchor* where there is a tide, they lay out two *anchors*, by which means, on the turning of the tide, the ship winds up clear of either.

ANCHOR, in *Architecture* and *Sculpture*, denotes an ornament in form of an *anchor*, or *arrow's* head, frequently carved on the ovolo of the capital, in the Tuscan and Ionic orders, as well as in the bed-moulding of Ionic and Corinthian cornices.—See *Tab. Archit. fig.* 10.

The *anchors* are usually mixed with representations of eggs; whence the *echinus*, or ovolo itself, is popularly called *eggs* and *anchors*.

ANCHOR, *ancora*, in *Literary Matters*, the figure of an *anchor*, represented in ancient books; which is of two kinds, *superior* and *inferior*. The *superior*, &c. is where the crooked part is uppermost, used to denote a thing or passage strongly expressed.

The *inferior* is where the crooked part is at the bottom, to denote a thing poorly or meanly set forth.

ANCHOR is also used in a less proper sense for any thing that holds another thing fast, or prevents its driving.

In this sense, sea-muscles are said to *vive at anchor*, by a sort of threads, the thickness of a large hair, which they emit out of the body, to the number sometimes of a hundred and fifty, which fastening to the stones and other adjacent bodies, keep them firm in their place.—The same is done by the PINNA *marina*.

ANCHOR, in *Heraldry*, is the emblem of Hope; and is taken for such in a *spiritual*, as well as in a *temporal* sense.

ANCHOR, a measure. See ANKER.

ANCHORAGE, ground fit to hold a ship's *anchor*, so that she may ride safely.

The best ground for a ship to anchor in is stiff clay, or hard sand; and the best *riding* at anchor is when a ship is sand-locked, and out of the tide.

ANCHORAGE, in *Law*, denotes a duty taken of ships for the pool of the haven where they cast anchor.

The ground in all ports and havens being the king's, no man can let an anchor fall in any port, without paying for it to the king's officer appointed by patent.

ANCHORED, or ANCRED, in *Heraldry*.—A cross *anchored*, or *ancred*, is a form of cross, so called, because the four extremities resemble the fluke of an anchor.

This cross is so like the CROSS *moline*, that the resemblance has occasioned many mistakes in heraldry.

ANCHOVY, in *Matters of Commerce*, &c. a little sea-fish, much used by way of sauce, or seasoning.

The word is derived from the Spanish *anchoras*, or rather from the Italian *anchioe*, which signifies the same.

Scaliger describes the *anchovy* as of the herring kind, about the length of a finger, having a pointed snout, a wide mouth, and no teeth, but gums as rough as a saw.—Others make it a sort of sardine, or pilchard: but others with better reason, hold it a peculiar species, very different from either.

The *anchovy* is caught in the months of May, June, and July, on the coasts of Catalonia, Provence, &c. at which season, it constantly returns up the straights of Gibraltar, into the Mediterranean. Collins says, they are also found in plenty on the western coasts of England and Wales.

The fishing for them is chiefly in the night-time: when a fight being put on the stern of their little fishing vessels, the *anchovies* flock round, and are caught in the nets. But then it is asserted to have been found by experience, that *anchovies* taken thus by fire, are neither so good, so firm, nor so proper for keeping, as those which are taken without fire.

When the fishery is over, they cut off the heads, take out their gall and guts; and then lay them in barrels, and salt them.—The common way of eating *anchovies* is with oil, vinegar, &c. in order to which they are first boned, and the tails, fins, &c. flipped off.—Being put on the fire, they diffolve almoft in any liquor. Or they are made into fauce by mincing them with pepper, &c.

Some alfo pickle *anchovies* in fmall caflk, or earthen pots, made on purpofe, of two or three pounds weight, more or leff, which they cover with plaifter, to keep them the better. *Anchovies* fhould be chofen fmall, freih pickled, white on the outfide, and red within. They muft have a round back; for thofe which are flat or large, are often nothing but fardines. Befide thefe qualities, the pickle, on opening the pots or barrels, muft be of a good tafte, and not have loft its flavour.

ANCHUSA, in *Botany*, called alfo *bugloffe* and *alkanet*, a plant of the *pentandria monogynia* clafs, of which the characters are: the flower is of one leaf, having a cylindrical tube, at the brim it is cut into five obtufe fegments, which fpread open; the germen afterwards becomes four oblong, blunt feeds, fhut up in the empalement.

It grows with us only in gardens, and flowers in June. The roots only are ufed. Parkinfon highly commends the infufion of the bark in *petitoeum*, as excellent in freih cuts and green wounds. At prefent it is very little ufed.

The common *alkanet*, *anchufa* offic. is brought from Languedoc and Provence; being the root of the *bugloffum radice rubra, fore anchufa vulgatiori*. The root is aftringent, and proper in hæmorrhages of all kinds; it is employed to colour ointments, &c. It muft be boiled in oil; for it does not readily communicate its tincture to water. The ancients ufed it as a cofmetic. See its hiftory, as a colouring drug, in Neumann's Works, p. 329.

ANCHYLOBLEPHARON, in *Surgery*, a diftemperature of the eye-*lids*, wherein they fometimes adhere to each other, and fometimes to the globe of the eye itfelf. This is eafily diftinguifhable from the flight glewing up of the eye-lids occafioned by the fmall pox, or other like caufes. This diforder is fometimes brought with an infant into the world; fometimes it comes upon adults by a fleihy excreicence from the angles of the eyes; and fometimes it happens from accidents, as blowing up of gun-powder, and the like. This is always dangerous, and difficult of cure, but moft fo when the eye-lids grow to the *cornea*. They are to be divided by a blunt pointed pair of fciffars, and when feparated from each other, it muft be tried whether they adhere to the eye; if they do, they muft be feparated with great caution with a blunt pointed fcalpel; but there is, in this cafe, great danger of injuring the fight: when feparated, they muft be kept from touching one another, to prevent their cohering again, by lint or a plate of lead.

ANCHYLOPS, in *Medicine*. See ANCHILOPS.

ANCHYLOSIS, ANCYLE, or ANCYLOSIS, in *Phyfic*, is when a juncture or articulation becomes immoveable.

The word is derived from αγκυλος, a *bending* or *contraction* of the joint.

Anchyloſis bears an affinity to contractures, fhrinkings, or witherings of the parts.

This fymptom fometimes happens in fractures near the joints, where the nutritious juice oozes into the cavities thereof.

This difeafe, when once formed, is incurable, but while yet freih, is fometimes removed by motion, friction, and the ufe of efficacious medicines.

ANCI, in Greek, αγκωνοιοι, *wrift-bones*, from αγκων, a *wrift*, and ουον, an *egg*. So Hippocrates calls thofe, who, from ſlipping the head of the *os humeri* into the *ala*, have an arm fhorter and fmaller than it ought to be, and the fulnefs or elbow of a *wrift*; whence they are called by fome *mufculani*, which fully expreſſes the Greek word, or barely *anci*. The diforder that gives occafion for the name, happens either in the womb, where the *os humeri* fuffers a luxation, from too much moifture; or in tender years by means of an abfcefs deeply ſeated about the head of the *os humeri*.

ANCIENT, or ANTIENT, in its uſual ſenſe, denotes a thing which exiſted in times long ago.

The word comes from the French *antien*, of the Italian *ancoano*, and that of the Latin *antiquus*, which denotes the ſame.

In which ſenſe *ancient* ſtands oppoſite to *modern*.

Ancient differs from *antique* as the *genus* from its *ſpecies*.

We ſay *ancient* nations, *ancient* architecture, ſculpture, philoſophy, &c. *ancient* manner, ceremonies, poets, phyſicians, and the like.

ANCIENTS, in *Scotiſh Deſcipline*. See ELDERS.

ANCIENTS, in *Inns of Court*, imports a diſtinction of a certain degree.—Thus, the ſociety of Gray's-Inn conſiſts of *benchers*, *ancients*, *barriſters* and *ſtudents* under the bar: here the *ancients* are the elder barriſters.

In the inns of Chancery there are only *ancients*, and ſtudents, or clerks; and among the *ancients*, one is yearly the principal, or treaſurer.—In the Middle Temple,

ancients are such as have gone through, or are past their reading.

ANCIENT, is sometimes also used in a military sense, for the colours, or an ENSIGN.

ANCIENT, in the *Naval Armament*, is the FLAG or streamer, borne in the stern of a ship.

ANCIENT *demesne*, or *demain*, in *Law*, is a TENURE, whereby all manors belonging to the crown in William the Conqueror's and Sir Edward's time were held.

The number, names, &c. thereof, were entered by the Conqueror, in a book called *Domesday Book*, yet remaining in the Exchequer; so that such lands as by that book appeared to have belonged to the crown at that time are called *ancient demesne*.

The tenants in *ancient demesne* are of two sorts; one who hold their lands frankly by charter; the other by copy of court-roll, or by the verge, at the will of the lord, according to the custom of the manor.

The advantages of this tenure are, 1. That tenants, holding by charter, cannot be rightfully impleaded out of their manor; and, when they are, they may plead the writ, by pleading the tenure. 2. They are free from toll for all things relating to their livelihood, and husbandry; nor can be impanelled on any inquest.

These tenants held originally by plowing the king's land, plashing his hedges, and the like service, for the maintenance of his household; and it was on this account that such liberties were given them, for which they may have writs of *monstraverunt* to such as take the duties of toll, &c.

No lands are to be accounted *ancient demesne*, but such as are held in socage. Whether land be *ancient demesne* or not, shall be tried by the book of DOMESDAY.

ANCIENT *differences*, in *Heraldry*. See BORDURES.

ANCIENTY, in some *Statutes*, is used for eldership or seniority.

The elder sister can demand no more than her other sisters, beside the chief *messe*, by reason of her ancienty. This word is used in the statute of Ireland, 14 Hen. III.

ANCLABRIS, in the *Religion of the Ancient Romans*, denoted a table in temples, whereon the priests set their portion of the sacrifices and oblations.

ANCLE, *Ancleus*, in *Surgery*.—The *ancle* is subject to be luxated, either in running, in jumping, or even in walking; and that in all four directions, either inward, or outward, backward or forward. When the *ancle* is luxated inward, the bottom of the foot is turned outward; and on the contrary, when it is luxated outward, the bottom of the foot is turned inward, which latter case is indeed much more frequent than the others. If it is dislocated forward, the heel becomes shorter, and the foot longer than it should be; and if backward, the contrary signs to these will appear. The *ancle*, however, can scarce possibly be luxated outwards unless the *fibula* be separated from the *tibia*, or else quite broken, which may happen to the external *ancle*; nor is it uncommon for a luxation of the *ancle* to be attended with very grievous symptoms, especially when occasioned by some great external violence. Nor can it indeed well happen otherwise in that case, since the distortion of the foot must necessarily overstrain the adjacent tendons, ligaments, and nerves, and thence excite very violent pains, and other bad symptoms: or the veins and arteries may also be very easily lacerated, which will occasion a large extravasation of blood about the whole foot, and too often give rise to a gangrene.

It is, however, necessary to observe, that the *ancle* is not always luxated, although it has been violently strained by leaping, or turning the foot on one side; for it sometimes happens that the *ancle* is not dislocated on these occasions, but only the parts violently contused and strained. The *ancle*, when truly luxated, is more or less difficult to be reduced, according to the violence of the force by which the accident was occasioned. The most ready way, however, of reducing a luxation of the *ancle*, is to place the patient upon a bed, seat, or table, letting the leg and foot be extended in opposite directions by two assistants, while the surgeon replaces the bones with his hands and fingers in their proper situation. When the foot is by this means restored to its proper position, it is to be well bathed with oxycrate and salt, and then carefully bound up with a proper bandage. The patient must be confined to keep his bed for a considerable time, till the bad symptoms are gone, and the *ancle* has recovered its strength so far as to bear the weight of the body, without any apprehension or danger.

We have an account of the *ancle* regularly evacuated at an ulcer of the *ancle*, in the Medic. Ess. Edinb. vol. iii. art. 9.

ANCON, in *Anatomy*, denotes the curvature, or flexure of the arm, wherein we rest in leaning.

This is otherwise called OLECRANUM.

ANCON, in *Architecture*, is used to denote the corners or quoins of walls, ends beams, or rafters.

ANCON also is used in *Ancient Architecture*, to denote the two parts or branches of a spire, which meet in an angle resembling the letter L.

ANCON is also used by Vitruvius, to denote a kind of mosaic, or tables before doors, bent somewhat after the manner of scrolls, so as to resemble the letter S. In this sense, it may amount to the same with what the Greeks call *scolopendra*, *prothyrides*.

ANCON is particularly applied in the *Ancient Architecture*, to the brackets, or thundering-pieces, called CONSOLES and CANTALES by the moderns.

ANCON was also used by the Carthaginians, to denote a dark prison or dungeon. Suidas mentions one of this kind, in which Carthalo used to put all who displeased him; from which Bostharus delivered many merchants of the Bull, whom the tyrant intended to put to death.

ANCON is also applied to the angles or declivities of streets; sometimes also to the tops of mountains.

ANCONEUS *Internus*, in *Anatomy*, the first muscle of the elbow so called, as being situated behind the ends of the *cubitus* or elbow.—See *Tab. Anat. Chirurg. fig.* 5. 40.

It arises from the back part, or the extremities of the humerus, passes over the elbow, and is inserted into the lateral and internal part of the *cubitus*, about three or four fingers breadth above the *os ancon*.—Its use is to assist in extending the arm.

Some *anatomists* make the following distinctions, according to Winslow.

ANCONEUS *externus*, a long muscle, lying on the outer part of the backside of the *os humeri*, from its neck to the external condyle.

ANCONEUS *internus*, a muscle shorter, and more fleshy than the *anconeus externus*, and lying towards the inner part of the lower half of the *os humeri*.

ANCONEUS *major*, a long fleshy muscle lying on the backside of the *os humeri*.

ANCONEUS *minor*, a small muscle obliquely triangular, lying on the oblong *fossula* on the side of the *olecranon*.

ANCONY, in the iron mines, a bloom wrought into the figure of a flat IRON bar, about three feet long with two square rough knobs, one at each end.

The proceis for bringing the iron to this state is this: they first melt off a piece from a sow of cast iron, of the proper size; this they first hammer at the forge into a mass of two feet long, and of a square shape, which they call a *Mum*; when this is done, they send it to the finery, where, after two or three heats and workings, they bring it to this figure and call it an *ancony*. The middle part, beat out at the finery, is about three feet long, and of the shape and thickness the whole is to be; this is then sent to the chafery, and there the ends are wrought to the shape of the middle, and the whole made into a BAR.

ANCRES, in *Heraldry*, the same with ANCHORED.

ANCTERES, in the *ancient Medicine*, seem to have been the same, at least to have answered the same uses, as our SUTURES.

Some also speak of a strong kind of sticking plaster under this denomination.

ANCTERIASMUS, in *Medicine*, the operation of applying a *fibula* to close the two patent lips of wounds.

This is also called by Latin writers, *infibulatio*.

ANCYBLASMUS is more particularly used to denote the putting a *fibula* through the prepuce of the ancient flagellants and buffoons.

ANCYBLITIUS, among *Ancient Physicians*, denotes a disease of the eyes, wherein there is an appearance of small, or little bones sprinkled on them.

This is otherwise called EXTILIFICATION.

ANCUS, a name for such as have an arm bent crooked, so that they cannot extend it.

ANCYLE, in *Antiquity*, denotes a small kind of brazen shield, said to have fallen from heaven into the hands of Numa Pompilius at the same time that a voice was heard, that Rome should be mistress of the world, while she preserved that shield.

Though there was but one *ancyle* that fell from heaven, yet there were twelve preserved: Numa, by the advice, as it is said of the nymph Egeria, having ordered eleven others, perfectly like the first, to be made by Veturius Mamurius, that if any should attempt to steal it, as Ulysses did the Palladium, they might not be able to distinguish the true *ancyle* from the false ones.

These *ancyla* were preserved in the temple of Mars; and were committed to the care of twelve *priests*, or *salii*, instituted for that purpose.

They were carried every year, in the month of March, in procession all round Rome; and the thirteenth day of that month they were again deposited in their place.

ANCYLE, see ANCHYLOSIS.

ANCYLOBLEPHARON, *inviscatio, adglutinatio palpebrarum*, a diſeaſe wherein the eye-lids are ſtuck fall, or glued together. The cure is by manual operation.

ANCYLOGLOSSUS, *ἀγκυλογλωσσος*, from *ἀγκυλος, crooked*, and *γλωσσα, tongue*, one that is tongue-tied, or has an impediment in his ſpeech, ariſing from a contraction of the *frænum* of the tongue.

This diſeaſe is alſo called *ancyloglossum*, which is either *naturel*, i. e. born with the infant, or *accidentel*, occaſioned uſually by ſome ulcer under the tongue, which leaves behind it a hardneſs, or *eſchar*. It is the common opinion of midwives, that ſome are born without this infirmity; and hence, one of the firſt things after a birth, is to cut the ſtrings of the infant's tongue.

The effect of the *ancyloglossum* is not only to hinder the uſe of ſpeech, but in children it alſo diſables them from ſucking. The cure is performed by a careful ſection of the *frænum*, ſo as not to hurt the nerves, or other veſſels. This operation is never to be performed, where the infant is able to thruſt its tongue ſtraight out of the mouth. Fabricius ab Aquapendente complains ſeverely of the officiouſneſs of midwives, who, without ever examining the condition of the *frænum*, practiſe the operation promiſcuouſly on all infants, from an opinion, that without it the child would never be able to ſpeak. But according to this author, there is ſcarce one child in 100,000 in whom this ligament needs any cutting at all. In ſome parts of Italy the midwives nouriſh a long nail on their right thumb, which is faſhioned after the manner of a knife's point, wherewith, as ſoon the child is born, they cut the ligaments. In other places, from a vain opinion that there is ſomething malignant in the nail, the operation is performed with the edge of a piece of money.

The operation is painful to the infant, and is ſometimes followed by inflammations, and even death itſelf.

ANCYLOMELE, *ἀγκυλομηλη*, from *ἀγκυλος, crooked*, and *μηλη, a probe*; a ſurgeon's crooked probe, or a probe with a hook.

ANCYLOSIS, ANCHYLOSIS.

ANCYROIDES, *ἀγκυροειδες*, is uſed by ſome writers in *Anatomy*, for the proceſs or ſhooting forth of the ſhoulder-bone, in form of a beak; otherwiſe called *coracoides*.

ANDA, *G. Piſon*, is a tree of Braſil, the wood of which is ſpungy and light; the leaf laugiſh, fibrous, and pointed; the flower large and yellow; and the fruit a grey nut, which encloſes, under a double rind, two kernels of the taſte of cheſnuts. The fruit is ſaid to be purgative, and a little emetic: two or three of the kernels are a doſe. They extract oil by expreſſion from theſe kernels, with which the natives anoint their limbs. The rinds of the fruit are eſteemed proper to ſtop a looſeneſs; thrown into ponds, they kill the fiſh.

ANDABATÆ, in *Antiquity*, a kind of GLADIATORS, who fought hoodwinked; having on a ſort of helmet that covered the eyes, and even the face.

They were called *andabatæ, quaſi ἀνοβατοι, aſcenſores*, becauſe they fought mounted on horſeback, or out of chariots. Others derive the word from *ανα, again*, and *βαινω, I go*.

Some ſay, the *andabatæ* fought in the dark, or late at night, after the *circenſia* were over. There were two men in the chariot, viz. the driver, or *auriga*, and the *magiſtratus*, who was alſo called *ανοβατης*, q. d. *aſcenſor*, or *mounter*; whence, by corruption, the Latins formed the *andabata*.

It has been diſputed among critics, whether the *andabatæ* were a people who actually fought blindfold, in their wars, or a ſet of combatants who only practiſed this method of fighting for exerciſe ſake.

ANDELANGA, in *Middle Age Writers*, occurs as part of the *formula* of divers donations.

In this ſenſe, we meet with *donare per andelangam & ſolarium, vendere & tradere per andelangam*, &c. Some will have the term properly to denote what we call an *ardre*; others a long ſtaff, or rod, which it is known was much uſed in the act of putting into poſſeſſion.

The word is ſometimes alſo written *andelangus, andelago, andelagus*, or *andalangus*, &c.

ANDENA, in *Ancient Writers*, denotes a ſwath in mowing. The word is likewiſe uſed to ſignify as much ground as a man can ſtride over at once.

ANDERENÆ, *ſal*, in *Natural Hiſtory*, a name given, by many of the old writers, to the nitre of the ancients, or NATRON. Some have, ſince their time, applied it to our common nitre; and it has been wondered at, that the accounts do not agree with the ſubſtance. But it is to be obſerved, that the nitre, or *natron*, of the ancients, is a fixed ſalt, approaching to the nature of *pot-aſh*, and not at all inflammable with ſulphur, as our nitre is. It is, therefore, no wonder if the things related of the one ſhould not be found to agree with the other.

ANDIRA, or ANGELYN, in *Botany*, *G. Piſon*, a tree in Braſil, the wood of which is hard and proper for building. Its bark is of an aſh colour; its fruit is of the ſhape and ſize of an egg, green at firſt, but growing blacker by degrees. It is covered with a hard rind, incloſing a grain, of yellowiſh kernel, of a bitteriſh, aſtringent taſte.

They pulverize this nut, and give it for worms; but not more than one ſcruple; for more than this is ſaid to be poiſonous.

ANDIRA, in *Zoology*, is an animal called alſo *ανδιρα-μυρικι*, a kind of bat in Braſil; the largeſt of which are as big as our pigeons: they call them horned bats, from a ſort of excreſcence, or plaiut body, above their brain. Some of theſe are very dangerous; for they get into chambers in the night, and ſo ſubtilly open the veins in the feet of thoſe who are in bed, that they are not perceived but by the flowing of the blood, which is difficult to be ſtopped. The inhabitants reckon the tongue and heart of that animal among poiſons.

ANDIRIAR, in *Botany*, the name by which Rhaſes, and ſome others, expreſs the BABAGO.

ANDORINHA, in *Ornithology*, a name by which the Portugueſe in the Braſils call the Braſilian ſwallow, more uſually known by its Braſilian name *tapera*.

ANDRACHNE, in *Botany*. See *Boſſard* ORTIFE.

ANDRACHNE is alſo a name given, by the ancients, ſometimes to a tree of the ARBUTUS, or ſtrawberry tree kind, and ſometimes to the herb PURSLAIN. Some of the later Latin writers have alſo called it *portula*, and ſome of the later Greeks have called it *καυκαλιδα*.

ANDRAPODISMUS, in *Ancient Writers*, the ſelling of perſons for ſlaves.

Hence alſo *andrapodiſtes, andrapodiſta*, a *dealer in ſlaves*, more particularly a *kidnapper*, who ſteals men or children, to ſell them; a crime the Theſſalians were noted for.

ANDRAPODOCAPELI, in *Antiquity*, a kind of dealers in ſlaves. The *andrapodocapeli* had a particular proceſs of taking off moles, and the like diſfigurements on the faces of the ſlaves they kept for ſale, by rubbing them with bran.

At Athens ſeveral places in the forum were appointed for the ſale of ſlaves. Upon the firſt day of every month, the merchants brought them into the market, and expoſed them to ſale, whilſt the crier ſtanding upon a ſtone erected for that purpoſe, called the people together.

ANDREW, *Knights of St. Andrew*, or the thiſtle. See THISTLE.

Knights of St. Andrew, is alſo an order inſtituted by Peter the Great of Muſcovy, in 1698; the badge of which is a golden medal, on one ſide of which is repreſented St. Andrew's croſs, and on the other, are theſe words, *Czar Pierre, monarque de tout la Roſſie*. This medal being faſtened to a blue ribbour, is ſuſpended from the right thoulder.

ANDREW's *Croſs*, is a badge worn in the hat, by the people of Scotland, on the day of the feaſt of that ſaint.

It conſiſts of blue and white ribbands, diſpoſed into a croſs, or *ſaltier*; and is intended as a commemoration of the crucifixion of St. Andrew, the tutelary ſaint of Scotland.

ANDRIA, in *Antiquity*, a name given by the Cretans to the public entertainments, at which whole cities, tribes, or other bodies of men, were preſent.

The hall, or place of eating, where theſe entertainments were held, was denominated *andreion*, in the uppermoſt part of which was a conſtant table ſet apart for ſtrangers.

ANDRIA, is alſo uſed by ſome naturaliſts, to denote a ſpecies of hermaphrodite, wherein the female ſex has the predominancy.

ANDRODAS, in *Ancient Writers*, denotes the ſixty-third year of man's life.

This is otherwiſe called, *annus Egyptius*, and *climacter magnus*.

ANDROGYNA, in *Botany*, plants bearing male and female flowers on the ſame root.

ANDROGYNUM, in *Eccleſiaſtical Writers*, is uſed to denote *matrimony*, or even one of the parties married.

ANDROGYNUM, *balneum*, denotes a bath common to both ſexes.

ANDROGYNUS, or ANDROGYNOUS, an HERMAPHRODITE, or one born with two ſexes, being male and female in the ſame perſon.

The word comes from *ανηρ γυνη*, a compound of *ανηρ, man*, and *γυνη, woman*, q. d. *man-woman*.

The aſtrologers alſo give the appellation *androgynous* to ſuch of the planets as are ſometimes hot, and ſometimes cold; as Mercury, which is reputed hot and dry when near the ſun, and cold and moiſt when near the moon.

ANDROIDES, or AUTOMATON, in the figure of a man; which, by virtue of certain ſprings, &c. duly contrived,

lived, walks, and performs other external functions of a man.

The word is compounded of *ανερ, ανδρος, man,* and *ειδος, form.*

Albertus Magnus is recorded as having made a famous *androides.*

ANDROLEPSY, ANDROLEPSIA, in *Antiquity.* If an Athenian were killed by a citizen of some other place, and such city refused to deliver up the criminal to punishment, it was held lawful to take three inhabitants of that city, and punish the homicide in them. This the Greeks called *androlepsia,* and the Romans CLARIGATIO. The word is formed of *ανηρ, man,* and *λαμβανω, capio, I take.*

Some authors also use *androlepsia* for REPRISALS.

ANDROMACHI *theriaca,* or *treacle of* ANDROMACHUS, in *Pharmacy,* is a capital alexipharmic compositions; called also *Venice Treacle.*

ANDROMEDA, in *Astronomy,* a constellation of the northern hemisphere, representing the figure of a woman chained.

It is supposed to have been formed in memory of *Andromeda,* daughter of Cepheus and Cassipeia, and wife of Perseus, by whom she had been delivered from a sea-monster, to which she had been exposed to be devoured for her mother's pride. Minerva translated her into the heavens.

Dr. Hook thinks he has discovered the hidden meaning of the story of *Andromeda.* Vide Poft. Works, p. 402.

The stars in the constellation, *Andromeda,* in Ptolemy's catalogue, are twenty-three, in Tycho's twenty-three, in Hevelius's forty-seven, in Mr. Flamsteed's no less than sixty-six. They are as follow.

ANDROMEDA, in *Botany,* a genus of the *decandria monogynia* claſs. We have no Engliſh name for this plant. The characters are, that the empalement of the flower is cut into five ſmall acute ſegments; the flower is of one leaf, oval, and bell-ſhaped, and is divided into five parts at the brim, which are reflexed; it hath ten ſtamina; the germen afterwards turns to a round, pentagonal veſſel, having five cells, which are filled with ſmall round ſeeds. Mr. Miller enumerates five, and Linnæus ten ſpecies, moſt of which are natives of America.

ANDROMEDA, in *Middle Age Writers,* denotes a kind of garment made of ram-ſkins.

ANDRON, or ANDRUM, in *Antiquity,* an apartment in houſes aſſigned for the uſe of the men. This was otherwiſe denominated *andrœum,* and *andronitis.*

The *andron* ſtood oppoſed to the GYNÆCEUM, or apartment of the women.

The Greeks alſo gave their dining-rooms the title *andron,* becauſe the women had no admittance to feaſts with the men.

ANDRONA, in *Ancient Writers,* denotes a ſtreet, or public place, where people met and converſed together.

In ſome writers *androna* is more expreſly uſed for the ſpace between two houſes. In which ſenſe the Greeks alſo uſe the term *αναθυρωμα,* for the way or paſſage between two apartments.

The word is ſometimes alſo written *andra, andrion,* and *andronium.*

ANDRONA is alſo uſed, in *Eccleſiaſtical Writers,* for that part in churches deſtined for the men. Anciently it was the cuſtom for the men and women to have ſeparate apartments in places of worſhip, where they performed their devotions aſunder; which method is ſtill religiouſly obſerved in the Greek church.

The *andron,* or *androna,* was on the ſouthern ſide of the church, and the women's apartment on the northern.

ANDRONION, in *Phyſic,* the name of a paſſil, invented by an ancient phyſician named Andro, ſaid to have been of great efficacy againſt the carbuncle and HERPES.

Its ingredients, according to Ægineta's preſcription, are the *ſquame* of copper, *ſal ammoniac, alumen rotundum,* ſhavings of verdigriſe, and frankincenſe, all wrought up with wine. Celſus gives another recipe, and Aetius a third.

ANDROPHAGI, from *ανηρ, man,* and *φαγω, I eat,* among *Ancient Geographers,* denoted man-eaters.

Theſe are more uſually called *anthropophagi.*

Herodotus and Pomp. Mela, ſpeak of a nation of *Androphagi,* in Scythia.

ANDROPOGON, in *Botany,* a genus of the *polygamia monœcia* claſs. Its characters are, that it has hermaphrodite and male flowers; the calyx of the former is an unifolous glume, and the corolla a glume bearded at its baſe; the ſtamina are three, the ſtyles two, and the ſeed ſingle; the calyx, corolla, and ſtamina of the male are the ſame. There are eighteen ſpecies.

ANDROSACE, in *Botany.* We have no Engliſh name for this plant. The characters are, that the flowers grow in an umbel ſet in an involucrum, and divided into five parts; it hath five ſmall ſtamina within the tube; the empalement afterward becomes a round capſule of one cell, which is full of round ſeeds. It is of the *pentandria monogynia* claſs.

Mr. Miller enumerates three, and Linnæus ſix ſpecies.

The *androſaces* approach much to the nature of the auricula, but differ from the ſtructure of the flower.

Androſace is ſo called, from its bringing relief to men,

q. d. *ανὰ κατὰ σχεσιν*. It is aperitive, and good for the dropsy, for retention of urine, and for the gout.

ANDROSÆMUM, in *Botany*. See St. JOHN's *Wort*.

ANDROTOMY, or ANDRATOMY, from *ανηρ*, *man*, and *τεμνω*, *I cut*, the *anatomy* or DISSECTION of human bodies. It is thus called in opposition to *zootomy*, which is used to denote that of brutes.

Anatomy is the *genus*, and comprehends all dissections in general, whether of men, beasts, or plants; and *androtomy* and *zootomy* are the *species*.

ANDRUM, in *Physiology*, a local disease, epidemical among the people of Malabar, being a peculiar species of *hydrocele*, or watery tumor of the *scrotum*.

The *andrum*, in the language of the country, is also called *periçal*; sometimes paraphrastically, *andu vnjaku*, q. d. a *popular water rupture*.

Its origin is derived from the vicious quality of the country waters, impregnated with corrosive muriatic salts, the source of most other diseases that affect the Malabarians. Its signs, or symptoms, are an erysipelas of the *scrotum*, returning every new moon, by which the lymphatics being exuded, pour a serous saline humour into the cavity of the *scrotum*.

The *andrum* is incurable; those once seized with it, have it for life; but it is not dangerous, nor very troublesome, to those used to it; though sometimes it degenerates into a hydrosarcocele.

The means of prevention is by a heap of sand fetched from a river of the province Mangatti, and strewed in the wells. This is practised by the rich. As to the cure, they have only a palliative one, which is by incision, or tapping and drawing off the water from the *scrotum*, once in a month or two.

ANDRYALA, *downy sow-thistle*; in *Botany*, a genus of the *syngenesia polyg. æqual.* class. The characters are, that it hath a short round hairy impalement; the flowers are compoled of many hermaphrodite florets, which are uniform and of one leaf, stretched out like a tongue on one side; the germen is situated at the bottom of each floret; and becomes afterwards a single oval seed, crowned with a down.

Mr. Miller enumerates two, and Linnæus three species, which are natives of the southern parts of Europe.

ANECDOTES, ANECDOTA, a term used by some authors, for the title of *Secret Histories*; but it more properly denotes a relation of detached and interesting particulars.

The word is Greek *ανεκδοτα*, q. d. *things not yet known*, or *hitherto kept secret*.

Procopius gives this title to a book which he published against Justinian, and his wife Theodora; and he seems to be the only person among the ancients, who has represented princes such as they are in their domestic relation. Varillas has published *Anecdotes* of the house of Medicis.

ANECDOTES is also an appellation given to such works of the ancients as have not yet been published.

In which sense, M. Muratori gives the name *Anecdota Græca* to several writings of the Greek fathers, found in the libraries, and first published by him. F. Martene has given a *Thesaurus Anecdotorum Novus*, in folio, 5 vols.

ANEE, in *Commerce*, denotes a corn-measure, used in some provinces of France, particularly in Languedoc and Maconnois.

It is otherwise called *asnee*.

The *anee* is not so properly a measure, as the denomination, or assemblage of a certain number of other measures. The *anee* at Lyons consists of six *bichets*, equal to one *septier* and three bushels, Paris measure. At Macon, the *anee* is somewhat more.

ANEE is also used for a quantity of wine, supposed to be an ass's load; and is fixed to eighty pots.

ANELE, or ANIL, the same with *indigo*. 23 El. cap. 9.

ANEMIUS *furnace*, among *Chemists*, a wind-furnace; used to make fierce fires for melting, &c.

The word is formed of *ανεμος*, *wind*.

ANEMOMACHIA, from *ανεμος*, *wind*, and *μαχη*, *fight*, in some *ancient Writers*, denotes a whirlwind, or hurricane. In which sense, we sometimes also meet with *anemocle*, *anemotarasis*, &c.

ANEMOMETER, a machine wherewith to measure the strength of the wind.

The word is compounded of *ανεμος*, *wind*, and *μετρον*, *measure*.

The *anemometer* is variously contrived. In the Philosophical Transactions we have one described, wherein the wind being supposed to blow directly against a flat side, or board, which moves along the graduated limb of a quadrant, the number of degrees it advances shews the comparative force of the wind.

Wolfius gives the structure of another, which is moved by means of sails, ABCK (*Tab. Pneumatics, fig.* 17), like those of a wind-mill; which raise a weight, L, that, still the higher it goes, receding farther from the centre of motion, by sliding along a hollow arm K M, fitted on to the axis of the sails, becomes heavier and heavier, and presses more and more on the arm, till being a counterpoise to the force of the wind on the sails, it stops the motion thereof. An index, then, MN, fitted upon the same axis at right angles with the arm, by its rising or falling, points out the strength of the wind, on a plane divided like a dial-plate into degrees.
